On March 26, 1953, I received a letter from you which read in part as follows: "The project which we need help on is the development of apparatus—including testing the apparatus out in animal experiments—for the purpose of destroying tissue by focused ultrasonic sound waves. There seems to be fair evidence that by using this technique it is possible to make experimental lesions in the central nervous system of a moderately well-localized character. Also, it seems possible that with proper regulation of the energy different cell types may be selectively destroyed, or all of the constituents of the area may be involved. This would represent an extremely powerful tool for experimental work and also promises the possibility of placing lesions in selected sites in the human brain for the control of pain, etc. We seriously need a method for making experimental lesions which will not involve extensive operative procedures, as the latter always introduce a complicating factor in both the physiological and anatomical results of experiments."

The possibility of developing a relatively simple method for using focused ultrasound fired our imaginations, and Ted Hueter and I went to work immediately to draw up plans for such a project. It was apparent, however, that this work should be done at the Massachusetts General Hospital rather than at the Acoustics Laboratory, M.I.T., since experimental animals would be involved and the therapeutic use of such a method was not beyond the realm of possibility. We were fortunate in securing permission to use certain space in the White Building, M.G.H., and within a few weeks had transferred our activities from the diagnostic uses of ultrasound to the destructive use of this energy, and our facilities from the Massachusetts Institute of Technology to the Massachusetts General Hospital. Throughout the year 1954, we experimented with various ultrasonic generators, crystals and focusing lenses, using white mice as our experimental animals. We found that a high degree of accuracy was possible in the use of focused ultrasound. For example, one-half of the spinal cord of a mouse could be damaged while the other seemed to function perfectly. Moreover, this could be done by irradiating the spinal cord through the skin and the soft bones of the spinal column.

In September 1954, Dr. Walle Nauta came up from your laboratory and we began our first experiments on the brains of cats. I do not remember the exact date, but I do recall that we worked long and earnestly through a day which seemed, as we looked out the window from time to time, to be a rather stormy one. Much to our consternation, when we tried to leave the laboratory that evening, we found that we had been working right through a rather severe hurricane!

During 1954-55, our attention was directed primarily to the instrumentation necessary for the production deep within the brains of experimental animals of small lesions whose location, size, and shape we could predict before irradiation. We found that this method required a scalp incision and removal of a portion of the skull of the animal but that it was not necessary to open the dura covering the brain. Ted Hueter contributed most significantly to this phase of our investigation and we had, as well, the help of Dr. Walter Cotter, who went on to become a Resident in Neurosurgery and who, at the time of this writing, is anxiously awaiting a grant from the U.S. Public Health Service in order that he may continue his neurosurgical education in London.

In July 1955, Dr. Dagoberto Sosa came to work with us and he, too, is now a member of our Neurosurgical Resident Staff. During this period we began a painstaking investigation of the pathological changes which take place within the focal region when a destructive intensity of ultrasound is employed. In September, Jane Rosenthal and Betty Francis joined the Group and have continued to be invaluable to us as technical assistants. Dr. Raymond Adams very kindly offered us the facilities of his experimental neuropathological laboratory and, a year later, the help of Dr. Karl Aström, a Research Fellow in Neuropathology, from Stockholm.

Many interesting and unique findings came from this neuropathological study, but the most important to us were the facts that (1) a lesion once made never enlarges beyond its original confines, (2) it is possible to concentrate damage into an area which lies remote from the point of entry of the beam of ultrasound into the brain, and (3) this area of damage may be at least as small as 0.02 mm.^{3}. Some of our lesions were, in fact, so small that it was very difficult to identify them in the gross.

During 1956, we made two other valuable additions to our Group. Eugene Bell, Ph.D. came to us from Brown University in July. He is a biologist who is interested in the interaction of embryonic tissues with ultrasound, and now holds dual appointments as Assistant Professor of Biology, M.I.T. and Associate Biologist, M.G.H. When, in 1957, Dr. Hueter accepted a research position with the Raytheon Corporation, Dr. Bell became Technical Director of our Medical Acoustics Research Laboratory.

In July 1956, Dr. Erik Heidensleben came to Boston for a year's appointment as Research Fellow in Neurosurgery at M.G.H. Due to his efforts, we were able to confirm statistically the fact that an ultrasound lesion could be placed deep within the brain of the cat with extreme accuracy.

Dr. Louis Bakay (Instructor in Surgery, H.M.S.) began to contribute to our research effort late in 1955. He had long been interested in the "blood-brain barrier"—that mechanism which normally prevents certain substances from passing out of the brain capillaries into the brain tissues. In order to identify easily in the gross our very small ultrasound lesions we had routinely injected trypan blue immediately after irradiation. This dye would pass the blood-brain barrier only where the tissue had been damaged and impart a blue color to that area. With Dr. Bakay we have expanded this technique and are now using radioactive isotopes as well as vital dyes in an investigation into the nature and location of this blood-brain barrier.

At this juncture our investigative efforts had gone far ahead of our laboratory facilities. Fortunately for us, the Mixter Laboratories for Neurosurgical Research were then in the process of construction, and our research was transferred to the fourth floor of the Warren Building when that floor was virtually an empty shell. Although our neuropathologic studies were continuing, we felt at this point that it was possible to begin certain neurophysiologic investigations. Accordingly, we joined forces with Dr. Mary Brazier, Neurophysiologist at M.G.H., and with the aid of a grant from the Air Force began to investigate the effect of focused ultrasound upon the function of the central nervous system. We used as our test apparatus the visual pathway of the cat and found that it was possible to derive valuable information concerning the manner in which impulses were transmitted along the visual pathway.

In reference to support, I should have stated earlier that the Department of the Army had generously come to our assistance in the early stages of our investigation of focused ultrasound but that the main bulk of our support after 1955 had come from the National Institutes of Health.

In July 1957, our neuropathology was sufficiently well studied to allow Dr. Karl Aström to give a paper before the 1st International Congress of the Neurological Sciences in Brussels. While his was the *pièce de résistance,* I, too, gave a paper concerning our total investigations up to that time.

During the past year we have paid more and more attention to neurophysiologic studies, in particular the changes in function secondary to small lesions in the midbrain. This is an extremely busy area of the brain, as you well know, and the functions of small specific structures are not well known. We have been able not only to throw some light on function of various regions of this portion of the brain but to find evidence that (1) a small "dose" of focused ultrasound can be used to stimulate nervous activity, (2) a larger dose of ultrasonic energy may temporarily affect function of a given area of the brain, and (3) a still larger dose of ultrasound will irreversibly affect function and produce tissue damage as well. These findings lead us to the conclusion that ultrasound is an ideal tool for the neurophysiologist and that it holds great promise in the field of neurological therapy as well. These investigations have been greatly aided by the efforts of Dr. David Klein, who has just completed a year with us as Research Fellow in Neurosurgery.

At the present time we are very busy on a number of projects. Dr. Bakay is continuing his investigations of the blood-brain barrier by the use of vital dyes, radioactive isotopes, and the lesions made with focused ultrasound. Our Neuropathology Laboratory, under the capable direction of Miss Charlotte Merrill, is studying the possible demyelinating effect of ultrasound with the help of Dr. E. P. Richardson of the Department of Neuropathology and Dr. Dagoberto Sosa, who has temporarily rejoined our Group. In July of 1958, Dr. C. Norman Shealy will hold a joint appointment as Research Fellow in Neurosurgery at this Hospital, and in the Department of Neurophysiology, Harvard Medical School. With his help we hope to use focused ultrasound to further investigate the nature of spinal cord reflexes and to gather more data concerning the reversible depression of function within the central nervous system.

Also beginning in July, Dr. J. S. Manlapaz will begin what may well prove to be the most exciting phase of our years of study, namely the use of ultrasound as a method of treatment. We are currently engaged in the construction of a compact, easily transportable ultrasonic generator with an irradiating "head" which can be simply attached to a human stereotactic instrument. With this apparatus we plan to begin the application of focused ultrasound to deeply situated, inaccessible brain tumors in patients.

I believe that within the next two or three years the techniques of focused ultrasound will be routinely employed by neurophysiologists and that there will be a growing body of neurosurgeons who will use this method for treatment of disease of the central nervous system. Other fertile fields for the method will be ophthalmology and otology. We should like to help workers in those fields begin their own specialized research efforts. It is also our hope that we may provide an interesting field for a trained neurophysiologist, so that in our clinical investigations we may have the benefit of his knowledge. Finally, we hope to go back to exploring the use of unfocused ultrasound as a diagnostic tool. We have recently been fortunate in securing fairly long-range support for our activities, and I can see no lack of problems to be attacked.

These investigative efforts have constituted a challenge and an adventure for me for which I am most grateful. The work of the Medical Acoustics Research Laboratory is, however, a true team effort. Without the cooperative spirit which exists within the Laboratory all would be chaos and confusion. I could not close this letter, moreover, without a word of sincere thanks to those individuals and granting agencies and particularly you, David Rioch, for the support and enthusiasm for this project through the years.

Always yours,
Tom

[**H. Thomas Ballantine, Jr., M.D.,**
Associate Visiting Neurosurgeon]

IMPORTANT NOTICE

The Massachusetts General Hospital Alumni Association has not held a formal meeting since October 1946. With the 150th Anniversary of the Hospital coming up in 1961, the officers of the Association are taking this opportunity to urge every MGH alumnus to come to a meeting at the Hospital on October 16 of this year. We hope that all alumni will immediately put this date on their calendars and plan to come with their wives this autumn. There will be light and serious entertainment and, of course, a scientific program.

* * *

Dr. Henry K. Beecher was one of five alumni of the University of Kansas to receive citations for distinguished service to mankind, conferred during the Commencement exercises of the University on June 2. The citations were voted by a secret committee, on the basis of an individual's contribution to the welfare of mankind. The University of Kansas does not grant honorary degrees, but the citations carry a similar distinction.

Their Annual Award for 1957 has been conferred upon Dr. George L. Nardi by the R. Franklin Carter Foundation, Inc. This honor is given to the individual who, in the opinion of the Advisory Scientific Committee of the Foundation, has made the most significant contribution to research on diseases of the biliary tract each year.

At the Annual Convocation of the American College of Physicians, held in Atlantic City on April 30, Dr. Chester M. Jones was elected to Mastership in the College, for his "professional attainments and the force of his example to younger men in the arts of medicine". This is an honor conferred by the College on those of its members who have attained special distinction and eminence in their profession. The accompanying citation read as follows: "Dr. Jones, a graduate of Williams College, received his degree of Doctor of Medicine from Harvard Medical School in 1919. In his distinguished medical career he has been continuously associated with the Massachusetts General Hospital. His valuable medical contributions, in the field of gastroenterology particularly, have given him a national reputation and brought him membership in the more important national medical societies. Dr. Jones has served an arduous term, first as Secretary-Treasurer and later as Chairman of the American Board of Internal Medicine—a most generous donation of time and strength to the future of internal medicine. As a Fellow since 1928, First Vice President in 1956 and now as a Regent, he has given valuable service to this College."

The Board of Trustees, at their meetings on April 4 and 18, and May 2, voted to appoint:

Dr. David W. Bailey as Intern on the Children's Medical Service for one year, beginning July 1;
Dr. Niels E. Brandstrup as Second Assistant Resident on the Children's Medical Service for one year, beginning July 1;
Dr. John M. Brogden as Acting Assistant Resident in Urology, for the period April 1 through June 30;
Dr. Thornton Brown as Acting Chief of the Orthopedic Service, from April 1 through May 17;
Dr. Humberto A. Fernandez-Moran (Villalobos) as Associate Biophysicist in Neurosurgery, effective as of March 17;
Dr. David W. Florence as Assistant Resident in Orthopedic Surgery for one year, beginning April 18;
Dr. Herbert A. Haessler as Second Assistant Resident on the Children's Medical Service for one year, beginning July 1;
Dr. Jordan S. Ruboy as Second Assistant Resident on the Children's Medical Service for one year, beginning July 1;
Dr. Bal M. Sahay as Assistant Resident in Psychiatry, beginning July 1;
Dr. R. Wyman Sanders as Intern on the Children's Medical Service for one year, beginning July 1;
Dr. John W. Saville as Assistant Resident in Orthopedic Surgery for one year, beginning July 1.

At their meetings on April 2, 9, 23, and 30, the General Executive Committee voted:

To promote:

Dr. D. Glyndwr Millard from the position of Second Assistant to that of First Assistant Resident in Radiology. beginning June 1;
Dr. Stefan C. Schatzki from the position of Acting Resident to that of First Assistant Resident in Radiology, beginning July 1.

To reappoint:

Dr. John F. Bertles for one year, beginning July 1, with a change in title from Clinical and Research Fellow to that of Clinical Assistant in Medicine;
Dr. George Kaldor as Research Fellow in Medicine for one year, beginning March 15;
Dr. Arthur Klein as Clinical and Research Fellow in Medicine, assigned to Allergy, for one year, beginning April 1.

To continue the appointment of:

Dr. John Q. Durfey as Assistant Resident in Anesthesia, through June 30.

To appoint:

Dr. Jose N. Astacio as Graduate Student Assistant in Pathology for one year, beginning April 7;
Dr. David A. Drachman as Clinical Fellow in Neuropathology for one year, beginning July 1;
Dr. Daniel D. Federman as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Lamont W. Gaston as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. William E. Karnes as Clinical Fellow in Neuropathology for one year, beginning July 1;
Dr. Charles S. Keevil, Jr. as Clinical Fellow

in Medicine, assigned to Cardiology, for one year, beginning July 1;

Borge Larsen, M.S. as Research Fellow in Medicine for one year, beginning April 15;

Dr. Paul R. McHugh as Clinical Fellow in Neuropathology for one year, beginning July 1;

Dr. Harilaos T. Sakellarides as Clinical Fellow in Orthopedic Surgery for one year, beginning April 7, with the privilege of assisting in the care of the private patients of Drs. Cave and Rowe;

Dr. Bruce J. Sams, Jr. as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Charles A. Sanders as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;

Dr. Nathan T. Sidley as Clinical and Research Fellow in Psychiatry for one year, beginning September 1;

Dr. Robert T. Spalding as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Mary J. Spiro, Ph.D. as Research Fellow in Medicine for one year, beginning July 1;

Dr. Lloyd B. Tepper as Clinical Fellow in Medicine, assigned to Occupational Medicine, for one year, beginning July 1;

Dr. John H. Wulsin as Research Fellow in Surgery, for the period April 7 through May 29;

Dr. Irving Zieper as Clinical Fellow in Neurology for one year, beginning July 1.

SURGICAL RESEARCH

DISEASES OF THE LIVER AND PORTAL CIRCULATION

The work in this laboratory, which has been focused primarily on diseases of the liver and portal circulation, breaks down into several categories which will be covered separately. In this brief survey of the past five years, it is apparent that the studies to be described represent a collaborative effort not only by personnel, permanently or transiently working in this laboratory, but also with many individuals in other departments of the Hospital.

I. The clinical and biochemical effects of portal-systemic venous shunts

For many years it had been apparent to the medical profession that massive hemorrhage from the esophageal varices which develop as part of the portal-systemic collaterals attendant upon a portal bed block, was one of the major causes of death from cirrhosis of the liver. In 1945, Dr. Allen Whipple demonstrated the feasibility of surgically constructing a portal-systemic shunt. Subsequently Drs. Blakemore, Linton, Child, and others applied this surgical approach extensively and showed that a high degree of protection against hemorrhage could be achieved in this way. Our interest in this problem began in 1953, when two patients, in whom portacaval shunts had been constructed following resection of the portal vein for invasive cancer of the pancreas, developed repeated bouts of central nervous system derangements. These episodes resembled the clinical and electroencephalographic disorder of "hepatic coma". Ultimately these episodes were shown to be related to a disorder in ammonia metabolism. Gradually a pattern evolved which makes it clear that in the presence of portal-systemic shunts (either spontaneously developed or surgically constructed) the absorption of ammonia (and very probably other products) formed by the action of intestinal bacteria on ingested nitrogenous material eventuates in a disorder of cortical function which fits into the somewhat nondescript category of "hepatic coma".

It is always important for us to realize that it is improved techniques which permit better metabolic definitions of clinical syndromes rather than any expansion of the powers of observation and perception of the human race. In 1883 Pavlov and his colleagues recognized this phenomenon in the Eck fistula dog and referred to it as "meat intoxication". William Shakespeare has been recognized as one of the keenest observers and recorders of human oddities. It is interesting to follow in *Twelfth night* the activities of Sir Andrew Aguecheek and Sir Toby Belch, whose lives were so closely associated with alcohol in one form or another. Although there is no histopathological evidence of cirrhosis, Sir Toby suggests (in reference to Sir Andrew) that "if he were opened, and you find so much blood in his liver as will clog the foot of a flea, I'll eat the rest of his anatomy". The phenomenon of "meat intoxication", which is gradually being defined, is not described in detail by Shakespeare, but Sir Andrew does say of himself: "I am a great eater of beef, and I believe that it does harm to my wit". These observations of Shakespeare led W. H. J. Summerskill, from the Postgraduate Medical School of London, who spent a year in Boston studying liver disease, to suggest that the clinical and biochemical abnormality, to which we have referred briefly, be called "Aguecheek's disease".

Much of the information accumulating in this field has come from this Hospital. Dr. Mary Ellen Jones, working under Dr. Fritz Lipmann, has contributed tremendously to the understanding of the Krebs-Henseleit cycle of urea synthesis. Don C. Pearl, Jr., a fourth year student at Harvard Medical School, has studied in this laboratory the effects of an ammonia load on this cycle, and the results suggest that in cirrhosis a rate-limiting step exists in the conversion of citrulline to arginosuccinic acid, and interferes with the normal clearance of ammonia.

In this same general area, related studies on the effects of ammonia and L-glutamic acid on the tricarboxylic acid cycle and of arginine and aspartic acid on urea synthesis are in progress.

II. Ascites and cirrhosis

While not as catastrophic nor as rapidly lethal a complication as bleeding esophageal varices, the intractable accumulation of fluid in the abdominal cavity of patients with cirrhosis is a frequent and distressing sequela of the disease. In many instances, improvement in nutrition and attendant increase in serum albumin level will result in disappearance of the ascites. In others, severe restriction of salt intake, and the use of diuretics are required in addition. There remains, however, a group of patients in whom ascites is intractable and persists despite all known forms of treatment. The volume of medical literature available on this problem attests to its complexity. The existence of an abnormal collection of fluid in a body cavity presents an obvious challenge to the surgeon, but the history of the innumerable techniques devised to deal with this problem represents a record of failure. Although related in some way to portal hypertension, it has become apparent that the correction of portal hypertension does not of necessity improve the ascites, and, experimentally, obstruction of the portal vein does not result in ascites. Recent experimental and clinical studies have focused on the metabolic pattern of salt and water retention and hyperaldosteronism in the patient with cirrhotic ascites. Again, however, the available evidence would indicate that this pattern is a secondary and not a causative factor.

If one surveys the literature on this subject, one is impressed with the possible importance of an intra-hepatic "outflow block" as an initiating mechanism in the formation of ascites. This concept relates, then, the case of cirrhotic ascites to the experimental or clinical development of the Budd-Chiari syndrome and to the recently described phenomenon of "bush-tea poisoning". It is this concept which we are exploring and studying experimentally, and we have been able to apply this information with apparent success in man. One year ago, a "double" portacaval shunt (decompressing the liver as well as the portal bed) was constructed in a patient with well-compensated cirrhosis but intractable ascites. Preoperatively, this patient showed the now well-recognized pattern of "hyperaldosteronism". Postoperatively, not only did the ascites disappear completely but the metabolic pattern was completely reversed. One year later, this first patient is completely free of ascites, is in excellent health, and, on an unrestricted salt intake, handles sodium in a way indistinguishable from the normal individual.

In order to study in more detail this hemodynamic and metabolic abnormality, we are attempting in dogs to reproduce with alkaloid extracted from *Crotolaria spectabilis* the syndrome of "bush-tea poisoning" seen in man in the Caribbean area.

(Incidentally, neither Sir Toby Belch nor Sir Andrew Aquecheek appeared to have developed ascites during the period covered by *Twelfth night.*)

III. Biophysics and trace metals

The concentration of copper in the liver and zinc in the pancreas is a natural stimulus to the curiosity of anyone interested in the normal and morbid physiology of these organs. Both of these trace metals have positron-emitting isotopes. The pioneering work of Drs. Gordon L. Brownell and William H. Sweet in isotopic arsenic encouraged us to exploit these isotopes as possible clinical tools. Dr. Richard M. Thors, from Iceland, a Research Fellow in Surgery, spent the better part of a year studying Cu^{64} and Zn^{62}

in laboratory animals with Dr. Brownell and Dr. Saul Aronow in the Physics Laboratories of this Hospital. The information obtained was encouraging enough to warrant construction of a total body scanner. The ultimate clinical objective of this work is the accurate delineation of the liver and pancreas in man and very possibly the identification of "cold" nodules of malignant disease.

IV. Organ hypothermia in hepatic surgery

During their tours of duty in the Navy, Dr. Charles E. Huggins and Dr. Edwin L. Carter of the resident staff of this Hospital, were stationed at the Naval Medical Research Institute in Bethesda, where they studied and reported on a technique of differential hypothermia in experimental hepatic surgery. This technique was subsequently employed at the Massachusetts General Hospital and proved to be an effective way of maintaining viability of the liver in man during total inflow occlusion. The instances when this technique is necessary in clinical surgery are relatively rare, but when the occasion does arise, this should prove to be a valuable tool in a traditionally difficult surgical area.

V. Liver blood flow

A survey of the work done in this field in this department illustrates the cooperative nature of the investigations. In collaboration with the clinical and biochemical studies in this laboratory on patients with liver disease and with portal-systemic shunts, Dr. Hugo M. Palazzi, a Research Fellow in Surgery, from Bolivia, has been measuring liver blood flow with a method introduced by Dr. George L. Nardi. Although this and other investigations are independent studies, a coordinated program incorporates much information from various sources, the correlation of which has proved to be very important.

Personnel

It has been interesting to me in writing this report to recall the persons who have been involved in the studies of liver disease carried out in this laboratory. We have had the stimulus of association with a number of surgeons from other countries: Mr. Athol G. Riddell (Manchester, England), Dr. Jacques H. Lebrun (Neuilly-sur-Seine, France), Dr. Daniel Joly (Buenos Aires, Argentina), Dr. Richard M. Thors (Reykjavik, Iceland), Dr. Hugo M. Palazzi (Cochabamba, Bolivia), and Dr. Rafael M. Casas (Bogotá, Colombia). Medical students from various universities have brought fresh outlooks to old problems: Parker Small (University of Cincinnati), Rosemary Freytag (Heidelberg University), Don C. Pearl, Jr. (Harvard Medical School), and Daniel C. Collins (Columbia-Presbyterian). Of the research associates and technicians, Phyllis Nachod, Joan Wareham, and Claude Laumont have left to study for doctorates; while Irene Palatine and Julia Farrelly are the present assistants in the laboratory.

William V. McDermott, Jr., M.D.,
Associate Visiting Surgeon

An Edward Peirson Richardson Lecture was delivered in the Bigelow Amphitheatre at the Hospital on May 14 by Dr. Erwin Uehlinger, Professor of Pathology at the University of Zurich, Switzerland. His subject was "Osteomalacia and the milkman syndrome". Dr. Uehlinger also gave an informal talk on "Late primary tuberculosis and its development", in the Ether Dome on the morning of May 13.

A tea for Dr. Uehlinger was given by Dr. Castleman in the Mallory Library on May 14 for a small group of doctors.

On April 15, Dr. E. F. Scowen, Chief of the Medical Professional Unit and Director of the Dunn Laboratories at Saint Bartholomew's Hospital, London, lectured in the Ether Dome on "Oxalosis and hyperoxaluria". He was the guest of the Medical Services at the Hospital.

Dr. Scowen gave a distinguished discussion on a topic he has long been interested in and on which he has done much research. He likes to call the field which it represents "biochemical genetics".

BIOGLET

Dr. John Q. Durfey, Assistant Resident in Anesthesia—born in Springfield, Ohio, October 28, 1929; Texas Military Institute, 1944-46; Amherst College, 1946-50; Columbia University College of Physicians and Surgeons, 1950-54; Cincinnati General Hospital, 1954-55; military service: Flight Surgeon on the U.S.S. *Coral Sea* and in Pensacola and Jacksonville, Florida, 1955-58.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

General Surgery

Nardi, G. L., and Lees, C. W.
Serum trypsin: A new diagnostic test for pancreatic disease.
New England J. Med. 258:797-798.

Pearl, D. C., and McDermott, W. V., Jr.
A vulnerable and rate-limiting step in urea synthesis in patients with hyperammoniaemia.
Proc. Soc. Exper, Biol. & Med. 97:440-443.

Neurology, Neurosurgery, and Psychiatry

Long, R. T., Lamont, J. H., Whipple, B., Bandler, L., Blom, G. E., Burgin, L., and Jessner, L.
A psychosomatic study of allergic and emotional factors in children with asthma.
Am. J. Psychiat. 114:890-899.

Laboratory Science

Leonsins, A. J., and Waddell, W. R.
Inhibiting effect of norepinephrine on gastric secretions in human subjects.
J. Appl. Physiol. 12:334-338.

Morgan, W. S.
Affinity of neutral red for cells with basophilic cytoplasm.
Nature 181:1132-1133.

Morgan, W. S.
A cytoplasmic neutral red-ribonucleic acid component not influencing protein synthesis.
Exper. Cell Research 14:435-439.

Murray, D. B., and Ditzel, J.
The effect of CO_2 inhalation on the conjunctival vessels, blood pH, and pCO_2 in young diabetic subjects.
J. Lab. & Clin. Med. 51:370-380.

Schmid, K., MacNair, M. B., and Bürgi, A. F.
The chromatographic separation and purification of acidic proteins on carboxylated ion exchange resins.
J. Biol. Chem. 230:853-864.

Waksman. B. H.
Cell lysis and related phenomena in hypersensitive reactions, including immunohematologic diseases.
Prog. in Allergy 5:349-458.

Ophthalmology

Donahue, H. C.
Some current concepts of headache, especially ocular.
A.M.A. Arch. Ophth. 59:489-494.

Otolaryngology

Kelemen, G.
Congenital deafness: Analysis of pathological findings.
Tr. 6 Int. Cong. Otolaryng.: 253-254.

Kelemen, G.
Otitic reinfection: An experimental study.
A.M.A. Arch. Otolaryng. 67:257-267.

Books

Means, J. H.
Ward 4.
Cambridge, Mass., Harvard University Press.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

PROPOSED AMBULATORY CLINIC BUILDING

In the past the approach of the Hospital to medical care might have been termed "centripetal", in that attention was centered largely upon patients whose illnesses required Hospital admission. In recent years this approach has subtly but firmly become more "centrifugal" with the expanding concept of the Hospital as a community health center whose responsibilities are not merely intramural but community-wide. It is through the MGH Clinic that the Hospital most directly extends its medical care into the community. Almost 200,000 patients are seen annually in the various Clinics of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary.

In August 1955, the Board of Trustees appointed a committee — known as the Clinic Committee — to determine what the function of the Clinic should be in the expanding community role of the Hospital. This is not a problem peculiar to the Massachusetts General, but one that is nation-wide in this era of rapid change in the economics and distribution of medical care.

The Clinic Committee, consisting of the 33 members representing all services at the Hospital, has made the following recommendations.

1. The establishment of an efficient appointment system to reduce the prolonged waiting period to which most clinic patients are subjected;

2. Adjustment of all payment systems, in order that patients may know what expenses to expect and make one inclusive postpayment;

3. Abandonment of the policy of trying to differentiate between patients who can pay for medical care and those who cannot, and the establishment of an open-door policy which would permit all patients to receive care of comparable quality and allow flexible use of Hospital facilities;

4. Inclusion of an automatic communication mechanism, accessible diagnostic facilities (such as X-ray), well-arranged admitting areas, adequate waiting rooms, modern examining rooms, conference rooms, and dining facilities in the construction of a new building to house all of the Clinics of the M.G.H.;

5. Its own ancillary diagnostic and therapeutic facilities to be included in the proposed new building;

6. Construction of the new building to be carried out in such a way that additional professional office space could be added later, if this should become desirable. The advantages to the Hospital and to the individual staff members of having private offices close to the Hospital are evident to all. It is assumed that X-ray and laboratory facilities initially constructed would be of sufficient size to permit their use by ambulatory private patients.

The Committee is unanimously of the opinion that the pre-eminent purpose of the MGH Clinic is to bring into being the best possible medical care for all members of the community who seek its aid, and that all other functions, however important and valuable, are ancillary to this challenge.

It is not only important that patients be given the best medical care in a strictly scientific sense, but that this care be given with due regard for the dignity of the individual. The Clinic, which is dependent upon the composite skills of its participating medical workers, must be organized to insure maximal utilization of these skills in an environment conducive to the best in medical care and teaching. Interchange of knowledge lies at the core of a good clinic, where there are unique opportunities to define the life history of disease and to carry out carefully controlled therapeutic trials in chronic illnesses.

Over and beyond the internal functions of patient care, teaching, and research, the ideal clinic must endeavor to serve as a community health center. In this role the Hospital, primarily through its Clinic, reaches out beyond its formal frontiers to find new and varied ways to contribute to total medical care.

The Hospital has already been called upon to provide through its Clinic direct medical care of patients, teaching, opportunities for research, and leadership as a community health center. In the light of current trends in American medicine, it will undoubtedly play an increasingly important role in the future.

* * *

Dr. Faxon has assembled the following dates and other interesting data concerning the various plantings on the Hospital grounds:

The earliest photograph of the Hospital on file in the Archives Department is dated ca. 1846. This was before the flats were filled in and the sea wall built. It shows trees between the Harvard Medical School and the Hospital, but it is impossible to make out what they were. The next photographs are dated 1880 and 1889. Both show the horse chestnut tree standing well toward 50 feet tall. For a tree of this variety to have grown as high as this must have taken at least 20 years. I think it is safe to say that it could not have been planted before 1859 when the flats were filled in, and that it probably was planted in the early 1860's. A framed picture of the chestnut tree, in full bloom, hangs in the Archives Room.

The 1880 and 1889 pictures do not show the elm trees, which have been such a feature in the Bulfinch Yard for many years. They do show shadows of what must have been fairly large trees—probably the elms in question—so I think we can estimate that the elm trees also were planted in the 1860's.

A few years before World War I (I am not sure of the date but think it may have been 1912), these elms along with most of the other elm trees in Boston, including those in the Harvard Yard, were infested with the leopard moth and were in bad shape. Several of our elms had to be cut down, and, to save the others, practically all the limbs were cut off (the infection being toward the extremities), leaving the trees truncated and bare. However, new limbs grew, and today one would never suspect the extent of the mutilation. Dr. Washburn showed me sections of some of these limbs, with tunnels chewed by the grubs just under the bark of the trees.

In the 1880 photograph, ivy appears on all the columns of the center section of the Bulfinch Building, and growing up to the top of the most western column. Flower beds are shown along the top of the banking and in the center of the lawn. By 1901 ivy had grown nearly to the top of both the east and the west wings of the Bulfinch. It was very lovely, but it harbored sparrows that awakened patients at dawn with their chirping, and mosquitoes. It also crept over the windows onto the screens and had to be cut back at intervals. The decision was finally made to discourage it except on the central section of the building.

After the leopard moth episode, Mr. John R. Macomber (a Trustee of the Hospital from 1919 to 1942, Vice-President of the Institution from 1942 to 1944, and President from 1944 until his death in 1955) donated many oak trees to be spaced between the remaining elms. It was believed that the oak would be more resistant to diseases than any other variety of tree. This gift is an early example of the interest Mr. Macomber took in the trees, shrubs, and grounds of the Hospital—an interest which led to his making more gifts of this sort than can be readily enumerated.

The catalpa trees in front of the Moseley and O.P.D. Buildings, at the main entrance to the Hospital, were planted in 1938 when the White Building was completed. I am not sure, but I think the two elms—one on each side of the entrance—were planted when the Moseley was built in 1916.

The trees and shrubs in the yard between the White Building and the Phillips House were the gift of Mr. Macomber and were planted in 1939 after the White Building was finished. Mr. Macomber took great interest in planning the development of that area.

Markers, for easy identification, have now been placed on all our trees.

New addresses:—

Dr. Julian F. Chisholm, Jr. (a.s. *Oph.*), 330 Dartmouth St., Boston, Mass.
Dr. Milton H. Clifford (a.r.p. 1935), Union Central Life Insurance Co., Cincinnati, Ohio
Dr. Albert Damon (*M.* 1952), Dept. of Industrial Hygiene, Harvard School of Public Health, 1 Shattuck St., Boston 15, Mass.
Dr. Robert H. Fennell, Jr. (sr. r.p. *Path.* 1949), Presbyterian Hospital, Pittsburgh 13, Pa. (after June 30).
Dr. Kenneth E. Liffmann (*Dn.* 1956), 168 Lloyd Ave., Providence 6, R. I.
Dr. Kiyokazu J. Momose (clin. fel. *R.* 1956), Montreal Children's Hospital, 2300 Tupper St., Montreal 25, Quebec, Canada
Dr. Federico Mora (*M.* 1951), 17 Ave. 18-66, Zone 10, Guatemala City, Guatemala
Dr. Jack Spencer (r.p. *R.* 1934), 31 Deering St., Portland, Maine
Dr. Clifford J. Straehley, Jr. (*W.S.* 1947), 713 E. Genesee St., Syracuse, N. Y.
Dr. Masao Yatsuhashi (*W.S.* 1945), Pondville Hospital, Walpole, Mass.

Brief bits:—

Dr. Mary A. B. Brazier has returned from a three months' leave of absence which she spent as Visiting Professor in the Department of Anatomy at the University of California Medical Center in Los Angeles.

Dr. Erich Lindemann will deliver the opening address at a conference concerning psychological and physiological stress, to be held at Oxford University, England, on July 15. The conference has been summoned by the British National Mental Health Research Council.

Dr. Robert S. Schwab was elected Chairman of the Medical Advisory Board of the Myasthenia Gravis Foundation, Inc. at the last Annual Meeting of the Foundation.

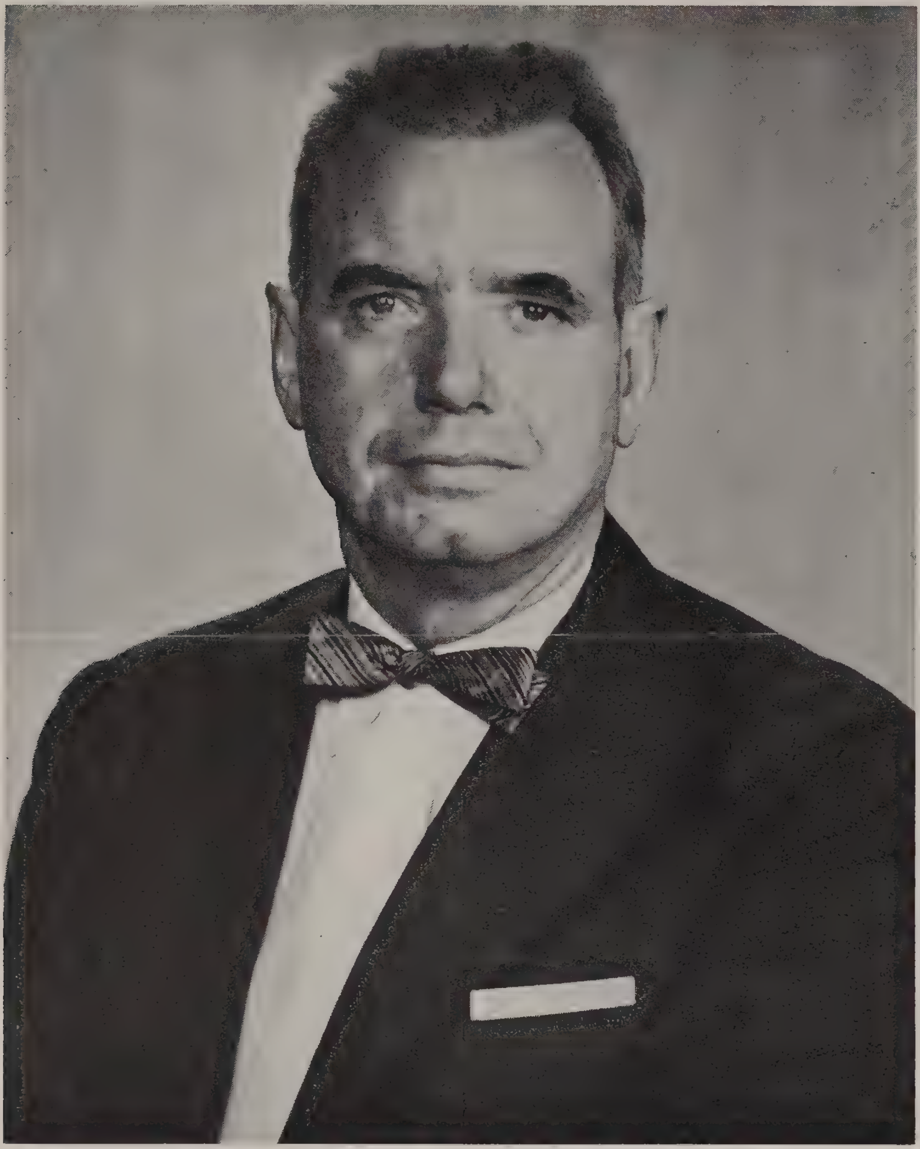
Dr. Richard P. Stetson (*W.M.* 1928) was named to the Board of Governors of the American College of Physicians at the College's 39th annual convention, held in Atlantic City in May.

Dr. Robbins has very kindly passed on to us this letter he received from Dr. Fleming McConnell (r.p. *R.* 1956). It was written in London on April 5, and reads:

> Thank you for your letter and for the news that the colitis article is finally off.
>
> Tomorrow sees the beginning of my tour of the Continent, with the starting point in Paris; then up to Munich and probably Berlin before going on to Scandinavia. This sounds pretty good, but if you could see the whacking great bundle of forms needed to get myself and the car across the frontiers involved you perhaps might think otherwise. (And if you could see the car I am sure you would!)
>
> This, plus the month of June in England, should send me back home early in July. Then for a try at the Canadian examinations this fall. After that, perhaps some work would be in order, but I don't yet know where.
>
> So far this trip has been worth while, but I have yet to see general Radiology approaching the quality of Boston's product. Mind you, I have seen only a couple of London's hospitals and perhaps when I visit the others in June the light will dawn.
>
> I do hope the Department is continuing to prosper and that the troops are behaving themselves.

A most interesting letter has come from Colonel Milton S. Thompson (*Or.* 1934). It was written in Taipei, Taiwan, on April 12, and reads:

> This tour of duty has brought me so many reminders of the Harvard Medical School and the Massachusetts General Hospital that a letter seems in order. The Army sent me here to give a 3-months' course in Orthopedic Surgery at the Chinese Army's First General Hospital, in the capital of Nationalist China, Taipei, Taiwan, and at its Branch Hospital at Peitou, 8 miles out of town. The class is composed of 24 officers of the Army, Navy, and Air Force who have, with the exception of one, been graduated from the National Defense Medical Center during the 9 years it has been on Taiwan. This class was graduated in 1943, when the NDMC was located in Yunnan, near the Burma border. The Center gives 6 years of medical school training, with well-equipped laboratories and a good faculty, but is authorized by the Ministry of Education to confer only a B.M. degree. The National Taiwan University can, for comparable learning, confer an M.D. degree. Graduates of NDMC must serve in the Armed Forces for a payback period which, until recently, was of indefinite length of time, but is now set at 10 years. This, if I can trust my memory, is exactly the same period required of graduates of the French Navy Medical School at La Rochelle. Military pay here sounds unbelievably small to Western ears. A Lieutenant gets $7.50 per month; a Lieutenant Colonel, $15; a Lieutenant General, $36 (or National Taiwan Dollars 1200). They also get 30 kg. of rice a month and their version of quarters, uniforms, and a food allowance (this latter varies with the size of the family, but a couple with 2 children might get about $2.70). One can live here cheaply if he is willing to forego comforts of living and pleasures of dining. An ethnologist at the Academia Sinica, Mme. Inez Beauclaire, told us that 3 meals a day there cost $3.60 per month, or 12¢ a day. For that she gets rice, soups, salads, and vegetables, with very little fish, meat, or fruit. The one luxury hotel, the Grand Hotel, on the other hand, charges $10 per day for a room, and 3 meals would be about as much.
>
> To return to the NDMC—about half the faculty came with it when it left Shanghai for Formosa in 1949, with the Communist armies at its heels. Classes were held out-of-doors or in tents until the Japanese quartermaster stables could be made over to house them. An incentive to the faculty was the establishment of the "Center Clinic" where they are permitted to see private patients for 2 hours a day. The average consultation fee is NT 50 (US $1.50). This enables them, however, to supplement their pay and live quite respectably. The Clinic has 15 or 20 "departments", each headed by the respective professor. It also has a small operating room, about 20 beds, X-ray equipment, a clinical laboratory, etc. About 40% of the proceeds reverts to the NDMC for construction and repair, and the rest is divided among the department heads who must in turn take care of the residents and junior staff men who may help them. If an emergency case arrives and all beds are occupied, the patient is referred to the University Hospital or Provincial Hospital, which makes for good public relations with the other doctors in town. The Center Clinic enjoys a good reputation for high professional skill and patient care. The American Embassy, for example, sends to the Clinic prospective visitors to the United States for health clearance before a visa is granted.
>
> The First General Hospital is mostly of one story, brick, sometimes with a Nissen hut type of second floor, built by the Japanese as a military hospital during their 51-year occupation of this island. The windows are small, and even the occasional 10 watt bulbs don't overcome the impression of dinginess and gloom. I find the professional care of patients, diagnostic skill, laboratory facilities, and surgical ability of quite high order. There aren't nearly as many nurses or trained attendants as are needed. I see relatives of the patients making beds, feeding patients (even via jejunostomy tube), and doing various other ward chores. A high ranking officer may occupy a ward bed, but he will have brought his orderly along. One general's daughter, in a private room, has her two amahs who special her round the clock except when they are relieved by her mother. The patients seem most grateful, even for a ward visit, and the personnel are most hospitable, even to the extent of a loud speaker which sometimes blares across the nurses' basketball court the strains of, believe it or not, "We'll fight for the name of Harvard till the last white line is passed".
>
> New buildings are going up, of 2-story stucco, with large light and airy wards. The finished ones are occupied by the medical service, but the dental clinic and OB ward should be ready soon.
>
> The Orthopedic ward is of the old type and has 10 four-bedded rooms. The chief of the Service is Lt. Col. Teng, Shu-wei (M.G.H. 1951-52). He and his staff are doing superb work under difficulty and are getting excellent results, all of which compensates to some extent for the lack of plaster, soap and water, paint, light, and nurses. Their conservative treatment of fractures is as good as I have seen anywhere; they remove disks and perform all the usual orthopedic procedures. They have a fair number of children as patients, with all the deformities and trauma and disease we see, and, of course, much more tuberculosis than most of us encounter in the U.S. They use streptomycin, PAS, isonicotinic acid, they evacuate abscesses of Pott's disease via paravertebral routes, and do fusions of spines, hips, etc. They nail fractured hips, using 2 portable X-ray machines, and obtain perfect lateral views. Needless to say, they know what they're doing and they do it well.
>
> Orthopedic out-patient clinics are held Wednesday afternoons with usually about 100 patients. Two current cases of clubfoot are being treated by weekly cast changes. Most of the patients are adults, and in general the cases are what we'd see in our own clinics, but there are very few backaches. Some of the most severe deformities have been of the feet, as the result of shell fragment wounds. These will require months of skin grafting before any correction can be done. One great gap in treatment is the absence of any physical therapy. The doctors show the patient or the parent what to do, and the rest is a matter of chance. The unavailability of braces taxes their ingenuity. The doctors do what they can with plaster, felt, and shoe corrections, and know all about tendon transplants, but braces must be bought by the patient. There seem to be no charities to which to appeal as we used to do through "divers good causes" in the *Boston Transcript*. The brace shop,



No. 75 in a series of Staff photographs
Dr. H. Thomas Ballantine, Jr., Associate Visiting Neurosurgeon

> however, makes excellent braces (and limbs). For example, bilateral long leg braces, nickel plated, with hip control, knee lock, ankle stop, drop-foot spring, T-strap, and shoes cost only $18, but that is NT 600 or 15 months' salary for a private. Thus, braces are out of the question for most patients. The brace shop is manned by Lt. Col. Chen, Chi-shien and a Captain Yang who began making limbs and braces about 30 years ago in the shop organized by Dr. Van Gorder at the Peking Union Medical College. The workmanship is marvelous, but their only source of material is the open market.
>
> I find the work really stimulating because of the interest the doctors show in all phases of orthopedics and trauma, and I am particularly proud to be able to answer in the affirmative when the veteran doctors from the mainland ask if I know Dr. Van Gorder. There is Dr. Lu, Kwang-Shun, Chief of Thoracic Surgery (M.G.H. 1950-51); Dr. Cheng, Bu-fei, Chief of Urology (M.G.H. 1954-55); Lt. Col. Lee, Hsing Ya, Chief Surgeon of the Air Force Hospital at Tainan, who is sitting in on our course (M.G.H. 1955-56). I've met lots of others that I can't begin to remember. Many people know Dr. J. Huang Liu (A.B. 1909, M.D. 1913, who interned at B.C.H., not M.G.H.), who is the "Elder Statesman" here, having had many government jobs, and who at present, although retired, heads the Chinese Red Cross, the Anti-Tuberculosis League, the Blood Bank, the Coordination Committee for Foreign Aid in Medicine and Health, and I don't know how many other things.
>
> Dr. Joseph Barr has made a terrific impact on all those who have been at the M.G.H., and I will admit that I am impressed with the frequent quotations from him, offered when I say something they don't agree with. They have all paid attention to Barr and Van Gorder. Perhaps some day they'll quote me.
>
> To answer the frequent question—no, I do not have to lecture in Chinese. They all speak English and understand it fairly well, too, if reaction to innuendoes is a test.
>
> I have enjoyed this temporary duty assignment over here and am loath to leave on May first to resume my duties at Walter Reed.

We were glad to receive this letter from Dr. George B. Murphy, Jr. (*S.* 1952), written from 221 21st Place, La Crosse, Wisconsin:

> My subscription money for The News is enclosed. I am pleased that I can afford it!
>
> The Gundersen Clinic has kept me active enough to delay atrophy of the scissors callus on my right thumb.
>
> There are so many MGH-ers here now that plans for the new hospital wing will doubtless resemble a miniature White Building.
>
> I find the weather cold, with plenty of snow, and I have almost succumbed to skiing.
>
> The Clinic has suggested changing my first name to Sven, to fit better with the rest of the staff, but I have not quite agreed to that.
>
> We miss Boston and the M.G.H., but find the practice good fun and the new life stimulating.

We are always particularly pleased to receive letters from MGH-ers who have returned to their homes in other lands. This letter has come from Dr. Benjamin D. Canlas, Jr. (r.p. *Path.* 1956). It was written on December 16, from the College of Medicine, University of the Philippines, Manila, P.I., and reads:

> I was certainly glad to hear from someone at the Massachusetts General Hospital and to know that even when we have severed our official connections with the Hospital we are still considered as members of the MGH family. I was greatly elated, for example, when about a year ago I received an invitation to the inauguration of the new Pathology Laboratory from Dr. Castleman — impossible though it was for me to attend the ceremonies. I have had correspondence with friends at the M.G.H. Although the letters have been few and far between, I have enjoyed them immensely. This is just to show you how much I have valued my stay at the General. As a matter of fact, I have considered Boston my second home, and every now and then I feel a little "homesick" for the old MGH crowd. I certainly hope there will come a time when I shall have a chance to renew my old acquaintances there.
>
> I am not now the "singleton" you thought me to be here in Manila. Another MGH-er — Dr. Remedios Rosales (r.p. *N.P.* 1952 & a.r.p. *Path.* 1954), "Rose" to her MGH friends — is now with the University of Santo Tomás College of Medicine. Unfortunately, we are associated with different institutions, so we have not seen much of each other.
>
> A lot of water has passed under the bridge in the year and a half since I returned to my country. I have found my training in the M.G.H. to be an excellent background for the work I am doing at present. I wish Dr. Castleman would take note of this: I owe it to him and his staff that I have attained even the humble position I now hold in our University. Because I was trained in a medical center like the Massachusetts General Hospital, many of the methods I learned in the Pathology Laboratory there have been adopted here. I was appointed Assistant Professor in Pathology when I got back home in 1956. There is a scarcity of medical men here who pursue academic medicine, including pathology, so a year later I found myself promoted to Associate Professor, which position I now hold.
>
> There is still a lot of room for improvement in pathology and medicine as a whole in our country, but I believe we are taking the right steps in this direction. The amount of our material is tremendous, but a lot of it is being wasted in many instances. Various institutions in the United States are helping us, but we must help ourselves if we really want to stand on our own feet.
>
> These, I believe, are some of the general conditions peculiar to my country, which you have asked me to tell you about.
>
> Finally, I should like to send my regards to everyone at the M.G.H. — especially the friends whom I have so miserably failed to correspond with.

Dr. Zvi Laron (r.p. *C.M.* 1955) is now with the Pediatric Metabolic Service at the Beilinson Hospital in Petah Tiqva, Israel. In response to a copy of The News which we sent to Dr. Laron, he wrote:

> Thank you very much for the December issue of The News. I am very interested in what is going on at the M.G.H., where I spent two pleasant and instructive years. I am sorry that because of foreign currency restrictions I cannot subscribe to your paper at the present time. [Perhaps someone would like to subscribe as a gift to Dr. Laron.—*Editor*]
>
> I have started to work in the Department of Pediatrics and Rogoff Institute for Medical Research of the Beilinson Hospital. As soon as I shall be a little settled, I shall write you a long letter telling you about medicine here. Until then, thanks again and best regards to all my friends at the M.G.H.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 179 Boston, Mass October 1958

NEUROSURGICAL SERVICE AFFAIRS

The last report on the Neurosurgical Service appeared in the June 1954 issue of THE NEWS. Much has happened in the last four years. Of particular concern to the entire Massachusetts General Hospital family was the loss of Dr. W. Jason Mixter, who died on March 16, 1958, of an illness which happily caused him no serious prolonged incapacity. Obituary notices, written by Drs. J. H. Means, W. H. Sweet, and J. C. White for the *Harvard Medical Alumni Bulletin*, the MGH NEWS, and to appear also in the *Journal of Neurosurgery*, stress so well his unique personality and distinguished career that nothing more need be said here except how much we miss him.

A number of changes in the staff have taken place. Dr. Merrill C. Sosman, for thirty-five years radiologist at the Peter Bent Brigham Hospital and associated with Dr. Harvey Cushing throughout the latter's work in neurosurgery, has recently come to us as Consultant in Neuroradiology. When Dr. Joseph Hanelin, who had been particularly interested in neurosurgical problems in radiology, left this Hospital to become Chief of Radiology at the Newton-Wellesley Hospital, Dr. Sosman had just retired from his post at the Brigham. With Dr. Robbins's enthusiastic backing he has been appointed Consultant to our Service and is giving us the help of his vast experience and outstanding ability as a teacher. Dr. Louis Bakay, after five years as the junior member of the full-time staff, has joined the Hospital Associates, with an office in the Warren Building. Dr. Alfred J. Luessenhop, on completion of four years' training as resident, is associated with Dr. Jost J. Michelsen in his private practice here at the Hospital and elsewhere. To replace Dr. Bakay on the full-time staff, Dr. Vernon H. Mark, a former resident, has returned after two years of military service as Chief of Neurosurgery at the Air Force hospital at Wiesbaden. New appointments to the research staff are mentioned below.

In October of 1955 our reconstructed operating rooms Nos. 1 and 2 on the third floor of the White Building were opened. Rebuilt for the special requirements of surgery of the brain and spinal cord, these are now fulfilling their purpose in a most gratifying fashion. Both have special ventilation and lighting. Room 1, in addition, is electrically screened, so that stereotactic placement of electrodes with recording of spontaneous and evoked potentials can be carried out without interference from nearby elevators, x-ray apparatus, and outside high-frequency waves. This permits more efficient electrocorticographic localization of epileptic foci and electrophysiological investigation of the human brain in the course of craniotomies for the control of tremor and pain.

The latest and perhaps the most important development has been the opening of the new research laboratories on the fourth floor of the Warren Building. These were named the Mixter Laboratories for Neurosurgical Research and were dedicated with appropriate ceremonies on Ether Day last October. Dr. Mixter, who helped so much in raising the necessary funds, was able to be there and hear the moving tribute paid him by Mr. Ferris, rector of Trinity Church. Every foot of floor space in these laboratories has been put to intensive use for the investigation of the following subjects:

1) The development of focused ultrasound for making accurately controlled deep lesions in the brain is being explored by Dr. Ballantine with Dr. Eugene Bell, who is Associate Biologist in Neurosurgery here as well as Assistant Professor of Biology at Massachusetts Institute of Technology. Sound waves vibrating 2.7 million times per second can be focused like light and thus used to make discrete lesions of any desired size without injury to overlying brain substance. These can be placed in deep centres such as the basal ganglia, sensory nuclei in the thalamus, and areas in the brain stem without destruction of surrounding areas, which cannot be avoided by any method of surgical approach. Dr. Ballantine recorded the historical development and possibilities opened up by the use of ultrasound in the June 1958 issue of THE NEWS.

2) Drs. Sweet, Mark, and Kjellberg are developing another method of making focal deep lesions by the use of Dr. Sweet's adaptation of the Horsley-Clarke stereotactic instrument to human surgery. With this instrument it is possible to place tiny electrodes with great accuracy in any part of the brain with only minimal damage to superficial structures from the passage of the electrodes. Carrying out these procedures in the new electrically screened operating room, they are able to locate the position of an electrode in a structure such as the sensory nucleus of the thalamus and then destroy any desired amount of tissue by means of a new radiofrequency lesion-maker constructed for this purpose by Dr. Saul Aronow of the Physics Department.

3) Dr. Albert H. Soloway, Assistant Chemist in Neurosurgery, has been the

M.G.H. HOUSE PUPILS ASSOCIATION REUNION

This year, on October 16—well known to the Hospital as Ether Day—the Massachusetts General Hospital House Pupils Association will meet for the first time since the 100th Anniversary of the first use of ether for major surgery in a public demonstration, and on this occasion will celebrate the 100th Anniversary of the Treadwell Library. The program for that day may be found below.

Mrs. Grace W. Myers wrote in one of her many publications, "Within the hub of the wheel of organization which keeps a great hospital running, there is a certain small spring which if touched into action, produces a force which gradually spreads and spreads until it reaches the outermost rim of the wheel, and so wakes to life an influence previously undreamed of. . . . This spring opens the door of the medical library."

Although the founders of the Massachusetts General Hospital had a medical library in mind when the by-laws were drawn up in 1811 and a committee was appointed in 1823 to collect a library for each department of the Hospital, it was not until 1844 that any financial support for a medical library was voted by the Trustees. By 1847 interest, stimulated by a letter from Dr. Henry I. Bowditch, had grown, and more money was allocated to the medical library with provision for an annual appropriation. In 1848 Dr. Bowditch was appointed librarian, and a bookplate was designed and engraved for use in indicating the ownership of the books. In 1858, when the Trustees voted to accept the bequest of Dr. John Goodhue Treadwell of Salem, the library was named for him, and Dr. Benjamin S. Shaw, Resident Physician (the title given the Directors from 1858 to 1922), became the librarian. Since the Treadwell collection contained some 2500 volumes, the Physicians' and Surgeons' Room on the first floor of the Bulfinch Building was adapted for use as a library. Dr. Shaw acted as librarian until some time after 1863. Soon after this the chairman of the library committee acted as the librarian—the post being held successively by Dr. Norton Folsom and Dr. Arthur T. Cabot.

By 1893 the collection had grown to such an extent that the library was

(Continued on page 2)

key figure in an attempt to develop the use of slow neutrons from a nuclear reactor in the treatment of brain tumours. A crucial feature of this method is the use of a compound containing the stable isotope boron^{10}. The chemistry as well as the reactions in the body of most boron compounds are poorly understood. Dr. Soloway has been synthesizing new compounds of boron and then, with the help of Dr. Simon Thiry of Liége, Belgium, and of Dr. Derek S. Gordon of Belfast, Ireland, has been testing these compounds. The biological responses are being studied, first in mice bearing gliomas, in tissue cultures of human tumours, and finally in patients at operation.

4) Dr. Gordon L. Brownell, Associate Physicist, and Dr. Saul Aronow, Assistant Physicist in the Division of Medicine, continue their work with Dr. Sweet on the use of radioactive isotopes in localizing brain tumours and studying physiological processes such as the secretion of cerebrospinal fluid. What is known as coincidence counting of the special paired gamma radiation arising from isotopes which emit positrons has been put to especially valuable use in localizing focal lesions of the brain, especially abscesses and tumours. The biological properties of compounds of arsenic and rubidium, elements which have positron-emitting isotopes, have been studied in the past. More recently Dr. John Mealey, Jr. (a.r.s.*N.S.*) has been studying zirconium and gallium.

5) The metabolism of water and electrolytes in nervous tissue is being studied by Dr. Adelbert Ames, III, Associate Biochemist in Neurosurgery. These investigations are concerned with factors affecting the movements of inorganic ions and water across nerve cell membranes, with particular attention to the relationship of these ionic movements to the maintenance of nerve cell function. The studies are being performed on a thin sheet of nervous tissue, the retina of the eye, removed from the body and maintained in an artificial medium.

6) Dr. Humberto Fernandez-Moran, Associate Biophysicist in Neurosurgery and a distinguished electron microscopist, has been recently appointed to the research staff to set up a special laboratory for studying the finer histological structure of the brain and other nervous tissues by means of this new technique. Working with the Siemens electron microscope will permit him to study nerve cells, glia, and neurofibrils at a resolution of 10 angstrom units, or one-millionth of a millimeter, which is over a thousand times better than the best light microscopes. Dr. Moran has already made outstanding contributions on electron micrography of myelin, brain tumours, and the retina, a field of study which dovetails well with investigations already under way on the Neurosurgical and Neurological Services of the Hospital.

7) With the appointment of Dr. Frank R. Ervin and Dr. Thomas P. Hackett to the Psychiatry Service, we now have invaluable help in investigating the relationship of psychological factors to the problems of pain and in dealing with formerly intractable painful conditions associated with cancer in the upper portion of the body that cannot be interrupted by dividing the spinothalamic pain pathway or regional sensory nerves. New procedures for giving relief that are under investigation consist of electrolytic destruction by means of inlying electrodes of the fibres connecting the frontal lobes with the dorsomedial nucleus of the thalamus, or primary destruction of this structure or the main sensory nucleus. These methods have shown promise of relieving not only chronic pain and need for narcotics, but also the mental suffering so often seen in the advanced stages of malignant disease. Unlike the earlier crude attempts to relieve pain by surgical lobotomy, these methods produce no serious psychological deterioration.

The various members of our visiting staff, with the help of the Research Committee of the Hospital, have been extraordinarily successful in obtaining the grants necessary to finance this broad program of investigation from the National Institutes of Health, the American Cancer Society, the National Foundation for Infantile Paralysis, and from numerous grateful patients. In addition, a generous grant from an anonymous medical foundation has been received each year since the war. This has given us the opportunity to finance pilot projects to test the value of new experimental methods, as well as clinical follow-up studies and publications. This has been of incalculable value, as the Harvard Medical School has never been able to contribute funds for research or secretarial help. Funds are now being sought to rebuild the top floor of the Burnham wards into laboratories for investigation of the special problems of neurology, psychiatry, and neurological surgery in children.

There has been no noteworthy change in the number of ward patients since the last report, with the exception of a gradual build-up of pediatric cases. With the assignment of Dr. Philip R. Dodge as a full-time pediatric neurologist and Dr. Vernon H. Mark concentrating on the care of neurosurgical problems in children, this interesting subspecialty is certain to expand. The number of private patient beds in the Phillips House and Baker has also been increasing, and this is likely to continue with the recent transfer to the associate staff of Dr. Louis Bakay and Dr. Alfred Luessenhop.

A noteworthy improvement in handling out-patient cases has recently been instituted. By making each of the four visiting men responsible for a day each month in the out-patient clinic, it is now possible to give each patient an appointment and thereby reduce the waiting time. This also enables him to be seen by the surgeon who was on duty at the time of his house admission, as well as to afford the visiting staff an opportunity to follow their own cases. In view of the present increase in the number of neurosurgeons in the Greater Boston area and all over New England, it is of vital importance to make the ambulatory clinic attractive and efficient in order to maintain an adequate number of patients for training our house staff and for ward teaching. The need for this is clear when one realizes that twenty years ago there were only four neurosurgical clinics and seven neurosurgeons in the area of Greater Boston. Now there are nine hospital services and nearly four times the number of surgeons engaged in this specialty.

A final point that deserves comment is the change in the type of neurosurgical patients. This has resulted from the admission of increased numbers of traumatic cases with serious injuries to the brain and spinal cord, as these are now brought to the M.G.H. from this portion of the city by the police ambulances; also from present day improvements in surgical technique which permit intervention on Parkinsonism and other disorders of movement, as well as on many cases of subarachnoid haemorrhage due to ruptured aneurysms and vascular malformations within the brain. While the mortality rate in these latter cases is high, it is distinctly lower than the previous formidable rate incurred under palliative treatment. Operation under hypothermia, which was first applied to neurosurgery in this Hospital in 1953, has added a valuable factor of safety in operating on these cases. Not only does body cooling to 80° (27° centigrade) permit complete arrest of circulation through the brain for periods of up to ten minutes, but it also results in a reduction in volume of the brain, thereby permitting better exposure of deep lesions. This is of particular help in the approach to vascular tumours and others in unusually difficult locations. While the mortality of the invasive malignant tumours of the brain still remains high, death has occurred after only 4.4% of the operations performed in a series of 25 parasagittal meningiomas recently reported from this clinic, and this mortality should be reduced to an even lower rate when more of these patients have been operated upon with the increased use of hypotensive drugs and hypothermia.

James C. White, M.D.,
Chief of Neurosurgical Service

(Continued from page 1)

moved to the rooms formerly occupied by the Resident Physician on the second floor of the Bulfinch Building. Also, there was enough work involved to warrant the appointment of a full-time assistant to Dr. Cabot. Consequently, in 1897 Mrs. Grace Whiting Myers became assistant librarian. She cataloged the entire collection, compiled bulletins on specific subjects, and started a reprint and pamphlet collection. In addition, she was the Medical Record Librarian. Mrs. Myers became librarian in 1911 and, upon her retirement in 1924, Librarian *Emerita.* During her tenure the Treadwell Library was moved, in 1916, to the newly constructed Moseley Memorial Building. Here it was in the heart of the Massachusetts General Hospital, since the administrative offices were at that time in the Moseley Building.

Miss Carrie L. Williams became librarian in 1925, and retired as Librarian *Emerita* in 1941. Her successor was Miss Eleanore A. Lewis, who served as librarian for the next fifteen years. Miss Genevieve Cole was appointed librarian in 1957.

Advance notices for the Massachusetts General Hospital House Pupils Association Reunion were mailed in July. Second notices over the signature of Dr. James Howard Means, Chairman of the Committee on Arrangements, were sent to all the pupils at the best address available in August. Many alumni, however, may not have received their notices due to the fact that the Association members are such a fast-moving group and forget to give the Hospital their most recent addresses. If you are a member of the Association or believe yourself to be a member and have not been invited, please get in touch with Dr. James Howard Means, Box 100, Massachusetts General Hospital, Boston 14, Massachusetts.

M.G.H. HOUSE PUPILS ASSOCIATION REUNION PROGRAM

Thursday, October 16, 1958

9-9:30 A.M. White Lobby
REGISTRATION
9:35-10 A.M. Moseley Rotunda
BUSINESS MEETING
10 A.M.-12 NOON Moseley Rotunda
SCIENTIFIC PROGRAM
Gordon L. Brownell, Ph.D.
Melvin J. Glimcher, M.D.
Alexander Leaf, M.D.
Robert S. Shaw, M.D.
12 NOON-12:30 P.M. Treadwell Library
SHERRY
IN OBSERVANCE OF
THE LIBRARY'S 100th ANNIVERSARY
12:30 P.M. Bulfinch Lawn
LUNCHEON
2-3:30 P.M. Moseley Rotunda
PANEL DISCUSSION
"FUNCTION OF THE TEACHING HOSPITAL"
James Howard Means, M.D., Moderator
Raymond D. Adams, M.D.
Walter Bauer, M.D.
Edward D. Churchill, M.D.
Dean A. Clark, M.D.
3:30-5 P.M.
OPTIONAL TOURS OF THE NEW BUILDINGS AT M.G.H.
5-6 P.M. Moseley Rotunda
LOWELL LECTURE
"THE TWO ROADS—SURGERY AND SCIENCE"
Francis D. Moore, M.D.
7-8 P.M. Harvard Club, Library
RECEPTION
8 P.M. Harvard Club, Harvard Hall
DINNER DANCE

JESSIE STEWART

Miss Jessie Stewart, an Assistant Director of the School of Nursing since 1947, died in the Baker Memorial on August 28 after a brief illness.

Miss Stewart was born in Gloucester, Massachusetts, on August 4, 1914. She entered the Massachusetts General Hospital School of Nursing immediately after finishing high school, and graduated in 1935.

Her career in graduate nursing began at the Massachusetts Eye and Ear Infirmary, where she held the position of head nurse for four years. She then filled the position of instructor there for two years.

In 1943 she received the degree of Bachelor of Science in Education from Boston University, and returned to M.G.H. as supervisor and instructor in Medical Nursing. She was appointed an Assistant Director of the School of Nursing in 1947. Without interruption of work, she again attended Boston University on a part-time basis and was awarded a Master's Degree in Education in 1955.

In addition to many administrative functions in the School of Nursing, her responsibilities included the counseling of student nurses and direction of the student personnel program. She was advisor to the Student Nurses' Cooperative Association, and chairman of many faculty committees.

For several years Miss Stewart was chairman of the Committee on Careers in Nursing at the Nursing Council of the United Community Services and the Eastern Massachusetts League for Nursing. As a result of her leadership and imaginative planning, this committee was highly successful in recruiting student nurses for the schools of nursing of Greater Boston.

Another community contribution was made by her when in 1957 she was appointed leader of the Study Staff to Develop a Regional School of Nursing—a part of the Regionalization Program for Health Services conducted by the Health Division of the United Community Services.

Miss Stewart's dedication to nursing, her ability as a teacher, and her unusual understanding of young people will be remembered warmly by members of the M.G.H. family and by countless student nurses and faculty members who benefited from her insight and guidance. The greatest interest in her life, besides her devotion to her family, was the Massachusetts General Hospital.

Anon.

♣ ♣ ♣

The office of THE NEWS has received word from Walter Reed Army Medical Center that Dr. Frank K. Austen (*M.* 1955) was awarded the Walter Reed Certificate of Achievement last June.

The award was made in recognition of Dr. Austen's service from September 1956 to June 1958 as Chief of the Rheumatology Clinic and Consultant in Rheumatology to the various services of Walter Reed Army Hospital. The citation reads in part: "Your professional conduct in the evaluation, diagnosis, and treatment of patients has been of positive benefit to the patient and this hospital. . . . During this period you also distinguished yourself in the field of research, making several original and valuable contributions to medical science. Through your noteworthy endeavors you have brought credit to yourself and the United States Army Medical Service."

♣ ♣ ♣

It is very gratifying to be able to report that Dr. John F. Radebaugh, Jr. (*C.M.* 1954) responded to our suggestion made in the June issue and has subscribed to THE NEWS as a gift for Dr. Zvi Laron.

Because of foreign currency restrictions in Israel, Dr. Laron has been unable to send money out of his country. In a letter from him published in the June NEWS, he expressed regret at not being able to subscribe to the paper. Dr. Laron is most grateful to the donor.

* * *

The Board of Trustees, at their meetings on May 2, 16, and 29, June 13 and 27, July 16, and August 15, voted:

That the appointment of Dr. Elwin W. Donnelly as Assistant Resident in Radiology begin October 1, 1958, rather than January 1, 1959;
That the appointment of Dr. John B. Little as Assistant Resident in Radiology become effective January 1, 1959, rather than October 1, 1958;
That the appointment of Dr. William M. Thurlbeck as Assistant Resident in Pathology be extended from June 30 to August 31.

To promote:

Dr. Hugo W. Moser to the position of Resident in Neurology for one year, beginning July 1.

To reappoint:

Saul Aronow, Ph.D. as Assistant Physicist (Medicine), effective July 20;
Dr. Oscar S. DePriest, III, as Second Assistant Resident in Surgery, beginning October 1;
Dr. Walter E. Klingensmith as Second Assistant Resident in Surgery, beginning July 1;
Dr. Ronald A. Malt as Third Assistant Resident in Surgery, beginning August 1;
Dr. Jens G. Rosenkrantz as Second Assistant Resident in Surgery, beginning November 1;
Dr. C. Gene Wheeler as Third Assistant Resident in Surgery, beginning Julv 1.

To appoint:

Dr. Barry G. W. Arnason as Assistant Resident in Neurology for one year, beginning July 1;
Dr. George E. Battit as Assistant Resident in Anesthesia for one year, beginning July 1;
Dr. Fernando A. Cardenal as Assistant Resident in Orthopedic Surgery for one year, beginning July 1;
Dr. Pierre M. Dreyfus as Assistant in Neurology, effective July 1;
Dr. H. Robert Dudley, Jr. as Assistant in Pathology;
Ray H. Elling, Ph.D. as Assistant Sociologist, beginning September 15;
Dr. Joachim S. Gravenstein as Associate Anesthetist, for the period June 13 through August 20;
Dr. Helen M. Herzan as Assistant in Psychiatry, beginning July 1;
Dr. Murray L. Janower as Second Assistant Resident in Radiology, beginning July 1, 1959;
Dr. Joan Kazanjian as Out-Patient Resident on the Children's Medical Service, beginning July 1;
Dr. Leo T. Kelly as Assistant Resident in Anesthesia, beginning July 1, 1959;
Dr. P. Herbert Leiderman as Assistant in Psychiatry, beginning July 1;
Dr. Yosh Maruyama as Acting Resident in Radiology, for the period August 1, 1958 through March 31, 1959, and as Second Assistant Resident in Radiology, beginning April 1, 1959;
Dr. Chaim I. Mayman as Assistant Resident in Neurology for one year, beginning July 1;
Dr. J. Gordon Millichap as Clinical Fellow in Neurology, to act as Assistant Resident, for one year, beginning July 1;
Dr. Walid A. Mnaymneh as Assistant Resident in Orthopedic Surgery for one year, beginning July 1;
Dr. John L. Myers as Second Assistant Resident in Surgery, for two months, beginning July 1;
Dr. Joseph C. Oakley as Intern on the Dental Service for one year, beginning July 1;
Dr. James F. Patterson as Assistant in Dermatology, effective July 1;
Dr. Henry P. Pendergrass as Assistant Radiologist, effective July 1;
Dr. Fernand Poirier as Assistant Resident in

Neurology, for the period July 1 through December 31;
Dr. David C. Poskanzer as Resident in Neurology for one year, beginning July 1;
Dr. Maxwell G. Potter as Assistant in Psychiatry;
Dr. Edward F. Rabe as Clinical Fellow in Neurology, to act as Assistant Resident, for one year, beginning July 1;
Dr. Sabino J. Sinesi as Assistant in Dermatology, effective July 1;
Kathleen Stratton, Ph.D. as Assistant Physicist (Medicine) for one year, beginning August 1;
Dr. William H. Tingey, Jr. as Intern on the Dental Service for one year, beginning July 1;
Dr. Maurice M. Tolman as Acting Chief of the Dermatology Service, from July 1 until the appointment of a permanent Chief of this Service;
Dr. Gerald F. Winkler as Assistant Resident in Neurology for one year, beginning July 1.

The Trustees also voted:

To appoint Drs. Myles P. Baker and Howard Ulfelder as Members-at-Large on the General Executive Committee, representing the Medical and Surgical Staff, respectively, for one year, beginning July 1;
That Mr. Ronald Belsey of England be invited to give a Richardson Lecture at the Hospital on May 15;
That Dr. David Mollin, Senior Lecturer at the Post-Graduate Medical School, London, England, be invited to give a lecture here at the Hospital on June 16;
That Hans Wandall, Director of the Institute of Experimental Surgical Research, University of Copenhagen, be invited to give a Richardson Lecture at the Hospital on May 9.

At their meetings on April 30, during May and June, on July 2 and 16, and August 13, the General Executive Committee voted:

To accept with regret the resignation of Dr. Winnifred P. Chase from the position of Clinical Assistant in Medicine, effective June 1;
To accept the resignation of Sylvia F. Jackson, Ph.D. from the position of Research Fellow in Medicine, effective as of May 31.

To promote:

Dr. David W. Bailey from the position of Intern to that of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1959;
Dr. James H. Duxbury to the position of Senior Assistant Resident in Urology for one year, beginning July 1;
Dr. Herbert A. Haessler to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1959;
Dr. H. David Hall from the position of Intern to that of Assistant Resident on the Dental Service for one year, beginning July 1;
Dr. Robert E. Key to the position of Senior Resident in Orthopedic Surgery, effective June 1 rather than July 1;
Dr. Raymond N. Kjellberg to the position of Resident in Neurosurgery, for a period of eight months, beginning September 1;
Dr. Guy W. Leadbetter, Jr. to the position of Senior Resident in Urology for one year, beginning July 1;
Dr. Herbert A. Newman to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1959;
Dr. Eugene R. Nobles, Jr. to the position of First Assistant Resident in Surgery for one month, beginning July 1;
Dr. Robert G. Ojemann from the position of Junior Resident at the Veterans Administration Hospital to Assistant Resident in Neurosurgery at the Massachusetts General Hospital, for a period of eight months, beginning September 1;
Dr. Claus W. Reichle to the position of Acting Chief Resident in Anesthesia, holding his present title of Clinical and Research Fellow in Anesthesia, effective as of April 25;
Dr. E. William Rosenberg to the position of Resident in Dermatology for one year, beginning July 1;
Dr. R. Wyman Sanders from the position of Intern to that of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1959;
Dr. Dagoberto Sosa from the position of Assistant Resident to that of Senior Resident in Neurosurgery, assigned to the Boston Veterans Administration Hospital, for a period of eight months, beginning September 1;
Dr. Alfred L. Weber to the position of Resident in Radiology, effective July 1.

To reappoint:

James E. Anliker, Ph.D. as Research Fellow in Anesthesia for one year, beginning July 15;
Dr. W. Gerald Austen as Second Assistant Resident in Surgery, beginning July 1;
Bronius Baskys, Ph.D. as Research Fellow in Dermatology for one year, beginning July 1;
Dr. William R. Brewster, Jr. as Clinical and Research Fellow in Anesthesia for one year, beginning July 1;
Dr. Nancy L. R. Bucher as Associate Biologist (Medicine) for one year, beginning July 1;
Dr. Willi Burgi as Research Fellow in Medicine, effective September 1;
Dr. Edwin L. Carter as Second Assistant Resident in Surgery for one year, beginning July 1;
Dr. Herbert S. Cline as Clinical Fellow in Psychiatry for one year, beginning July 1;
Dr. Alan S. Cohen as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. John D. Constable as First Assistant Resident in Surgery, for one month, beginning July 1; it was further voted that he be promoted to the position of Resident in Surgery, beginning August 1;
Dr. Ralph C. Darling, Jr. as First Assistant Resident in Surgery, for the period July 1 through December 31;
Dr. Luis L. de Mola as Clinical Fellow in Pathology for one year, beginning July 1;
Dr. Harry B. Ditmore, Jr. as First Assistant Resident in Surgery, beginning July 1;
Dr. Nancy A. Durant, with a change of title from that of Clinical and Research Fellow to that of Clinical Fellow in Psychiatry, for one year, beginning July 1;
Lewis L. Engel, Ph.D. as Associate Biochemist (Medicine) for one year, beginning July 1;
Dr. Joseph W. Ferrebee as Research Fellow in Pathology for one year, beginning June 1;
Dr. Stuart Q. Flerlage, Jr. as Clinical and Research Fellow on the Children's Medical Service for one year, beginning July 1;
Dr. Timothy S. Harrison as Second Assistant Resident in Surgery, beginning July 1;
Dr. Stephen E. Hedberg as Second Assistant Resident in Surgery, beginning July 1;
Dr. Mahlon B. Hoagland as Associate Biochemist (Medicine) for one year, beginning July 1;
Gillray Kandel, Ph.D. as Research Fellow in Psychology, in the Department of Anesthesia, for one year, beginning September 30;
Dr. Thomas J. Keenan as Assistant Resident in Anesthesia for one year, beginning August 31;
Elizabeth B. Keller, Ph.D. as Assistant Biochemist (Medicine) for one year, beginning July 1;
Dr. William M. Keynes as Clinical and Research Fellow in Surgery, for the period July 1 through September 30;
Dr. David M. Klein as Assistant Resident in Neurosurgery, assigned to Neuroradiology, for the period September 1, 1958 through February 28, 1959, when he will then be assigned to the Boston Veterans Hospital, beginning March 1, 1959;
Dr. Harold L. May as Second Assistant Resident in Surgery, beginning July 1;
Dr. John E. Mazuzan, Jr. as Assistant Resident in Anesthesia for one year, beginning August 15;
Dr. John Mealey, Jr. as Assistant Resident in Neurosurgery, assigned to Neuropathology, for a period of eight months, beginning September 1;
Dr. Hugo M. Palazzi as Clinical and Research Fellow in Surgery, for a period of six months, beginning July 1;
Dr. Emil J. Pawlowski as Clinical Fellow in Psychiatry for one year, beginning July 1;
Dr. Jan-Henrik Probst as Clinical and Research Fellow on the Children's Medical Service, for the period July 1 through December 31;
Dr. Robert A. Schmidt as Assistant Resident in Anesthesia for one year, beginning July 1;
Dr. Jesse F. Scott as Associate Biophysicist (Medicine) for one year, beginning July 1;
Gene M. Smith, Ph.D. as Research Fellow in Anesthesia for one year, beginning September 1;
Dr. Juan F. Sotos as Clinical and Research Fellow on the Children's Medical Service for one year, beginning July 1;
Leonard B. Spector, Ph.D. as Assistant Biochemist (Medicine) for one year, beginning July 1;
Mary L. Stephenson, Ph.D. as Research Fellow in Medicine for one year, beginning July 1;
Anne M. Stoffyn, Ph.D. as Research Fellow in Medicine for one year, beginning May 13;
Dr. Dorothy B. Villee as Clinical and Research Fellow on the Children's Medical Service for one year, beginning July 1;
Dr. Barbara E. Waud as Assistant Resident in Anesthesia for one year, beginning July 1.

To extend the appointments of:

Dr. Thornton Brown as Acting Chief of the Orthopedic Service, through May 26;
Dr. Elias C. Dow as Clinical and Research Fellow in Medicine, from June 30 through August 31;
Dr. Hyman Gaylis as Clinical and Research Fellow in Surgery, from June 30 through August 31;
Dr. Elliott L. Mancall as Clinical and Research Fellow in Neurology, from June 30 through November 30;
Dr. Yang Wang as Clinical Fellow in Medicine, assigned to Cardiology, through September 30.

To appoint:

Dr. Khalil Abi-Torbey as Clinical and Research Fellow in Urology for one year, beginning July 1;
Dr. Rolf G. Baginsky as Clinical Fellow in Physical Medicine, retroactive to February 1, through July 31;
Dr. Christian Beckers as Clinical and Research Fellow in Medicine for one year, beginning September 1;
Dr. Paul H. Black as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Edgar S. Cathcart as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. James J. A. Cavanaugh as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Jacques de Rougemont as Research Fellow in Neurosurgery for one year, beginning approximaty September 1;
Dr. Franco R. Dinale as Clinical Fellow in Anesthesia for one year, beginning October 1;
Dr. Jacques É. Dumont as Clinical and Research Fellow in Medicine for one year, beginning September 1;
Karl Dus, Ph.D. as Research Fellow in Medicine for one year, beginning April 29;
Dr. Michael H. M. Dykes as Clinical Fellow in Anesthesia for one year, beginning January 1, 1959;
Dr. Howard S. Frazier as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Sidney Gelfand, Ph.D. as Research Fellow in Psychology, effective as of August 25;
Dr. Helen S. Gyftaki as Research Fellow in Physics, for a period of six months, beginning May 12;
Dr. Richard M. Hays as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Helmut F. Hofmann as Clinical and Research Fellow in Neurosurgery for one year, beginning September 1;
Dr. John R. Huckell as Clinical Fellow in Orthopedic Surgery, for the period July 1,

1958 through April 30, 1959, with the privilege of assisting Dr. J. S. Barr in the care of his private patients;
Dr. Guy J. Isaac as Clinical and Research Fellow in Medicine for one year, beginning September 1;
Elton P. Katz, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning April 28;
James G. Kelly, Ph.D. as Research Fellow in Psychology, beginning August 25;
Dr. Alexander D. Kenny as Associate Pharmacologist in the Department of Pathology, for a three-year period, beginning July 1;
Keith F. Killam, Jr., Ph.D. as Research Fellow in Neurophysiology on the Neurology Service, pro tempore, for the months of July and August;
Marvin R. Lamborg, Ph.D. as Research Fellow in Medicine for one year, beginning July 1;
Dr. Melvin Lederman as Clinical and Research Fellow in Surgery for one year, effective as of July 1;
Dr. Barbara Lipowska as Clinical Fellow in Medicine for one year, beginning July 1;
Dr. Gisela A. M. Meloy as Research Fellow in Psychiatry for one year, beginning July 1;
Dr. Hans Nevinny-Stickel as Clinical Fellow in Medicine for one year, beginning July 1;
Kirit S. Parikh, Sc.D. as Research Fellow in Orthopedic Surgery, for a period of three months, from June 16 through September 15;
Charles J. Parker, Jr., Ph.D. as Research Fellow in Medicine for one year, beginning September 1;
Dr. Albert McL. Rogers as Clinical Fellow in Orthopedic Surgery, for the period September 1 through November 30;
Ascanio M. Rossi, Ph.D. as Research Fellow in Psychology, beginning August 25;
Dr. Hugues Ryser as Clinical and Research Fellow in Medicine for one year, beginning September 15, or as soon thereafter as he arrives in Boston;
Dr. Ihsan Sahinalp as Research Fellow in Neurosurgery, effective January 1 through December 31;
Dr. Clyde N. Shealy as Clinical and Research Fellow in Neurosurgery, for a period of ten months, beginning July 1;
Dr. Clarence E. Thornton as Clinical Fellow in Psychiatry for one year, beginning July 1;
Dr. Arnold van den Hooff as Research Fellow in Medicine for one year, beginning October 1;
Dr. Markus F. Vest as Clinical and Research Fellow on the Children's Medical Service for one year, beginning September 1;
George R. Weiss, A.M. as Research Fellow in Physics (Surgery), for the period June 9 through September 1.

The General Executive Committee also voted that:

The appointment of Dr. Peter J. Gomatos as Assistant Resident in Medicine be changed to that of Resident in Medicine for one year, beginning July 1;
The appointment of Dr. Judith F. Gould as Clinical Fellow in Anesthesia become effective July 1, 1960 rather than September 1, 1959;
The appointment of Dr. Timothy S. Harrison be that of First Assistant Resident in Surgery, beginning July 1, rather than Second Assistant Resident;
The appointment of Dr. Jan Koch-Weser as Resident in Medicine become effective January 1, 1959 rather than July 1, 1958.

The McLean Hospital has announced the following appointments to its part-time staff:

Dr. Ruth M. Murphy, Clinical Fellow in Psychiatry;
Dr. William D. Temby, Assistant Attending Psychiatrist;
Dr. Elizabeth R. Zetzel, Psychiatrist.

The McLean Hospital also announced the appointments of:

Mr. Robert Schnitzer, Assistant Psychologist;
Dr. Katherine Spencer, Research Associate in Social Anthropology.

The following Residents in Psychiatry have been appointed at McLean:

Dr. Robert Ball
Dr. Barbara Gurd
Dr. Herbert Lazarus
Dr. Egbert Mueller
Dr. Jack Rice
Dr. Phelps Robinson

The Executive Committee of the Massachusetts Eye and Ear Infirmary, at their meetings on May 19 and July 9, made the following appointments:

Dr. Peggy Clark-Roberts—Fellow in Anesthesiology for one year;
Dr. Louis E. Griffey—Assistant in Otolaryngology;
Dr. David Lozano—Special Fellow in Ophthalmology, assigned to the Retina Service for one year, beginning July 1;
Dr. Alexander Papadopoulos—Fellow in Anesthesiology for one year;
Dr. John C. Snow (Hionides)—Chief of Anesthesiology;
Dr. Irvin S. Taylor—Assistant in Ophthalmology.

IMPORTANT NOTICE

Despite substantial increases in the cost of issuing THE NEWS, no increase has been made in the price of the paper since 1947. Now being faced with the necessity of either raising the price or reducing the number of issues per year, it has been decided to adopt the custom followed by many publications of somewhat similar type, and cover the academic year, only —October through June—when vacations are over for most of our readers.

* * *

SURGICAL RESEARCH

During the past three years research done in my laboratory has centered about the liver and pancreas, with occasional excursions into the fields of carcinogenesis and coronary circulation. I will summarize briefly some of the work we have done and are doing in attempting to apply basic research techniques to clinical surgery.

I. THE PANCREAS

Pancreatic visualization: One of the chief obstacles to early diagnosis of pancreatic disease is the total absence of any method of rendering the gland opaque to x-rays. If some agent could be found which selectively localized or was concentrated and excreted in the pancreas, iodination might result in a compound that would provide pancreatograms.

While a medical house officer here, Dr. Isaac M. Taylor (*M.* 1946 and c.r.p. 1951) called my attention to the fact that certain fluorescent alkaloids derived from colombo root resulted in localized pancreatic fluorescence when injected into animals. We have prepared some of these alkaloids and confirmed this selective localization by fluorescence under ultraviolet light. In order to confirm this finding Dr. John Seipel, while a Harvard Medical student, devised a quantitative gravimetric method for recovery of these alkaloids. He demonstrated that between 15 and 75 percent of the injected alkaloid could be extracted from the excised pancreatic tissue which represented less than 1 percent of the total body weight.

Our endeavors to iodinate these alkaloids have been a collaborative effort with Drs. William Sandusky and Leo Burger at the University of Virginia, and the Mallinckrodt Chemical Company. Although several iodinated complexes have been synthesized, these have unfortunately been exceedingly insoluble. Current efforts are being directed at producing a soluble iodinated molecule which will permit administration of adequate iodine to opacify the pancreas.

We are also attempting iodination with radioactive iodine, since a much smaller amount of iodine would provide adequate radioactivity for body scanning.

Serum trypsin: Determinations of serum amylase and lipase have been of considerable value in the diagnosis of pancreatitis. However, these are often of little value in chronic disease and malignancy. It seemed to us highly desirable to devise a test for the pancreatic proteolytic enzyme, trypsin, which might have the advantage of specific pancreatic origin, lacking in both amylase and lipase determinations.

The availability of synthetic polypeptide substrates with amide linkages vulnerable only to a specific enzyme has enabled us to devise a simple and apparently reliable method for the quantitative analysis of a circulating proteolytic enzyme which is probably trypsin of pancreatic origin.

The specific substrate we have utilized is benzoyl l'arginineamide (BAA) which is commercially available. Incubation of this substrate with the patient's blood results in splitting of amide from the substrate by any trypsin present. The amount split off is proportional to the concentration of trypsin and is measured quantitatively as ammonia. We have been greatly aided in our clinical appraisals by the entire clinical staff of the Hospital, and Dr. Chester Jones and Dr. Marshall Bartlett in particular. The laboratory determinations have been diligently done by Miss Natalie Goregliad. At the present time Joseph Barrie (Harvard Medical School) is revising the technique of the determination to simplify its execution so that it may be done colorimetrically in any clinical laboratory. In addition, we are correlating our findings in approximately 300 determinations with the patient's clinical course.

Preliminary results are most promising. The test has been positive in 10 consecutive cases of carcinoma of the pancreas. The laboratory was awarded the Annual Award of the R. Franklin Carter Foundation, Inc. for 1957 on the basis of this work.

II. LIVER BLOOD FLOW

For several years we have been measuring hepatic blood flow by utilizing a radioactive colloid, chromic phosphate tagged with P-32, which is extracted by the reticuloendothelial system of the liver and spleen. A minute amount of the colloid is injected intravenously and the disappearance rate of the radioactivity from the peripheral blood, which is proportional to the liver blood flow, is determined.

The procedure is harmless, requires only 2 venepunctures, and can be easily repeated.

Our investigations were initially directed with Dr. William V. McDermott, Jr. toward a study of hepatic hemodynamics in cirrhosis and portal hypertension. Dr. Hugo M. Palazzi (Bolivia) has done a great deal of the clinical work with these patients, and during the summer has been aided by Joseph S. Barr, Jr. (Harvard Medical School).

We have found that, in general, cirrhotics do not have a markedly reduced liver blood flow. Splenectomy and shunt procedures usually result in a reduction of hepatic flow which, in some cases, may result in hepatic coma and death. Cirrhotics with reversible ascites have a markedly reduced flow. It is possible that the latter group should have shunt surgery and that determination of flows may eventually help us select the proper patients for surgery or aid in selecting the proper procedure for each patient.

More recently we have applied this technique to a study of liver blood flow in shock. Dr. John P. Bunker and Dr. Marie-Louise Levy of our Department of Anesthesia have initiated a collaborative study of the effect of anesthesia, hypothermia, blood loss, and surgery on hepatic blood flow.

III. CARCINOGENESIS

John Hanley (Boston University Medical School) and John Chacko (Harvard Medical School) have been carrying on a study of amino acid metabolism of human tumors. Sterile tumors and normal tissues are being transplanted into hamster cheek pouches where, under the influence of cortisone, the tissue may grow independently. When the transplant is established, the animals are injected with a radioactively tagged amino acid and the cheek transplant biopsied at various time intervals. The biopsies are then extracted and their amino acid content analyzed by paper chromatography. The chromatograms are then placed on an x-ray film and a radioautograph made. Comparison of the serial radioautographs permits one to trace the metabolic pathway of the injected amino acid in normal and neoplastic tissue. Our experiments here are not yet far enough along for us to draw any conclusions.

IV. CORONARY ANGIOGRAPHY

In cooperation with Dr. Stanley M. Wyman of our Department of Radiology we have been able to demonstrate the coronary arteries of dogs *in vivo*. By using a pressure injector, a bolus of from 5 to 10 cc. of contrast material can be delivered into the ascending aorta in a fraction of a second. This results in rapid and complete coronary filling which can be demonstrated beautifully on films taken on the rapid sequence biplane equipment available in the research suite of the X-ray Department. This form of single rapid injection of small volume accomplishes good filling of the coronaries without the hazards of anoxia and arrhythmias. It is believed that this technique will be necessary in the proper selection of patients for surgery or coronary occlusive disease.

George L. Nardi, M.D.,
Assistant Surgeon

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Anesthesia

Goldberg, L. I.
Effects of hypothermia on contractility of the intact dog heart.
Am. J. Physiol. 194:92.
Macris, S. G., Gravenstein, J. S., Reichle, C. W., and Beecher, H. K.
Drug synergism (potentiation) in pain relief in man: papaverine and morphine.
Science 128:84.

Biological Chemistry

Baskys, B., Lever, W. F., and Klein, E.
Separation of heparin-induced lipemia clearing factor from human plasma.
Federation Proc. 17:11.
Klein, E., Lever, W. F., and Fekete, L. L.
Inhibition of lipemia clearing activity by tissue components.
Federation Proc. 17:520.
Klein, E., Lever, W. F., and Fekete, L. L.
Inhibition of lipemia clearing activity by tissue extracts.
Proc. Soc. Exper. Biol. & Med. 98:658.

Cardiology

Shanahan, W. R., Romney, S. L., and Currens, J. H.
Coarctation of the aorta and pregnancy.
J.A.M.A. 167:275.

General Medicine

Irwin, J. W., and Burrage, W. S.
The role of adrenocortical steroids in the treatment of intractable bronchial asthma.
J. Allergy 29:233.

General Surgery

Grillo, H. C., Watts, G. T., and Gross, J.
Studies in wound healing: I. Contraction and the wound contents.
Ann. Surg. 148:145.
Waddell, W. R.
The secretory function of the stomach after denervating operations.
J. Appl. Physiol. 12:468.
Watts, G. T., Grillo, H. C., and Gross, J.
Studies in wound healing: II. The role of granulation tissue in contraction.
Ann. Surg. 148:153.

Laboratory Science

Isselbacher, K. J.
A mammalian uridinediphosphate galactose pyrophosphorylase.
J. Biol. Chem. 232:429.
Jeanloz, R. W., and Stoffyn, P. J.
Chemical structure of *B*-heparin.
Federation Proc. 17:249.
Jeanloz, R. W., Stoffyn, P. J., and Trémège, M.
Sulphated galactosamine-containing mucopolysaccharides.
Ciba Foundation Symposium on chem. and biol. of mucopolysaccharides, p. 85.
Nardi, G. L.
Serum trypsin determination in pancreatic disease.
J. Lab. & Clin. Med. 52:66.
Schmid, K., and MacNair, M. B.
Characterization of the proteins of certain post-mortem human synovial fluids.
J. Clin. Investigation 37:708.
Waksman, B. H.
Discussion du rapport de Elvin A. Kabat.
VI Congres International de Neurologie, 1957, p. 48.

Neurology

Hirsch, O.
Hypophyseal duct tumors (craniopharyngiomas) versus adamantinomas.
J. Neuropath. & Exper. Neurol. 17:305.

Neurophysiology

Brazier, M. A. B.
The development of concepts relating to the electrical activity of the brain.
J. Nerv. & Ment. Dis. 126:303.
Brazier, M. A. B.
Studies of responses evoked by flash in man and cat.
In Reticular formation of the brain, sec. 6, Boston, Little, Brown and Company.

Neuropsychiatry

Benda, C. E., and Melchior, J. C.
Progressive deteriorating diseases of infancy.
J. Neuropath. & Exper. Neurol. 17:205.
Bronner, F., Benda, C. E., Harris, R. S., and Kreplick, J.
Calcium metabolism in a case of gargoylism, studied with the aid of radiocalcium.
J. Clin. Investigation 37:139.

Neurosurgery

Bakay, L.
Results of surgical treatment of intracranial metastasis from pulmonary cancer. Report of a case with five-year survival.
J. Neurosurg. 15:338.
Bakay, L.
Spinal fluid protein in tumors of the sellar region.
Neurol. 8:455.

Ophthalmology

Dunphy, E. B.
Report on the diathermy treatment of retinoblastoma.
Am. J. Ophth. 45:95.
Dunphy, E. B.
The three-year residency.
Tr. Am. Acad. Ophth. & Otolaryng. Mar.-Apr.: 241.

Otolaryngology

Kelemen, G.
Arteria stapedia in bilateral persistence.
A.M.A. Arch. Otolaryng. 67:668.

Physiology

Blank, I. H., Griesemer, R. D., and Gould, E.
The penetration of an anticholinesterase agent (sarin) into skin. II. Autoradiographic studies.
J. Invest. Dermat. 30:187.
Blank, I. H., Jones, J. L., Jr., and Gould, E.
A study of the penetration of aluminum salts into excised human skin.
Proceedings of the Scientific Section of the Toilet Goods Association 29:32.
Griesemer, R. D.
Studies on enzymes in the skin: Their use as a research tool.
J. Soc. Cosmetic Chemists 9:148.

Psychiatry

Gellert, E.
Reducing the emotional stresses of hospitalization for children.
Am. J. Occup. Therapy 7:125.

Sifneos, P. E.
Phobic patient with dyspnea: Short term psychotherapy.
Am. Pract. & Digest Treat. 9:947.
Smith, G. M.
Six measures of self-concept discrepancy and instability: Their interrelations, reliability, and relations to other personality measures.
J. Consult. Psychol. 22:101.
Talland, G. A.
The effect of set on accuracy of auditory perception.
Brit. J. Psychol. 49:117.
Weisman, A. D., and Hackett, T. P.
Psychosis after eye surgery: Establishment of a specific doctor-patient relation in the prevention and treatment of "black-patch" delirium.
New England J. Med. 258:1284.

Books

Adams, F. D.
Adams' physical diagnosis, ed. 14.
Baltimore, Williams and Wilkins Company.
Terracol, J., and Sweet, R. H.
Diseases of the esophagus.
Philadelphia, W. B. Saunders Company.

VOLUNTEER GROUPS

Distaff Club

The first of this year's Distaff Club meetings was held on September 25, at 8 P.M., in the Pent House, with Mrs. Guy W. Leadbetter, Jr. as hostess. We all enjoyed the opportunity to see old friends again and meet some new ones. Mrs. Soma Weiss took us on a very interesting tour of the Hospital before the meeting.

The October meeting will be a panel discussion on the subject "Work in the community". The panelists will be representatives from the League of Women Voters, the School Committee of Weston, and the Massachusetts Medical Society. The meeting is planned for the 22d of October, at 8 P.M., in the Pent House. It will be of special interest to us all.

Looking far ahead, plans are being made for the November Square Dance. This will not only be great fun, but very good exercise, as well.

This letter came to Dr. Butler from appreciative parents:

> My husband and I would like to thank your entire staff who helped to make our daughter's stay at the Hospital a pleasant one.
>
> Being a nurse, I have had the opportunity of working in pediatrics in several hospitals, and I have never seen such happy and well-adjusted patients as those at Massachusetts General. I think most of the credit should go to the staff, which does so much to make the patient feel "at home".

New addresses:—

Dr. Paulo F. Albuquerque (r.s. *U.* 1944), Rua da Assembleia 51, Rio de Janeiro, Brasil
Dr. Arthur F. Amick (*M.* 1957), Loup City, Nebr.
Dr. Fred B. Ballard, Jr. (a.r.p. 1958), 15 Devon St., Glendale, Mo.
Dr. Florosa A. Bautista (a.r.p. *C.M.* 1958), Chapin Hospital, Providence, R. I.
Dr. Richard F. Bedell (*C.M.* 1958), 1303 York Ave., New York 21, N. Y.
Dr. Robert D. Breer (a.r.p. *C.M.* 1957), 690 B, Route 1, Anniston, Ala.
Dr. Norman K. Brown (*M.* 1957), 596 Delaware Ave., Buffalo, N. Y.
Dr. Bob Bullwinkel (*S.* 1957), NAS Navy #943, Box 62, Agana, Guam, c/o Fleet Post Office, San Francisco, Calif.
Dr. Chung H. Cho (clin. fel. *An.* 1958), Dept. of Anesthesia, Providence Lying-In Hospital, Providence, R. I.
Dr. George O. Clark (*E.S.* 1904), 633 Lilac Drive, Santa Barbara, Calif.
Capt. John P. Connelly, MC, USAF (*C.M.* 1957), 2750th USAF Hospital, Wright-Patterson A.F.B., Ohio
Dr. Daniel Deykin (*M.* 1958), Beth Israel Hospital, Boston, Mass.
Dr. Sylvia Davies Diehle (a.r.p. *C.M.* 1958), 580 W. 215th St., New York 34, N. Y.
Dr. Pierre M. Dreyfus (r.p. *N.* 1955), McLean Hospital, Waverley, Mass.
Dr. Edward Dunn (a.r.s 1956), 1200 E. Genesee St., Syracuse, N. Y.
Dr. John Q. Durfey (a.r.p. *An.* 1958), St. Vincent's Hospital, New York, N. Y.
Dr. Henry C. Everett, III (a.r.p. *Psychiat.* 1958), Student Health Service, University of Illinois, Champaign, Ill.
Dr. Robert P. Fornshell (sr. r.s. *Or.* 1958), 21 Sunrise Rd., Danbury, Conn.

No. 76 in a series of Staff photographs
Dr. George L. Nardi, Assistant Surgeon

Dr. Frank W. Garran, Jr. (*S.* 1951), 40 Lewis Bay Rd., Hyannis, Mass.
Dr. Leon I. Goldberg (*M.* 1957), National Heart Institute, Bethesda, Md.
Dr. Jack J. Greenberg (*S.* 1957), 215 Gerry Rd., Chestnut Hill, Mass.
Dr. Edgar Haber (*M.* 1957), National Institutes of Health, Bethesda, Md.
Dr. Arthur Haut (*M.* 1950), Dept. of Medicine, University of Utah, Salt Lake City, Utah
Dr. Jeannette A. Hovsepian (a.r.p. *R.* 1958), 599 W. 190th St., New York 40, N. Y.
Dr. Mary Ellen Jones (assoc. biochem. *Res. Chem.* 1957), Brandeis University, Waltham, Mass.
Dr. John W. Josse (*M.* 1957), Washington University School of Medicine, St. Louis, Mo.
Dr. Herbert J. Levine (a.r.p. 1958), Peter Bent Brigham Hospital, Boston, Mass.
Dr. John A. Malcolm (*S.* 1953), Bellevue Hospital, New York, N. Y.
Dr. John A. Mannick (*S.* 1954), Mary Imogene Bassett Hospital, Cooperstown, N. Y.
Dr. William M. O'Brien (*M.* 1957), National Institutes of Health, Bethesda. Md.
Dr. John H. Peters (*W.M.* 1943), 44 E. 23d St., New York, N. Y.
Dr. John F. Radbaugh, Jr. (*C.M.* 1954), 26 S. Goodman St., Rochester, N. Y.
Dr. James A. Rose (*M.* 1957), National Institutes of Health, Bethesda, Md.
Dr. Carter R. Rowe (*Or.* 1939), 705 Warren Bldg., 275 Charles St., Boston, Mass.
Capt. Allan I. Sandler, MC, USAF (*M.* 1956), 4231 USAF Hospital, Hunter A.F.B., Ga.
Dr. Charles L. Schepens (a.s. *Oph.*), 99 W. Cedar St., Boston, Mass.
Dr. R. Neal Schneiderman (r.p. *D.* 1958), Apt. 5 K, 577 Ave. Z, Brooklyn 23, N. Y.
Dr. Tetsuo Sugiyama (j. r. s. 1944; r.s. *U.* 1946), 604 Metz Bldg., Grand Rapids, Mich.
Dr. John F. Tannheimer (r.p. *Path.* 1945; a.r.p. 1948), 525 Lafayette St., Ionia, Mich.
Dr. Douglas G. Tompkins (sr. r.s. *Or.* 1958), Gundersen Clinic, La Crosse, Wis.
Dr. Arnold N. Weinberg (*M.* 1957), National Institutes of Health, Bethesda, Md.
Dr. Louis Weinstein (assoc. p. *C.M.*), N. E. Medical Center, Harrison Ave. and Bennet St., Boston, Mass.
Dr. Carl T. Wolff (*M.* 1958), Massachusetts Mental Health Center, 74 Fenwood Rd., Boston, Mass.
Dr. Kazuo Yanagisawa (*Or.* 1944), 216 E. 50th St., New York, N. Y.

Brief bits:—

Dr. Henry K. Beecher was the Peter T. Bohan Lecturer at the University of Kansas Medical Center, Kansas City, Kansas, last June. His subject was "Pain".

Dr. Edward B. Benedict attended a joint luncheon meeting of the Editorial Board of Gastroenterology and the Governing Board of the American Gastroenterological Association in Washington, D.C., on May 23. He also took part in the meeting of the American Gastroscopic Society and presented a paper on "Gastroscopic biopsy". He went to the meetings of the World Congress of Gastroenterology held in Washington, May 25-31, and took part in the discussion of a series of papers on carcinoma of the stomach presented by physicians from Denmark, Japan, Argentina, Spain, Poland, Switzerland, Italy, France, Great Britain, and the United States. The World Congress of Gastroenterology was initiated by the International Society of Gastroenterology, founded in Brussels in 1935 by Dr. Georges Broheë. The recent meeting in Washington was quite an affair and included an Inaugural Ceremony at Sheraton Hall, a Grand Reception at the Pan American Union Building, a National Symphony Orchestra Concert in Constitution Hall, an American Gastroscopic Society Banquet at the Shoreham Hotel, a World Congress Banquet, an American Gastroenterological Association Banquet, and a Dinner Dance—all at Sheraton Hall, besides official tours to the Capitol, White House, Mount Vernon, Bethesda, etc.

Among the grants announced by the Rockefeller Foundation for the first quarter of 1958 was one to Dr. Mary A. B. Brazier.

Dr. Bradford Cannon presided at the annual meeting of the American Association of Plastic Surgeons, held in Dallas, Texas, and delivered the presidential address on May 23.

Dr. James A. Halsted (*W.M.* 1932), Director of Professional Services, Syracuse V.A. Hospital, and Associate Professor of Medicine, State University of New York Medical Center at Syracuse, N. Y., has received a Fulbright Award to be Visiting Professor of Medical Science at the University of Shiraz, Iran. for the academic year 1958-59. Dr. and Mrs. Halsted left for Iran in September, and will return next June.

Dr. Oscar Hirsch has been appointed Consultant in Experimental Pathology to the Children's Cancer Research Foundation, and Consultant in Pathology in the Department of Pathology of the Children's Medical Center for one year, beginning last July 1.

Dr. Varaztad H. Kazanjian attended the annual meeting of the American Association of Plastic Surgeons, held in Dallas, Texas. On May 22 he presented a paper on "The repair of eyelid defects" before the Society.

Dr. Rita M. Kelley, who is in charge of the Breast Clinic at the Pondville Hospital, is Senior Investigator at Pondville, under a grant from the Cancer Chemo-Therapy National Service Center, and is Tumor Consultant at Newton-Wellesley Hospital, has delivered several lectures to various hospital and medical society groups and to lay groups, under the auspices of the American Cancer Society.

Dr. George L. Nardi was the guest of Dr. Roger E. Wilcox (*S.* 1949) at the Miner's Memorial Hospital in Beckley, West Virginia, last June. Dr. Nardi spoke on "Esophageal reconstruction" and "Diagnosis and treatment of chronic pancreatitis" while he was there. At the Northeast Regional Meeting of the College of American Pathologists. held in Swampscott, Massachusetts, on June 14, Dr. Nardi delivered a talk on "Measurement of serum trypsin in pancreatic disease".

Dr. Arthur S. Spangler gave a paper on "Fibrin foam treatment of depressed scars—three and one-half years' experience". Dr. Spangler prepared a scientific exhibit for the same meeting, with the same title as the paper. His exhibit won honorable mention, out of more than 400 exhibits.

Miss Mary Ruth Wolf, Director of Volunteers at M.G.H., served as Chairman of the Instructional Conference at the American Hospital Association Convention, held in Chicago last August. The topic under discussion was "Pilot studies for new volunteer services". Miss Dorris Hamm, Senior Evening Nursing Supervisor, and Mrs. Stephen J. Lent, Jr., a volunteer, were also speakers at this session. Miss Dorothy Bartol represented the Ladies' Visiting Committee, and Mrs. Francis G. Barnum, Jr. the Staff Wives Association.

SURGICAL RESEARCH

THE TRANSPLANTATION OF LIVING TISSUE

Except for the transplantation of living cornea and the transfusion of properly typed blood, the transplantation of living tissue in ordinary medical practice is only a hope for the future. The tempting array of possibilities which might be opened to medicine if tissue transplantation could be made workable would become of greatest interest to the surgeon, whose tools could be given new scope. These possibilities have prompted a great deal of work on a clinical level for many years and there remain many ardent claims for clinical successes of various kinds—particularly in the field of endocrine transplants—successes which have never been adequately refuted. Nevertheless, as work progresses under controlled laboratory circumstances, it seems quite clear that any graft of living, nucleated cells (i.e., not erythrocytes) which is vascularized by the tissues of a host other than the identical twin of the donor will be doomed to a sure death in less than two weeks' time from transplantation. There may be special exceptions to this rule in that some tissues may be peculiarly resistant to the response of the host. Cartilage is probably one example.

On the other hand, some sites within the recipient may be unusually hospitable to foreign tissue, as for example the anterior chamber of the eye and the region within the blood-brain barrier. The developing embryo is also a special case of great theoretical importance. In fact, the science of experimental embryology would be far poorer if embryos had not been found to support the growth of tissue grafts from other embryos, and from adults, for relatively long periods. Such transplants have taught us much of what is known about embryonic organizer substances.

The recent history of the now fast-moving transplantation field goes back to only about 1944. At that time the air was still filled with exorbitant claims of men like the notorious Voronoff, who recommended transplants of monkey testes for the waning vigor of old age. The most authoritative treatise on the general subject was less hopeful, however. In it, Leo Loeb concluded, after long and careful study, that homografts (a graft from one individual to another) would not in fact survive. This was attributed to certain tissue "incompatibility factors" which could be found throughout all higher organisms and which were closely regulated by the animal's genetic constitution.

Here the matter rested until new impetus was indirectly generated by the pressing medical needs of the second World War. During the London blitz the incendiary bombs resulted in a large number of casualties which involved extensive burns. At this time, the Medical Research Council recognized once again the desirability of covering burned areas in such patients with permanent homografts. A brilliant young zoologist, Peter Medawar, was commissioned to look into the problem, and here it is that the modern history of the subject begins.

I shall not attempt even to outline the rapid development of theoretical knowledge in the field of transplantation since then. It would involve forays into genetics, embryology, immunology, and radiology, at least, as well as surgery. Suffice it to say that the last fifteen years of activity both in Medawar's laboratory and in an increasing number of other places have seen an immense amount of progress in the understanding of the complex mechanisms involved in what appears to be a grossly simple event—the rejection of a graft of living tissue by a homologous host.

The reaction is now believed to be an example of a special class of sensitivity or immunologic response. It is a highly specific affair in that the rejection of a bit of tissue from a given donor by a host imparts a state of heightened sensitivity to subsequent grafts from the same source only. The reaction appears to require the participation of host leukocytes which must come in very close contact with the graft for a proper reaction to occur. Circulating antibodies of the conventional type may well be involved but do not appear to be able to bring about graft rejection on their own. So far as is known, all nucleated cells are antigenic in the transplantation system, and they appear to be active even during embryonic life in this respect. On the other hand, an animal's ability to respond to foreign tissue develops only at about the time of birth, as suggested above. Tissue presented to developing animals up until this time often settles down to become permanently incorporated in the maturing recipient, imparting to it a specific, permanent state of "actively acquired tolerance" to later grafts from the same donor.

The antigens which are released by cells to provoke the transplantation reaction have not been characterized. There is reason to believe, however, that they are under close control of the genes and that the actual genetic material, the DNA proteins, or closely related complex molecules may be involved.

It is into this general field that our surgical laboratory has stepped.

After returning to the M.G.H. in 1955 from a year of apprenticeship under Professor Medawar in London, I again took up full-time clinical work as Resident on the East Surgical Service. Thereafter the work of assembling the new laboratory was begun. Valuable stockroom space was generously relinquished by the Huntington Laboratory on the third floor of the Research Building. Following a fine job of remodelling, largely according to a scheme drawn up by Dr. Hermes Grillo, whom the laboratory also houses, it has been designated the Ira T. Nathanson Memorial Laboratory.

The personnel, in addition to the writer, have so far been two in number—Elizabeth M. Sparrow, Ph.D., and R. F. Gittes, a third year Harvard Medical student. Dr. Sparrow and I worked together in Professor Madawar's laboratory in London, where she was a full-time research worker after finishing her doctorate with him at Birmingham University. We have been most fortunate to have her, a circumstance which we partly owe to the excellence of Harvard's School of Architecture, to which her husband came for postgraduate work.

Dr. Sparrow and I have been pursuing a variety of lines of investigation, all related to the general field of tissue specificity. With the idea of learning a little more of the behavior of the nuclear substances in grafts, one series of experiments has involved transferring grafts of skin previously labeled radioactively in the DNA fraction. These are grafted to other animals both of the same and of different inbred strains from the donor. We have followed the changes in radioactivity in such grafts and the appearance of activity in various locations within the recipient animal. There are some significant differences between autografts and homografts measureable by this technique which we are endeavoring to learn more about.

Another project revolves about the fascinating experimental tool introduced by the late Glenn Algire of the National Institutes of Health. He found that small bits of tissue from one animal could be made to live in an unrelated recipient if shielded by a thin, porous, plastic envelope. The critical feature of this arrangement appeared to be that the size of the pores had to be sufficiently small to prevent completely the influx of any host leukocytes which will attack a graft if allowed to come in close contact with it. Careful experiments by Algire and subsequently by others have failed to uncover any evidence that such protected tissues release detectable amounts of transplantation antigens. This question has important bearing on the problem of how the homograft response is brought about, and Algire's results in this regard seemed to require confirmation or denial. We are accordingly performing a careful series of experiments with rabbits in which suspensions of enzymatically dissociated epidermal cells are tested for their antigenicity when implanted in Algire chambers.

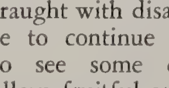
Another line of work in the laboratory has been the particular project of Ben Gittes. He has reopened the question of the difference in antigenicity of various tissues. This has been done using parathyroid grafts as compared with skin. The status of the grafted parathyroid can be very nicely followed by means of its influence on the serum calcium of the recipient, which is kept on a standard low calcium diet, so that the tempo of response to the two tissues can be closely compared. He has so far found some striking differences which may lead us to reconsider the presently held concept that virtually all nucleated cells in the same animal have roughly equivalent antigenic properties in the transplantation system.

Running parallel to this have been some pilot experiments on a clinical level. With Byron Waksman and W. H. Baker a series of experimental skin homografts have been done on patients with Hodgkins disease. The prolonged survival time of such grafts suggested a variable degree of anergy in this condition, a phenomenon probably related to the impairment of lymphoid tissue activity coincident with the disease. This finding has recently been reported in the literature (by Good and Varco), who have apparently had some interests similar to ours, so we cannot claim to have come across it first. At present we hope to go on with similar studies in other conditions.

Another project is being done with Dr. Joseph J. M. McGovern, who has plans for treating leukemia in children with autologous and homologous bone marrow infusions.

Altogether the work has proved a source of endless stimulation. Progress is slow and fraught with disappointments, but we hope to continue and perhaps eventually to see some developments which will allow fruitful applications in the clinical surgery of the future.

Paul S. Russell, M.D.,
Assistant in Surgery



The Board of Trustees, at their meetings on August 15, and September 12 and 26, voted:

To accept with regret the resignation of Dr. Robert L. Berg from the position of Associate Physician, effective September 30;

To accept with regret the resignation of Dr. Gaston E. Blom from the position of Associate Psychiatrist, effective as of July 15;

To accept with regret the resignation of Dr. Philip H. Henneman from the position of Assistant in Medicine, effective August 31;

To accept the resignation of Dr. Elizabeth B. Keller from the position of Assistant Biochemist (Medicine), effective September 30;

To accept with regret the resignation of Dr. John D. Reeves from the position of Associate Radiologist, effective September 30.

To appoint:

Dr. Luis L. de Mola as Second Assistant Resident in Pathology, for the period September 1, 1958 through June 30, 1959;

Dr. Robert E. Dinsmore as Second Assistant Resident in Radiology, beginning October 1, 1959;

Dr. Murray L. Janower as Second Assistant Resident in Radiology, beginning July 1, 1959;

Dr. Leo T. Kelly as Assistant Resident in Anesthesia, beginning July 1, 1959;

Dr. Sidney W. Klein as Exchange Resident on the Children's Medical Service, for a period of six weeks, beginning October 20;

Dr. Francis C. Lowell to the position of Physician, effective November 1;

Dr. Yosh Maruyama as Acting Resident in Radiology, for the period August 1, 1958 through March 31, 1959, and as Second Assistant Resident in Radiology, beginning April 1, 1959;

Dr. Jan Mellgren as Visiting Pathologist pro tempore for one week, beginning October 10;

Dr. Clarence L. Morgan as Second Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1959;

Dr. Edward C. Parkhurst as Assistant in Urology, effective August 1;

Dr. Robert H. Richie, Jr. as Assistant to the Children's Medical Service, effective as of July 1;

Dr. John T. Sharp as Assistant in Medicine, effective October 1;

Dr. Frederick S. Tomchik as Assistant Radiologist, beginning December 1;

Dr. Michael P. Tristan as Assistant to the Children's Medical Service, effective September 1;

Dr. Mark McN. Walter, Jr. as Assistant Psychiatrist at McLean Hospital, effective September 15;

Dr. Sarita G. Walzer as Assistant in Anesthesia, beginning September 15;

Dr. Edwin T. Wyman, Jr. as Assistant Resident in Orthopedic Surgery for one year, beginning September 11;

Dr. Nicholas T. Zervas as Junior Resident in Neurosurgery, beginning September 1.

The Trustees also voted:

That Dr. Winfield S. Morgan, Assistant Pathologist, be granted a leave of absence beginning September 1;

To invite Dr. John Edwards, Lecturer in Social Medicine at the University of Birmingham, England, to give a Richardson Lecture at the Hospital on September 18;

To establish a Treadwell Award, to be given from time to time by the Hospital to an outstanding graduate of the Hospital's internship-residency program, the winner to be selected by the Trustees on the recommendation of the House Pupils Association and the General Executive Committee; that Dr. Robert F. Loeb, Professor of Medicine at Columbia University, College of Physicians and Surgeons, and a graduate of the West Medical Service 1920, be chosen as first recipient of this award; that the award this year be made on the occasion of the House Pupils Association meeting, held on October 16; that a design of a suitable scroll for the award be referred, with power, to the Treadwell Library Committee.

At their meetings on September 10, 17, and 24, the General Executive Committee voted:

To accept the resignation of Gillray L. Kandel, Ph.D. from the position of Research Fellow in Psychology in the Department of Anesthesia, effective September 1;

To accept the resignation of Dr. Hermann K. Schueler from the position of Clinical Fellow in Urology, effective August 31.

To promote:

Dr. Clinton B. Seeley to the position of First Assistant Resident in Radiology for one year, beginning October 1;

Dr. D. Albert Young to the position of Clinical Assistant in Surgery, assigned to the Tumor Clinic;

Dr. George D. Zuidema from the position of Second Assistant to First Assistant Resident in Surgery, beginning November 1, for a period of two months; it was further voted to promote him to the position of Resident in Surgery, beginning January 1, 1959.

To reappoint:

Dr. William H. Batchelor as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. C. Bremner Cameron as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. Anthony M. Dawson as Clinical and Research Fellow in Medicine for one year, beginning October 1;

Edwin H. Eylar, Ph.D. as Research Fellow in Medicine for one year, beginning September 1;

Dr. Richard F. Jackanich as Assistant Resident in Anesthesia for one year, beginning October 16;

Dr. Susanne J. Lamdin as Assistant Resident in Anesthesia for one year, beginning September 20;

Dr. Charles I. Levene as Research Fellow in Medicine for one year, beginning September 1;

Dr. Marie-Louise Levy as Clinical and Research Fellow in Anesthesia for one year, beginning October 29;

Dr. LeRoy H. Maffly as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. Antal M. Martonosi as Research Fellow in Medicine for one year, beginning October 1;

Dr. Pierre A. Maurice as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Thomas Nussbaumer, Ph.D. as Research Fellow in Medicine for one year, beginning September 15;

Dr. Edwin W. Salzman as Second Assistant Resident in Surgery, effective October 1;

Dr. Adalbert F. Schubart as Clinical and Research Fellow in Medicine for one year, beginning October 1;

Elizabeth M. Sparrow, Ph.D. as Research Fellow in Medicine for one year, beginning September 1;

Pierre J. J. Stoffyn, Ph.D. as Research Fellow in Medicine for one year, beginning September 1;

Dr. A. Dennis Surtees as Clinical Fellow in Anesthesia for one year, beginning July 25;

Zofia Tarasiejska, Ph.D. as Research Fellow in Medicine for one year, beginning September 1;

Dr. Alejandro H. Villegas as Clinical and Research Fellow in Surgery for one year, beginning September 1.

To appoint:

Dr. Scott Adler as Clinical Fellow in Orthopedic Surgery, for the period September 11 through December 31, with the privilege of assisting Dr. Otto E. Aufranc in the care of his private patients;

Dr. Juan M. Arizaga as Clinical Fellow in Pathology for one year, beginning October 1;

Dr. Ann B. Barnet as Clinical Fellow on the Children's Medical Service for one year, beginning September 26;

Dr. Frederick A. Horner as Clinical and Research Fellow in Neurology, assigned to Electroencephalography, for the period September 1 through December 31;

Dr. George F. Kwass as Clinical Fellow in Pathology, for the period September 1, 1958 through June 30, 1959;

Dr. Ezra Lamdin as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. John K. Leach as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning October 1;

Dr. Federico G. Lopez as Research Fellow in Neuropathology for one year, beginning September 1;

Dr. Sanford I. Roth as Clinical Fellow in Pathology, for the period September 1, 1958 through June 30, 1959;

Richard W. Sagebiel, A.B., as Research Fellow in Pathology for one year, beginning September 1;

Dr. Rudolf E. Siebenmann as Research Fellow in Pathology for one year, beginning December 1;

Dr. Peter Waisberg as Graduate Student Assistant in Orthopedic Surgery for one year, beginning September 2.

The General Executive Committee also voted that Dr. Károly (Charles) Balogh's title be changed from Research Fellow to that of Clinical and Research Fellow in Pathology, beginning September 1.

The McLean Hospital announces the following part-time appointments to its medical and psychiatry staff:

Dr. Ruth B. Buescher, Clinical Assistant in Psychiatry;
Dr. John G. Clark, Clinical Assistant in Psychiatry;
Dr. John H. Dwyer, Clinical Fellow in Psychiatry;
Dr. William A. Hall, Clinical Assistant in Medicine;
Dr. P. Stefan Kraus, Associate Attending Psychiatrist;
Dr. Theodore Sack, Clinical Fellow in Psychiatry;
Dr. Alan A. Stone, Clinical Fellow in Psychiatry.

THE MIXTER BRAIN STEREOTACTIC LABORATORY

Man has always been interested in his physical measurement. He has compiled the dimensions of his bones and other parts of his body in relation to every imaginable category, and is ever seeking new ways of comparing himself with himself. The mirror image he examines, however, scarcely reflects his internal anatomy. The external landmarks which have been used to compute his skeletal and bodily growth and proportion usually serve only as reference points to deeper structures.

The phrenologist used to propound your I.Q. and personal aptitude by qualifying the bumps on your head. The fissures of the cortex were once considered to be a likely index of cerebral development. But the porpoise was found to clearly outfissure man. So what made the human brain so remarkable?

The skull, especially, was considered by early anthropologists to correlate closely with the form and function of the organ it held. One could derive brain size from the weight of lead pellets that would fill the cranial cavity. Cerebral shape and configuration could be guessed from the topography of the inner calvaria. Actually, the size and shape of the skull is determined more by the growth pattern of the brain itself.

As the actual recording device of the physical indices it has invented, the human brain knows surprisingly little about its own living dimensions. One can weigh the brain and describe its gross appearance at necropsy; and after hardening in fixating solutions, cutting, and allowing 10% for shrinkage, anatomists like Dr. Paul Yakovlev have been able to estimate accurate reconstructions of internal relationships by studying whole brain sections of post-mortem specimens. Such data gradually developed the basic knowledge needed for human stereotactic brain surgery. Compilation of measurements on fresh frozen whole brain slices by Drs. Bailey, Amador, and Blundell proved beyond doubt the remarkable range of internal variation and indicated that every living brain must be regarded as a unique problem with respect to the geometry of its nuclear structures and connecting systems. Central reference points have to be identified in each patient at the start.

One laboratory on the Mixter Floor of the Warren Building, having the formidable title "Anthropometric Radiophotography and Stereotaxy", is assigned as the present headquarters of the Central Nervous System Stereotactic Department. The application of its equipment and information to the patient, however, may be performed in several parts of the M.G.H., notably on the O.R. and x-ray floors. This involves the invaluable help and patience of personnel in these departments as well as of the principal operators (Drs. W. H. Sweet, V. H. Mark, and R. N. Kjellberg). An instrument to locate and reach a foreordained area within the human brain has been designed and built by Paul A. MacPherson (over a six-year period and still undergoing modification). The device has been applied to patients for the purpose of interrupting pain pathways, to ameliorate tremor and rigidity in dyskinesias and Parkinsonian states, and to implant electrodes to study the electrophysiology of special types of epilepsy with a view toward surgical treatment. The laboratory houses electronic recording and stimulating equipment, and contains a shielded roomette that electrically isolates the patient under observation.

In order to plot a projected point in the living brain, laborious preliminary x-ray study is conducted with the stereotactic instrument attached to the head of the patient, who is usually under anesthesia. The scalp is then marked, incised, and the skull trephined to permit placement of electrode or cannula, which is rechecked before a test lesion and a subsequent therapeutic lesion is attempted. A number of such efforts may be required to obtain the maximum beneficial effect.

Work is in progress to try to devise a radiological method that can be performed as a separate maneuver, individually derived from basic craniocerebral x-rays taken with the head of the subject fixed constant with respect to position and distance. The designated area is thereby determined at the intersection of three planes within the brain of the patient. These data are then transposed at another session to the stereotactic instrument. Success in this direction will reduce the time and stress for everyone involved with the procedure. It is also likely that radiologic data obtained from x-rays of an increasing series of heads exposed under standard conditions may provide additional anthropometric information on the living brain.

Thus man continues his quest for self-measurement.

Hannibal Hamlin, M.D.,
Assistant in Neurosurgery

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Anesthesia

Bunker, J. P., Bendixen, H. H., Murphy A., and Rand, W. M.
The evaluation of a new and inexpensive carbon dioxide analyzer.
Anesthesiology 19:97.

Bunker, J. P., and Goldstein, R.
Coagulation during hypothermia in man.
Proc. Soc. Exper. Biol. & Med. 97:199.

Malt, R. A.
Effect of preanesthetic medication on cardiovascular force.
Anesthesiology 19:353.

Bacteriology

Blank, I. H., and Dawes, R. K.
The water content of the stratum corneum. IV. The importance of water in promoting bacterial multiplication on cornified epithelium.
J. Invest. Dermat. 31:141.

Cardiology

Malt, R. A.
Ballistocardiogram during paralysis with succinylcholine.
Am. Heart J. 56:245.

General Medicine

Benedict, E. B.
Bronchial adenoma in a ninety-two-year-old man.
New England J. Med. 258:1157.

Shamma'a, M. H., and Benedict, E. B.
Medical progress: Esophageal webs.
New England J. Med. 259:378.

General Surgery

Churchill, E. D., Sweet, R. H., Scannell, J. G., and Wilkins, E. W., Jr.
Further studies in the surgical management of carcinoma of the lung.
J. Thoracic Surg. 36:301.

McDermott, W. V., Jr.
Management of hepatic coma.
Am. J. Gastroenterol. 30:51.

McDermott, W. V., Jr.
The role of ammonia intoxication in hepatic coma.
Bull. New York Acad. Med. 34:357.

Laboratory Science

Isselbacher, K. J., and McCarthy, E. A.
Identification of a sulfate conjugate of bili-

rubin in bile.
Biochim. et Biophys. Acta 29:658.

Waddell, W. R.
Effect of tolbutamide on serum cholesterol levels in hypercholesterolemic patients.
Proc. Soc. Exper. Biol. & Med. 98:280.

Medical Education

Churchill, E. D.
Annual Discourse: Reflections on the challenge to the medical profession in India. (Presented at the annual meeting of the Massachusetts Medical Society, Boston, May 20, 1958.)
New England J. Med. 259:551.

Pathology

Aström, K.-E., Mancall, E. L., and Richardson, E. P., Jr.
Progressive multifocal leuko-encephalopathy: A hitherto unrecognized complication of chronic lymphatic leukaemia and Hodgkin's disease.
Brain 81:93.

Cope, O., Keynes, W. M., Roth, S. I., and Castleman, B.
Primary chief-cell hyperplasia of the parathyroid glands.
Ann. Surg. 148:375.

Josse, J. W., and Zacks, S. I.
Thymoma and pancytopenia.
New England J. Med. 259:113.

Richardson, E. P., Jr.
Degenerative diseases of the nervous system.
In Principles of Internal Medicine, New York, McGraw-Hill Book Company, Inc., chapter 259.

Rosen, S. H., Castleman, B., and Liebow, A. A.
Pulmonary alveolar proteinosis.
New England J. Med. 258:1123.

Russfield, A. B.
Hypophyseal changes in hypothyroidism induced by radioactive iodine in man.
A. M. A. Arch. Path. 66:79.

Russfield, A. B., and Byrnes, R. L.
Some effects of hormone therapy and castration on the hypophysis in men with carcinoma of the prostate.
Cancer 2:817.

Zacks, S. I.
Chemodectomas occurring concurrently in the neck (carotid body), temporal bone (glomus jugulare) and retroperitoneum.
Am. J. Path. 34:293.

Psychology and Psychiatry

Benda, C. E.
Divorce from a psychiatrist's point of view.
Pastoral Psychol. 9:86.

Chafetz, M. E.
The role of psychiatry in the treatment of Parkinson's disease.
Geriatrics 13:435.

Mendelson, J., Solomon, P., and Lindemann, E.
Hallucinations of poliomyelitis patients during treatment in a respirator.
J. Nerv. & Ment. Dis. 126:421.

Talland, G. A.
Sex differences in self assessment.
J. Social Psychol. 48:25.

Books

Benedict, E. B., and Nardi, G. L.
The esophagus: Medical and surgical management.
Boston, Little, Brown and Company.

Churchill, E. D. (Editor)
To work in the vineyard of surgery — The reminiscences of J. Collins Warren (1842 - 1927), with Appendices, Notes, and Comments.
Cambridge, Mass., Harvard University Press.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

* * *

Under the aegis of the National Institutes of Health, I journeyed through many countries of other lands during the latter part of 1956 and the spring of 1957. The purpose of my trip was to visit centers where respiratory diseases of environmental origin were being studied. This took me for brief visits to the United Kingdom, Germany, Belgium, Switzerland, Luxembourg, and France, and for longer stays in certain parts of Africa, including the Union of South Africa, the Belgian Congo, Northern Rhodesia, French Equatorial Africa, and, in transit, through French West Africa. Finally, I experienced a breath-taking trip over the Andes, from Rio de Janeiro, Brazil, to Lima, Peru, where I had the opportunity of studying dust disease in men working at high altitudes.

While I learned much about the chemical pneumonias, sudden deaths from smog in London, and pneumoconiosis, you will see from what follows that I also learned a great deal about the political, economic, and social affairs of the countries I visited. Here, in retrospect, is a brief account of conditions as I saw them and as they impressed me.

Cape Town is a beautiful city. It seemed to be a reasonably settled community, whose color problems should be slowly solved by the Europeans there of mixed national backgrounds. However, it was quite a shock to learn that the *apartheid* approach is used by the pure Afrikaners (who are of Dutch origin) in the Transvaal in their dealings with Europeans of British origin. Several spoke with horror of eventual intermarriage (of white and black), but of its being likely in the future. One physician said that by schooling and the building of houses for the natives the Government was working toward its own destruction. He said that the example of the Dutch being thrown out of Indonesia by the natives and the fact that South Africa is the last "Western" stronghold in this part of the world make suppressive measures reasonable, because of the few whites and many blacks. Squalor, overcrowding, tuberculosis, malnutrition, and no sewage disposal were freely admitted. Throughout, I was lectured on the U.S. responsibility for anti-colonialism—with some justice, if we think of the slave trade during our early history, and the alcohol, disease, and destruction brought by us to the native American Indian. True, there has been a change in our behavior, marked by our trying to make amends, 300 years later, by giving civil liberty to the Indian and the Negro.

But—back to Cape Town. The people there live pleasantly—some in what I (perhaps mistakenly) considered a colonial manner. The women never work. (Several confessed they were bored, and they asked with interest about women in the United States.) I saw wonderful gardens, much outdoor life, swimming, etc. —all very enjoyable. The medical people seemed to me to be efficient (those I saw)—but too modest, in a way, and too deferential to overseas medicine, especially that of the United States. Perhaps I was just getting the V.I.P. treatment!

In Johannesburg hostility was evident everywhere, on people's faces and in incidents I read of in the local papers—not only white against black and vice versa, but white (Afrikaners) against white (English). While I was there, a boycott of native buses reached its crisis, and the buses were removed (March 1957). Some said they thought the natives would in time start a general strike. This would seriously cripple Johannesburg, which is completely dependent on black labor. There were riots and murders, and black people were arrested for almost any excuse—e.g., "interfering" with the police. The English-language newspapers were *very* critical of the Nationalist Party in power. Also, while I was there, a law was about to be passed forbidding any meetings of black and white people without permission of the Minister of Native Affairs—this to include the churches and the well-established Institute for Race Relations. A much-beloved Protestant Bishop died during my stay, having just finished a letter to the Prime Minister begging him not to push this law, saying that the Church could not obey. In his will he had written, "Bury me where there is no color bar." The day before I left, apropos of such laws, I saw an organization of women, called the "Black Sash", lined up outside the Johannesburg City Hall. They wore white dresses, with black sashes over their shoulders and tied at the waist. They stood silently in a straight line for some distance on either side of the main entrance, where there were huge banners, in both Afrikaans and English, reading "We oppose tyranny. Every new law is a link in the chain of slavery." The great silence was an effective instrument of real embarrassment to the officials.

Very dramatic to me, personally, were the physicians I met who were planning to migrate with their families because of fear of certain bloodshed. Children begged their parents not to go out at night. There were accounts of shots in the dark, by frightened constables, at lovers in parked cars, etc., etc. It was generally considered that the Government was moving toward a showdown, which would mean slaughter on both sides. I hope this will not occur!

I saw compounds of men brought from their farms (kraals) miles away, to be fed, exercised, housed, and trained for underground mining. I was told they are well treated, "like good pieces of machinery"! They are not allowed to bring their wives and families with them. (The Belgians bring their families into townships which they, the Belgians, own; but the natives must build their houses themselves with money they have earned.)

I found Rhodesia much more relaxed, although there was labor union trouble and the fear that the natives were being corrupted by urban ideas and foreign influences, including U.S. anti-colonialism and communism. However, new construction and expansion were in progress. I should judge that the natives are well cared for, though my stay was short and I had to spend much time and energy "explaining" what I could about the United States. I discovered that the greatest compliment paid me, as I met various people, was that I am "not a typical American". I think I see what the trouble is. The American is disliked in other countries for several reasons. He is often too smug and too assertive about the present prosperity and vigor of the United States—which prosperity may be only an accident of time in history. Furthermore, some Americans are often most annoying in their demands that everything abroad be as it is at home—ice, service, food, etc. They seem often to be insensitive to trouble round them, or are apparently unable to try to understand it, because things are going so well for them now. In spite of all this, I am glad to say that I met some well-liked fellow countrymen and a number of people from other countries who have visited the United States, all of whom helped me out in my "explaining". So—I have learned a great deal about the United States, as well as about Europe and parts of Africa.

During my eight days of observation in the Congo, I was given the V.I.P. treatment by the Union Miniere—the great mining company—and Sabena Airlines. Everything there seemed more peaceful, cleaner, and outwardly serene. The Belgian Government allows no voting and no ownership of land by either the native or the European, in order to avoid problems. In contrast, a Belgian official told me, "We Europeans must be ready to use brutality to keep order." They believe there may be trouble with the urbanized black if wages go down, which problem they plan to handle with force.

My visit to Dr. Schweitzer's hospital at Lamborene in French Equatorial Africa lasted five days. I slept, ate, worked (not as hard as the others) as a member of the regular staff of Europeans—at that time numbering about 25, with 4 doctors and 6 nurses. There were also many dedicated women who carried out household and administrative duties. Dr. Schweitzer ate at the table with us. Mrs. Schweitzer (obviously very fragile—she died two months later) joined us briefly for the noon meal. We each lived in a relatively narrow, screened-in cubicle or small bedroom, about 5 feet by 12. These cubicles were in rows of 8 or 10 for the Europeans. Noticeable protocol and ritual concerning every phase of our lives were closely adhered to, guarded by two older women who had been chief staff members and who had sat on either side of Dr. Schweitzer at the table for years. They looked sad, somehow. Their skin was like yellow parchment, they seemed fragile in appearance, and were always hurried and harrassed by some detail or other. It is not surprising that they do not look well, having worked for years in that tropical climate. I, who boast that I do not mind the summer heat of New England, wondered often during my short visit if I were suffering from heat stroke.

Dr. Schweitzer, as you know, is a tall man who makes an impressive appearance. He looked well, and ate enormously—so it seemed to me. He appeared to be weary, often, but was obviously rested by eating. He always smiled at me as we sat down—a good warm smile. He seldom spoke, but seemed lost in faraway thoughts. Occasionally, he told stories of his travels, of his acquaintance with Einstein or someone else of fame. He spoke in lively German, and seemed to be enjoying these occasions.

Dark comes completely and suddenly in the jungle there at about 6 P.M. By kerosene lamp, after supper, Dr. Schweitzer would announce a hymn in an old German hymnal. He played on a poor tropical-ruined piano as though he were touching the keys of a great cathedral organ. Following this, he would read two short bits from a Bible in a French I gradually grasped. Then, without a word, he would leave, and the rest of us (especially the physicians) would talk together for an hour or two in the hot night.

In the daytime, there was hustle, bustle, and everywhere animals of all kinds. Gorillas, goats, antelopes, cats, dogs, hens created endless trouble and untidiness; but they were all very much a part of the life. One nurse kept three young antelopes in her room at night; another had a four-months-old gorilla *and* an African baby who had been sick. These two were in my row of rooms, and for several nights the noises were wild, indeed!

Now, let me describe something of the work of the place. As is well known, sick people are brought by their families, who care for them. They live in the African village located below the Europeans' living quarters while the patient receives surgery or medicine. Dr. Schweitzer has natives on his "payroll", who clean the Europeans' rooms, do laundry work or carpentry, sew, serve the food, help the nurses, etc., and all are paid by food which Dr. Schweitzer gets for them and the patients (bananas and rice) plus a small amount of money. The food for the Europeans, incidentally, is excellent: native fruits and vegetables carefully tended, imported cheese, butter, some meat—a generous supply of everything.

Dr. Schweitzer has built a new leper village, about a quarter of a mile away, with his Nobel Peace Prize money. This is the most hopeful spot for the visitor to see. There are about 6 native men who help with the medical work, but otherwise Europeans do all except menial work at the hospital. Only outpatients are admitted there, and those operated upon are put directly back into their crowded "casa" (dormitory) beds and cared for by their families.

Except for simple social greetings, I had only one talk with Dr. Schweitzer, and because of my poor French and German, and his unwillingness to use English, our interview was carried on through an interpreter. We talked mostly about atomic energy developments. It was not a very satisfactory talk, really, though I caught a bit of his personal charm which has rightly drawn to him so many people of all types and backgrounds.

A widespread, and perhaps correct, interpretation of medical practice at Lamborene is that Dr. Schweitzer is a 19th century continental who believes in 19th century colonialism and practises 19th century medicine. However, the M.D.'s say, he has sharp clinical acumen, and in general leaves them alone in their work. Gunther seems to have pretty fairly described the present-day Dr. Schweitzer. He is 83 years of age, and 44 years in the tropics should be taken into consideration. Also, Dr. Schweitzer had to work very hard in the past to get buildings built and food procured for everyone at Lamborene, especially during the two wars, and these factors probably have a bearing on his present behavior.

It has occurred to me that the excessive Schweitzer publicity is perhaps a mistake. Instead, let his legend of self-initiated service to native slaves act as a spur to moral conscience wherever there is privilege, ease, domination; and let his great intellectual and musical achievements stand, as they well can, documented in his writings. The parallel between Dr. Schweitzer and Lawrence of Arabia was brought up more than once in talks I had with various people.

Harriet L. Hardy, M.D.,
Associate Physician

No. 77 in a series of Staff photographs
Dr. Hannibal Hamlin, Assistant in Neurosurgery

Brief bits:—

Dr. Henry K. Beecher participated recently, by invitation, in an international symposium on submarine and space medicine, at the United States Submarine Base at New London.

Dr. Robert L. Berg left the M.G.H. on Sept. 30, to be Professor of Preventive Medicine and Community Health at the University of Rochester Medical School.

Dr. Carl A. L. Binger lectured in Buenos Aires, Argentina, on "The relations of medicine, psychiatry and psychoanalysis in the United States — Historical considerations", to the Psychoanalytic Society of Argentina, August 15-21. He also presented a paper on "Concept of cure in psychiatry, or some goals for psychotherapy" to the 3rd Ibero-American Medical — Psychological Congress in Rio de Janeiro on August 22.

Dr. Mary A. B. Brazier is visiting Czechoslovakia, Poland, the U. S. S. R., and Rumania, at the invitation of the Academies of Sciences of these respective countries. In Moscow she will be participating in a colloquium on the electrical activity of the brain.

Dr. Earle M. Chapman addressed the Milwaukee Academy of Medicine, last May 20, on "Radioactive iodine treatment for heart disease". Dr. Chapman has been appointed Chairman of the Isotopes Committee here at the Hospital.

At the Annual Meeting of the Massachusetts Public Health Association held last April, Dr. Dean A. Clark was voted president-elect. He assumes the duties and office of president as he closes the next Annual Meeting, which will be held April 30, 1959.

Dr. Erich Lindemann was the keynote speaker at the National Assembly in Community Mental Health Education held at Cornell University, Ithaca, N. Y., September 10-13.

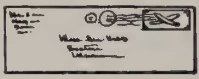
The Medical Art Department has moved into more spacious quarters on the 3rd floor of the old Pathology Building.

Dr. Jan Mellgren, Professor of Pathology at the University of Gothenburg, Sweden, delivered a lecture on Wednesday afternoon, October 15, in the Ether Dome. The subject of the talk was "Lymphoid tissue reactions in the adaptation syndrome". A tea was given for Dr. and Mrs. Mellgren in the Mallory Memorial Library of the Pathology Department preceding the lecture.

Dr. Winfield S. Morgan, Assistant Pathologist, has been granted a leave of absence to study at the Wenner-Grens Institute, Stockholm, Sweden, for two years. He will work with Professor Hultin, a biochemist interested in protein synthesis research. Dr. Morgan's address in Sweden is: Hersbyvägen 22, Lidingö, Sweden.

Dr. Arthur L. Watkins was awarded the Gold Key for meritorious service in rehabilitation at the American Congress of Physical Medicine and Rehabilitation Meeting, held in Philadelphia last August.

Dr. Sumner Zacks, formerly resident in the Department of Pathology, has been assigned Chief of Laboratories at DeWitt Army Hospital, Fort Belvoir, Virginia. Captain Zacks will set up the teaching in clinical pathology, corroborate the laboratory medicine with the staff, and give CPC's at this military hospital.



New addresses:—

Dr. Charles R. Allison (*W.M.* 1938), 15 Prince St., Rochester 7, N. Y.
Dr. Norman W. Andrew (r.p. *An.* 1956), 31 Commonwealth Ave., Boston 16, Mass.
Dr. Fred B. Ballard, Jr. (a.r.p. 1958), 9750 Old Warson Rd., Rock Hill 17, Mo.
Dr. Rafe Banks, Jr. (*E.S.* 1943), 106 S. Enota Drive, Gainesville, Ga.
Dr. Robert L. Berg (*M.* 1944), Dept. of Preventive Medicine and Community Health, University of Rochester Medical School, Rochester, N. Y.
Dr. Stewart H. Clifford (*E.M.* 1927), Boston Lying-in Hospital, Boston 15, Mass.
Dr. Beverly W. Cobbs, Jr. (*M.* 1953), Emory University Clinic, Dept. of Internal Medicine, Box 459, Atlanta, Ga.
Dr. Arthur B. Emmons, II (*W.S.* 1905), Bay View Estates, Brewster Drive, Largo, Fla.
Dr. Lionel O. Garrote (clin. and res. fel. *N.S.* 1958), Hotel Prescott, 10 W. 61st St., New York 16, N. Y.
Dr. Joachim S. Gravenstein (clin. and res. fel. *An.* 1958), J. Hillis Miller Health Center, University of Florida, Gainesville, Fla.
Dr. Robert G. Greene (a.r.p. *Or.* 1953), 63 S. Fullerton Ave., Montclair, N. J.
Dr. Eugene Guralnick (clin. a. *S.*), 5 Bay State Rd., Boston 15, Mass.
Dr. Theodore H. Ingalls (r.p. *C.M.* 1938), Dept. of Public Health and Preventive Medicine, University of Pennsylvania School of Medicine, Philadelphia 4, Pa.
Gillray B. S. Kandel, Ph.D. (res. fel. *Psychol.* 1958), Rensselaer Polytechnical Institute, Troy, N. Y.
Dr. Edward Karian (a.r.p. *D.* 1955), 324 Common St., Watertown, Mass.
Dr. Glenn A. Langer (*M.* 1955), Apt. 4-K, 617 W. 168th St., New York 32, N. Y.
Dr. William E. Lassiter (*M.* 1955), 59 Hamilton Rd., Chapel Hill, N. C.
Dr. Claud E. McGahey (r.s. 1946), 795 Elm St., Manchester, N. H.
Dr. W. Wallace McKay (*C.M.* 1921), R.R. 1, Aylmer, Quebec, Canada
Dr. Bernard I. Maisel (r.p. *Path.* 1943), 1 E. 69th St., New York 21, N. Y.
Dr. Gardner Middlebrook (*M.* 1945), National Jewish Hospital at Denver, Denver 6, Colo.
Dr. Jule P. Miller, Jr. (a.r.p. *Psychiat.* 1955), 222 South St., Pittsfield, Mass.
Dr. Winfield S. Morgan (r.p. *Path.* 1951), Wenner-Grens Institute for Experimental Biology, Stockholm, Sweden
Dr. Eugene R. Nobles, Jr. (*S.* 1955), Rosedale, Miss.
Dr. H. Eugene Patterson (a.r.p. *C.M.* 1952), Suite 40, Yakima Medical Center, 210 S. 11th Ave., Yakima, Wash.
Dr. John D. Reeves (r.p. *R.* 1951), J. Hillis Miller Health Center, University of Florida, Gainesville, Fla.
Dr. John A. Reidy (*Or.* 1939), 3 Seaward Rd., Wellesley Hills, Mass.
Dr. Francoise J. Robert Robillard (a.r.p. *Path.* 1956), 1676 Van Horne Ave., Montreal, Quebec, Canada
Dr. Raymond L. Robillard (a.r.p. *N.* 1957), 1676 Van Horne Ave., Montreal, Quebec, Canada
Dr. Leonard J. Rothfeld (a.r.p. *An.* 1955), 711 Grevillea, Hawthorne, Calif.
Dr. Hermann K. Schueler (r.s. *U.* 1957), Harlan Memorial Hospital, Harlan, Ky.
Dr. John C. Seed (*M.* 1946), Wellcome Research Laboratories, Tuckahoe 7, N. Y.
Dr. William H. Smith (*W.M.* 1897), 262 Commonwealth Ave., Boston, Mass.
Dr. Clarence E. Thornton (a.r.p. *Psychiat.* 1958), 14 Main St., Topsfield, Mass.
Dr. William H. Thurlbeck (a.r.p. *Path.* 1958), 8 Beaufort House, Beaufort St., Chelsea, London S.W. 3, England

SURGICAL RESEARCH

"A slow sort of country," said the Queen. "Now, *here*, you see, it takes all the running you can do to keep in the same place. If you want to get somewhere else, you must run at least twice as fast as that!"

Almost anyone who has been involved in the development of cardiac surgery in the past 10 years can appreciate what the Red Queen had in mind, and also some of Alice's consternation.

Yes, we have a "pump", thanks to the efforts of Dr. Shaw and Dr. William G. Austen, plus Dr. Villegas and many others who have helped get the program off the ground. By "pump", of course, I mean a pump-oxygenator — a device that permits total bypass of the heart by removing the entire venous return, oxygenating it, and returning it to the arterial side of the circulation in amounts approximating the normal cardiac output. We have a disc oxygenator similar to the apparatus produced by Kay and Cross in Cleveland from a machine designed by Björk in Sweden, etc., etc. It is similar in fundamentals to the machine currently in use at the Children's Medical Center.

In early times — 1956 and 1957 — we had a "bubbler", the simplest of all oxygenators, in which oxygen is bubbled up through a column of blood, producing voluminous amounts of red foam, which is then de-foamed and, rich in oxygen and cleared of its carbon dioxide, returned to the patient under pressure. The bubbler is the product of the surgical ingenuity of the University of Minnesota, where it is still used with great effectiveness. Other oxygenators there are, of varying simplicity, effectiveness, and expense, and a great deal of engineering talent is engaged in developing such apparatus and producing standard models.

Though interested in extracorporeal circulation for many years, our interest here was largely spectator until 2 years ago. At that time an active program was begun in the animal laboratory, with the generous cooperation of the Peripheral Vascular Laboratory and the Anesthesia Laboratories of Dr. Brewster. The initial efforts were, of course, in the direction of merely trying to get the machine to work, and to make such modifications of the original DeWall oxygenator (bubbler) as were found to be desirable in our circumstances. Such early experience was invaluable, but also, of course, extremely expensive in time, materials, and animals. This is not the place to describe the many problems which arise when one takes over the cardiopulmonary function for a patient. They range from the relatively simple problem of determining optimum rates of flow to the more complex and still partly-known difficulties that arise in the blood which is subjected to this artificial environment. A great deal of systematic study has been done in this regard, and much remains to be done.

Then, there has been the subject of elective cardiac arrest. Obviously, the significance of the pump-oxygenator has been that it is possible to exclude the heart from the circulation, and, having done so, to carry out appropriate surgical maneuvers within it. To have a quiet, dry field it is necessary to occlude the coronary circulation, and if the heart continues to beat under these circumstances it will itself show the effects of anoxia which may be disastrous. Just what changes may occur are presently the subject of investigation. Elective cardiac arrest can be obtained by perfusion of the heart with dilute solution of potassium citrate. When the latter has been washed out of the coronary circulation by reperfusion with oxygenated blood, the heart will resume its normal beat, or, at least, can usually be made to do so. That such a procedure is clinically important is demonstrated by the fact that in the last two open operations we have done for tetralogy of Fallot — "blue babies" aged 10 and 13, respectively — the heart has been stopped and excluded from the circulation for slightly over an hour in each case, and has rather promptly resumed its intrinsic rhythm in each, though only after electrical defibrillation. Such are the problems of open heart surgery.

Our clinical experience here to date consists of about 25 open heart cases. About half of these have been in patients with congenital heart disease: atrial septal defects, ventricular septal defects, pulmonic stenosis, tetralogy of Fallot. A second group of patients who have come to open operation have been severely incapacitated by acquired valvular disease. Almost all of these (12) have had severe aortic stenosis; 3 have had reoperation on recurrent mitral stenosis. The results have been both encouraging and discouraging. In the congenital group, results have been excellent when the defect could be clearly seen and repaired, and this includes most atrial and ventricular septal defects and our limited experience so far with tetralogy. In the acquired group, calcific aortic stenosis continues to be a stubborn problem. Since it is a notoriously lethal lesion, once symptomatic, heroic efforts are justifiable and may be rewarding, but we cannot be at all complacent about our present attack. Mitral and aortic regurgitation are obvious targets for an open approach, but so far we have only pondered the problem and not attacked it directly. Mitral stenosis continues to be managed satisfactorily in a large proportion of cases (the MGH "series" now numbers about 300) by a closed, or blind, approach, and we have considered open operation only after the conventional operation has failed, or we have strong reason to think that it may.

Actually, our first open heart operation here (in 1955) was on a patient who was thought to have mitral stenosis but who proved to have a tumor within the cavity of the left atrium. He was operated upon under hypothermia — a technique of total body cooling which allows one to stop the circulation for 5 to 10 minutes, during which open heart operations are possible. This is a technique which is useful but unfortunately imposes limitations of time which have led us to concentrate our efforts toward extracorporeal circulation. Incidentally, the patient mentioned at the outset of this paragraph recovered and is now well.

Prior to the present pump program, our cardiac surgical efforts had been chiefly centered about an active clinical program, with mitral stenosis the chief subject of attack, and also in the Cardiac Catheterization Laboratory. The latter goes back as an active, functioning unit to 1948, when it became apparent that such a laboratory was essential to the clinical investigation and evaluation of congenital and acquired heart disease and the proper treatment thereof, be it medical or surgical. The activities of this laboratory might well be the subject of another communication for The News. Suffice it to say, it has been invaluable in preoperative and postoperative evaluation, and has served as the focal point of our clinical investigation.

If called upon to describe the present status of our cardiac surgical program, I should sum it up as follows. We have tried to establish a sound specialized program within the framework of a general surgical service. We have kept it very much a joint effort with the medical service, realizing that it is important to monitor surgical efforts with sound clinical cardiology. We are in a position to move along with the technical development of extracorporeal circulation as well as to explore the possibilities that extracorporeal circulation offers; for example, Dr. Austen is presently working on partial support of the left side of the circulation (left-heart bypass) and also the perfusion of extremities as a possible method of tumor therapy. We have a whole new field of surgical pathology unfolding before us. It is an exciting field and a rewarding one.

J. Gordon Scannell, M.D.,
Associate Visiting Surgeon

The Board of Trustees, at their meeting on October 24, voted to appoint:

Dr. Howard P. Baden as Assistant Resident in Dermatology for one year, beginning July 1, 1959;

Dr. James P. Bell as Assistant Resident in Orthopedic Surgery for one year, beginning November 23;

Dr. Norris B. Finlayson as Second Assistant Resident in Pathology for one year, beginning July 1, 1959;

Dr. David J. Lang as Second Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1959.

At their meetings during October and on November 5, the General Executive Committee voted:

To accept the resignation of Dr. George Kaldor from the position of Research Fellow in Medicine, effective as of August 31.

To promote:

Dr. Stanford B. Friedman to the position of Chief Resident on the Children's Medical Service for one year, beginning July 1, 1959;

Dr. Jordan S. Ruboy to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1959.

To reappoint:

Mary D. Albert, Ph.D. as Research Fellow in Medicine for one year, beginning November 1;

Dr. Margit M. Bellman as Clinical Fellow in Psychiatry for one year, beginning September 3;

Dr. Alberto Miyara as Clinical Fellow in Medicine for one year, beginning July 1;

Irving Weliky, Ph.D. as Research Fellow in Medicine for one year, beginning October 1.

To appoint:

Dr. Michael A. Browne as Graduate Student Assistant in Orthopedic Surgery, for the period October 6, 1958 through January 6, 1959;

Dr. Ellen S. Kang as Clinical and Research Fellow on the Children's Medical Service, beginning November 1;

Dr. Geza Ferenc Pal Kaplany de Kaplanyhaza as Clinical Fellow in Anesthesia, beginning October 15, provided he is able to obtain a temporary license to practise in this State;

Dr. Raymond N. Kjellberg as Clinical Assistant in Neurosurgery, with the understanding that this appointment will run concurrently with his appointment as Resident in Neurosurgery;

Dr. Harlin G. Knierim as Graduate Student Assistant and Clinical Fellow in Dermatology for one year, beginning October 1;

Lorna J. Langer, Ph.D. as Research Fellow in Biochemistry in the Department of Pathology for one year, beginning October 1;

Dr. Marriner W. Merrill as Graduate Student Assistant in Surgery, for the period September 1 through December 20;

Dr. Richard S. Morgan as Research Fellow in Medicine, beginning November 1;

Dr. Earle H. Rosenberg as Clinical Assistant on the Dental Service for one year, beginning October 1;

Dr. Aaron Toledano as Graduate Student Assistant in Surgery for one year, beginning November 1;

Dr. Alan Ziskind as Clinical and Research Fellow on the Children's Medical Service for one year, beginning July 1, 1959.

The General Executive Committee also voted:

To extend the appointment of Dr. Leonardo S. J. Martin as Clinical and Research Fellow in Urology to November 15;

To change the title of Dr. James L. Vanderveen from Clinical Fellow to that of Research Fellow in Anesthesia, effective October 1.

* * *

HOUSE PUPILS ASSOCIATION

October 16, 1958

October 16, 1958, was a memorable occasion at the Massachusetts General Hospital. This day marked the 112th anniversary of the demonstration of the use of ether anesthesia by Dr. W. T. G. Morton, and was celebrated this year with an unusually interesting program sponsored by the MGH House Pupils Association. This organization, which has been in existence since the year 1905, has been rather inactive in recent years. Its last official meeting was held in 1946, when the 100th Anniversary of Ether Day was celebrated by a dinner at the Copley Plaza.

The day's program this year was opened by its leading spirit, Dr. James Howard Means, who spoke briefly of the history of the House Pupils Association. A new slate of officers was introduced by the nominating committee, and the following former house pupils were elected to office: Dr. James M. Faulkner, President; Dr. Edward Hamlin, Jr., Vice-President; Dr. Reed Harwood, Secretary-Treasurer. While the new president strode to the platform to conduct the morning's scientific program, the new secretary-treasurer performed his only official act of the day by quickly taking possession of the precious volume, *Transactions of the Association,* and impounding it in the MGH Archives safe. (This volume had mysteriously disappeared during the long hibernation of the HPA and its whereabouts had been discovered only through diligent search by certain rather belatedly responsible persons. A careful perusal of this priceless record is planned for the near future, and may be the subject of an article in a later edition of THE NEWS.)

The morning scientific program in the Moseley Rotunda included talks by four young investigators. Dr. Gordon L. Brownell's paper was concerned with recent technical developments in the detection of radioactivity. Dr. Melvin J. Glimcher described some fascinating studies of the physicochemical structure of collagen and bone. Dr. Alexander Leaf described his experiments with the isolated bladder of the toad, in which he measured the transport of sodium across this living membrane. Dr. Robert S. Shaw described the clinical picture of intestinal ischemia, its anatomical problems, and the successful treatment of this condition by endarterectomy.

This informative program was brought to a close at noon, and the assembled members of the House Pupils Association and their wives and guests toiled up the familiar stairs of the Moseley Building — not painfully to the 4th floor as in the days when they used this building for short nights of oft-interrupted sleep — but merely to the 2nd floor to the pleasant sanctuary of the Treadwell Library where, in observance of the Library's 100th Anniversary, pretty maids and matrons were pouring and passing the very best of imported sherry. Surely Treadwell was never so eagerly patronized! And for once its well-stacked shelves were ignored, its dedicated silence shattered. Its reading room was invaded by the excitement of reunion and reminiscence, the gaiety of broken routine, and (as anyone who was there can testify) a spirit of the unity of shared experience which has been for decades an amazing, if not unique, quality of the old M.G.H.

The sherry hour — a scant thirty minutes, actually — passed all too soon. The great open spaces of the Bulfinch Lawn were calling, and there, under a nearly-cloudless Indian summer sky, the company took lunch, standing in queues for second helpings and sitting round in small groups. This was Ether Day at its best; the worriers should have realized that the weather was bound to smile on the auspicious occasion.

After lunch, the crowd returned to the Moseley Rotunda to listen to what was announced in the program as a panel discussion entitled "Function of the teaching hospital". In reality, this turned out to be a series of brief expositions by four distinguished members of the Staff. Dr. Walter Bauer discussed the alliance of basic research, clinical studies, teaching, and the care of the patient as the essence of the continued growth of modern medicine. Dr. Edward D. Churchill presented an outline of the training program offered to the surgical house pupils of today, stressing its well-rounded character and its flexibility and the recent shift from the apprentice system of former times to what he termed the "tutorial" system. Dr. Raymond D. Adams detailed the special problems of training neurologists and the relation of neurology to its sister specialties, psychiatry and neurosurgery, and their parents, medicine and surgery. And last, Dr. Dean A. Clark described the changes in the M.G.H. since the last meeting of the House Pupils Association. In the intervening twelve years, he reported, the Hospital had erected $7,500,000 worth of buildings — all devoted to "supporting services", rather than space for new beds. The annual budget had increased by an astounding 400% and the number of admissions to the Hospital and to the Emergency Ward had increased by 50% and 100% (in round figures), respectively. Dr. Clark felt a gentle urge to mention in passing (and who could blame him and who was taken by suprise?) the chronic financial difficulties that beset all modern teaching hospitals, including (we gathered) our own.

This session was followed by a brief intermission designed to give the visitors an opportunity to inspect the new buildings. During this period there was shown a movie of the vintage of 1932, dramatizing on the silver screen the renowned "Demonstration of the administration of ether", produced, directed, and filmed in the Ether Dome itself. At about the same time, the coveted MGH pins for long service were being bestowed in the lobby of the Warren Building upon a number of faithful members of the Staff and other MGH personnel.

Just before the Lowell Lecture at 5 P.M., the Hospital presented to Dr. Robert F. Loeb the first Treadwell Award. This Award was established by the Trustees on the occasion of the 100th Anniversary of the Treadwell Library, and on recommendation of the Treadwell Library Committee was given to Dr. Loeb who came from New York City to receive it. (The News carries in this issue the text of the citation.)

Dr. Henry K. Beecher introduced the final speaker, welcoming back a well-beloved former house pupil, a distinguished neighbor, Dr. Francis D. Moore, whose Lowell Lecture subject was "The two roads — science and surgery". Introducing his subject with a series of lantern-slide reproductions of anatomical drawings by Leonardo da Vinci (1452-1519) and those by Andreas Vesalius (1514-1564), he briefly reviewed the development of modern surgery, and the disciplines of its art and its science, relating his historical outline to the problems of modern surgical practice and of modern surgical research. No one could deny that Dr. Moore held his audience spellbound. He may have strayed from our precincts — indeed, he did stray, as far as the Peter Bent Brigham Hospital — but he made it clear to us that his loyalty to the M.G.H. was undiminished, though he had gone elsewhere to fulfill his early promise as surgeon, scientist, and speaker.

Darkness was soon to fall on this memorable Ether Day. In the dusk, the men donned their black ties, the ladies their prettiest dresses, and all ventured forth to the Harvard Club where a party had been organized under the able guidance of Miss Dorothy Rackemann. A "reception" was the first order of business there. Quotation marks appear about this euphemism because in reality this hour, devoted to the imbibing of tissue-restoring alcoholic beverages, resembled (as is usual at such gatherings) the scrum of an English football game, as the more timid souls sought to capture the strategic positions held by their more forehanded colleagues at the bar. But there was no weeping, no pain felt at the end as the company descended to Harvard Hall to enjoy a sumptuous dinner and to dance to the familiar and nostalgic rhythms of Ruby Newman's orchestra. The only bit of business was the announcement by Dr. Dana L. Farnsworth of the James Howard Means Fund. (The News gives a report of this Fund elsewhere in this issue.)

The unbiased observer — well, perhaps he *was* a little biased — observed the crowd from his special point of vantage (which is to say, he was one of the few stags) and noted with satisfaction that a good time was had by all.

Reed Harwood, M.D.,
Secretary-Treasurer

Dr. Dana L. Farnsworth made the following announcement at the House Pupils Association dinner, at the Harvard Club, on October 16, 1958.

At this reunion of the House Pupils Association of the Massachusetts General Hospital it seems particularly appropriate to announce the formation of a new educational resource for the Hospital. This one is compounded of sentiment and has been devised to honor one who has influenced every one of us here, one way or another. Willa Cather stated that happiness is to be dissolved in something good and great. Our friend, to whom we do honor, is eminently qualified by this definition, or any other for that matter, to be called a happy person. As a physician, teacher, author, artist, companion, and friend he has for three decades brought up house pupils to be better than they knew. As a foremost scholar of thyroidology he has set a standard of medical research which his younger colleagues envy with friendly approval. He was a skillful administrator before the advent and applicability of Parkinson's Law. As a fearless crusader, believing in better manners at the bedside rather than more bedside manners, and being more interested in the ethics of physicians in medical practice than in medical ethics, he has accomplished much in the improvement of medical care for all the people.

It is with pleasure that I speak for friends of Dr. Means and report that a sum amounting to $20,000 has been subscribed by them to establish in his honor a James Howard Means Fund. This will enable the Hospital occasionally to invite a distinguished physician and scholar to spend some time with our Staff, discoursing on whatever matters may be uppermost in his mind on the never-ending problem of alleviating human suffering.

Dr. Robert F. Loeb (*W.M.* 1920), the recipient on October 16 of the first Treadwell Award, is the Bard Professor of Medicine at Columbia University and Director of the Medical Service at the Presbyterian Hospital in New York City.

The Award, symbolized by an appropriately designed scroll, was created by the Trustees in honor of the 100th Anniversary of Treadwell Library. The text of the citation to Dr. Loeb is as follows:

While a House Pupil, your wholehearted admiration of the kindly bedside skills of the senior physicians of an era already past was a stepping stone to a career as educator and pathfinder in scientific medicine. Your life has shown that a passionate love of truth can bridge generations in family and in profession, without pretense or compromise and that no conflict exists between the humanitarian, the scientific and the educational undertakings of a great physician.

The spirit of William H. Smith, affectionately known as "Big Bill" proudly watches over and joins with us as you receive this First Treadwell Award.

The signatures of Dr. James M. Faulkner, President of the MGH House Pupils Association, and Mr. Francis C. Gray, Chairman of our Board of Trustees, are affixed.

Directly after the presentation of the scroll, a pseudoserious note was interjected when Dr. Churchill reminded Dr. Loeb that, somehow, he had failed to sign the West Medical records (now in bound volumes nos. 1362 and 1368) when he finished his internship here in 1920. He was forthwith ushered by Dr. Clark and Dr. Churchill to where these volumes were on display, and they witnessed his signing of these old records.

DIABETES DETECTION DRIVE

Last month, visitors to the M.G.H. witnessed a new and interesting activity in the Hospital. The Diabetes Clinic, with the help and cooperation of Miss Ruth M. Farrisey and the School of Nursing, initiated a program for the detection of diabetes, in observance of National Diabetes Week. On November 19 and 20, booths were set up in the lobbies of both the White Building and the Warren Building, and the materials for a quick, easy method of testing for sugar in the urine were supplied to all who were interested in testing themselves. All persons who returned with evidence of a positive test for sugar were then offered a free blood sugar test.

There were 516 persons who performed the urine test and of these, 7 were found to have sugar in the urine. All 7 with positive tests submitted to a blood sugar test and answered a questionnaire designed to help interpret the results of the tests. Normal blood sugar values were found in 6 of the 7 cases and these were classified as "glycosuria, cause undetermined; diabetes possible". Only 1 person had a definitely abnormal blood sugar, and was diagnosed as having diabetes. Reports of the tests and their interpretations were sent to all 7, and to the 6 who had given the names of their doctors.

Many persons also took home to their relatives small supplies of the urine-testing material, as well as pamphlets containing information on diabetes.

Judging from the experiences of other detection drives, the M.G.H. encountered a group that was remarkably free of diabetes. Ordinarily one would expect to discover 5 or 10 cases in a crowd of 500 persons. Nevertheless, this brief campaign served its purpose of demonstrating that unsuspected diabetes can be found by the performance of simple laboratory tests.

Reed Harwood, M.D.,
Associate Physician
and *Head of Diabetes Clinic*

REUNION IN BRUSSELS

Members of the Cardiac Staff of the M.G.H. were hosts on September 18 at a reunion and reception in honor of Dr. and Mrs. Paul D. White during the Third World Congress of Cardiology in Brussels. More than seventy former students and research workers at the Hospital and their wives were present, including representatives from Canada, Mexico, Ireland, England, France, Belgium, Portugal, Italy, Austria, Sweden, Turkey, Syria, Pakistan, India, Thailand, the Philippines, and South Africa.

The reception was held in the Commissioner-General's lounge in the United States pavilion at the World's Fair. Among those present from the M.G.H. were Mrs. Charles P. Howard (a member of our Ladies' Visiting Committee and President Eisenhower's special representative at the Fair), Dr. and Mrs. Walter

Bauer, Dr. and Mrs. Allan L. Friedlich, Dr. and Mrs. James H. Currens, Dr. and Mrs. William R. Brewster, Miss Helen Donovan, and Drs. William P. Chapman, John C. Rowe, Arnold M. Katz, and Edward F. Bland. During the reception Dr. White presented a scroll to Miss Helen Donovan in recognition of her long service to him and to cardiology; and Drs. White and Bland, together with Mrs. Howard, recorded for the "Voice of America" a brief description of the Congress and of our reunion, stressing the importance of science and medicine in fostering better understanding and good will among nations.

E. F. B.

[Edward F. Bland, M.D.]

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Cardiology

Currens, J. H.
"Pulseless disease"—Description by Robert Adams, 1827: An historical note.
Circulation 18:396.

Dentistry

Hall, H. D., and Shaw, J. H.
Parabiosis in strains of caries-susceptible and caries-resistant rats.
J. Dent. Research 37:912.

General Medicine

Gardner, F. H., and Freymann, J. G.
Erythrocythemia (polycythemia) and hydronephrosis. Report of a case with radio-iron studies, with recovery after nephrectomy.
New England J. Med. 259:323.

General Surgery

Austen, W. G., Shaw, R. S., Scannell, J. G., and Thurlbeck, W. M.
Postmortem study of the technique of aortic valvulotomy in calcific aortic stenosis by quantitative examination of valvular function by perfusion.
J. Thoracic Surg. 36:571.

Hyperparathyroidism

Cope, O., Keynes, W. M., Roth, S. I., and Castleman, B.
Primary chief-cell hyperplasia of the parathyroid glands: A new entity in the surgery of hyperparathyroidism.
Ann. Surg. 148:375.

Laboratory Science

Friis, T., and Chapman, E. M.
The function of the thyroid in euthyroid patients with exophthalmos.
Acta endocrinologica 27:207.

Neurosurgery

White, J. C.
The problem of the painful scar.
Ann. Surg. 148:422.

Otolaryngology

Kelemen, G.
Congenital deafness.
American Academy of Ophthalmology and Otolaryngology, 1956 Instruction Section, Course No. 462:1.

Kelemen, G. (J. Berberich, joint author)
Erkrankungen der Nase.
In Pathologie der Laboratoriumstiere (Cohrs, P., Jaffé, R., and Meessen, H., Editors), Berlin-Göttingen-Heidelberg, Springer-Verlag, 1:18.

Kelemen, G. (J. Berberich, joint author)
Erkrankungen des Ohres.
In Pathologie der Laboratoriumstiere (Cohrs, P., Jaffé, R., and Meessen, H., Editors), Berlin-Göttingen-Heidelberg, Springer-Verlag, 1:670.

Kelemen, G.
Tympanoplasty.
American Academy of Ophthalmology and Otolaryngology, 1958 Instruction Section, Course No. 463:1.

Lewis, D. K.
Medical progress: Recent contributions to the study of deafness.
New England J. Med. 259:169.

Psychiatry

Beecher, H. K.
Psychotomimetic drugs.
J. Chron. Dis. 8:253.

Binger, C. A. L.
The need for human acceptance.
Ment. Hosp. 9:10.

Talland, G. A.
Perception of apparent movement in Korsakoff's psychosis.
J. Personality 26:337.

Wolf, I.
Alcoholism and marriage.
Quart. J. Stud. on Alcohol 19:511.

MASSACHUSETTS EYE & EAR INFIRMARY

HENRY WHITTIER PORTER BACTERIOLOGY LABORATORY

It is interesting to note that the Massachusetts Eye and Ear Infirmary did not have a separate bacteriological department until the era of chemotherapy and antibiotic therapy was born. This is not because infections and their treatment were not of great importance to both the otolaryngologist and the ophthalmologist. On the contrary, before the advent of antibacterial therapy, some of the most life-endangering infections had their origins in the middle ear or the sinuses. Often an upper respiratory infection would be followed by acute otitis media or sinusitis or meningitis with and without brain abscess and death.

While infections of the eye were not apt to be fatal, partial or complete loss of vision was not an uncommon outcome of eye infection.

One speculates, therefore, as to why the need for a well-equipped and staffed bacteriological department was not felt. Searching among the old publications produces titles of papers relating to problems of infections and their control. Invariably one finds that these were written by staff members who were interested enough to do whatever work was necessary themselves.

As a routine, the junior residents were assigned to the laboratory service for the first three to six months of their training. This included doing all the routine clinical laboratory procedures, such as hematology and urine analyses, plus any bacteriological work necessary. Most of these young residents were not qualified to perform accurate bacteriological studies and, furthermore, they were not interested. To them it was a chore to be done with as soon as possible so that they could find time for the things that did interest them.

Not infrequently they called upon the bacteriological department of the M.G.H. for help; and later, in the middle 1930's, they turned to the Surgical Research Bacteriology Department, which was under Dr. Edward D. Churchill and Dr. Champ Lyons, where the present bacteriologist got her early experience and training after college. Usually these consultants were called upon in cases of serious infection. Early in the 1940's, after the introduction of the sulfonamides, the need for a department of bacteriology became more apparent. Dr. LeRoy Schall, the new Chief of Otolaryngology, decided to establish such a laboratory. Room was found for the laboratory on the first floor, and an incubator and an autoclave were installed. A bacteriological technician was put in charge. Under the guidance of Dr. Merrill King, who had started out as a bacteriologist under Dr. Hans Zinsser and had later been bacteriologist at the M.G.H., the first careful bacteriological studies were undertaken at the Infirmary. In April 1943, the present bacteriologist took over. She will never forget the remark of one of her surgeon friends who quipped when she told him of her new position, "You'd do better to brush up on your chemistry. Now that we have penicillin you bacteriologists are going to be out of your jobs!" Little could he or anyone else guess then what the future held for bacteriologists.

The past fifteen years have been very productive. The primary function of the laboratory is the identification as rapidly as possible of etiological agents of infection. The discovery of successive antibiotics, the emergency of resistant strains of bacteria, especially of the staphylococcus aureus, and the danger of super-infection all make it important that the bacteriologist carry out his studies as rapidly and efficiently as possible. The progress of the patient on antibiotics must be followed bacteriologically as well as medically. Antibiotic sensitivity studies are often a very useful and necessary guide as to therapy.

The laboratory performs between 5,000 and 6,000 routine cultures a year. It undertakes research projects as they come up.

Early in 1944 the new department began to justify the faith put in it when the laboratory established that purulent conjunctivitis, especially in children and young adults, was not due to n. gonorrhoeae but to n. meningitidis. Up to that time diagnosis was made on the basis of smears which showed the presence of intra- and extra-cellular gram negative diplococci. It had been assumed that these were gonococci. Careful bacteriological studies proved otherwise.

Shortly thereafter the laboratory again proved its usefulness when it started to produce crude penicillin for local use. That was during the period when all penicillin was carefully preserved for the Armed Services and desperately sick civilian patients. Conditions which could be treated with local antibiotics were not serious enough to warrant using the precious commercial product. The laboratory-produced antibiotic proved very useful in the treatment of eye, nose, and external ear infections. This, of course, was before the emergency of resistant strains and the sensitization of patients to penicillin.

After the general introduction of broad-spectrum antibiotics, it was noted that routine cultures from treated patients often showed spore-like organisms. A study of these soon showed that superinfection with Monilia albicans was not uncommon and that this complication might be more serious than the original infection. The *New England Journal of Medicine* published a letter summarizing the study, which proved to be one of the first reports to the medical profession about this complication.

Over the years this has been the type of help that the laboratory has tried to give the clinician.

In addition to routine smears, cultures, and sensitivity studies, the bacteriology service has tried to awaken and stimulate the interest of both the visiting and resident staffs in the whole problem of infection and its treatment. A series of lectures starting with the fundamentals of practical bacteriological procedures and ending with discussions of antibiotic therapy is given yearly to the otolaryngology residents. The ophthalmology residents are required to take a course in basic science before beginning their residency. Such a course and one in which the laboratory participates is the one given at the Infirmary in collaboration with the Harvard Medical School, under the direction of Dr. Henry F. Allen, Assistant Surgeon in Ophthalmology.

A major problem facing all hospitals within the past few years has been that of infections due to resistant strains of staphylococcus aureus in hospitalized patients, especially following surgery. A major role in the work the laboratory has done in tracking down and controlling sources of staphylococcic infection has been played by Dr. Allen, especially in the evaluation of filters in the air-conditioning system and the vacuum cleaner presently being used at the Infirmary. His studies relating to this cleaner are soon to be published.

As a result of bacteriological studies, certain routines have been established in an effort to cut down on the number of staphylococci surrounding the environment of the patient. An inspection committee has been appointed, consisting of a nursing supervisor, the Infirmary housekeeper, and the bacteriologist. Meticulous cleanliness in the hospital is thereby rigidly enforced. Since mattresses, blankets, and pillows were found to be great sources of staphylococci, changes in well-established hospital procedures were made.

All pillows are now covered with disposable plastic covers which are discarded when the patient leaves the Infirmary. Mattresses are covered with washable plastic covers, and all blankets are sterilized in ethylene oxide gas between use by patients. Bacteriological controls are routinely carried out on all these procedures.

To keep the operating room staff aware of the possibility of contamination, they are asked to carry out monthly surveys, consisting of culturing all instruments, solutions, and ointments that have been used in eye operations.

Air sampling of the patients' rooms, operating suites, and other patient areas is carried out routinely. If bacterial counts increase, the reasons are sought and corrective procedures undertaken immediately.

Situated in attractive air-conditioned quarters in the research wing which it has occupied since May 1956, the bacteriology laboratory was dedicated at that time in memory of Henry Whittier Porter, a former member of the Board of Managers. Now that the continued use and development of antibiotics have made the role of the bacteriologist more important than ever, the Porter Laboratory of Bacteriology continues to perform a vital service at the Infirmary.

Anita Mangiaracine,
Bacteriologist

Dr. LeRoy A. Schall, Chief of Otolaryngology, presided over the annual meeting of the American Academy of Ophthalmology and Otolaryngology, held in Chicago from October 12 to 17. Dr. Schall was elected president at last year's meeting of the Academy, which is the largest special society of its kind in the world, numbering over 6,500 certified ophthalmologists and otolaryngologists.

Dr. David D. Donaldson, Assistant in Ophthalmology, exhibited his stereoscopic photographs of corneal dystrophies and degenerations at the International Conference of Ophthalmology, held in Brussels early this fall.

Dr. Albert E. Sloane, Associate Surgeon in Ophthalmology, has returned from Israel, where he established a Low Visioned Clinic in the out-patient department at the Mayer De Rothschild Hadassah University Hospital in Jerusalem. Modeled on the clinic that Dr. Sloane set up at the Infirmary four years ago, this visual aid clinic is the first of its kind in Israel.

New addresses:—

Dr. Edwin C. Albright (*W.M.* 1942), University of Wisconsin Hospitals, Madison, Wis.
Dr. Betty Q. Banker (a.r.p. *N.P.* 1954), Children's Medical Center, Boston, Mass.
Dr. Richard M. Barry (a.r.p. 1957), 206 Pitshanger Lane, London W 5 (Ealing), England
Dr. Frederic M. Blodgett (*C.M.* 1946), Yale University School of Medicine, New Haven, Conn.
Dr. Roy L. Byrnes (a.r.p. *Path.* 1954), Clinical Laboratory, 679 S. Westlake Ave., Los Angeles, Calif.
Dr. George E. Donaghy (assoc. an. 1953), St. Francis Hospital, Columbus, Ga.
Dr. Hans J. Eberlein (fel. *An.* 1958), Chirurgische, Universitäts Klinik, 16 Marburg/Lahn, Germany
Dr. Albert J. Finck (a.r.p. *An.* 1949), Beth Israel Hospital, Boston 15, Mass.
Dr. Buford Hall (*M.* 1946), 40 S. Clay St., Hinsdale, Ill.
Dr. William J. James (r.s. *N.S.* 1949), 27 Live Oak Drive, Ventura, Calif.
Dr. Paul R. Johnson (*Path.* 1936), 85 Jefferson St., Hartford, Conn.
Dr. George Kaldor (res. fel. *M.* 1958), McArdle Laboratory, University of Wisconsin Medical School, Madison 6, Wis.
Dr. Richard N. Kleaveland (*S.* 1952), 407 W. Riverside, Spokane, Wash.
Dr. Louis Kunian (clin. a. *M.*), 23 Broad St., Lynn, Mass.
Dr. John B. Lloyd (*E.S.* 1944), Lemuel Shattuck Hospital, Boston, Mass.
Dr. Paul L. Norton (*Or.* 1933), 1180 Beacon St., Brookline, Mass.
Dr. Murray E. Pendleton (a.p. *C.M.*), Boston Lying-in Hospital, Boston 15, Mass.
Dr. Ihsan Sahinalp (res. fel. *N.S.* 1958), Maltepe Hale Sokak S/2, Ankara, Turkey
Dr. Germán C. Sánchez-Checa (clin. fel. *R.* 1957), Ave. Arica 360, San Miguel, Lima, Peru
Dr. Jesse E. Thompson (*E.S.* 1943), 1008 N. Washington Ave., Dallas 4, Tex.
Dr. Frederick S. Tomchik (r.p. *R.* 1955), Dept. of Radiology, Massachusetts General Hospital, Boston 14, Mass.
Dr. Curtis C. Tripp (*W.S.* 1923), 97 Madison St., New Bedford, Mass.
Dr. Theodore van Ravenswaay (a.r.p. *Path.* 1957), Apollolaan 72, Amsterdam Z, The Netherlands
Dr. Yang Wang (*M.* 1953), c/o Dr. H. B. Burchell, Mayo Clinic, Rochester, Minn.
Dr. Franz Wendlberger (clin. fel. *An.* 1958), Surgical Clinic, University of Munich, Nussbaumstrasse 20, Munich, Germany
Dr. Earle W. Wilkins, Jr. (*W.S.* 1945), Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.
Dr. John L. Wilson (*E.S.* 1940), Dept. of Surgery, Veterans Hospital, Fort Miley, San Francisco, Calif.
Dr. John B. Youmans (*E.M.* 1921), U.S. Army Medical Research and Development Command, Dept. of the Army, Main Navy Bldg., Washington 25, D. C.

Brief bits:—

Following the World Congress of Cardiology in Brussels, Drs. Walter Bauer and Edward F. Bland participated in a four-day symposium on rheumatic fever and rheumatic heart disease in London at the Postgraduate Medical School at Hammersmith and at the Rheumatic Fever Hospital in Taplow. This

No. 78 in a series of Staff photographs
Dr. J. Gordon Scannell, Associate Visiting Surgeon

symposium was organized by Professor John McMichael and by Dr. Eric Bywaters, a former research fellow with the Arthritis Unit at this Hospital. Among the participants was Dr. Xavier Robles-Gil of Mexico City, also a former research fellow at the M.G.H.

After attending the World Congress of Cardiology at Brussels, where Dr. Paul D. White officiated in September, and making a few visits to the exciting Exposition, Dr. and Mrs. James H. Currens motored through central Czechoslovakia and on to Poland, where they visited Krakow and Warsaw. Dr. Currens attended the Second Medical Clinic there and gave a lecture on "Pulseless disease". Professor D. Aleksondrow and his associates were most hospitable and were engaged in good clinical and investigative work. The Currenses visited the wife of Dr. Jan Nielubowicz in Warsaw, who is also a doctor. Dr. Jan has spent the last 10 months at the M.G.H. on the surgical service. Dr. and Mrs. Currens had an interesting return trip by car through Poznań, East Germany, and Berlin.

Golda M. Edinburg, Director of Psychiatric Social Work at McLean Hospital, has joined hundreds of social workers from all parts of the world at the Ninth International Conference of Social Work, being held in Tokyo, Japan, from November 30 to December 6.

Dr. Guy W. Leadbetter, Jr. (sr. r.s. *U.*) and Dr. Leonardo S. J. Martin (clin. and res. fel. *U.*) presented papers before the Fundamental Surgical Forum at the recent meeting of the American College of Surgeons.

Dr. Wyland F. Leadbetter is now President of the New England Section of the American Urological Association.

VOLUNTEER GROUPS

MGH Staff Wives Association

Tickets! Tickets! The Reception Center of the Staff Wives Association, located next to the General Store, has recently been appointed the agency through which entertainment tickets will be handled for the *professional* Hospital family. These tickets are donated by Staff members and friends of the Hospital, and are available free of charge to members of our professional group. The Staff Wives will be grateful to receive at the *earliest* possible date any tickets for the symphony, the theatre, the circus, etc., so that they may place them in the most deserving hands.

A bulletin board has been placed on the partition next to the General Store, which will announce the availability of tickets — particularly last-minute ones. Watch this board for announcements of Friday afternoon symphony concerts.

Starting on November 13, Mrs. Walter T. St. Goar began to conduct tours of the Hospital for those wishing this service. These tours leave at 2 P.M. every Thursday afternoon, from the Staff Wives Reception Center. With Mrs. St. Goar's knowledge of M.G.H.'s many facilities, her services as a guide will be of great assistance to our professional visitors.

Distaff Club

The fall issue of the *Distaff News* was published in October. Mrs. Milton S. Grossman was the editor. The issue included a calendar of events for the Club and news of various members.

On October 16, some of the Distaff members helped, in various capacities, with the commemoration of the anniversary of Ether Day.

November was a busy month, with two gatherings. On the 8th, Mr. Bill Baxter officiated as caller for the square dance held in the Moseley Rotunda. We all enjoyed the evening, which was heightened by an excellent entertainment of songs and guitar by Dr. Clarke Anderson. On the 20th, Mrs. Bruce J. Sams, Jr. was hostess for a meeting held in the Pent House. Mrs. DeVere Armstrong discussed holiday decorations and ideas and suggested the use of certain local shops and New England flora for carrying out these ideas. We all benefited a great deal from her helpful talk.

This letter from Dr. William P. Boger (a.r.p. 1942), written to Dr. Means, gives an account of a very active life. We have learned from an outside source that Dr. Boger is now Director of the Medical and Surgical Division, Department of Research Therapeutics, at the Norristown State Hospital in Pennsylvania.

> I have just received the invitation to the House Pupils Reunion and I am caught in a conflict of emotions. It goes without saying that I am always pleased to be identified with the Massachusetts General Hospital. At the moment, I am extremely regretful that I will not be able to be on hand, for I will be in Washington participating in a program of the Antibiotics Symposium. I am certain that it would be far more rewarding for me, personally, to be on hand to hear, particularly, the panel discussion of the function of the teaching hospital than it will be for me to present in Washington the modest scientific data that we have developed. Be assured that I shall take the earliest opportunity to pay a visit to M.G.H., to compensate in some measure for my absence at the reunion.
>
> Last spring I had the privilege of making a lecture trip around the world, and it was a real pleasure to unexpectedly encounter an HMS graduate in my audience in Hong Kong and to visit with John Wilson in Beirut. I was there at the time the rioting began and just got out in time.

THE MIXTER RADIOISOTOPE LABORATORY

Prior to the opening of the Mixter Radioisotope Laboratory in the Warren Building, the scanning of brain tumors with radioisotopes and the biological investigations related to this project had been carried out at a number of points within the Hospital. A small scanning room was located on White 11, where routine scanning was carried on, and many of the biological studies were carried out in the Physics Research Laboratory or on White 4. The new laboratories immensely improved our facilities for brain tumor scanning and for biological and medical research in these fields.

The positron scanning technique for localization of brain tumors was evolved some five years ago by cooperative effort between the Physics Research Laboratory and the Neurosurgical Service. Since that time the number of patients scanned has increased steadily to a point where one positron scanner is now used full time. In the summer of 1955 a paper based on some 700 scans was presented at the Geneva Conference on the Peaceful Uses of Atomic Energy. This paper related our clinical experience up to that time, and the accuracy of diagnosis among our scans of patients with brain tumors and with other neurological diseases. Since that time our tally of scans has risen to nearly 3,000, and the laboratory is struggling to maintain up-to-date clinical data on all scanned patients.

Until the fall of 1957 this scanning procedure was carried on under the direction of Miss Pauline Montgomery. Since that time Miss Ruth A. Collins has been in charge of patient scanning. The isotopes used in the scanning procedures are obtained either from the cyclotron at M.I.T. or from the cyclotron and reactor at Oak Ridge. The M.I.T. cyclotron targets are processed in the hot laboratory, and a sterile solution is prepared for injection of the patients. The Oak Ridge material is received from Abbott Laboratories in sterile form. Subsequent to the intravenous injection of the material, the scanning procedure commences after a period of approximately one hour. The scans take about 45 minutes to perform. In certain cases an AP scan is performed on the patients subsequent to the first lateral scan. In other cases the scans are repeated in 24 hours. The scans are then interpreted and the results placed in the patient's record, together with copies of the actual scan.

As our scanning load increased, it became obvious that compilation and correlation of clinical data on patients who have been scanned would become a full-time undertaking. Consequently, Miss Sara L. Emery joined our laboratory in 1958 to take on this task. Since then we have inaugurated a punch card system for recording data records, and have set up a standard protocol for collecting clinical information subsequent to the scanning procedure. Miss Emery, assisted by Drs. John A. Scholl and John Mealey, Jr., has succeeded in compiling data on scans up to January 1958. This information will soon be ready for correlation and processing. We are planning to use some machine techniques for this correlation.

The biological studies carried out in the Isotope Laboratory on the Mixter Floor deal primarily with positron emitters of interest for scanning. We have accumulated a large amount of data on As^{74}, Cu^{64}, and Rb^{86} distribution and turnover in humans, and papers on arsenic and copper have been accepted for publication. A paper on rubidium is now in preparation. During the past summer studies on copper compounds other than Cu^{64} versenate, routinely used for scanning, were performed. The study considered copper tartrate. Biological, animal studies, and scans in humans were performed with this material, comparing the results with those done with copper versenate. The study was carried on by Dr. Henry J. Powsner. During the summer we started preliminary studies of a third compound of copper—copper acetate. Dr. Mealey has been studying an isotope of zirconium obtained from the M.I.T. cyclotron. This element shows quite novel behavior in humans, and may be of use in certain scanning problems.

We are particularly interested in biological studies on an isotope of gallium—Ga^{62}. This isotope has a 68-minute half-life, but is the daughter of a 250-day parent—Ge^{62}. Techniques have been developed to separate the gallium from the germanium within a period of 10 minutes. Studies on this substance have been carried out on animals and humans. These studies were performed by Drs. John Mealey, Helen Gyftaki, and Mr. Harold B. Carter. Many of these studies have been performed with double tracer technique, and a beta and gamma well counter are located in the Radioisotope Unit for such measurements.

Another aspect of our work in the Radioisotope Laboratory is the development of scanning apparatus. Dr. Saul Aronow has been conducting investigation into the use of high-speed electronic circuits for scanning procedures. More recently we have been carrying out studies on a new concept of a scanner, called the positron camera. This device will not use mechanically moving parts but will involve large-area scintillators, multiple phototube, and complicated electronic circuitry to produce a scan. The final picture will appear on the face of a television tube. We believe that this technique, when developed, may offer considerably greater sensitivity and versatility than the present scanning devices.

Dr. Aronow has also been cooperating with others on the Mixter Floor in the use of an RF lesion generator which he has developed. This device has found considerable application both in research problems and in therapeutic applications.

In association with others on the Mixter Floor, we have been studying the physical problems concerned with neutron capture therapy. A paper on these physical aspects is to be presented at the Second International Conference on Peaceful Uses of Atomic Energy at Geneva this year. Collaborating with the reactor group at M.I.T., a medical facility has been designed and built. To study the energy spectra of neutrons at this facility, a crystal neutron spectrometer is being built and will be operating by the time the reactor is at full power. A further development has been the design of a semiconductor alpha-probe detector by Mr. James Mayer of Purdue. We plan to make extensive tests of these devices and use them in neutron capture therapy.

Mr. William H. Ellett and Mr. John R. Lyons have been collaborating with Drs. Derek S. Gordon and Albert H. Soloway on developing a technique for radiophotographic study of the distribution of boron compounds and radioisotopes in brain tissue. This type of study is essential in the determination of the precise cellular location of these compounds and the prediction of their therapeutic possibilities.

Gordon L. Brownell, Ph.D.,
Associate Physicist in Medicine

* * *

At the Annual Meeting of the Radiological Society of North America, held in Chicago the last week of November, Dr. Laurence L. Robbins was installed as president of the organization for the coming year.

* * *

Contributions to THE NEWS in the amount of $584.60, over and above the subscription fees, were received during the fiscal year 1957-1958. A note of appreciation is always sent to each contributor, but THE NEWS takes this opportunity to express publicly its thanks for such generosity from so many of its readers.

The Board of Trustees, at their meetings on November 7 and 21, voted:

To reappoint:

William H. Ellett, B.Sc. as Assistant Physicist (Medicine) for one year, beginning September 24, 1958.

To appoint:

Dr. Maurice J. Boivin as Assistant Resident in Anesthesia, beginning July 1;
Dr. Nancy L. Davis as Assistant Resident in Anesthesia for one year, beginning July 1;
Dr. William Franklin as Assistant Physician, effective January 1;
Dr. Milton R. Okun as Assistant Resident in Dermatology for one year, beginning July 1;
Hugh J. O'Rourke, D.S.C. as Assistant Podiatrist in the Orthopedic Department, effective November 1, 1958;
Dr. Richard L. Sallade as Assistant Resident in Urology, on affiliation, for a period of six months, beginning December 1, 1958;
Dr. Joyce K. Wong as Out-Patient Resident on the Children's Medical Service for one year, beginning July 1.

The Trustees also voted to confirm the invitation to Mr. Rodney Smith, Surgeon, St. George's Hospital, London, to give a Richardson Lecture at the Hospital on November 17, 1958.

At their meetings on November 12, 19, and 26, the General Executive Committee voted:

To promote:

Dr. Arthur K. Asbury to the position of Assistant Resident in Medicine for one year, beginning July 1;
Dr. Caesar Briefer, Jr. to the position of Assistant Resident in Medicine for one year, beginning July 1;
Dr. William T. Butler to the position of Assistant Resident in Medicine for one year, beginning July 1;
Dr. Myron A. Hofer, II, to the position of Assistant Resident in Medicine for one year, beginning July 1;
Dr. George A. Jacoby, Jr. to the position of Assistant Resident in Medicine for one year, beginning July 1;
Dr. Myron Lotz to the position of Assistant Resident in Medicine for one year, beginning July 1;
Dr. John T. Pollard, Jr. to the position of Resident in Radiology for one year, beginning January 1;
Dr. Robert H. Schapiro to the position of Assistant Resident in Medicine for one year, beginning July 1;
Dr. Robert T. Schimke to the position of Assistant Resident in Medicine for one year. beginning July 1;
Dr. Rodman D. Starke to the position of Assistant Resident in Medicine for one year, beginning July 1;
Dr. William E. Strole, Jr. to the position of Assistant Resident in Medicine for one year. beginning July 1;
Dr. Hibbard E. Williams to the position of Assistant Resident in Medicine for one year, beginning July 1.

To reappoint:

Dr. William Sharpe, Jr. as Clinical Fellow in Psychiatry for one year, beginning October 1, 1958.

To extend the appointment of:

Dr. Joan N. Angelo as Research Fellow in Neurology, from January 1 through June 30.

To appoint:

Dr. Utumporn Anekamaya as Graduate Student Assistant in Medicine, assigned to Cardiology, for a period of eight months, beginning October 1, 1958;
Dr. Arthur C. Cairns as Graduate Student Assistant in Medicine, assigned to Cardiology, for a period of seven months, beginning November 1, 1958;
Dr. Edgardo G. Carrasco as Clinical and Research Fellow in Medicine for one year, beginning December 15, 1958;
Dr. Thamboo J. Danaraj as Graduate Student Assistant in Medicine, assigned to Cardiology, for a period of eight months, beginning October 1, 1958;
Dr. Joseph H. Dimon, III, as Clinical Assistant in Orthopedic Surgery, for the period November 24, 1958 through April 30, 1959, with the privilege of assisting Dr. Aufranc in the care of his private patients. It was further voted to appoint him as Senior Resident in Orthopedic Surgery, for the period May 1 through December 31;
Edna M. Follensby, Ph.D. as Assistant Immunologist in the Department of Medicine for one year, beginning November 1, 1958;
Dr. Fraser J. Gagnon as Graduate Student Assistant in Medicine, assigned to Cardiology, for a period of eight months, beginning October 1, 1958;
Dr. Andrew G. Goesl as Graduate Student Assistant in Medicine, assigned to Cardiology, for a period of eight months, beginning October 1, 1958;
Dr. Leonard W. Jarcho as Research Fellow in Neurology, for the period November 1, 1958 through April 30, 1959;
Dr. Robert E. Kahn as Clinical and Research Fellow in Medicine for one year, beginning November 1, 1958;
Dr. Ronald J. Knudson as Graduate Student Assistant in Medicine, assigned to Cardiology, for a period of eight months, beginning October 1, 1958;
Dr. Augusto D. Litonjua as Clinical and Research Fellow in Medicine for one year, beginning November 18, 1958;
Dr. Gerald Ç. Matura as Graduate Student Assistant in Medicine, assigned to Cardiology, for a period of eight months, beginning October 1, 1958;
Dr. J. Gaston Mercier as Graduate Student Assistant in Medicine, assigned to Cardiology, for a period of eight months, beginning October 1, 1958;
Dr. Roger E. Monier as Research Fellow in Medicine, for the period November 1, 1958 through October 31, 1959;
Dr. Ernest H. Picard as Clinical and Research Fellow in Neurology for one year, beginning July 1;
Dr. Alexander Polak as Clinical and Research Fellow in Neurology for one year, beginning July 1;
Dr. Harvey H. Seiple as Graduate Student Assistant in Medicine, assigned to Cardiology, for a period of eight months, beginning October 1, 1958;
Dr. Pustika K. Sudjana as Graduate Student Assistant in Medicine, assigned to Cardiology, for a period of eight months, beginning October 1, 1958;
Dr. Oscar F. Tristan as Graduate Student Assistant in Medicine, assigned to Cardiology, for a period of eight months, beginning October 1, 1958.

To rescind the appointment of:

Dr. Alberto Miyara as Clinical Fellow in Medicine, since it is understood that the Board of Registration in Medicine allows limited registration for only one appointment and it is believed his registration now applies to the Jewish Memorial Hospital.

MASSACHUSETTS EYE & EAR INFIRMARY

At a meeting of the Executive Committee of the Massachusetts Eye and Ear Infirmary, held on November 24, 1958, the following appointments were made:

Mr. Hilmi Arslan—Research Associate, assigned to the Micro-Circulatory and Eaton-Peabody Laboratories;
Dr. Sergio L. Cunha—Fellow in Ophthalmology, assigned to the Retina Service;
Dr. Claes-Henrik Dohlman—Fellow in Ophthalmology, assigned to the Retina Service.

ALCOHOL AND THE CHRONIC ALCOHOLIC

Alcohol's role in social functioning dates back to antiquity. Birth, marriage, comradeship, victory, health, etc. have long been celebrated with alcohol. Certain cultures, like the Irish, consider its use for the release of tension as acceptable, while other cultures — orthodox Judaism and the Chinese — utilize it for ceremonial purposes, and forbid it as a release mechanism. For others, however, alcohol has become more than a means of making social and ceremonial adjustments. It has become a way of life. These are the alcohol addicts.

While there are many theories as to the etiology of alcoholism, most workers in the field consider it to be the symptom of underlying emotional problems. In this way the alcoholic is seen as developing a psychological dependence which, in time, with continued intake, is complicated by physiological habituation.

In 1952, with State funds, a clinic for the treatment of alcoholism was established at the Massachusetts General Hospital under the direction of the Department of Psychiatry. Its aim was to utilize long-term psychotherapy in the treatment of the alcoholic, and thereby to develop greater understanding of the mechanisms resulting in addiction. Some of our initial findings were reported to the American Psychiatric Association meetings in San Francisco, in May 1958. A compilation of our psychotherapeutic experiences with alcoholics for a five-year period is being prepared for publication.

While we are involved in the rehabilitation of the alcoholic by psychiatric techniques, the Department of Neurology has expressed its interest in alcoholism via its work on Korsakoff's syndrome, Wernicke's disease, cerebellar ataxia, etc., and the Medical Department has long studied and treated cirrhosis and malnutrition associated with chronic alcoholism. The Psychiatry Ward personnel has shown interest in withdrawal reactions and acute psychotic reactions related to addictive alcoholism. Of course, the Emergency Ward of the Hospital is the most active facility in our contact with the alcoholic, and we shall elaborate upon this later. These varied interests emphasize that a multidisciplinary approach is essential in the handling of the alcoholic problem.

Physicians are trained to fit patients into diagnostic "pigeonholes". There is a great tendency to classify alcoholics into a category which limits interest in them and discourages treatment programs. It is most important to evaluate each patient separately, to study the factors involved in the pathological use of alcohol, and to devise individualized therapeutic approaches.

Although there is no such thing as an alcoholic personality, certain common denominators exist in our population which are of interest in formulating an approach to the problem.

In the reactive alcoholic group, some drink to alleviate an uncomfortable feeling, like tension or depression. Others employ it as a method for overcoming phobic reactions, e.g., a lawyer drinking before a trial, or a man using alcohol so he can board a plane. Still others may use it to avoid responsibility for their actions, while others employ it to control their environment, e.g., a rejecting wife or mother who becomes attentive when the alcoholic is intoxicated.

For others, however, the drive toward alcoholism is even more serious, because drinking may not be associated with any external stress, and seemingly arises without rhyme or reason. For them one drink is too many, a million is not enough. Drinking involves a self-destructive element, which led Karl Menninger to label addictive alcoholism as "chronic suicide". By "self-destructive" it is meant that the addict will destroy his family, work, health, in order to drink. Once they start to drink, only sickness or stupor will end their quest.

These addicts constitute the most difficult category of alcoholism to treat. This is because psychologically their level of adapting to life is primitive, and alcohol becomes the main method of avoiding conflicts and achieving gratification. Due to the level of their personality development, the ability to form mature give-and-take relationships is precluded. The demands in the interpersonal relationships of alcoholics are similar to their attitudes toward alcohol, e.g., alcohol must gratify all needs and wishes, be available in inexhaustible supply, and be under constant control. Few people can tolerate for long the insatiable demands of such a relationship. The most frequent response to the expressed and implied demands of the alcoholic is rejection and the adoption of moralistic and punitive attitudes. These responses reactivate the rejected and depressed feelings prevalent in alcoholics, and result in their reversion to ethanol as their "only true friend", putting them out of reach of rehabilitative measures.

Because of the insatiable demands of the alcoholic as outlined above, it is our impression that the most appropriate locale for dealing with the alcoholic is a general hospital, employing a team setting. There are many reasons for this conclusion.

Anyone with a need for help must have motivation for seeking aid. Usually some event will precipitate this. Most commonly, with the alcoholic, it is the development of secondary complications and being too sick to drink that leads him to seek help. Therefore, directly or indirectly, the alcoholic is asking for treatment not only for the complications which have arisen, but ultimately for the underlying cause of these complications. This is in reality the first rehabilitative contact that may, if handled correctly, lead to a successful therapeutic relationship. However, since these patients have an intense need for punishment, they continually seek out and establish relationships of a punitive nature. It is important, therefore, to avoid playing along with this need and to remember that initial rejection is a continual hazard. Permitting the patient to be treated as a second-class citizen who waits around, handled gruffly or with little interest, is a major illustration of this. Merely pushing some medication at the patient and discharging him outright does not promote the establishment of a therapeutic relationship.

Of course, a busy hospital has multiple problems and the alcoholic constitutes only a fraction of the hospital population. Our group studied the alcoholic population of the Emergency Ward, and found that 200 alcoholics are admitted every 2½ months. Although the numbers are high, the emergency ward of a general hospital, with its specialized services, its diagnostic and therapeutic facilities, is an ideal locale in which to minister to the multiple needs of the alcoholic, and to establish a healthy first therapeutic contact. We hope, in the near future, to provide increased personnel in our Emergency Ward — workers with special interests in alcoholism — in order to handle some of the excessive demands imposed by the alcoholic. At the same time we shall put into practice our hypothetical formulations involving the first therapeutic contact.

Along with the Emergency Ward and General Hospital facilities, other team members are essential. The social worker is an all-important member. This worker is available to help with the financial, family, and social pressures which commonly arise to interfere with treatment. At our Clinic, the social worker usually makes the first contact at the intake interview and, therefore, her approach sets the tone of the Clinic for the patient. Frequently we are able to establish a helpful relationship with a patient because a devoted worker spends much time making brief daily visits to depressed and withdrawn patients on the wards. The social worker, in a number of instances provides the most meaningful contact to those patients whose problems require a satisfying relationship with a woman. Also, the worker serves another part of the program by seeing the mate while the patient is seen by a doctor.

A consulting psychologist is available for testing, to provide clues when certain therapeutic roadblocks are encountered. A consulting neurologist delineates any neurological complications that may be present, and utilizes them as a means of establishing a relationship in patients where "relationship therapy" is the treatment of choice. The Medical Clinic is routinely used for evaluation of the physical well-being of the patient prior to the onset of psychotherapy, and it is essential in delineating the physical complications which may interfere with psychiatric treatment.

While treatment is the first and foremost role of the Alcoholism Clinic, two other areas are essential.

The first of these is education. Since the general attitudes toward the alcoholic are moralistic and punitive, it is important that many of the misconceptions be corrected. The alcoholic is not a delinquent — he cannot "stop drinking if he would just want to" — he is an emotionally, and often physically, very ill individual. The adoption of attitudes toward the alcoholic which in the past were reserved for the mentally ill (the stigmatized vestiges of which remain, often to preclude the possibility of early treatment) does nothing toward promoting proper aid to the patients. For this reason our Clinic staff has been engaged in television and radio broadcasts, in cooperation with the office of the State Commissioner of Alcoholism. Lectures have been given to medical, psychiatric, social worker, rehabilitative, nursing, student, and lay groups who have shown an interest in alcoholism.

The monthly Alcoholism Clinic seminar held in our Department of Psychiatry has been directed toward the exchanging of ideas relating to different approaches to the problem, as well as to basic information concerning biochemical, physiological, neurological, and psychological responses. These seminars have now become a part of the training available to public health nurses and pastoral counselors, and are being further expanded. A most important educational advance is the rotation of residents in psychiatry through the Alcoholism Clinic. This is not primarily for experience in treatment, but for exposure through intake procedure to the alcoholic, in order to develop an understanding approach to the condition. We feel that this program is beneficial to the Clinic as well as to the resident, and it is hoped that in the future other services will rotate their personnel through the Clinic.

The other area of great importance to the Alcoholism Clinic involves research. We are a member clinic of the large research program being conducted by the Yale Center for Studies in Alcohol for evaluation of treatment results in alcoholism. In the future it will be necessary to test more formally the thesis of the importance of the initial therapeutic contact and its ultimate effect on long-term treatment, and also to study some of the basic physiological and biochemical effects of alcohol upon the alcoholic. Pilot studies involving radioactive magnesium levels, as well as psychological responses to experimental stress situations in the chronic alcoholic, were completed this year. A study of the marital status of alcoholics, in comparison with a matched group of patients from the Medical and Psychiatry Clinics, was published this past year. The results of the Emergency Ward admission study and the findings observed from the first five years of Clinic operation have been completed.

As our knowledge increases concerning the alcoholic population, it becomes apparent that in time we shall have to go out into the community to deal with and assess this problem more properly. This is because social and cultural factors play an important role in sustaining the alcoholic in his drinking, thereby interfering with attempts at treatment. Only by greater understanding of the family, social, work, and cultural factors can we hope to give the alcoholic the more total approach which now appears necessary.

The study of the community origins of our Emergency Ward alcoholic population is a step in such a direction.

One may well ask if all this effort is worth it. It is conservatively estimated that in the United States there are 5 million addictive alcoholics, 20 million problem drinkers, and that industry loses over one billion dollars a year as a consequence of alcoholism. In addition, it is impossible to measure the total effects of alcoholism upon family life and physical well-being All this is evidence enough that continued medical and community measures will be necessary to cope with this immense problem.

Morris E. Chafetz, M.D.,
Director of the Alcoholism Clinic

VOLUNTEER GROUPS

DISTAFF CLUB

Santa Claus made a special trip early this year, to be at the Distaff Club Christmas Party on December 10, in the Pent House. Thanks to Mrs. Dwight R. Robinson, hostess for the evening, everyone had a delightful time and felt very much in the Christmas mood. It was a gay start to the holiday season.

On December 18, Mrs. Scott Adler was hostess for the annual "gift wrapping" evening. These gifts were given to the employees' children at the Employees' Christmas Party on December 22. Distaff-ers assisted at the party.

The last event of the month was the Christmas Party for the Burnham patients, held on December 24. Distaff Club members helped at the party. The children, of course, loved seeing Santa Claus.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Anesthesia

Brewster, W. R., Jr., Isaacs, J. P., Osgood, P. R., Nylander, A. M., and Chock, R. Y. W.
The effect of thyroid hormones and temperature on the kinetics of contraction and relaxation of ventricular heart muscle.
Bull. Johns Hopkins Hosp. 103:157.

Hallowell, P., Murphy, J. T., and Mangiaracine, A. B.
Sterilization of ampuls with ethylene oxide.
Anesthesiology 19:665.

General Medicine

Henneman, P. H., Benedict, P. H., Forbes, A. P., and Dudley, H. R.
Idiopathic hypercalcuria.
New England J. Med. 259:802.

General Surgery

Grillo, H. C., and Nardi, G. L.
Perforation of the colon during enema into the colonic stoma.
Surg., Gynec. & Obst. 107:659.

McDermott, W. V., Jr.
The treatment of cirrhotic ascites by combined hepatic and portal decompression.
New England J. Med. 259:897.

Quinby, W. C., Jr., and McGovern, J. J.
Surgical correction of defective absorption of vitamin B_{12} in a child.
New England J. Med. 259:755.

Hematology

Freymann, J. G., Burrell, S. B., and Marler, E. A.
Role of hemolysis in anemia secondary to chronic lymphocytic leukemia and certain malignant lymphomas.
New England J. Med. 259:847.

Immunology

Waksman, B. H., and Matoltsy, M.
The effect of tuberculin on peritoneal exudate cells of sensitized guinea pigs in surviving cell culture.
J. Immunol. 81:220.

Waksman, B. H., and Matoltsy, M.
Quantitative study of local passive transfer of tuberculin sensitivity with peritoneal exudate cells in the guinea pig.
J. Immunol. 81:235.

Laboratory Science

Irwin, J. W.
The pulmonary microcirculation of living rabbits during passive anaphylaxis.
Anat. Rec. 130:474.

Scott, J. F., and Taft, E. B.
The conservation of ribonucleic acid by Ehrlich ascites tumor cells.
Biochim. et Biophys. Acta 28:45.

Taft, E. B., and Scott, J. F
Studies in histochemistry. II. Quantitative histochemical estimation of activities of alkaline and acid phosphomonoesterases.
J. Histochem. & Cytochem. 6:340.

Taft, E. B., and Scott, J. F.
Studies in histochemistry. III. Effect of fixation and paraffin embedding on the activity of alkaline and acid phosphomonoesterases.
Lab. Invest. 7:505.

Weille, F. L., Irwin, J. W., Jako, G., Holschuh, L. L., Weille, A. S., Stanley, C. A., and Rappaport, M. B.
Pressures of the labyrinthine fluids.
Ann. Otol., Rhin. & Laryng. 67:858.

Neurosurgery

White, J. C.
Choice of surgical procedures for relief of pain in incurable diseases of chest and abdomen.
In Surgical Clin. North America, vol. 38, no. 5, pp. 1373-1392.

Nursing

Sleeper, R.
What's right with diploma schools of nursing—a reaffirmation of belief.
Hospitals 32:32.

Oral Medicine

Trieger, N., and Stoeckle, J. D.
Stomatitis and pancytopenia associated with thymoma.
Oral Surg., Oral Med., & Oral Path. 11:1229.

Otolaryngology

Kelemen, G.
Toxoplasmosis and congenital deafness.
A.M.A. Arch. Otolaryng. 68:547.

Physical Medicine

Watkins, A. L.
Medical progress: An evaluation of electrodiagnostic testing.
New England J. Med. 259:868.

Physiology

Malt, R. A., Cassells, J. S., and Smith, D. D.
Effect of Valsalva maneuver on circulation time.
J. App. Physiol. 13:303.

Radiology

McConnell, F., Hanelin, J., and Robbins, L. L.
Plain film diagnosis of fulminating ulcerative colitis.
Radiology 71:674.

Schatzki, S. C., and Blade, W. R.
Emergency X-ray examination in the diagnosis of severe upper gastrointestinal bleeding.
New England J. Med. 259:910.

Reconstructive Surgery

Cannon, B.
Presidential address.
Plast. & Reconstruct. Surg. 22:287.

Brief bits:—

Dr. Benjamin Castleman recently returned from Geneva, Switzerland, where he was the United States member at a Conference of the World Health Organization which met to discuss the introduction of preventive medicine into the teaching of pathology. The other panel members were Professors George Payling Wright of Great Britain, Colip of Canada, Hamperl of West Germany, Favilli of Italy, Yoshida of Japan, Cooray of Ceylon, and Avtsyn of the Soviet Union. Dr. Castleman (in collaboration with Dr. Samuel H. Rosen of the Armed Forces Institute of Pathology, and Dr. Averill A. Liebow, Professor of Pathology at Yale University Medical School) has won the second award—the Silver Medal—for their exhibit "Pulmonary alveolar proteinosis—A new entity" at the recent meeting of the American Roentgen Ray Society in Washington, D.C.

Dr. Champ Lyons (*W.S.* 1933) has been elected chairman of the Board of Regents of the National Library of Medicine. Dr. Lyons has been a regent since 1956.

Dr. John W. Raker, by invitation, addressed the Kansas City Surgical Society on November 19. His topic was "Experiences gained in the study of civilian disasters". At this same meeting Dr. Raker was elected an honorary member of the Kansas City Surgical Society.

New addresses:—

Dr. Richard F. Bedell (*C.M.* 1958), New York Hospital, 525 E. 68th St., New York 21, N. Y.

Dr. Madelaine R. Brown (n.), Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.

Dr. Norman K. Brown (*M.* 1957), Walter Reed Army Institute of Research, Walter Reed Army Medical Center, Washington 12, D.C.

Dr. William N. Christenson (*M.* 1949), Cornell Medical Center, New York Hospital, 525 E. 68th St., New York 21, N. Y.

Dr. Harvey S. Collins (*M.* 1944), 131 E. 15th St., New York, N. Y.

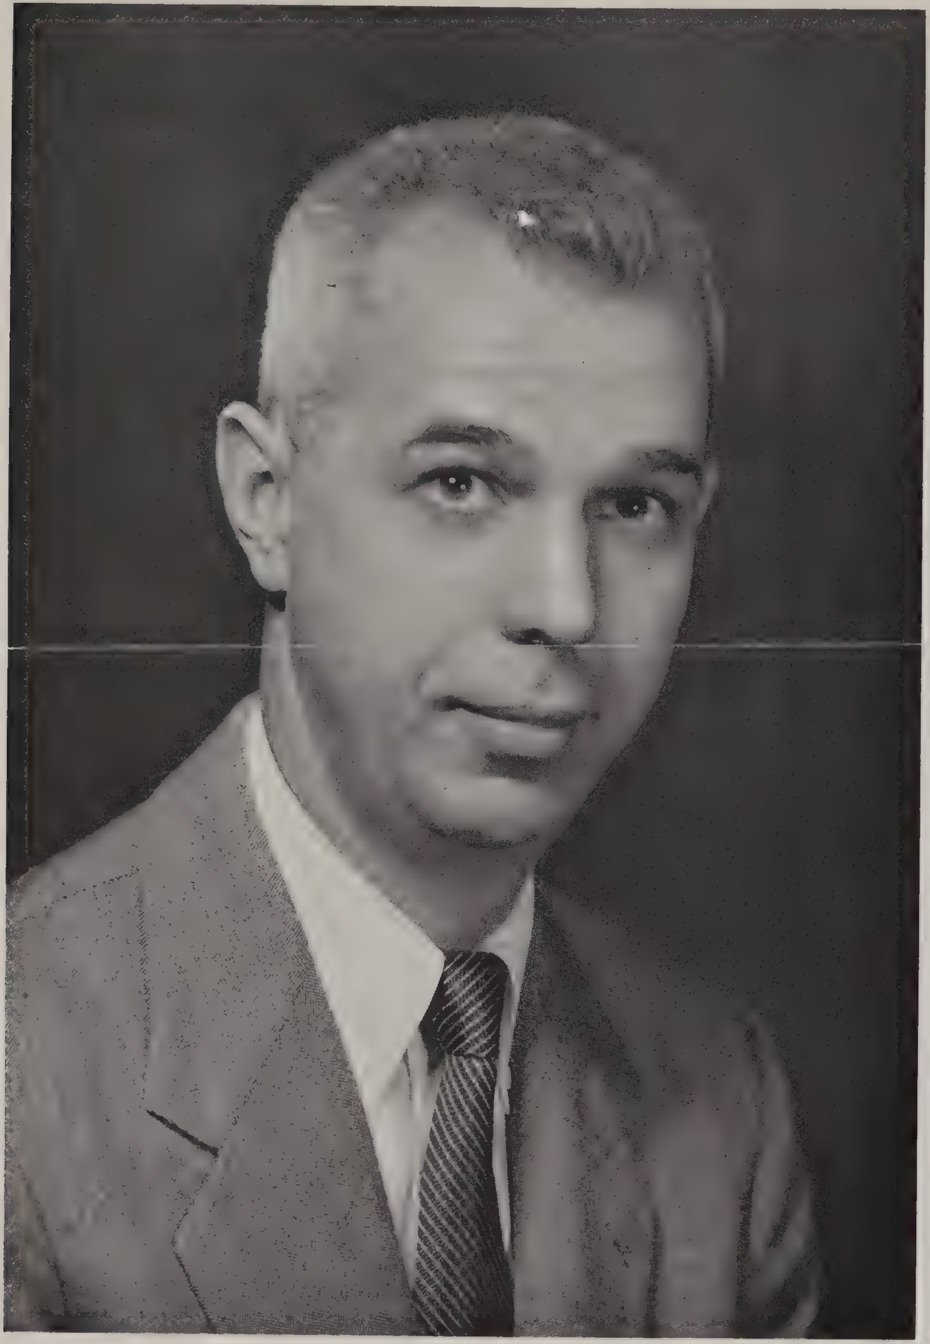
Dr. Richard Collins (*E.S.* 1933), 202 W. Glendale Ave., Alexandria, Va.

Dr. James J. Ferguson, Jr. (*M.* 1951), 507 Bryn Mawr Ave., Swarthmore, Pa

Dr. Chester N. Frazier (c. *D.* 1958), 154 Hamilton Rd., Chapel Hill, N. C.

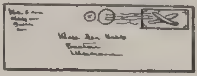
Dr. Harold M. Frost (*W.S.* 1915), Friendship, Maine

Dr. Richard W. Greene (*M.* 1945), 713 E. Genesee St., Syracuse 2, N. Y.



No. 79 in a series of Staff photographs
Dr. Gordon L. Brownell, Associate Physicist (Medicine)

Dr. John B. Griggs (*C.M.* 1929), 650 Farmington Ave., Hartford, Conn.
Dr. John E. Harty (r.p. *Psychiat.* (*McL.*) 1939), 101 N. Main St., Waterbury 2, Conn.
Dr. Milton E. Helman (a.d.), 1874 Beacon St., Brookline 46. Mass.
Dr. Helmut F. Hofmann (clin. & res. fel. *N.S.*), 603 High St., Westwood, Mass.
Dr. Elliott P. Joslin (*W.M.* 1895), 15 Joslin Rd., Boston, Mass.
Dr. Richard B. Kearsley (*C.M.* 1954), Main St., Norwell, Mass.
Dr. Glenn A. Langer (*M.* 1955), Columbia-Presbyterian Medical Center, 622 W. 168th St., New York 32, N. Y
Dr. J. Thaddeus Monroe, Jr. (*M.* 1956), North Carolina Memorial Hospital, Chapel Hill, N. C.
Dr. Huerta C. Neals (gr. stud. a. *M.* 1958), 130 Atlantic St., Jersey City 4, N. J.
Lt. Ernest H. Picard, MC, USAR (a.r.p. *N.* 1957), Annex IV, Brooke Army Hospital, Fort Sam Houston, Tex.
Dr. Francis D. Pierce (r.p. *W.M.* 1931), 619 E. Broward Blvd., Fort Lauderdale, Fla.
Dr. Helen S. Pittman (assoc. p.), Warren Bldg., Massachusetts General Hospital, Boston 14. Mass.
Dr. Desire J. A. Rebello (a.r.p. *D.* 1954), Skin and Cancer Hospital of Philadelphia, 804 Pine St., Philadelphia 7, Pa.
Dr. Thomas Rutter (*E.S.* 1946), 832 E. Main St., Medford, Oreg.
Capt. Allan I. Sandler, MC, USAF (*M.* 1956), 4050 USAF Hospital, Westover AFB, Mass.
Dr. Edward W. Shannon (r.s. *N.S.* 1944), 930 Hanna Bldg., Cleveland 15, Ohio
Dr. Milton V. Veldee (*E.M.* 1920), 1855 Bay Laurel Drive, Menlo Park, Calif.
Dr. Jerome Waldman (a.r.s. *Or.* 1949), 1893 Sheridan Rd., Highland Park, Ill.; 215 W. Water St., Waukegan, Ill.



This most interesting letter has come from Dr. Zvi Laron (r.p. *C.M.* 1955), written from the Beilinson Hospital in Petah Tiqva, Israel:

I am extremely happy to receive The News and so it seems to me as if I am very close to the M.G.H. to which I got accustomed so much. It not only informs me of your newer hospital activities, but also brings me news about many people dear to me, about whom I would otherwise not hear.

Returning home after a three-year absence I found many things changed. The fast increasing population demanded big construction projects and there were many sections completely new to me. So, also, was the hospital I joined, which has 750 beds, of which 75-80 are pediatric ones, besides a newborn station. This is one of the hospitals of the Federation of Labor—the medical insurance which covers more than half the population. We have all the services, including heart surgery, and neurosurgery, and very modern laboratory facilities. The hospital also houses the Rogoff Institute for Medical Research and an Isotope Unit. In our research we are collaborating with the University Medical School in Jerusalem, the Weizmann Institute of Science in Rehovoth, and the Biological Research Station in Nes Ziona.

Our hospital is a non-teaching hospital but is approved for internships and residencies. It also has a Nursing School. It serves a very big population. To give you an example: with 75 beds capacity, the Pediatric Service has about 2000 admissions a year. There are also follow-up clinics, such as tumor clinic, thyroid clinic, adult endocrinology, pediatric endocrinology and metabolism, neurology, dermatology, etc. All the patients are referred from the regional out-patient clinics of the previously mentioned insurance system. Compared with the turnover of patients, our hospital is understaffed because of budgetary reasons. On the other hand, we have many physicians per head of population: 4600 for 2 millions. Nevertheless, most of the doctors are concentrated in the big cities. Last year there was an immigration of 400 physicians from Egypt, Hungary, and Poland, most of whom are already settled here.

The big problems our medicine faces are increased demands for beds and special institutions for convalescence, the mentally retarded, etc. Happily, many institutions for TBC are closing from lack of patients. Also, polio has been reduced markedly since vaccination started last year. Education and sanitary measures have greatly reduced infectious diseases, but still much remains to be done, especially in the field of gastrointestinal infections in infancy. The infant mortality rate is now 32 per 1000 live births.

Personally, I am trying to establish a pediatric metabolic service and to make use of the knowledge I acquired in the United States, especially at the Children's Service of the M.G.H.

Because of the big immigration (tripling of the population in 10 years) our country has many specific problems, a few of which I have briefly mentioned. As one humorist put it, "Israel is a country so small you cannot write its name on a map, and a country where the children teach their parents their national language and sometimes hygiene, too."

Dr. Means received this letter from Dr. William N. Christenson (*M.* 1949) last October:

I certainly wish I could attend the House Pupils Reunion at the M.G.H., but unfortunately I am unable to get away at that time. My reply is terribly delayed, due to my failure to keep the M.G.H. informed of my address change, hence the invitation traveled to London and back before it reached me. [Another illustration of why we are unable to keep the Directory section of our *Annual Report* up to date. —— *Editor*]

My present address has reverted to the New York Hospital, as I returned here two years ago to work in M. Harold Wolff's Human Ecology Study Program. I don't know whether I am a confirmed New Yorker as yet, but I am most happy working in a group which allows me to participate in studies of people, their personalities, and adaptive patterns in relation to their susceptibility to illness. As part of our program, I am trying to develop an immuno-hematology laboratory in which I can follow up some lines of interest stemming from work which I did on cold agglutinins several years ago.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 183 Boston, Mass. February 1959

A PURCHASING DEPARTMENT ACTIVITY

HOSPITAL PURCHASING CORPORATION

An interesting facet of the activity of the Massachusetts General Hospital Purchasing Department is its participation in the Hospital Purchasing Corporation of Boston, Inc., a unique Red Feather supported group-purchasing endeavor, with offices at 25 Huntington Avenue.

Hospital Purchasing Corporation came into being as a result of a belief widely held in the community that proved industrial buying techniques could be profitably employed by hospitals in the battle against constantly rising costs. Under the distinguished leadership of Mr. Robert Cutler of Peter Bent Brigham Hospital, the corporation was formally organized in May 1952 by trustee-appointed representatives of ten Greater Boston hospitals, including Mr. George S. Weld, Secretary and Assistant Treasurer of the Massachusetts General Hospital.

In spite of the enthusiasm at the trustee level, Hospital Purchasing Corporation experienced several difficult years before starting to take root in the community. Hospital personnel generally mistrusted the effort, vendors feared it, and, in turn, Hospital Purchasing Corporation management at times demonstrated a remarkable lack of understanding of its place in the hospital procurement picture. Hard work and enlightened leadership by administrators such as Mr. Henry J. Murphy, Assistant Director of Massachusetts General, carried HPC through this first period, although these difficulties continue to plague the organization.

Enthusiasm for the Hospital Purchasing Corporation activity now comes from all segments of the community. It is one of the regional projects of the Hospital Council of Greater Boston; financial aid and administrative support continue to come from the Red Feather-United Community Fund in spite of sporadic merchant opposition; Mr. J. Reed Morss, President of the Hospital Council of Metropolitan Boston, directed a letter to the hospitals in the area urging maximum utilization of the facility; third party agencies support it as an ally in the battle against rising rates; the general public's interest, an extension of its concern with the cost of hospitalization, was manifested in the *Boston Herald* editorial, "Tender efficiency", published May 17, 1958; and support from the medical community was manifested in the February 1958 issue of the *Massachusetts Physician.*

What is unique about Hospital Purchasing Corporation is the fact that it is essentially a committee-type operation. The board of directors has a membership drawn from hospital administration and the general public. Mr. Frederick D. Foster, Assistant Director of Massachusetts General Hospital, serves on this committee and as vice-president. At the heart of the organization is the Standardization and Purchasing Committee, made up of purchasing agents from member hospitals. This group, which includes Mr. Joseph F. Hill, Jr. of Massachusetts General Hospital, is charged with final responsibility for all contracts and price offers which are negotiated for the membership. This committee is supported in its work of standardization by product committees of dietitians, maintenance engineers, and pharmacists, which set specifications and explore the suitability of items for group purchase. Expert advice is called upon and professional testing facilities are retained wherever it is deemed necessary. These committees are serviced and coordinated by a small office staff composed of a manager, assistant manager, and two clerks.

The value of HPC to the Greater Boston hospital community extends far beyond the dollars and cents savings in the products which it purchases. Of far greater importance is the fact that through this facility — for the first time —hospital representatives meet to exchange ideas and discuss problems with a view to finding the product or products which will contribute most effectively to patient care. The development of this technique was accompanied, of necessity, by a limiting of personal purchasing prerogatives to those deemed justifiable because of good judgment. Over the years, however, even this severe limitation has come to be accepted. By transferring purchasing from a personal preference basis to one of carefully reasoned choice, and by creating a set of circumstances wherein an individual's ideas were reviewed and either approved or disapproved by his professional peers, Hospital Purchasing Corporation made a substantial contribution to better hospital administration. Much of the credit for the development of this phase of HPC must go to Mr. Foster. Obviously, as the use of this technique spread, it became a major weapon against the hospitals' mistrust mentioned above. Other, older, group purchasing organizations have watched the growth of this new approach to group purchasing with considerable interest and there are indications that it will set the pattern for future development.

For several years, Massachusetts General Hospital has used a patient gown which was developed in one of the early HPC projects. The democratic character of Hospital Purchasing Corporation was evolved during the gown project which was undertaken at the request of the membership because of general dissatisfaction with the commercial gowns which were available.

In developing the gown, product committees of housekeepers, laundry managers, and nursing personnel were called upon to aid in drawing up specifications, in order that features which the majority felt were most desirable might be incorporated. The next step was to call in five leading hospital garment manufacturers and ask them to criticize the hospital specifications from the standpoint of practical manufacturing methods and to tell of their experience with this item. Considerable discussion and numerous suggestions ensued; divergent views on style, material, and other features had to be weighed and reconciled before a specification could be finalized. In the process a number of sample gowns were made up, illustrating features which were being considered. When finally completed, the draft of the specification was given to Professor Frederick of the Lowell Textile Institute Research Council for a last evaluation and, when approved by him, was accepted as a basis for calling for bids. The time and care which went into this specification has been more than paid for in the satisfaction of the users of the gown. Not only are hospitals pleased with the gown and are reordering it, but it is also being paid the supreme compliment by other gown manufacturers who are copying its features. For the past two years, the gown has been manufactured for Hospital Purchasing Corporation, on a low bid basis, by Altro Workshops — a non-profit corporation employing the handicapped in New York City.

One of Hospital Purchasing Corporation's most difficult problems — and one at which it has worked most diligently —has been that of acquiring good public relations. As a matter of policy, the group is dedicated to purchasing from local suppliers whenever this procedure does not militate against the best interests of the patient. Yet, at times, fear, mistrust, or personal philosophy has caused local suppliers to refuse to sell to the hospitals as a group. In many instances this antipathy has been overcome and a healthy local situation exists; in other instances, the barrier must still subside. In retrospect, it is quite clear that if it were not for the fundamental soundness of group procurement and strong public interest in the success of HPC, attacks by trade groups and their threats to withhold contributions to the Red Feather-United Fund drive could well have brought about a decline in the organization's activity. The hospitals are confident, however, that time and understanding will bring a spirit of friendly cooperation to its relations with all local trade groups.

Once standardization has been achieved, the approach to a contract calls for a study of the problems and costs involved in the manufacture and distribution of a given item. The intent is to use this information for writing a contract which is economically sound — that is, one which accrues savings to the member hospitals and still provides the contractor with a profit which he considers satisfactory. A major goal is the elimination of unnecessary costs in the process of bringing the item from the manufacturer to the consumer. The member hospitals, themselves, have been the greatest obstacle to the reduction of these costs. Even a superficial survey of the structure of firms which service hospitals and the relationships of salesmen to the hospitals which they service, reveals that empires have been built and are being built upon the general belief in the permanence of hospitals' chronic inability to plan. Far from being apologetic about their unnecessary and unreasonable demands, hospitals have generally come to consider this de luxe service as one of their birthrights.

During the negotiation of a contract, Hospital Purchasing Corporation has invariably been able to identify to its membership the costs (and potential savings) inherent in their present mode of doing business, and has attempted to persuade the institution that it should try to conduct its business in a more responsible manner. Like many others who are concerned with the welfare of hospitals, HPC looks to improved planning as a key to a better control over costs.

One of the features of the past year at HPC has been the activity of the Food Committee in development of contracts for 32 items with a dollar value of $139,827.45. Actually, this program has been an extension of the traditional MGH food contracting procedure, and the success which it enjoyed is due almost exclusively to the trail-breaking efforts of Miss Louise Hatch, Director of the Dietary Department, and Mr. John J. Norton, Assistant Purchasing Agent, of Massachusetts General Hospital. At one time or another, they have had to contend with and overcome all of the problems discussed above. An interesting feature of the food program is the fact that, in addition to using wholesalers, HPC has acquired the services of a food broker. This man's interest in the food program has brought about a remarkably pleasant change in the attitude of a number of wholesalers and therefore has made him doubly welcome. The food buying program has progressed so well that it is planned to add a food buyer to the HPC staff during the coming year.

A monumental event during 1958 saw Harvard University and Hospital Purchasing Corporation join hands in the negotiation of a fuel oil contract and successfully conclude a long-term arrangement with a prominent Boston oil company at a never-before-achieved discount from the Boston tank car price. The specifications for the oil and the manner of testing were worked out by the Maintenance Committee of HPC. Mr. Joseph W. Degen, Assistant Director, and Mr. John H. Dobbins, Assistant Purchasing Agent, of M.G.H. have been working closely with this group.

Of interest, too, is the fact that the Maintenance Committee of Hospital Purchasing Corporation made it possible for HPC to place contracts for both lumber and electrical supplies. The manner in which problems of quality, manufacture, supply, and price were worked out reflects great credit to the organization.

Although the Pharmacy Committee of HPC is just beginning its work with Mr. John W. Webb, Assistant Pharmacist-in-Chief, representing M.G.H., Dr. John T. Murphy, Pharmacist-in-Chief, has for some time been working with HPC as a valued consultant.

While the hospitals in Boston work to improve and extend their group procurement facility, similar activity is taking place in many other centers across the nation. In addition, plans are under way for the formation of a national group procurement organization which could begin functioning within the year. This national group would pursue contracts with manufacturers for appropriate items, attempting to find savings in the manufacturing which could be passed on to the hospitals.

Hospital Purchasing Corporation is fortunate to have Mr. Parker D. Perry as its manager. Mr. Perry has spent many years in hospital service industries. The assistant manager of HPC is Mr. Geoffry Jackson, who has been known to Massachusetts General Hospital personnel from the time of his administrative residency here. These men have played an important role in the continuing growth and acceptance of HPC. The volume of purchases has grown from an initial $195,800 to a 1958 figure of $1,268,622.

Joseph F. Hill, Jr., Ph.D.,
Director of Purchases

The Board of Trustees, at their meetings on December 5, 19, and 31, voted:

To accept with regret the resignation of Dr. Thorkild Waino-Andersen from the position of Associate Anesthetist.

To promote:

Dr. Roy E. Mabrey from the position of Clinical Associate in Surgery to that of Assistant Surgeon.

To appoint:

Dr. Joseph Albert as Assistant Resident in Dermatology for one year, beginning July 1;
Dr. Theodore C. Barton as Third Assistant Resident in Surgery, beginning July 1;
Dr. James R. Callison as Third Assistant Resident in Surgery, beginning July 1;
Dr. Monroe Cole as Assistant Resident in Neurology for one year, beginning July 1;
Dr. Noble J. David as Clinical Fellow in Neurology, to act as Assistant Resident in Neurology, for a term of six months, beginning January 1;
Dr. Pierre M. Dreyfus as Assistant Attending Neurologist at McLean Hospital, beginning July 1, 1958;
Dr. Robert G. Frost as Assistant Resident in Anesthesia, beginning September 1;
Dr. Jacqueline Gauthier as Assistant in Psychiatry at McLean Hospital, beginning July 1;
Louisa P. Howe, Ph.D. as Assistant Sociologist, beginning January 1;
Dr. Richard T. Johnson as Assistant Resident in Neurology for one year, beginning July 1;
Dr. Arnold M. Katz as Assistant Resident in Medicine for one year, beginning July 1;
Dr. John H. Knowles as Assistant in Medicine, beginning January 1;
Dr. Glenn A. Langer as Resident in Medicine for one year, beginning July 1;
Dr. Donald B. Lathrop as Exchange Assistant Resident on the Children's Medical Service, for the term December 12, 1958 through January 21, 1959;
Dr. William J. McIlroy as Assistant Resident in Pathology, assigned to Neuropathology, for one year, beginning July 1;
Dr. Alexander M. McPhedran as Clinical Fellow in Neurology, to carry on the duties of Assistant Resident, for one year, beginning July 1;
Dr. Harry S. Olin as Resident in Psychiatry at McLean Hospital, beginning July 1;
Dr. Clement E. Papazian as Assistant Resident on the Children's Medical Service for one year, beginning July 15;
Dr. Alphonse M. Prus as Assistant Resident in Anesthesia, beginning July 1;
Dr. Mitchell T. Rabkin as Resident in Medicine for one year, beginning July 1;
Dr. Claus W. Reichle as Assistant in Anesthesia, beginning January 1;
Dr. Ellis L. Rolett as Resident in Medicine for one year, beginning July 1;
Dr. Richard L. Sidman as Assistant in Neurology, beginning January 1;
Dr. Merrill K. Wolf as Assistant Resident in Neurology for one year, beginning July 1.

The Trustees also voted:

That Dr. Geoffrey Bourne of Emory University, Atlanta, Georgia, be invited to give a lecture at the Hospital on December 15, 1958;
To grant Mary A. B. Brazier, Ph.D. leave of absence for the months of February and March;
That the promotion of Dr. Yosh Maruyama to the position of Second Assistant Resident in Radiology become effective January 1 rather than April 1.

At their meetings on November 26 and during December, the General Executive Committee voted:

To accept the resignation of Dr. C. Bremner Cameron from the position of Clinical and Research Fellow in Medicine, effective December 12, 1958, because of his returning to England.

To promote:

Dr. W. Gerald Austen to the position of First Assistant Resident in Surgery, beginning January 1;
Dr. Edwin L. Carter to the position of First Assistant Resident in Surgery, beginning January 1;
Dr. Roman W. DeSanctis to the position of Resident in Medicine for one year, beginning October 1;
Dr. John E. Mazuzan, Jr. to the position of Chief Resident in Anesthesia, beginning January 1;
Dr. Jens G. Rosenkrantz to the position of First Assistant Resident in Surgery, beginning January 1.

To reappoint:

Dr. John Denovian as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning December 1, 1958;

Dr. Josip Matovinovic as Clinical and Research Fellow in Medicine for one year, beginning December 12, 1958;
Dr. Hugo M. Palazzi as Clinical and Research Fellow in Surgery for one year, beginning January 1;
Dr. Maurice M. Pechet as Clinical and Research Fellow in Medicine for one year, beginning October 1, 1958.

To appoint:

Dr. Gianfranco Dal Santo as Clinical Fellow in Anesthesia, effective upon his arrival in this country;
Dr. James C. DeWitt as Clinical Fellow in Anesthesia, part time, effective immediately;
Dr. G. Richard Dickersin as Clinical Assistant in Pathology, beginning January 1;
Dr. Robert S. Harper as Clinical Fellow in Pathology, for a period of six months, beginning January 1;
Dr. Stefan Kozminski as Clinical and Research Fellow in Surgery for one year, beginning November 1, 1958;
Dr. Annick Lazorthes as Clinical and Research Fellow in Surgery for one year, beginning December 9, 1958;
Dr. Richard C. Packert as Clinical Fellow in Radiology, for the period January 1 through March 31;
Dr. Gilberto Rebouças as Clinical Fellow in Medicine for one year, beginning December 1, 1958;
Dr. Margaret A. Single as Clinical and Research Fellow on the Children's Medical Service for one year, beginning January 1;
Dr. Robert C. Spagnoli as Clinical Fellow in Radiology for one year, beginning July 1;
Dr. Albrecht Struppler as Research Fellow in Neurology, for a period of six months, beginning January 1;
Dr. Hirsh Sulkowitch as Research Fellow in Chemistry, assigned to Urology, for one year, beginning January 1.

A General Executive Committee vote of July 16, 1958, which failed to reach the office of THE NEWS until recently, is that of Dr. Edmund Klein, who was appointed Assistant Resident in Dermatology for one year, beginning September 1, 1958.

* * *

A Distinguished Achievement Award for "significant contributions to human health and welfare" has been made to Dr. Henry K. Beecher. Announcement of the award was made by the board of medical editors of *Modern Medicine*, a publication which annually makes the award. To quote from a news release from *Modern Medicine*:

> Dr. Beecher and nine other leaders of American medicine who were similarly honored were chosen from hundreds of medical researchers, teachers, and clinicians nominated by deans of medical schools and readers of the journal.
>
> Dr. Beecher's contributions to the effectiveness and safety of anesthetic and pain-relieving agents were cited in his award for "Zeal in improving methods of anesthesia and development of means for critical evaluation of new analgesic and anesthetic agents."
>
> As Henry Isaiah Dorr professor of research in anesthesia, Dr. Beecher holds the oldest endowed chair of anesthesia in the world. His is the first full-time laboratory of research in anesthesia. He also has been a consultant to the surgeons general of the army, navy, air force, and public health service.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Biological Chemistry

Fekete, L. L., Lever, W. F., and Klein, E.
Inhibition of lipemia clearing activity by human white blood cell and platelet components.
J. Lab. & Clin. Med. 52:680, 1958.

General Medicine

Katz, A. M., and Pan, C. T.
Echinococcus disease in the United States.
Am. J. Med. 25:759, 1958.

Laboratory Science

Earle, D. P., Hutt, M. P., Schmid, K., and Gitlin, D.
A unique human serum albumin transmitted genetically.
Tr. A. Am. Phys. 71:69, 1958.

Neurology

Schwab, R. S.
A simple device for measuring the visual motor reaction time.
Neurol. 8:719, 1958.

Schwab, R. S., and England, A. C., Jr.
Medical and surgical therapy in Parkinson's disease.
In Pathogenesis and treatment of Parkinsonism, compiled and edited by William S. Fields, Springfield, Ill., Charles C. Thomas, chap. 8, 1958.

Schwab, R. S., and England, A. C.
Parkinson's disease.
J. Chron. Dis. 8:488, 1958.

Ophthalmology

Leahey, B. D.
Penetrating keratoplasty: Observations based on a series of 148 cases, with special emphasis on techniques of graft fixation.
Am. J. Ophth. 46:541, 1958.

Otolaryngology

Kelemen, G.
Peristapedial pathology and otitic reinfection.
A.M.A. Arch. Otolaryng. 68:683, 1958.

Kelemen, G.
Physiology of phonation in primates.
Logos 1:32, 1958.

Vallesi, R. N.
L'orecchio nell'idrocefalo congenito.
Boll. d. mal. d. orecchio, d. gola., d. naso 76:465, 1958.

Physiology

Griesemer, R. D., Blank, I. H., and Gould, E.
The penetration of an anticholinesterase agent (sarin) into skin. III. A method for studying the rate of penetration into the skin of the living rabbit.
J. Invest. Dermat. 31:255, 1958.

Psychiatry

Blom, G. E.
The reactions of hospitalized children to illness.
Pediat. 22:590, 1958.

The next issue of THE NEWS will be the last one in which 1958 titles will appear.

THE RECENT LOWELL LECTURES AT THE MASSACHUSETTS GENERAL HOSPITAL

ON DISEASE AND THE ADVANCEMENT OF BASIC SCIENCE

The series of lectures recently presented here grew out of my term as Chairman of the Committee on Research at the Massachusetts General Hospital. The obligations entailed in that post led to a fresh look at the Hospital and other such hospitals in general. Two very different and little explored areas seemed to need examination. The first of these has been discussed in a long and rather tedious review, "Experimentation in man", an area too little considered, or so it seemed to me, in terms of the proper degrees of freedom involved, and the necessary ethical and moral limitations required of the responsible investigator. Consideration of the second area led to this series of lectures.

* * *

There is not much point in arguing whether there are such things as basic and applied science. One can, as many have done, take the view that there is merely good science and bad science. But there is such a thing as science where the principal interest is in concept, with the discovery and establishment of new scientific concept. This is, probably, basic science at its best. And then there is the application of such concepts, applied science, whether it occurs in a university laboratory of biochemistry or on a hospital ward. The series of Lowell Lectures just concluded was based upon the thesis that some kinds of fundamental advances can be made only in the sick room, in the presence of disease, in the hospital. Recognition of this fact marks a milestone in the development of the university hospital. I do not believe it is overly nationalistic to say that this is, to a considerable degree, an American development. Of course the roots of this are as ancient as the history of man, and the history of experimentation in man is as ancient as the practice of medicine. It may have been the Greeks who first called medicine the mother of the sciences.

In an earlier series of Lowell Lectures, some of us presented a picture of the hospital as it then existed in its relationships with the sea of life around it. *The hospital in contemporary life* was the published form of those lectures. Now, a dozen years later, the task was to examine a newly emerging role of the university hospital, the university hospital as an indispensable instrument for the advancement of some kinds of truly basic science.

One can borrow a figure from the physicists and think of the human body, in one sense a closed system, as a black box. The characteristics of this system are studied and then, just as the physicist after studying his black box puts a perturbation, as he calls it, a stress, on it, so disease affecting the human body provides such a perturbation and its effects are there for study. Nature presents us with far bolder experiments than we would ever dare perform ourselves. We can profit from them. This series of lectures was dedicated to an exploration of some examples of the scientific progress which comes from such a source. Having seen what fundamental ends can be achieved, the investigator is led to carry on where Nature leaves off. Human investigation thus becomes richer and more complex than ever before.

THE UNIQUE POSITION OF THE HOSPITAL AND ITS MATERIAL IN THE ADVANCEMENT OF LEARNING

Knowledge can be advanced in several ways. There is observation and recording; there is the experimental method; there is reasoning, inductive and deductive. Full appreciation of all the broad uses of these tools inside the hospital has yet to be attained; we have not yet come to a full utilization of the material offered by the hospital as the stuff from which basic learning can be advanced. These Lowell Lectures provided an opportunity to show how material to be found only within the hospital can be utilized to make fundamental progress.

Of the three sources of knowledge—observation, experimentation, and reasoning—observation has been the principal source of learning within the hospital. Reasoning, of course, has not been neglected; but reasoning flowers best when experimentation has risen to a really important place. In an elementary sense, every time a physician prescribes a new drug or uses a new dosage of an old one he is experimenting. The immediate interest is not in this often empirical, hit-or-miss pursuit of information, for so many centuries a part of life within the hospital, but rather in man as an experimental animal, where he is the sole source of necessary data, where experiments on him must be far more thoughtfully and carefully planned than animal experiments almost ever are.

We know a great deal about what can be learned from animals. In general, we know how to surround such studies with the proper controls. Is it extreme to say that we know little of how to utilize man as a source of information? I suppose this is too strong a statement when limited to studies of objective phenomena. Nevertheless, we do not yet know well how to utilize man as a subject in the area of subjective phenomena. In this area man is not merely the animal of choice, he is the experimental animal of necessity.

We have already learned that the mathematician is essential here. For years I have been dependent upon Frederick Mosteller, Professor of Mathematic Statistics at Harvard. He has a formal relationship with our department. The mathematician must enter the hospital if the field under discussion is to grow, not just to grow soundly, but to grow at all. You may say, of course sound experimental design is necessary, but why emphasize the importance of the mathematician within the hospital? The answer is quite simple: much of the subjective response material we are concerned with exists only inside the hospital, or at least only within the sick room. The physician experimenter must learn something of the mathematics involved and the mathematician something of the problems that beset the biologist, if they are to form a productive team. We have learned already that to study most of the problems of pain, for example, we must use pain of pathological origin. We are learning that to study even a quasi-subjective matter like cough we must use cough that originates in disease to find out which agents will suppress it. Our work on the measurement of euphoria and the effects of drugs on euphoria and the relationship of personality type to the power of chemical agents to produce euphoria has meaning only in the presence of stress, and some of the very greatest stresses arise in disease found within the hospital. I suspect that in time it will be possible to make some very broad generalizations as to the essential use of "real" (pathologic) phenomena as opposed to contrived (experimental) material.

The point is, the hospital provides a vast amount of such material, material quite different from that obtainable anywhere else, material which can be utilized to make not only clinical advances but also basic (this overworked term is used in a fundamental sense), to make basic advances in the sciences of physiology and pharmacology and neurophysiology as well as in the fields of psychology and psychiatry.

One cannot overlook the fact that the use of man raises profound ethical and moral questions. These problems are intensified by the fact that in many inquiries we are obliged to go to the sick bed for our answers. When we stop to consider the emotion sometimes directed against those who use animals in their studies, we had better strengthen ourselves against the storm which could result when we are accused of making capital, even scientific capital, out of human illness. These matters must be studied first, to prevent abuses of the patient material, and then to prevent abuses of the investigator. You may be as surprised as I was to learn that in the legal view, the physician investigates to his peril, and yet experimentation is essential to the advancement of medical care. If either abuse exists, of the patient or of the investigator, the hospital will suffer. Both must be protected and in this the growth of learning in this broad new field will be advanced.

Everyone knows of the great age and honorable traditions of the Lowell Institute and the lectures carried out under it. I would not like to close these comments about the series of lectures just completed without expressing my regard for the great flexibility of the Institute and its Trustee, Mr. Ralph Lowell, who so generously supported this endeavor to have this series of lectures presented at the Massachusetts General Hospital, even though it did not conform to the established pattern of Lowell Lectureships. The average attendance for each of the 20 lectures was 165.

Henry K. Beecher, M.D.,
Chief of Anesthesia Service

MASSACHUSETTS EYE & EAR INFIRMARY

EAR, NOSE AND THROAT TUMOR CLINIC

The Tumor Clinic of the Massachusetts General Hospital and Massachusetts Eye and Ear Infirmary, headed by Dr. Claude E. Welch, is subdivided into many sections, one of which is known as the Ear, Nose and Throat Thursday Clinic. The largest of these sections is this Ear, Nose and Throat Tumor Clinic, headed by Dr. LeRoy A. Schall, Chief of Otolaryngology. This Clinic meets regularly each Thursday morning on White 2, adjacent to the General Head and Neck Clinic and the X-ray Therapy Department. This busy Clinic is efficiently run by Miss Isadora Glann, R.N. and her associates, assigned specifically to the Tumor Clinic.

The Tumor Clinic of the Massachusetts General and the Eye and Ear officially opened as a separate department in the year 1925. The activities of the Clinic were further accelerated in 1941, when the Huntington Memorial Tumor Clinic patients and their records were brought over here, following the termination of its previous location, and became an integral part of our Clinic.

Originally, the ENT Tumor Clinic was handled by conscientious, able men with foresight who laid the groundwork for those of us who now take part in this important function of the Infirmary. Names like Dr. D. Crosby Greene and Dr. Edwards W. Herman stand out like beacons of light. Dr. Carl H. Ernlund was Senior Surgeon at the Clinic from 1941 until 1957. Dr. Schall's interest in the Clinic dates further back, to the Huntington Clinic, and he has been a most stimulating Chief of the Tumor Clinic along with his many activities as Chief of Otolaryngology. It is the author's good fortune to have worked under these men since 1943. At that time, one small room was utilized to see ten or eleven patients during the course of a morning. In the past fifteen years we have moved three times to larger quarters as the demand for service increased. Over the years, through this Clinic the Massachusetts Eye and Ear Infirmary staff has been able to give increasingly better service to patients afflicted with neoplasms, and we feel that this is one more way in which the Infirmary and the M.G.H. have jointly given a better service to the New England Community.

The need and value of this special ENT Tumor Clinic is best exemplified by a few statistics. In 1948, 1283 patient visits were recorded as having been made. This rose to 1504 in 1951, and down to 1486 in 1952. In that same five-year period of 1948 through 1952, the total visits per year to the entire Clinic went from 12,671 in 1948 to 11,084 in 1952. These figures have dropped off somewhat this past year, there having been 10,137 tumor patient visits in the entire Clinic and 1135 visits to the Tumor Clinic. It is our feeling that this decrease is due to the development of other tumor clinics throughout Massachusetts and other New England States where many of our graduates who have had special tumor training are actively taking part in this general program of better tumor care in patient-areas that formerly were channeled to our Tumor Clinic.

The residents of the Massachusetts Eye and Ear Infirmary, twelve in number, rotate through the ENT Tumor Clinic as part of their educational program and, of course, are able to fortify and apply their knowledge on the wards and in the operating rooms at the Infirmary. We have exposed both Harvard and Tufts University medical students to the ENT Tumor Clinic over the years, hoping to build a cancer-consciousness in these young men, and events have proved this to be a valuable by-product of the Clinic. Many MGH student nurses also rotate through the Clinic, where they are exposed to cancer management.

The function of any department of the Infirmary and the General Hospital includes (1) the best possible service to the patient from the standpoint of early proper diagnosis, early adequate and proper treatment, and conscientious follow-up management. It is our feeling that this is being accomplished in our Clinic. (2) Teaching. Resident and medical student training is carried on within the limits of their programs, but could be improved upon if more of their limited time could be so assigned. Our Clinic staff has always preferred that all the patients be seen by the visiting staff, with residents and students joining us in observation and discussion, rather than to assign patients as cases to each of these young men, as in some other clinics. In this way they see more and benefit by many more discussions of the problem at hand.

Our present ENT Tumor Clinic consists of four assigned examining rooms, leading from a large central room where nurses and secretarial help facilitate a more efficient running of the Clinic. Our Tumor Clinic has been fortunate over the years to have assigned to it Mrs. Ruth Adair, the Tumor Clinic social worker from the Infirmary. She has been doing yeoman work contacting families of patients, relieving the doctors of innumerable small tasks, and helping maintain most satisfactory public relations between the patients, their families, and the Hospital.

Most of the patients originally find their way to the ENT Tumor Clinic by way of the Eye and Ear Infirmary, either from the ENT general clinic, or from the House itself. Some are referred directly to the Tumor Clinic by other otolaryngologists or family physicians.

Laryngeal cancer appears to be our number one lesion and, fortunately, has proved to be most effectively treated in the light of our modern day techniques of radiation and/or surgery. Our head nurse and social worker give us an interesting observation about our patients with this dreaded disease. They have observed that these patients with ENT cancer are rather distinctive, as noted by them, in comparison with other patients in the general Tumor Clinic. They rarely reveal any great outward emotional display as they await their turn to be seen, and show a most unusual feeling of empathy for their fellow patients. There is a kindred spirit which seems to be present year after year. Almost all of these patients know that they have or have had cancer and very rarely refuse to abide by the decisions of the attending physician. It is most unusual for one of these patients not to appear for his stated appointment. The rapport between staff and patients has always been excellent, which apparently aids in the general well-being of the patients. We have tried where possible for that staff member to see the same patient on his return visit, although this is difficult to do. Dr. Harley C. Shands and his group of the MGH staff have already pointed out in their excellent article in *Cancer* how important it is to cancer patients for one physician to assume charge and direction of each individual patient. It certainly reduces the feeling of insecurity and even allays the fear of death, with attendant great suffering, which is present in some degree in all patients in whom cancer has been diagnosed. Hopelessness has been reduced to the irreducible minimum where possible.

One of the most notable changes in the ENT Tumor Clinic since my exposure to it has been the gratifying response to radical neck dissection for metastatic cancer from the upper respiratory system. Whereas prior to 1950 many, many patients would appear with large sloughing, odorous, broken-down neck glands which we treated palliatively with radiation, requiring numerous dressings by doctors, visiting nurses, or family at home, this is rarely seen by us now. Radical neck dissections were only occasionally done at the Eye and Ear Infirmary in the past; 3 in 1948, 9 in 1949, and 4 in 1950, but since then there has been a tremendous application of this form of treatment, resulting in the salvage of so many heretofore failures.

In 1956 a summation of all our neck dissections done at the Eye and Ear Infirmary revealed a very fascinating and most satisfactory fact. In his report of that year, Dr. George F. Reed noted that those patients who presented themselves with metastatic lymph nodes of 2 cm. or smaller, and were subjected to radical neck dissection, showed no evidence of recurrence of the disease at least 2 years later in about 80% of the cases. However, if the metastatic node was not discovered clinically until it had reached a size of greater than 2 cm. at the time of the radical neck dissection, then the 2-year survival rate without evidence of recurrent disease dropped to about 10%.

Therefore, it seemed evident to us that closer and more frequent observation of our post-laryngectomy cases had become a must if we were to salvage still more of our patients. This led to earlier and a greater number of radical neck dissections, so that whereas by 1953, 47 neck dissections had been done, by 1955, 75 had been done. At this writing over 200 radical neck dissections have been done at the Massachusetts Eye and Ear Infirmary since 1952. It is true that there have been failures to eradicate the cancer in many cases, but the overwhelmingly good results and large salvage have been most rewarding.

A re-evaluation of the signs and symptoms of nasopharyngeal cancer, and the significance of certain early objective and subjective findings were reported out of this Clinic by your author as an aid in making an earlier diagnosis. This was pointed up by the finding that whereas only an occasional patient with cancer of the nasopharynx survived prior to 1940, our patients with this disease have had a 28.5% chance for 5-year cure if the diagnosis is made before metastatic glands are noted in the neck. When this occurs, the 5-year cure rate drops to about 3.4%. Almost all cancers of the nasopharynx are radiosensitive, and we owe a debt of gratitude to our most competent X-ray Therapy Department for their mutual help in the management of these problems. However, in view of the poor rate of cure in those patients with metastatic cancer from primary nasopharyngeal cancer, we are observing the results over the next decade from our decision to do radical neck dissections on such patients, if there is a reasonable chance that the primary in the nasopharynx has been controlled by radiation.

In our recent review of the problem of ear cancer, it was observed that cancer of the auricle located within 1 cm. of the external auditory meatus is a very dangerous lesion and will recur in 85% of the cases unless radical surgery including mastoidectomy is done. This fact revealed itself as a result of a study of repeat visits made by these patients over a 15-year period. This has changed our methods of managing these hitherto considered low-grade lesions.

There are many more important areas of information that have been revealed to our ENT Tumor Clinic staff over the years. Frequent re-evaluation of our methods of management, in the light of more statistical information derived from the many problems in the Clinic, has

No. 80 in a series of Staff photographs
Joseph F. Hill, Jr., Ph.D. — Director of Purchases

tended to make us more humble in the face of this disease. However, the increasingly better statistics have made us more optimistic about our end results.

Drs. John E. McKeigue, William P. Rogers, Jr., George F. Reed, and recently Louis E. Griffey have been a most conscientious staff with which to work; and we hope to continue to produce more cures as a result of careful and frequent observation of our ENT Tumor Clinic patients, followed by the proper application of surgery and X-ray therapy.

Daniel Miller, M.D.,
Associate Surgeon

New addresses:—

- Dr. Daniel W. Badal (r.p. *Psychiat.* 1942), 11328 Euclid Ave., Cleveland 6, Ohio
- Dr. Gerardo M. Balboni (hon.p.), 78 Mount Vernon St., Boston 8, Mass.
- Dr. Paul Colokathis (a.r.s. *Or.* 1954), 795 Elm St., Manchester, N. H.
- Dr. Solomon D. David (*Or.* 1922), 911 Medical Arts Bldg., Houston 2, Tex.
- Dr. Sylvia Davies Diehl (a.r.p. *C.M.* 1958), Albert Einstein College of Medicine, New York 61, N. Y.

Brief bits:—

Mary A. B. Brazier, Ph.D. has been elected a Foreign Affiliate of the Royal Society of Medicine of London, England.

Dr. Bradford Cannon spoke recently to the staff of the Akron General Hospital on "Homotransplantation", and presented a clinic on plastic surgery problems.

Dr. Oliver Cope addressed the Cameron-Willacy County Medical Society, Harlingen, Texas, on January 19. The title of his talk was "Newer concepts in the management of hyperthyroidism". On January 28, Dr. Cope spoke to the Buffalo Academy of Medicine, Buffalo, N. Y., on "Non-toxic nodular goitre: The evolution of the responsibilities of internist and surgeon".

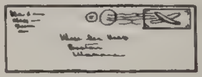
Dr. Hermes C. Grillo presented a paper entitled "Étude chimique et morphologique de la rétraction cicatricielle" before the Société Française de Chirurgie Plastique et Reconstructive at the VI^e Congrès Annuel in Paris on September 26, 1958.

Dr. Oscar Hirsch has been invited to lead a program on "The transsphenoidal approach to the pituitary area". This discussion will assume the form of a symposium, held on February 18, at the New York Academy of Medicine, Section on Otolaryngology.

Dr. Joseph E. Lichty, past Assistant Director at M.G.H., is now Director of Akron General Hospital. We have been told that the Akron newspapers are full of his exploits as a bicycle rider.

The after-dinner address at the May 1958 meeting of the Association of American Physicians was given by Dr. Howard B. Sprague. His title was "The murder of the Penultimate Puritan"—an account based upon original material concerned with the murder of Dr. Parkman by Professor Webster in 1849, in the old Harvard Medical School which stood where the present White Building entrance is located. Dr. Sprague has collected records and memorabilia of this famous case for many years.

Dr. Milton S. Thompson (*Or.* 1934), former Chief of Orthopedic Surgery at Walter Reed Army Hospital, Washington, D.C., has retired from the Service and is living at 441 Burr Road, San Antonio, Texas. Dr. Thompson is an active member of the Prosthetics Research Committee of the N.A.S.—N.R.C.



This letter has come from Dr. Hugh Chaplin, Jr. (*M.* 1948), written from Washington University School of Medicine, St. Louis, Missouri:

I have just received the current Annual Report of the Trustees of the Massachusetts General Hospital. I wish to express my appreciation for being included on your mailing list, since I always review the publication with great interest. My years spent at the Massachusetts General were among the most pleasurable and profitable of my life, and I welcome every opportunity to maintain close ties there.

I note that my own address in your file is approximately five years out of date! This is my own fault for not keeping you informed. I returned from England and was assigned to the National Institutes of Health for three years (1953-1956). Thereafter, I joined the faculty at Washington University School of Medicine in St. Louis, and have been associate dean of the medical school for the past eighteen months.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 184 Boston, Mass. March 1959

CURRENT WORK IN THE HEMATOLOGY UNIT, THE HEMATOLOGY RESEARCH LABORATORY, AND THE CLINICAL LABORATORIES

I have interpreted literally the invitation given me to describe for these columns the activities of the new Hematology Unit and Laboratories and to write down something of the thinking behind its program and of the current state of the art itself. Surely, anyone writing on the state of any field of learning today could begin by pointing to the enormous rate at which progress is being made, to the increasing difficulty of keeping abreast with the printed reports of that progress, and to the still worse difficulties of maintaining effective communication between individuals in and out of the field.

I shall begin this way, too, but with the added qualification that medicine is especially subject to these difficulties. Perhaps no one will be offended if I suggest further that internal medicine is the most sensitive area of medicine in this regard and—I shall go all the way—hematology is medicine's most tumultuous sector. Possibly this view could be debated and I should be happy to debate it, but that would slow down our work. For the purposes of this brief essay, let us accept the premise that hematology is, at the least, one of medicine's most vital and active arenas.

What does this mean for those responsible for research and teaching in hematology and for providing consultative assistance in the care of patients with blood diseases? I would say, first, in trying to answer the question of how to cope, that there is probably no better answer than the famous dictum of Professor P. W. Bridgman: you do your damnedest. As in all fields, the unknown will always outweigh the known and the sum of knowledge will always exceed any one man's capacity for knowledge. The pit into which we are peering seems not to have a bottom and that is the way things are.

In light of this, how are we to proceed with our daily work? What principles should guide our choice of the ways in which we spend our time? I have the deep conviction that these are very great questions with no *right* answers—that is, no answers that are right for everyone. I have given these matters much thought in planning *our* program and, before describing it in any detail, perhaps I might be permitted to state briefly some concepts which do seem reasonable to me.

One of these is that we must follow where the problems lead. Hematology, possibly more than many branches of medicine, has a large picture window facing out upon the central square of contemporary biological science. To deal constructively with the everyday problems of hematology, one must necessarily face some of the fundamental problems of immunology, biochemistry, genetics, physical chemistry, cellular biology, and other sciences uncounted. In many cases, the basic scientific issues raised are still unresolved in or out of the clinical context. Thus, hematology counts among its routine problems many of the great outstanding unsolved problems of science. Of course, it is also a matter of tribal pride to hematologists that many of science's greatest advances sprang directly from the study of blood and blood disease. Among these are Pauling's discovery of S hemoglobin, a major advance in genetics and biophysics; Ingram's elucidation of the possible mechanistic basis of sickling gene function, a discovery of profound significance for biology; Castle's discovery of the intrinsic factor; the discovery of vitamin B_{12}; the blood groups whose significance for immunology, immunochemistry, and anthropology is immense; and many more.

The choice that faces us is: should we await a distant day when chemists and geneticists will come to our clinics and wards to assist us with our problems? Or should we ourselves become geneticists and chemists as well as hematologists? Here, too, I am sure there is no right answer. My own belief, however, is that increasing numbers of us must enter these fields with all flags flying; that the obligation to straddle fields and to do so competently is ours and it cannot be evaded; that, in fact, the barriers between these fields are artificial man-made contraptions which now need to be dismantled.

Moreover, we must do what we do as well as it can be done. Hematology is, increasingly, a laboratory discipline. Because the blood is easily accessible (though, sadly, the marrow is not), we can examine our material directly and by many techniques. This is done in the laboratory. As new techniques and tests pour forth in increasing number, it is our task to sift out what has merit, to learn to do it well ourselves, and to develop *evidence* in each case that the method being used has or has not validity in our hands. I am certain this is the goal of every group in the Hospital. But few of these have had to decipher, for example, the utter confusion that is today's literature on blood coagulation. I think the point is made. Our laboratory men today must be professionals.

A third and final general point is one that at various times has distressed me greatly. I think that as physicians we should do a better job in delineating the areas of our ignorance. I speak, of course, only for hematology where so much of what we do, so many of the problems we daily encounter lead only to utter frustration. Hematology Rounds is an unending procession of questions without answers: we do not know the cause or cure of leukemia; we do not know why some patients develop marrow aplasia after chloramphenicol therapy and others do not; we do not know why megaloblasts are megaloblasts; we do not know what happens when we give patients steroids as we so often do; we do not know why marrow sometimes becomes fibrotic and we do not know how to reverse this process. The list is a very long one.

This is not to deny that there are a great many things that we do know. I wish here only to emphasize the surpassing importance, at least in my own thinking, of accurate citations of the literature, accurate attribution of credit to those who were, in fact, the true innovators, and critical consideration of what was done in these investigations, what was found, and what may thereby be inferred. To say this, of course, is to say the obvious. I think, however, that when so very much is unknown, we must be unusually careful to keep saying we don't know until the day arrives when we do know. Doing this, I think, will hasten that day.

* * *

Turning from platitudes, let us briefly review the current activities of "organized hematology" in the Hospital. They occur in three categories:

The Hematology Unit. This is the division of the Medical Services whose basic responsibility is to give consultative assistance in the care of patients with blood diseases and to teach hematology to the House Staff and Harvard students. The Unit consists of the members of the Hematology Research Laboratory and other members of the Medical Services with an interest or skill in hematology in one or another of its branches. The key individual in this group is the Clinical Fellow who answers consultation requests and reviews them with the senior members of the Unit. Dr. Bruce J. Sams, Jr. is our first Clinical Fellow. In July 1959, he will be succeeded by Dr. J. W. B. Forshaw of England.

One of the important tasks of the Clinical Fellow is to supervise a large variety of laboratory procedures that are essential in patient care. Among those now being done are the assays for serum B_{12}, leukocyte alkaline phosphatase, A_2 hemoglobin, red cell glucose 6-phosphate dehydrogenase, the Schilling test, Cr^{51} and Fe^{59} studies, and the folic acid absorption test. Much of this work is done with the good technical assistance of Miss Sarah Mair, an important member of our Unit.

Another member of the Hematology Unit is Dr. Lamont W. Gaston, now a Research Fellow in the Hematology Research Laboratory. It is he who has assumed the responsibility of running and supervising the coagulation tests needed in studying obscure hemorrhagic disorders in the light of contemporary knowledge. As I mentioned above, this is an intricate laboratory specialty. Gaston has done a fine job in launching this important work; but many problems lie ahead in this area, among them, the problem of making these tests available to all who may wish them. Much of this work must be done under rigorously controlled conditions of the type available only in the research laboratory. This means that there is a limit in the amount of space and the number of trained hands which can be put to this work. The demands we have already encountered attest to the importance of this field. We will need, in time, to come to grips with the problem of blood coagulation tests and their proper place in the constellation of service laboratories. Until that day, we will merely do our best to meet the demands within the limits that exist.

A most important member of the Hematology Unit and one to whom I wish to pay special tribute is Dr. Bernard M. Jacobson. It is unnecessary for me to recount how much he has contributed and is continuing to contribute to hematology in this Hospital. For many years, Dr. Jacobson carried much of this load on his own shoulders, working tirelessly in the good cause. He is an active member of the new Unit, whose experience and enthusiasm is one of our invaluable assets.

A problem that remains unsolved is the pressing need for a strong Hematology Clinic. At present, out-patients with hematologic disorders are divided between the Anemia Clinic and the lymphoma-leukemia section of the Tumor Clinic. I hope that, in the near future, this schism can be closed so that a strong new Hematology Clinic can come into being.

The Hematology Research Laboratory. The problems under investigation in the Hematology Research Laboratory are all related, in one way or another, to the biochemistry, physiology, and biology of human bone marrow, a tissue about which we know so very little. It is remarkable, actually, how meager is our knowledge of this important organ. What we know has been derived almost entirely from morphological, nutritional, and radiobiological data. We know almost nothing, to cite but a few examples, of the mechanisms governing the release of blood cells from marrow into blood, of the finer architecture of the marrow, of the mechanisms of cellular maturation and differentiation, or of the possible biochemical and nutritional interactions among different cell types.

We have, therefore, undertaken several investigations which aim to cast some light in this dark corner. Dr. John F. Bertles, our first Research Fellow in Hematology, in collaboration with Mrs. Fleurette Hershman, is currently investigating biochemical aspects of the process of reticulocyte maturation. As reticulocytes mature into adult erythrocytes, they lose many constituents, including nucleic acid and a large number of enzymes, among them being those which catalyze Krebs cycle activity and protein synthesis. Since reticulocyte maturation can be observed *in vitro,* the effort here will be to determine the fate of these lost materials, the mechanisms of their loss, the possible significance of the fact that genetically determined phenomena (such as S hemoglobin synthesis) continue actively in the absence of the prime genetic mover, the gene, which presumably was lost with the nucleus in the preceding stage of maturation (a loss, by the way, whose mechanism is completely unknown).

A second problem under investigation relates to the role of vitamin B_{12} in metabolism, a problem which is now one of the urgent unsolved problems in biochemistry. We have chosen to investigate this problem in *Lactobacillus leichmanii,* an organism which requires vitamin B_{12} for growth except when deoxyribosides are added to the medium. If clues to the metabolic role of B_{12} can be obtained in this microbiological system, we will then address ourselves to the question of its role in mammalian metabolism in hopes of finding similar mechanisms. I am fortunate in this work to have the excellent assistance of Miss Barbara Hurlock, formerly of Cambridge University and the University of Chicago.

Studies are also in progress on certain aspects of mammalian cell genetics as manifested in bone marrow cells, tissues which possess a number of possibly useful genetic markers. This work entails yet another attempt to cultivate human bone marrow cells *in vitro,* in this instance using contemporary techniques. Despite the great difficulties involved in this approach, we are optimistic of finding conditions which will permit the establishment of continuous and recognizable cell lines with clonal growth patterns and good plating efficiencies. These are the prerequisites for any meaningful study of cell genetics. Dr. Shelby Kashket, now a Fellow in the Department of Bacteriology and Immunology, will continue this work as a Research Fellow in Hematology beginning July 1, 1959.

We are also continuing our investigations of the biochemistry of peripheral blood leukocytes in various clinical conditions. It is hoped, incidentally, to apply some of this knowledge to the problem of cell type diagnosis in tissue culture preparations where morphology no longer provides useful diagnostic criteria. Finally, we anticipate that Dr. Gaston will soon begin work on the biosynthesis of certain coagulation factors in liver slices *in vitro.*

The general feeling behind the research effort in the Hematology Research Laboratory is that we will first endeavor to obtain basic knowledge concerning the physiology or biochemistry of hematopoietic tissues. Then we will attempt to apply this knowledge in the investigation of clinical problems. At the moment, each of our projects is near to its beginning. Only time will tell if these approaches are fruitful.

The Clinical Laboratories. A third area of responsibility is in the Clinical Laboratories, the Hospital's service laboratory in the field of hematology and clinical pathology.

Two great problems have had to be dealt with in the Clinical Laboratories: one of these may be considered a scientific problem; the other, administrative. As regards the former, it has been necessary to undertake a systematic review of the methods being used in the Laboratory and to revise them, one by one, in favor of more modern, more accurate, or more efficient methods. These efforts are now under way and they will continue in the months and years ahead. For example, we are currently converting to the cyanmethemoglobin method for hemoglobin and have obtained new spectrophotometers which will add greatly to the accuracy of our hemoglobin determinations. We have been dismayed at times by the idiosyncrasies of the clotting time method that has been used in years past and we are now attempting to do something about it, particularly since prolonged clotting times now lead automatically to consultation requests. To improve our assay, it may be necessary to take a heated water bath to the bedside, in which case our range of normal values will be different. If this comes about, the staff will be duly notified. Likewise, we expect in the near future to adopt the blood pressure cuff method of measuring the bleeding time (a method whose proper eponymic designation I will leave to others to decide). This is a better method of doing bleeding time determinations and we should be using it.

Regarding choice of methods, a number of general considerations arise. When procedures are being carried out by relatively inexperienced technicians, the best ones are those which involve clean-cut simple operations that yield easily readable and reportable numerical values. An example of this is the hematocrit determination. The next most desirable category of tests (or perhaps these might be called the second least desirable category) includes tests whose end points do not involve dial reading but the observation or non-observation of certain phenomena. An example of this would be blood typing tests where agglutination or non-agglutination is looked for, or perhaps the "L.E." test. These require the technician to look for a phenomenon and recognize it when she sees it, and this raises the possibility that the observer may or may not be able to decide, in a given case, whether she has indeed found what she is looking for. This is particularly disturbing in situations where phenomena obstinately refuse either to occur or not to occur.

Finally, we have a category of tests which are the most worrisome. These are the tests in which the technician must not only find and recognize something, she must also classify and interpret what she has found and, in failing to report it, convey the implication that it was not there. The examinations of the urinary sediment and the peripheral blood smear are the classic examples of this category of tests. I have not yet found a way by which a laboratory director can confidently give a blanket endorsement to the work of his technicians in this area, even when he has, as I have, the highest respect for the competence of his technical assistants. As one who was once associated with Dr. Thomas Addis, I rather feel as he did that physicians should not so readily relinquish these tasks to laboratory technicians. Addis wrote, "When the patient dies the kidneys may go to the pathologists, but while he lives the urine is ours. It can provide us day by day, month by month, year by year, with a serial story of a major event going on in the kidney. The examination of the urine is the most essential part of the physical examination of any patient with Bright's disease."

I agree with this principle as do those in the Hospital, I feel sure, who regularly see a large number of patients with renal disorders. Although the personnel of the Clinical Laboratories will continue to do tests of this type as well as they possibly can, I hope, nevertheless, that individuals reading these results will keep in mind the conditions and limitations under which this work is done.

This brings me to the second category of problems in the Clinical Laboratories, the administrative problems. I will refer to these only briefly. Within the past year the Clinical Laboratories has been reorganized so that what formerly were five autonomous laboratories (Baker, EW, OPD, White 6, and Burnham 6) is now a single organization with one head technician, Miss Althea King. The seemingly insurmountable problem we face in running this laboratory has to do with the shortage of competent technical personnel. This shortage is probably due to the fact that fewer and fewer women are entering this field and that hospital salaries do not compete successfully with those paid by private physicians and other institutions. We are continuously hiring inexperienced young ladies straight from their training courses, training them on the job for periods of six months or longer, and then losing them to higher paying technical jobs for which their experience at the Massachusetts General Hospital has qualified them. There is a grave shortage of experienced people and we are doing what little we can to correct this shortage by participating in the instruction of Simmons College students who are studying medical technology in the MGH-Simmons course recently begun under Drs. DuToit's and Castleman's direction. But this will not solve the problem and it is difficult, indeed, to get through our daily work load as matters now stand. This is a problem, I think, that the Administration, in its wisdom, will eventually have to meet realistically.

* * *

This concludes my summary of the activities in the field of hematology with which I am associated. As I have already mentioned, these are new enterprises and, as I see them, they have horizons unlimited. Only individuals who are unusually good or foolish would try to gain a foothold in this city of hematological Titans. Since I am sure the present members of the Hematology Unit are very much one of these and not the other, it will be interesting, indeed, to watch how their work comes along.

William S. Beck, M.D.,
Chief of the Hematology Unit
and *Director of the Clinical Laboratories*

The 67th Annual Vincent Show, to support the Vincent Memorial Hospital, will open at New England Mutual Hall on Wednesday, April 1 and run through Saturday, April 4. Last year the Vincent Club gave the Hospital $45,000. This contribution, the largest the Club has ever made, was due in no small measure to the success of the Show, the generous support of its patrons, and the advertisers whose names appeared in the 416-page program of the Show.

This year's Show, entitled "Heaven's above", was written by Mrs. Francis E. Baker, Jr., Dr. Herbert Barry, Jr.'s daughter. The scene is laid in outer space and the action takes place in the year 2020 on a space platform. Living on this way station between planets are, among others, the Hill family. Mr. Hill, in addition to being Chairman of the Defense Council, is much involved in the gala Interplanetary Peace Exposition which is about to open. Other characters include Mrs. Hill, an attractive and dynamic housewife; and the Hills' charming eighteen-year-old daughter, Marion, and precocious small son, Davis, who are anticipating a visit from their grandmother, Mrs. Pettigrew. Having come from Earth (a backward planet), this elderly lady is constantly amazed and bewitched by the push-button existence on the space platform. The threat of an invading robot army and Davis's do-it-yourself invention, Bartholomew, cause considerable chaos and make for many amusing incidents. The frantic gyrations of the dead-pan diplomats, the arrival of the Interplanetary Beauty Queens (Miss Mars is missing), the dancing delegation from Earth, and the "Heavenly Bodies" add sparkle to the plot.

Tickets will be on public sale at the Vincent Show box office at New England Mutual Hall, 225 Clarendon Street, March 16 through April 4. The box office will be open from nine-thirty to five o'clock, Mondays through Fridays. The box office telephone number is COpley 7-6112. Flyers and applications for tickets may be obtained at the Massachusetts General Hospital, at the White Building Information Desk.

The Board of Trustees, at their meeting on January 16, voted:

That Dr. Agnes Burt Russfield be granted leave of absence from her position of Assistant Pathologist, effective as of November 1, 1958;

To rescind the appointment of Dr. Claus W. Reichle as Assistant in Anesthesia until such time as he obtains a Massachusetts license.

To appoint:

Dr. Donald J. Annino as Assistant to the Children's Medical Service, beginning January 15;

Dr. Irwin M. Freedberg as Assistant Resident in Dermatology for one year, beginning July 1;

Dr. William H. Hendren, III, as Assistant in Surgery, effective January 1;

Dr. Bernard F. Mach as Intern in Medicine, for the period January 13 through June 30;

Dr. Joseph F. Stocks as Second Assistant Resident on the Children's Medical Service for one year, beginning July 1;

Dr. James W. Tanner as Second Assistant Resident in Radiology, beginning January 1, 1960.

The Trustees also voted that the number of Interns on the Surgical Service be increased from 8 to 10, effective July 1, 1960.

At their meetings on November 26, January 7, 14, and 28, the General Executive Committee voted:

To promote:

Dr. Milton S. Grossman to the position of Assistant Resident on the Children's Medical Service for one year, beginning January 1;

Dr. Marvin M. Lipman to the position of Resident in Medicine for one year, beginning January 1;

Dr. Donald B. Martin to the position of Chief Resident in Medicine for one year, beginning January 1;

Dr. Walther T. Weylman to the position of First Assistant Resident in Radiology, beginning January 1.

To reappoint:

Dr. Leslie J. DeGroot as Clinical and Research Fellow in Medicine for one year, beginning January 1;

Donald L. Weston, Ph.D. as Research Fellow in Psychology for one year, beginning September 1, 1958;

Dr. Herman Wing as Clinical Fellow in Physical Medicine for one year, beginning September 1, 1958.

To appoint:

Laurence C. Bonar, A.B. as Research Fellow in Orthopedic Surgery for one year, beginning January 1;

Dr. Gerald S. Brickman as Clinical Assistant in Orthopedic Surgery for one year, beginning February 1;

Dr. Ralph C. Darling, Jr. as Clinical Assistant in Surgery, effective January 1, with the privilege of assisting Dr. Robert Linton in the care of his private patients;

Dr. Gardner F. Fay as Clinical Assistant in Orthopedic Surgery for one year, beginning January 19, with the privilege of assisting

Dr. Paul Norton in the care of his private patients in the Baker Memorial and Phillips House;

Dr. Robert C. Hume as Clinical Fellow in Psychiatry for one year, beginning January 1;

Dr. Paul J. Kestens as Clinical and Research Fellow in Surgery for one year, beginning January 1;

Dr. Warren L. Reinoehl as Graduate Student Assistant in Surgery, for a period of four months, beginning January 5;

Dr. Hugh Tatlock as Clinical Assistant in Medicine, beginning January 26;

Dr. Robert G. Willocx as Clinical Fellow in Medicine, for a period of six months, beginning January 1.

The General Executive Committee also voted:

That Dr. David M. Klein be assigned to the Boston Veterans Administration Hospital on affiliation, for a period of three months, beginning February 1, as Junior Resident in Neurosurgery;

That the appointment of Dr. Tsutomu Oyama as Clinical and Research Fellow in Anesthesia be extended an additional two months, beginning January 1;

That in addition to Dr. Joseph D. Sabella's appointment as Clinical Fellow in Pathology, he be given the additional title of Acting Assistant Resident, retroactive to July 1, 1958;

That the appointment of Kathleen Stratton, Ph.D. be changed, retroactively as of August 1, 1958, from that of Assistant Physicist (Medicine) to Research Fellow in Physics (Medicine);

That Dr. Nicholas T. Zervas be assigned to the Neuroradiology and Ward Service, for a period of eleven months, beginning February 1.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Cardiovascular Surgery

Baumgartner, D. A., Jr., and Nevin, J. E.
Changes in peripheral circulation in lower extremities following the Beck I operation for coronary heart disease.
Am. J. Cardiol. 3:61, 1959.

General Medicine

Pawlowski, E. J., and Pawlowski, M. M. F.
Unconscious and abortive aspects of pseudocyesis.
Wisconsin M. J. 57:437, 1958.

General Surgery

Waddell, W. R., and Cannon, B.
A technic for subtotal excision of the trachea and establishment of a sternal tracheostomy.
Ann. Surg. 149:1, 1959.

Laboratory Science

Nardi, G. L., and Palazzi, H. M.
Studies of liver blood flow in man.
Strahlentherapie, Sonderbande 38:105, 1958.

Waddell, W. R., Geyer, R. P., Hurley, N., and Stare, F. J.
Abnormal carbohydrate metabolism in patients with hypercholesterolemia and hyperlipemia.
Metabolism 7:707, 1958.

Waddell, W. R., Leonsins, A. J., and Zuidema, G. D.
Gastric secretory and other laboratory studies on two patients with Zollinger-Ellison syndrome.
New England J. Med. 260:56, 1959.

Neurosurgery

Bakay, L.
Radioactive phosphate concentration in the cerebral cortex.
Neurol. 9:18, 1959.

White, J. C.
Injuries to the cervical cord: Fundamental factors in treatment and rehabilitation. (Editorial)
J. Bone & Joint Surg. 41-A:11, 1959.

Otolaryngology

Hinojosa, R.
Pathohistological aural changes in the progeny of a mother with pseudohypoparathyroidism.
Ann. Otol., Rhin. & Laryng. 67:964, 1958.

Pediatrics

Hendren, W. H., III, and Haggerty, R. J.
Staphylococcic pneumonia in infancy and childhood: Analysis of seventy-five cases.
J.A.M.A. 168:6, 1958.

Physical Medicine

Wing, H., and Watkins, A. L.
Some medicolegal aspects of physical medicine and rehabilitation.
Arch. Phys. Med. & Rehabil. 39:761, 1958.

Radiology

Blakemore, W. S., Murphy, J. J., Pendergrass, H. P., and Greening, R. R.
Carbon dioxide as contrast medium in roentgenography.
J.A.M.A. 167:310, 1958.

Pendergrass, H. P., Tondreau, R. L., Pendergrass, E. P., Ritchie, D. J., Hildreth, E. A., and Askovitz, S. I.
Reactions associated with intravenous urography: Historical and statistical review.
Radiology 71:1, 1958.

Miscellaneous

Farnsworth, D. L.
Counseling in medical school via faculty advisers.
J. Med. Ed. 33, no. 10, pt. 2, 107, 1958.

Farnsworth, D. L.
Financing a college health program.
Student Medicine 7:143, 1958.

This is the last issue of THE NEWS in which 1958 titles will appear.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

American Cancer Society, Inc.
Symposium on cancer of the head and neck. Annual session, Oct. 28-29, 1957.
New York, American Cancer Society, Inc., 1958.
(13V)

Bankoff, G.
Plastic repair of genito-urinary defects.
New York, Philosophical Library, 1956.
(17A)

Boyer, P. D., and others.
The enzymes, ed. 2, vol. 1.
New York, Academic Press, Inc., 1959.
(5C)

Ciba Foundation.
Ciba Foundation Symposium on amino acids and peptides with antimetabolic activity.
Boston, Little, Brown and Company, 1958.
(5B)

European Society of Haematology.
Proceedings of the Sixth Congress, Copenhagen, 1957, 3 vols.
Basel, S. Karger, 1958.
(14B)

Experimental Cell Research, suppl. 5.
The submicroscopic organization and function of nerve cells.
New York, Academic Press, Inc., 1958.
(2Am)

Freud, S.
The standard edition of the complete psychological works, vol. 12.
London, The Hogarth Press, 1958.
(19Op)

Haynes, B. G.
Autonomic dyspraxia.
London, H. K. Lewis & Co., Ltd., 1958.
(19S)

International Union Against Cancer.
International Cancer Congress, 7th, London, 6th to 12th July, 1958. Abstracts of papers.
London, Chester Beatty Research Institute, Royal Cancer Hospital, 1958.
(13V)

Laegeforeningens Aarbog, 1958-59.
Medicinsk vejviser, 1958-59.
Copenhagen, N. Olaf Mollers Boghandel, 1958.

VOLUNTEER GROUPS

MGH STAFF WIVES ASSOCIATION

Our cupboard is bare! Furniture is needed!

One of the most successful and worthwhile projects of the Staff Wives Association needs your support again. The supply of furnishings which we lend to our visitors from abroad, and which is so greatly appreciated, is woefully low. We would gratefully accept anything that is usable — chairs, desks, bookshelves, tables, chests, beds, baby articles, household items (such as pots, pans, dishes, glasses, silverware, bedding, draperies, rugs), and any appliance which is in working order (such as irons, toasters, or radios).

We can pick up any articles, or they may be left at the Staff Wives Reception Center, next to the General Store. If you have anything to contribute, please telephone Mrs. Gerald S. Foster, IV4-7405, Mrs. John F. Burke, IV4-6006, or Mrs. Paul M. Howard, IV4-0643.

On January 29, the Staff Wives Association played hostess at a tea in Bartlett Hall for our foreign visitors who are currently studying at the Hospital. This is the only such event planned for this winter for our guests from other lands so the attendance was large, as was anticipated. Other special guests were the officers of the Ladies' Visiting Committee and the Distaff Club, as well as the secretaries of the various Hospital department heads, all of whom have given so much assistance to the Staff Wives Association in rendering service to our visitors from other countries.

DISTAFF CLUB

On January 13, Mrs. Ollie Robbins of the Weston Book Stall Store spoke on "Techniques of story telling". Besides giving us very helpful information and hints, she brought a display of the latest children's literature. Mrs. Roman W. DeSanctis was hostess for the evening.

"Game Night", held in the Pent House on February 19, was a very gay evening, topped off with door prizes and refreshments. Mrs. Gerald F. Winkler acted as hostess.

On February 20, the Club held its second bake sale of the year. Mrs. Ronald A. Malt and Mrs. Wayne M. Hebertson were the co-chairmen for the sale.

* * *

BELGIAN HOSPITALITY

Perhaps the readers of the MGH NEWS might like to hear about my three-weeks' visit in the Benelux last summer and about the First International Symposium on Radioactive Iodine Treatment, to which I was invited by the Belgians. The Symposium was planned and carried out under the chairmanship of Professor Lucien Brull, Chief of the Department of Medicine of the University of Liége. Dr. Brull met several of us who arrived from Brussels by a helicopter which dropped us to the narrow asphalt strip by the river Meuse. Liége lies in a valley whose hillsides are dotted with coal mines and whose heavy industry includes one arms plant which employs about 12,000 men. It is a dynamic city. Soon we felt the warmth and sparkle of Belgian hospitality. We had a leisurely two-hour luncheon with the appropriate wine and then were given a tour of the city before driving to the Brull residence on the outskirts, where Madame Brull had readied a light five-course supper. Theirs is a new home built after the war, and even certain wooden pieces have been chosen carefully by Dr. Brull, who loves to work with his hands, either in the laboratory or at home.

The next day a few of us went on ward rounds and found that the methods of approach to the patient, the investigation of his or her disease, and the care extended were very much like our own. We were impressed with the number of homesick Italians who had come to work in the Belgian coal mines and had soon fretted themselves into peptic ulcers.

The Belgian economy is high and the evidence of prosperity can be seen in their programs of building new roads and huge modern apartments. Their factories are going full blast, the shops are filled with choice articles, and the people are happy and determined, whether they are on foot or on bike, motor scooter, or quadratyred. This country, the battleground of Europe for a thousand years, has an eternal spirit of reconstruction, adventure, and contentment.

Meetings of the Symposium were held around a huge green baize-covered table in the Library of the Hôpital de Baviere. Promptly at 9 A.M. on August 28, the members gathered to begin an informal exchange of ideas, factual and speculative, on the use of radioactive iodine. Fortunately for the three of us from Boston, English was chosen as the medium of exchange. Dr. Carl Cassidy from the New England Medical Center and Dr. Ward Slingerland from the Veterans Administration Hospital were the other two. Many old friends of the Thyroid Clinic were on hand—Professors Michel de Visscher of Louvain, Lamberg from Finland, W. R. Trotter from University College Hospital, London, and L. G. Larsson from Stockholm. Tape recordings were made of the meetings, but the true value lay in the personal exchanges that will not be apparent in the publications.

After the meeting on August 29, Dr. and Madame Brull again entertained us at a garden party at their home—a picturesque scene, with the chef in an enormous white hat visible in the kitchen window and two liveried men busy bringing wines and cakes to our tables which were flanked with roses.

At noon, August 30, the sessions ended and a caravan took us all to a small chalet-restaurant down at the edge of the Ardennes, not far from Bastogne, where we sipped wine under the trees and had more discussions as we waited for the ladies to finish luncheon. That evening came the climax—a dinner at the Vieux Liége, an ancient restaurant that fortunately had escaped the German buzz-bombs. After apéritifs at 7, we climbed the narrow stairway to the third floor and then, around a banquet table, there followed four hours of dining, wining, and verbal exchanges in many tongues. The toastmaster, H. Wijnbladh, Surgical Director of St. Goran's in Stockholm, led the evening with his introduction of the Dean of the Medical School of the University of Liége and then called on several for responses. Dr. Zara of Paris was most amusing. As our representative, I encouraged the continuation of this International Symposium, not only as a means of exchange of scientific data, but one that would draw together the world community in mutual understanding so that we may live peacefully as united nations.

On Sunday, the 31st, everyone folded his papers and stole off, chiefly in the direction of the magnificent World's Fair in Brussels.

Earle M. Chapman, M.D.,
Physician

New addresses:—

Lt. Arthur F. Amick, MC, USNR (*M.* 1957), 9242 Phillip Ave., Norfolk, Va.

Dr. K. Jack Momose (clin. fel. *R.* 1956), 40 Burnview Crescent, Scarboro, Ontario, Canada
Dr. John R. Mote (*W.M.* 1937), 11 E. 68th St., New York 21, N. Y.
Dr. John D. Reeves (r.p. *R.* 1951), University of Florida College of Medicine, Gainesville, Fla.
Dr. Frederic W. Rhinelander (*E.S.* 1937 & *Or.* 1938), Cleveland Metropolitan General Hospital, Cleveland 9, Ohio
Dr. Fiorindo A. Simeone (*W.S.* 1936), Cleveland Metropolitan General Hospital, Cleveland 9, Ohio
Dr. Donald B. Steenburg (*E.S.* 1915), McKee Bldg., Aurora, Nebr.
Dr. Edmund K. Steenburg (*E.S.* 1919), 4200 Cathedral Ave., N.W., Washington, D.C.
Dr. Richard W. Steenburg (clin. fel. *S.* 1948), 205 Churchwarden Rd., Baltimore, Md.
Dr. Hugh Tatlock (*W.M.* 1940), 264 Elm St., Northampton, Mass.
Dr. Langdon T. Thaxter (*E.M.* 1916), Cumberland Foreside, Portland 100, Maine
Dr. Yasuzo Tsukada (res. fel. *N.S.* 1958), Dept. of Physiology, Toho University, Ohmori, Ohtaku, Tokyo, Japan
Dr. Katharine Spreng Waldmann (*M.* 1955), 397B Dawson Ave., Rockville, Md.
Dr. Arthur T. Willetts (a.r.s. *U.* 1942), 79 Union Place, Summit, N. J.

* * *

Having changed all addresses which had been Cleveland City Hospital to Cuyahoga County Hospital in last year's Directory section of our *Annual Report,* we were somewhat puzzled when a recent communication from Dr. Fiorindo A. Simeone indicated still another change. This clarifying reply to our query has come from Dr. Simeone's office.

I am embarrassed that I did not explain to you the change in our hospital's name in sending you Dr. Simeone's address.

In January of 1958 Cleveland City Hospital was transferred to Cuyahoga County ownership and technically became Cuyahoga County Hospital. There is, however, at least one other Cuyahoga County Hospital in Cleveland and it has been necessary to give our County hospitals popular names in order to avoid confusion. The name given this hospital by the Board of Trustees in November of 1958 was Cleveland Metropolitan General Hospital.

I can well understand your wonderment in finding that Dr. Simeone was at Cleveland City Hospital in 1957, Cuyahoga County Hospital in 1958, and Cleveland Metropolitan General Hospital in 1959—and all with the same address of 3395 Scranton Road! We can assure you that it's the same Department of Surgery and the same group of hospital buildings. Only the name has been changed.

* * *

Brief bits:—

Dr. Bradford Cannon attended the meeting of the American Society for Surgery of the Hand, held in Chicago, January 23-24. On January 25 he spoke on "Soft tissue plastic procedures" before the American Academy of Orthopedic Surgeons, also in Chicago.

Dr. Oliver Cope is acting as Visiting Professor of Surgery at Yale University School of Medicine, March 2-7, and gave the Leon Sample Lecture there on March 4. Dr. Cope will be the guest speaker at the Annual Meeting of the Southwestern Pennsylvania Chapter of the American College of Surgeons, held in Pittsburgh on March 20.

Dr. James Howard Means has written the Foreword for Harry Eckstein's new book, *The English Health Service: Its origins, structure, and achievements,* published by Harvard University Press, Cambridge, Massachusetts.

Dr. Marion W. Ropes received the Elizabeth Blackwell Award at the New York Infirmary on January 25. These Awards, established in 1949 in honor of Dr. Blackwell, the first woman physician, are made each year to women who have made significant contributions to the science, practice, or teaching of Medicine.

* * *

Dr. Nathaniel W. Faxon was given the honorary degree of Doctor of Science at the commencement exercises of the University of Rochester last June 8. At last we have succeeded in securing a copy of the citation which was read at that time.

No ancient authority can tell us why a Greek physician of great repute contrasted the endurance of art with the brevity of life, but Nathaniel Wales Faxon, by filling his days with human interest, has blended medicine and life into an art of lasting value. His family was a prodigious progenitor of males produced under the exclusive eye of nature's prognosis. He completed his education at Harvard Medical, served his apprenticeship in his father's country practice, and answered the call of duty during World War I before he became an Assistant Director at the Massachusetts General Hospital in 1919. Three years later he left the salty shores of New England for the banks of the Genesee to serve as Director of the new Strong Memorial Hospital. Here he became an ardent promoter of the hospital insurance plan, at the same time endearing himself to both the staff and the community because he ruled not "by authority and sanction but by influence and example"; he knew how to substitute contingent reason for arbitrary certainty. In 1935 the rumble of the sea lured him back to Massachusetts General where he served [as Director] until his retirement in 1949.

Functioning under the conviction that an institution is not the expanding circumference of a Director's dominion but a growing organism of which the Director is an important part, he identified himself completely with his hospital, he integrated his hospital with the best interests of the community, the municipality, and the State. He grew along with his institutions as they served, and in this wise they realized the full measure of human values "as rare as they are difficult to attain."

No. 185 Boston, Mass. April 1959

SURGICAL RESEARCH

WOUND HEALING

The surgeon depends in nearly all his efforts upon the generally predictable responses of the connective tissue. From a vast experiential knowledge derived from centuries of cutting and sewing he has learned what to expect from his tentative approximation of these tissue layers with one or another of the suture materials. He has also learned to recognize aberrations from desired behavior—failures of union or excessive scar proliferation—but real knowledge of the intimate processes of repair remains small. Correspondingly, the ability to control these processes remains essentially undeveloped. The all-inclusive term "wound healing" encompasses the multitudinous biological activities involved in these processes. Our laboratory is engaged in research in certain problems in this field. I shall preface these brief notes on our activities by stating a hope which guides most investigators in this field and provides the only answer, if answer be required, to the question: "What practical information can be obtained by experimentation which will actually help the healing of wound?" One does hope that comprehension of the intimate processes of wound healing will ultimately lead to opportunities to alter and control these processes. In the meanwhile we must approach this goal by primary efforts in the analysis and dissection of specific problems of a more theoretical nature.

Initially I worked in the laboratory of Dr. Jerome Gross in the Lovett Foundation, studying the properties of connective tissue, in particular those of collagen, and techniques for connective tissue analysis. Later the Huntington Laboratories generously made available a space for surgical research on the third floor of the Research Building, a space previously used as a stock room. I was given the pleasant opportunity to design in this space a small laboratory named the Ira T. Nathanson Memorial Laboratory in tribute to the late Huntington surgeon and investigator. Dr. Paul Russell shares this area, and we have found that a tight but flexible nautical design compensates as well as can be hoped for any space limitations.

Surgeons have long been familiar with the phenomenon of closure of a full thickness skin wound by contraction—the migration of the preformed tissue bordering the wound in toward the center of the wound, effecting partial or complete closure depending upon a host of factors. The assumption had been made for half a century that this process resulted from activity of the granulation tissue filling the wound—acting by shortening of collagen fibers in the mass or in some mysterious way—as an "organ of contraction". But most of the large amount of laboratory work devoted to this problem has been directed to quantitating the process experimentally by attempting to discover mathematical formulae governing the process, or else by utilizing an experimentally contracting wound system as a general measure of "wound healing".

On the basis of the loss of edema and compaction of granulation tissue which is directly observable in a maturing open wound, Dr. Gross and I considered the hypothesis that abstraction of water might secondarily lead to contraction of the new formed tissue and we designed a series of experiments to answer this question. We hoped also to correlate the changes in composition of the granulation tissue with the contraction process.

Dr. George T. Watts, a surgeon from the Queen Elizabeth Hospital in Birmingham, England, worked energetically and capably with us for a year on these researches. As the work progressed we were able to demonstrate that tissue dehydration was not a cause of contraction, and also, surprisingly, we demonstrated a notable lack of correlation of the contraction process with the total amount and concentrations of various elements of the granulation tissue filling the wound: collagen, ground substance, and non-collagenous proteins. This indication that the time-accepted hypothesis of the role of the granulation tissue filling the wound bed as an agent of contraction might not be true was followed by a series of morphological experiments which proved that contraction occurs quite independently of the central granulation tissue filling the wound bed. Only interference with the wound margin itself interfered with the wound contraction process.

This work has served to localize the site of origin of the biological forces resulting in the contraction process. We have recently completed a careful histological study of the marginal area—the "picture frame" of tissue wherein the activity goes on—which further localizes the activity to the loose connective tissue of the margin. Dr. Charles Levene of the Lovett Laboratories has been most helpful in this aspect of the study.

Our present data have led to the formulation of a hypothesis that oriented cell migration is the motile force for the contraction process.. This mechanism is of course yet to be conclusively proved and fully elucidated. A fuller dissection of the role of the various connective tissue elements involved in this "picture frame" zone of activity is currently in progress, utilizing a number of techniques and experimental tools, including scurvy and lathyrism. The work continues as a collaborative venture with Dr. Gross. Dr. Arnold van den Hooff, working in Dr. Gross's laboratory, has also become intrigued by the problem of transmission of forces which the above hypothesis presents and is submitting the problem to electron microscopic analysis.

It will thus be seen that our progress has been by the application of multiple techniques to the problem under study rather than determination of the direction of study by the techniques used.

Other projects are under way and I shall note some of them briefly here. A fuller study of the chemistry of new tissue formation in vitamin C deficiency is in progress. This is presently only a preliminary study following up earlier observations, which we hope may add to our understanding of the role of vitamin C in collagen fiber formation. The endless analytical determinations which these experiments require, as well as the careful observations and manipulations of the contraction experiments, have been diligently done by Miss Martha Morton.

Some years ago in his studies on the properties and behavior of collagen molecules Dr. Gross defined conditions under which collagen might be extracted from tissues, purified, placed in solution, and then reconstituted as a rigid gel. Potential surgical applications of this material as a structural replacement substance seemed evident. We demonstrated that this gel could be dried under special conditions, easily sterilized, and stored indefinitely. It can be poured into molds, resulting in any desired shape. We have put considerable effort in the past into studying the applicability of this material. We have demonstrated that the material, although a heterologous protein, is tolerated as a tissue implant with minimal reaction. Immunologic response is minimal even in the present incompletely purified state, despite rigorous stimulation with adjuvants. The implanted material is gradually replaced by host connective tissue, which may offer some advantage over synthetic fabric prostheses. Although these aspects of the problem, which originally seemed to represent difficult problems, have proved to be no serious barrier to further testing of reconstituted heterologous collagen prostheses, problems of intrinsic structure have posed themselves.

Thus far we cannot supply a happy ending to this story.

These paragraphs will make it evident that while we label our chief field of interest "wound healing", it may be more appropriate to describe the laboratory's field as "studies of connective tissue response to injury".

Hermes C. Grillo, M.D.,
Assistant in Surgery

* * *

On January 28, the American Academy of Orthopaedic Surgeons presented to Dr. Melvin J. Glimcher the Kappa Delta Award for Outstanding Orthopaedic Research. Dr. Glimcher is Assistant in Orthopedic Surgery and Director of the Orthopedic Research Laboratories here at the Hospital.

The Award is donated each year by the Kappa Delta Sorority and awarded by the American Academy of Orthopaedic Surgeons, at its Annual Meeting, to the American citizen in the United States or its possessions who has performed the most valuable research in orthopedic surgery.

At the time of the presentation it was stated that "The Kappa Delta Award is presented for the outstanding scientific contribution to the field of orthopaedic surgery or related basic sciences and the single most important scientific research in this field."

Dr. Glimcher received the Award for research which he has carried on over a period of three years in the laboratories of Professor Francis O. Schmitt at the Massachusetts Institute of Technology.

A report of the October 10, 1958 meeting of the Board of Trustees failed to reach the office of THE NEWS until March. At that meeting the Trustees voted to appoint:

Dr. John F. Barlow as Third Assistant Resident in Pathology for one year, beginning July 1;
Dr. Alan M. Bornstein as Third Assistant Resident in Pathology for one year, beginning July 1;
Dr. William L. Dunn as First Assistant Resident in Pathology for one year, beginning July 1;
Dr. Frederick A. Horner as Visiting Physician in Children's Medicine pro tempore, for the month of October 1958;
Dr. Herbert I. Krickstein as Third Assistant Resident in Pathology for one year, beginning July 1;
Dr. Eliot M. Slater as Assistant Resident in Anesthesia, beginning June 1.

At that same meeting the Trustees voted that Sir Geoffrey Jefferson be invited to give a Richardson Lecture at the Hospital in November 1958.

At their meetings on February 4 and 20, the Trustees voted:

That the resignation of Dr. Louis Nathan from the position of Clinical Associate in Orthopedic Surgery be accepted, with continuing privileges at Baker Memorial;
That the appointment of Dr. Donald J. Glotzer as Acting Assistant Resident in Pathology be extended from January 1 through March 31, and that he be appointed First Assistant Resident in Surgery, beginning April 1.

To appoint:

Dr. Frederick W. Ackroyd as Assistant Resident in Pathology, for the period February 16 through June 30, and as Clinical Fellow in Pathology for one year, beginning July 1;
Eugene T. Agard, B.Sc. as Assistant Physicist in the Department of Radiology, beginning January 19;
Dr. Frank W. Bora, Jr. as Assistant Resident on the Orthopedic Service for one year, beginning February 4;
Dr. Robert D. Brodell as Exchange Assistant Resident on the Children's Medical Service, for the period January 21 through March 2;
Dr. James B. Caulfield as Assistant in Pathology, beginning July 1;
Maurice Cohen, Ph.D. as Consultant in Physical Metallurgy on the Orthopedic Service;
Dr. David A. Drachman as Resident in Neurology, beginning July 1;
Dr. Robert Fienberg as Clinical Associate in Pathology, beginning January 1;
Dr. Martin H. Flax as Clinical Fellow and Acting Resident in Pathology for one year, beginning July 1;
Alan J. Hodge, Ph.D. as Consultant in Biophysics on the Orthopedic Service, effective January 1;
Dr. W. Scott James as Exchange Assistant Resident on the Children's Medical Service, for the period March 3 through April 11;
Dr. Paul R. McHugh as Resident in Neurology, beginning July 1;
Dr. David G. Satin as Assistant Resident in Psychiatry, beginning July 1;
George Scatchard, Ph.D. as Consultant in Physical Chemistry on the Orthopedic Service;
Dr. Richard J. Stenger as Assistant in Pathology, beginning July 1.

The Trustees also voted to reappoint Drs. Leo B. Burgin, Edward Hamlin, Jr., and Vincent P. Perlo on the Social Service Advisory Committee, for a three-year term; and to appoint Dr. Victor G. Balboni and Mrs. James Howard Means as members of the Social Service Advisory Committee, for a three-year term.

At their meetings on February 11 and 18, the General Executive Committee voted:

To extend the appointment of:

Dr. Frederick A. Horner as Clinical and Research Fellow in Neurology, assigned to Electroencephalography, for the five additional months of January 1 through May 31.

To reappoint:

Dr. J. Gordon Millichap for one year, beginning July 1, with a change of title from Clinical Fellow in Neurology to Clinical and Research Fellow in Neuropathology, working under Dr. Dodge in Pediatric Neurology;
Dr. Edward F. Rabe as Clinical Fellow and Acting Assistant Resident in Neurology for one year, beginning July 1.

To appoint:

Dr. Barry G. W. Arnason as Clinical and Research Fellow in Neurology for one year, beginning July 1;
Dr. Ingrid Gamstorp as Clinical and Research Fellow in Neurology and Pediatrics, for a period of nine months, beginning January 1;
Dr. Jørgen G. Jacobsen as Clinical and Research Fellow in Medicine, effective April 1;
Dr. Bruce W. Konigsmark as Clinical Fellow in Neuropathology for one year, beginning July 1;
Dr. Chaim I. Mayman as Clinical and Research Fellow in Neuropathology for one year, beginning July 1;
Dr. Hugo W. Moser as Clinical and Research Fellow in Neuropathology for one year, beginning July 1;
Dr. Elizabeth Struppler as Research Fellow in Neurology, for a period of six months, beginning January 1;
Dr. Octavio B. Tourinho as Clinical and Research Fellow in Surgery for one year, beginning February 1;
Dr. Gerald F. Winkler as Clinical and Research Fellow in Neuropathology for one year, beginning July 1;
Dr. Irving Zieper as Clinical and Research Fellow in Neuropathology for one year, beginning July 1.

Feby 23. 1827

MASSACHUSETTS EYE & EAR INFIRMARY

TEMPORAL BONE LABORATORY

A report to the May 1955 NEWS mentioned that moving into our new research wing would pave the way to expanded activity and that additional workers would be welcomed. Both expectations came true.

Although histopathological work has included organs from the entire field of otolaryngology, the central problem, especially in the technical sense, has remained the processing of temporal bones. Long training and dexterity are needed for this task, even when it is restricted to the usual laboratory animals. But with human material, the difficulties multiply. The hardest bone of the organism encloses the delicate sense organs, yet both have to be processed to be viewed together under the microscope. As this calls for sound experience, scarcity of adequate technical personnel keeps down the number of laboratories equipped for this kind of work. The official list of the American Academy of Ophthalmology and Otolaryngology contains no more than twelve institutions prepared to process temporal bones for histological investigation; and no more than four of these twelve are found on the East Coast.

As a consequence, widely varied material is constantly flowing into this laboratory. Human specimens of clinical importance are its central interest. Animal material arrives from a large number of institutes not equipped for temporal bone work but which are still eager to add information from this special direction to their experimental findings in other organs.

With this inundation by current work, a time lag in reaching the stage for microscopy is often unavoidable because of the long months required in histological preparation of temporal bones. A batch of animal heads may suddenly arrive, representing several months of activity for the technician. Miss Dorothy Linden, the mainstay of the laboratory, has to struggle valiantly indeed to keep our head above water.

Investigation into the pathology of congenital deafness—under a Public Health Grant—was prompted by the fact that, in many conditions where maternal disease was followed by deafness in the offspring, the pathologic basis remained unexplored. For a long time, well-defined and classified abnormalities in the hearing organ have been known—or at least were supposed—to form the basis for congenital hearing loss. After lesions in the wake of rubella of the mother in early pregnancy came into the limelight (among which deafness occupied a prominent position), the large and poorly explored field of embryopathies began to receive due attention. This laboratory considers itself lucky to have secured the wholehearted collaboration of the departments of pathology at the Massachusetts General Hospital, the Lying-in Hospital, the Children's Medical Center, and the Laboratory of Developmental Pathology in collecting rare specimens from the prenatal, perinatal, and early postnatal periods. Rubella, erythroblastosis fetalis, toxoplasmosis, and poliomyelitis have come under observation. This material was made up entirely of "firsts". So it was felt necessary to have recourse—to gain an adequate background for comparison —to conditions which had been thoroughly analyzed, at least in adult pathology: syphilis, nephritis, diabetes. In the latter field some of the findings turned out—to our surprise—to be again "firsts" in the field of intrauterine pathology. The rule was observed to investigate only such cases where a maternal disease had been followed and documented by competent observation through an adequate period. Only in this way was it possible to build on a solid basis when interpreting findings encountered in the hearing organs of the offspring.

Most welcome material for comparison was provided by participating, as to aural histopathology, in the work of other institutions engaged in animal experimentation on problems of their own. Along this line, the Department of Developmental Pathology of the Harvard Medical School and the Roswell Park Memorial Institute of Buffalo, N. Y., offered collaboration on the effects of radiation: the latter in the analysis of the effects of poisoning—by arsenious acid, and again by fluoroacetate, a potent antimitotic by enzyme prohibition; the Harvard School of Public Health in experiments on anoxia.

Around a subject which depends upon a random flow of material, no final integration can be expected at this time. But some features have started to emerge with fair regularity. The ear shows a remarkable resistance amid far-reaching destruction of other organs, even of those in its vicinity, such as brain and eye. While the ear goes on, seemingly undisturbed, to normal development, signs of vascular damage become manifest in characteristic locations. Fragility of the vessels will then show its effects at any period of strain in intrauterine life, at delivery, in the postnatal period. Vascular lesions are responsible, for example, when slow deterioration results in the comparatively later appearance of deafness, around puberty, as in syphilis and diabetes. Yet the wide field—embryopathies of the hearing organ—is hardly scratched at its surface; diligent search for related material, followed by careful processing and interpretation, is urgently needed.

In the field of otolaryngology, animal experimentation is severely handicapped by frequent and extensive pathology in the ear, and in the nasal and paranasal spaces. It is almost impossible to recognize a pathological condition in the living animal: rhinoscopy cannot be applied, X-ray is of little avail, and even serious otitic processes remain hidden, as the drum membrane often remains unperforated. Physiological, pharmacological, behavioral experimentations suffer—thus, a serious setback. Rat, guinea pig, rabbit were investigated in this laboratory, with the purpose of tabulating the changes, and it was found that roughly half the animals were affected by severe, hemorrhageous, suppurative conditions. Disregard of this factor can result in bizarre distortion, as in experimentation in audiology; or when the classic animal of comparative psychology, the rat, is supposed to solve maze problems with the help of its foremost sense—olfaction—and the animal is suffering from a hemorrhageous-suppurative pansinusitis. It would seem that only embryonic material is safe from this source of grave error; after birth no way is left except to carry out a careful postmortem pathohistological investigation and omit from the final tabulation individuals found to be infected. A number of publications from this laboratory have tried to elaborate the statistical and pathohistological aspects of this problem. Lately, collaboration with the Lobund Institute of Notre Dame University has given some hope that germfree breeding, in case it is more generally exercised, may be the way to procure experimental animals with uninfected ears and upper airways—uninfected, that is, for at least a few weeks after removal from the incubator, or remaining uninfected when the nature of the experiment permits the animal to stay permanently in the apparatus.

In the field of phonetics, the supraglottic speech organs were investigated, in collaboration with the Department of Slavic Languages of Harvard University, supported by a grant from the Rockefeller Foundation. The findings could be correlated with data obtained on newborn larynges, in cases with laryngeal stridor, from the Children's Medical Center. The laboratory participated in the launching of a new periodical—*Logos,* New York, National Hospital of Speech Disorders—comprising the entire field of speech communication.

Another field of interest to this laboratory is comparative anatomy. A number of whale's ears are ready, in sectional series, for interpretation. Here, as in other instances, collaboration by the Museum of Comparative Zoology, Harvard University, has been very helpful. The Field Museum of Natural History, Chicago, released the larynges of a rare species of tropical bats, to be studied in connection with the echolalia orientation of these mammals.

Comparative phonetics are represented with studies on the anatomical basis of phonation; the Wenner-Gren Foundation for Anthropology showed its interest in these studies by supporting them with a grant. These investigations yielded a conception regarding the controversial relation between structure and (phonatory) performance in animals.

During the last two years, the collection of sectional series of temporal bones underwent a radical systematization in storage, cataloguing, and description. Individual study of the material is open to every interested person and is facilitated very much by the current system. We have to thank Dr. Paul I. Yakovlev, Director of the Warren Museum of Pathology, for his consent to transfer the large Greene collection of temporal bones to the Infirmary. This very extensive macroscopical collection, together with our collection of sectional series, offers an all-round basis for temporal bone studies. A selection of our histological sections serves now as material for the examination on pathology at the American Board of Otolaryngology.

Among the authors of publications originating from this unit, nine members of the staff of the Infirmary are represented, as well as others from the Harvard Medical School and institutes within and outside the United States. During the last year, Dr. R. Niccoli Vallesi, assistant professor at the University of Florence, Italy, spent six months in the laboratory as a Fulbright fellow and published an essay on the problem of congenital hydrocephalus and the ear. Dr. R. Hinojosa, with a grant from the Cardiologia Institute of Mexico City, spent five months here studying general otolaryngologic pathology; part of these studies resulted in a publication on aural pathohistology in a case of pseudohypoparathyroidism. Dr. J. Sade came from Tel Aviv, with support of the Wenner-Gren Foundation for Anthropology, to pursue comparative anatomical studies on the larynges in higher monkeys.

The modest framework of the laboratory—one technician, two rooms—gives hardly any idea about the amount of material processed routinely or about the endless variety of problems for a large area converging at this clearing center. On the other hand, probably, this "bursting at the seams" testifies to the vitality of the unit. We propose to carry on in the expectation that plans for considerable expansion in personnel and physical plant will materialize.

Moses H. Lurie, M.D.,
Director of Otolaryngological Research
George Kelemen, M.D.,
Research Associate

The Executive Committee of the Massachusetts Eye and Ear Infirmary made the following appointments at their meeting held on January 19:

Dr. Arthur F. Calnan—Assistant in Ophthalmology;
Dr. Andrew J. Gay, Jr.—Fellow in Ophthalmology, assigned to the Howe Laboratory, for the period January 1 through June 30;
Dr. William S. Hagler—Fellow in Ophthalmology, assigned to the Retina Service, for one year, beginning July 1;
Dr. Leon J. Richard—Fellow in Ophthalmology, assigned to the Retina Service, for one

year, beginning May 1;
- Dr. Felix N. Sabates—Fellow in Ophthalmology, assigned to the Retina Service, for one year, beginning July 1;
- Dr. Benjamin Ziv—Fellow in Ophthalmology, in charge of the new Electro-Retinography Laboratory.

At a meeting of the Board of Managers of the Massachusetts Eye and Ear Infirmary, held on February 18, the following appointments were made:

- Dr. Thomas P. Cronin — Assistant Surgeon in Ophthalmology;
- Dr. Edwin B. Goodall — Assistant Surgeon in Ophthalmology;
- Dr. Linley C. Happ — Assistant Surgeon in Ophthalmology;
- Dr. John M. Hill — Assistant Surgeon in Ophthalmology.

At a meeting of the Executive Committee of the Eye and Ear Infirmary, held on February 24, the following appointments were made:

- Dr. Paul A. Chandler — reappointed as Associate Director of Ophthalmic Resident Training;
- Dr. Raniero Di Piero — Fellow in Anesthesiology for one year, beginning February 23;
- Dr. Carl Kupfer — Assistant in Ophthalmology;
- S. Peter Marfey, Ph.D. — Biochemist in Otolaryngology;
- Dr. Edward C. Sweebe — Fellow in Ophthalmology;
- Dr. Arthur S. Woodward — Fellow in Otolaryngology for one year, retroactive to July 1, 1958.

The resignation of Dr. Irvin S. Taylor was accepted.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

General Surgery

McCann, M. B., Trulson, M. F., Waddell, W. R., Dalrymple, W., and Stare, F. J.
The effects of various vegetable oils on the serum lipids of adult American males.
Am. J. Clin. Nutrition 7:35.

Waddell, W. R., and Grillo, H. C.
Metabolic effect of fat emulsion.
Am. J. Clin. Nutrition 7:43.

Physical Medicine

Watkins, A. L.
The nervous system — Rehabilitation of the patient with hemiplegia.
In Current therapy — 1959, sec. 12, p. 499.

Watkins, A. L.
Therapeutic exercise in rheumatoid arthritis.
Arthritis & Rheumatism 2:21.

⁂

SOUTH WITH THE SUN

Last November I had the good fortune to venture forth from my usual confines in the Bulfinch Basement and journey to Porto Alegre, Brazil, to give a two-weeks' course on "The medical uses of radioisotopes". The trip was jointly sponsored by the Instituto de Aposentadoria e Pensoes Dos Comerciarios (IAPC) and the Rio Grande de Sul State Medical Society.

The IAPC, one of a group of semiautonomous governmental agencies analogous to our Social Security Administration, provides medical care and pensions to commercial workers in return for around a 15% (7½ employer, 7½ employee) tax on their wages. The IAPC center in Porto Alegre recently set up an elaborately equipped Isotope Unit, largely on the initiative of their radiologist, Dr. Levy de Albuquerque Souza. Twenty-six physicians from Porto Alegre and other cities throughout Brazil (a country larger than the U.S., I found) gathered there for the session. Although I had ample assurance that I need not speak Portuguese, it developed that about one-half of the group understood my English very poorly. We, therefore, ended up with translating everything, for about eight hours a day. This was arduous, but in one respect rather fortunate, since it gave me time to compose my thoughts while my Brazilian colleague explained the previous sentences in his own tongue.

My hosts were fabulously hospitable—so much so that the experience now seems almost like a story I recently read in a book! Eating huge meals and sampling the local spirits was a necessary part of my visit, and a pleasant one. Rio Grande de Sul wine was excellent—both red and white were full-bodied, somewhat fruity, yet dry. The beef was plentiful and good, usually served broiled on a spit. Interestingly, a well-advertised "regional" dish, the "Galleto de primo canto" or the "Chicken's first song", turned out to have been introduced by Italian cooks only four or five years ago! Lunch, with wine, always lasted for two hours, and was followed by an excellent but thimble-sized cup of coffee. This combination had a marked relaxing and even soporific effect. I would like to suggest that the practice be inaugurated in the White Building dining rooms at once. Certainly, our staff would survive longer on this regimen.

Brazil seemed to be a nation undergoing rapid growth, with abundant natural resources, but a weak industrial base. It is at present gripped by inflation, and the middle class is especially hurt. Naturally, leftist organizations are busy kindling strife and resentment among the laborers. Brazil is presently struggling to overcome deficiencies in basic industry, and in transportation.

Medical care in Porto Alegre appeared not greatly different from ours, but over one-half is supplied via the government "Institutes". This portion is rapidly enlarging, and the Brazilian M.D.'s know they will face the problem of essentially complete government medical care within a few years.

Most astonishingly, in Porto Alegre was a huge medical center being developed by the University Rio Grande de Sul. The plant is ultramodern in design and is in a "garden" setting. The fact that work seems to be progressing rapidly after years of delay is attributed by some to the recent appointment of a surgeon as Rector of the University!

My wife joined me in Porto Alegre toward the end of the course and after a round of farewells we flew on to Buenos Aires. In Buenos Aires we met a large group of endocrinologists, including Drs. Felipe A. de la Balze (res. fel. *M.* 1946), Alberto B. Houssay (clin. & res. fel. *M.* 1950), Enrique del Castillo, J. Reforzo Membrives, friends of Drs. Means and Stanbury. During our visit of three days I toured the hospitals and laboratories and gave informal talks, while Mrs. DeGroot surveyed the shops on Avenida Florida, which, alas, compare favorably with those of Paris. Dr. Bernardo Houssay was a most gracious host at a luncheon which, in typical Argentinian style, consisted of three meat courses and two varieties of wine.

We went next to Mendoza, the capital of Argentinian wine-making industry and, fortuitously, an area of endemic goiter. Readers of THE NEWS probably will recall the 1951 expedition to Mendoza by Drs. Stanbury, Brownell, and Riggs, and their subsequent report published by the Harvard University Press entitled "The adaptation of man to iodine deficiency". Our Thyroid Laboratory has continued to maintain close contact with Dr. Hector Perinetti, Director of the Instituto del Bocio (Goiter Institute). This Institute recently received financial aid from a Rockefeller grant to its parent University, and isotope studies of endemic goiter will be accelerated when their new equipment arrives. The results of salt iodination, mandatory for the last seven years, have not yet been studied.

In December the University de Cuyo Medical School in Mendoza graduated its second class. The Medical School has a six-year program but, in contrast to other Argentinian schools, has a selective admission policy. I was impressed by the research going on under Dr. Fasciola in the Department of Physiology on a biosynthesized polypeptide with marked hypotensive properties. The School is at present situated in the Municipal Hospital Building, where ample clinical material is available. The Hospital, in similarity to many South American institutions, was characterized by more space than needed for both clinical and laboratory use.

Mendoza is a delightful town, on an arid plateau at the very foothills of the Andes. Irrigation and hot weather combine to produce lush vineyards. The province produces vast quantities of superb wines, but none are exported. The explanation, simply, "We drink it all."

The political scene in Argentina was tense during the time of our visit, as Frondizi had just lost his Peronista supporters, and violence threatened over a railroad strike and the recently negotiated oil exploration contracts. Inflation is going on at the rate of several percent per month, despite governmental crackdowns on merchants who increase their prices too actively. A new Chevrolet, for instance, now costs over $10,000 in Argentina.

The organization of their medical profession is quite different from ours. All who wish (many thousands, actually) may enter the free six-year medical schools, although only 300 to 400 ultimately graduate. The sixth year of medical school provides much practical experience, but internships and residencies are not yet established. Instead, most practising physicians donate each morning to the City Hospital, caring for service cases and, in turn, furthering their education. There is general agreement that this arrangement is not consonant with changing times, and should be eliminated.

After four days in Mendoza, we flew, literally, *through* the Andes, to Santiago, and there visited Dr. Jorge L. Litvak and Dr. Jose Barzelatto, both former Fellows in the MGH Thyroid Laboratory.

After this, we flew north, via La Paz, Lima, Panama, and then, with a descending thermometer, to Miami and New York. At Idlewild we put back on the coats we had carried for eight thousand miles. In what seemed like only hours, I was again dodging laundry trucks in the spacious corridors of the Thyroid Laboratory.

Leslie J. DeGroot, M.D.,
Clinical and Research Fellow in Medicine

Brief bits:—

Mr. Alexander Armour, Director of Purchasing at McLean Hospital, was one of the leaders at a program for registered dieticians, held February 16-20 in Detroit, under the sponsorship of the Catholic Hospital Association of the United States and Canada. Mr. Armour also led a conference on food purchasing at the New England Hospital Assembly, held March 23-25 at the Statler Hilton Hotel in Boston.

Dr. Chester M. Jones served as Physician-in-Chief at the Rhode Island Hospital for three days last February. Every year the Rhode Island invites outstanding physicians to join its medical staff for a few days. Dr. Jones was the ninth to be invited.

VOLUNTEER GROUPS

MGH STAFF WIVES ASSOCIATION

Eight concerts have been given in our Chapel during the past three months, planned by the Staff Wives Association and under the able direction of Mrs. Milford D. Schulz, chairman of the Music Committee. As always, these concerts have been deeply appreciated by the many wheel-chair patients who have been brought from the various floors of the Hospital, entertained in the Chapel, and returned to their respective areas by members of our Association. Any vacancies left in the Chapel after the patients are in place are always filled by members of the Hospital personnel, who enjoy the talents of the fine artists.

As he has done each year since the concerts were instituted, the renowned pianist, Rowland Sturges, appeared—to open the series this season. Three Staff Wives — Mrs. Josip Matovinovic, a pianist, Mrs. Nathan B. Talbot, a vocalist, and Mrs. John B. Stanbury, a violist—have been among the artists giving the concerts. The Hospital family has been further represented by Miss Adele Khoury from Dr. Beecher's office and Miss Natalie Goregliad of Dr. Nardi's department, both of whom gave song recitals. On February 18, the twenty-four girls of the Buckingham School Special Chorus charmed their audience.

Concerts are planned for the remainder of the season at two-week intervals, on Wednesday afternoons at three o'clock. Watch the bulletin board at the Staff Wives Reception Center for the detailed programs.

DISTAFF CLUB

Under the supervision of Mrs. W. G. Constable, members of the Distaff Club met on February 10 in the Pent House, to mount pictures for the art wagon. Mrs. W. M. Daggett was the hostess for the evening.

At the March 19 meeting our topic was interior decorating, and we all learned many new and creative ideas.

No. 82 in a series of Staff photographs
Dr. Hermes C. Grillo—Assistant in Surgery

Mrs. J. C. Oakley was hostess for the refreshment period after the talk.

Dr. Robert Anderson of the Harvard Graduate School of Education will speak to the Club on April 28. His subject, "Trends in elementary education", is of great interest to us all. We are looking forward to the meeting and to having the members of the MGH Staff Wives Association and the Wives of the Boston City Hospital House Officers as our guests.

New addresses:—

Dr. Shen Kuang Wang (a.r.s. *Or.* 1957), 624 Fairmont Ave., Fairmont, W. Va.
Dr. William C. Wigglesworth (*E.S.* 1945), 78 County Rd., Ipswich, Mass.

* * *

This very interesting letter has come from Lt. William L. Strickler, MC, USNR (a.r.s.), Station Hospital, Navy 103, c/o Fleet Post Office, New York, N.Y. The letter was written on October 25.

Enclosed is my check for The News. Thanks very much for sending it. The News certainly helps close the gap between Newfoundland and Boston.

Since leaving the Surgical Service, I have been working as the surgeon at the U.S. Naval Station hospital here in Argentia. We serve about 8,000 military men and their dependents. We have a 60-bed hospital, with a staff of 8 doctors and 7 nurses. I replaced Jim Rosenkrantz up here, incidentally.

So far, my most interesting experiences have been taking care of the 18 survivors of the recent airplane crash in Placentia Bay, and a 3-day voyage, with helicopter landing, to see a man with head injury on an island outpost following hurricane Helene.

This coming week three of us will attend a medical convention at St. John's, which is the capital as well as the oldest city in North America. John Cabot landed there in the 1500's. It is also the point from which Marconi sent his first trans-Atlantic message.

Argentia is the main airbase for a fleet of $9,000,000 Super Constellation radar patrol planes which provide the distant early warning network over the North Atlantic. These Navy pilots have to be good, because not only is Argentia the only year-round ice-free port in Newfoundland, but it is the most fogbound weather station in the world.

The country is beautiful and abounds with good trout and salmon fishing. Jim Rosenkrantz had quite a reputation as a fisherman before he left. There are many other activities going on up here, in addition, and the time passes very quickly and enjoyably. Nevertheless, I am looking forward with much eagerness to returning to Boston and the M.G.H.

Dr. William J. James (r.s. *N.S.* 1949) sends us this note from 27 Live Oak Drive, Ventura, California:

On September 1, 1958, I was retired from the U.S. Navy with the rank of Rear Admiral, after having served twenty-seven years as a medical officer in a regular and a reserve status. I have opened practice in Ventura in the specialty of Neurosurgery.

This brief line has come from Col. Henry A. Kind, MC, USA (*C.M.* 1935):

Have been in the Army Medical Corps for 23 years and expect to make it 30!

THE NEWS

1811

No. 186 Boston, Mass. May 1959

THE SILVER IMAGE—1821-1959

Most doctors are familiar with practical photography and many are using it in scientific research, but how many are familiar with its background? How many can name the physician who touched off a complete revolution in photography about 8 decades ago?

When the Massachusetts General Hospital was incorporated in 1811, photography did not exist, although the pioneers of photochemistry had long been at work on the idea. Johann Schulze, a natural philosopher in Germany who gave lectures in anatomy and surgery, had published his demonstration of photosensitivity in 1727. He admitted sunlight through the openings of a stencil into a flask containing chalk and lunar caustic (silver nitrate), thereby obtaining a momentary dark image. Exactly 50 years later, the Swedish chemist Scheele found that luna cornea (silver chloride) is sensitive mostly to the violet and blue portions of Newton's color spectrum, that the silver salt is reduced to dark metallic silver by sunlight, and that ammonia would separate the darkened salt from the unchanged salt by dissolving the latter. About 1800, Wedgwood and the chemist Davy of England obtained evanescent "profiles" on sensitized paper by a simple contact method, but they failed in trying to combine photochemical and optical principles in the camera obscura. Subsequent pioneers followed independent lines, but they were all trying to find a chemical agent that would bring out the image faster than sunlight alone, and a suitable solvent that would arrest the process of development at the proper moment — without affecting the silver image.

A few years after the opening of the M.G.H. in 1821, Niépce of France made a primitive photograph of his courtyard (exposure time 8 hours) on a pewter plate, which is now preserved in the Gernsheim collection in England as the world's oldest surviving photograph. Photomicrography is nearly as old, for in 1835 Fox Talbot of England made crude photomicrographs on silver chloride paper of objects magnified 17 times. Two years later, another Briton named Reade was making photomicrographs of objects enlarged 50 to 100 times.

Reade was the first, in 1837, to use hyposulphite of soda ("hypo", or sodium thiosulfate) as a fixing agent. It seems strange that the pioneers took so long to become acquainted with hypo, which had been described by Herschel in 1819. Its solvent action upon silver nitrate and chloride was also described shortly afterward in Brande's *Manual of Chemistry* (London). The explanation for the delay was probably due to the lack of communication among the scientists and inventors of that time.

Fox Talbot's negative-to-positive paper process was published prematurely in England in February 1839 and reprinted in America 2 months later. Two Harvard College seniors, Edward Everett Hale and Samuel Longfellow, then succeeded in making a dark brown print of Harvard Hall in which a bust of Apollo "came out" distinctly on a window sill. In his later method, Fox Talbot used silver iodide or bromide as the sensitive material and gallic acid as the developer. The waxed paper negative being translucent, positive copies could be printed in quality, although the fibers in the negative caused fuzziness in the prints.

The details of the process of Daguerre, a former partner of Niépce, were revealed to the world at an adroitly staged joint session of the Académie des Sciences and the Académie des Beaux Arts in Paris on August 19, 1839. Daguerre had stumbled upon the phenomenon of the latent image when an underexposed iodized silver plate was accidentally developed by mercury vapor. Being a direct positive on metal, the daguerreotype could not be used as a negative for duplication; however, it could be converted by an engraver into an etched printing plate.

It would be difficult and perhaps fruitless to try to ascertain who made the first daguerreotype in New England, but it is a historical fact that one of the claimants of this honor was Dr. Henry Coit Perkins of Newburyport, who, in 1866, was elected president of the Massachusetts Medical Society. In Boston, Albert S. Southworth and Josiah J. Hawes established a daguerreotype studio at 5½ Tremont Row (Scollay Square). In their hands the craft became art; according to Beaumont Newhall of the George Eastman House in Rochester, N. Y., they produced many of the finest daguerreotypes ever made, some of which are now in the Boston Museum of Fine Arts and the Metropolitan Museum of Art in New York. Southworth and Hawes made this interesting statement in a long advertisement placed in the 1852 *Massachusetts Register and Business Directory* (pp. 327-328): "We have made several pictures of the Surgeons of the Massachusetts [General] Hospital with the patient under the influence of ether, all accurate likenesses." It is reasonable to believe that the 3 daguerreotypes which are in safe keeping in the MGH Archives and which comply with the above description were produced by Southworth and Hawes.

The daguerreotype found only limited use in medicine, but Dr. Henry J. Bigelow, an MGH surgeon who regularly employed a medical artist, had daguerreotypes taken of some of his patients. Evidence of this may be found in the *Descriptive Catalogue of the Warren Anatomical Museum* (Boston, 1870), which was compiled by Dr. John B. S. Jackson, curator of the museum and an MGH physician. This museum was in the Harvard Medical School, then located close to the Hospital. Item no. 3004-5 in the catalogue (p. 652) reads in part: "Daguerreotypes of a boy, eleven years old, and showing quite a prominent tumor below the lower jaw. . . . the case occurred in 1851." These daguerreotypes were given to the museum 7 years later by Dr. Bigelow.

A new era of photography opened in 1851 when Scott Archer of England introduced the wet collodion emulsion, which was coated upon a glass plate. In America the technique was mastered by John Whipple of Boston, whose work drew international recognition. The other professionals in this country, even the renowned Mathew Brady of New York, had to come to Whipple's studio on Washington Street to relearn their craft as the popular demand for daguerreotypes declined. The collodion wet process has survived in some methods of photomechanical reproduction and was recently given a trial in radioautography.

Oliver Wendell Holmes, who was an MGH physician and a Harvard professor of anatomy and physiology as well as a writer, learned photography from Whipple's partner, James Black. With characteristic wit, Holmes described the sensitized plate as a "mirror with a memory". He became fascinated with the binocular effect of the stereoscope, and invented the simplest and best stereographic hand-viewer, which was mass-produced by Underwood and Underwood. He also submitted articles on photography to the *Atlantic Monthly,* in one of which he presented an analysis of the act of walking based on a series of stereoscopic views. Perhaps someone may some day bring to the MGH Archives a stereograph of the Bulfinch Building as it looked a century ago.

The *Boston Medical and Surgical Journal* published an editorial on December 10, 1857, complimenting Dr. John B. Brown, the pioneer orthopedic surgeon of Boston and formerly of the MGH staff, for his use of photography in documenting the progress of his patients. It was also stated that "the daguerreotype apparatus may be fairly considered one of the articles of the surgeon's armamentarium". On September 2, 1858, the same journal presented another editorial on the same subject, requesting the medical profession to make more use of photography and stating: ". . . we would express the hope that our hospitals and similar institutions may have photographists attached to them, in like manner as they now have microscopists, pathological anatomists, chemists, etc.".

Several branches of applied photography had their beginnings in the wet plate era. For example, the larynx was photographed successfully in 1861 by the physiologist Czermak of Vienna. The Young-Helmoltz theory of color vision was demonstrated photographically in 1861 by the British physicist Clerk Maxwell. This event set in motion decades of experiments in color synthesis based on the additive principle (combining primary colors to produce a desired color). Several years later the subtractive principle (subtracting colors from white light to produce a desired color), the basis of most color processes today, was described clearly by du Hauron.

One of the earliest photographic prints that can be found in the MGH patient records is dated 1863. A young farmer was admitted to the service of Dr. Henry J. Bigelow with a huge enchondromatous tumor of the scapula, which on subsequent autopsy was found to weigh 31 pounds. The case history appears in the MGH *Surgical Records* (East), vol. 111, p. 186, with 4 small prints pasted thereon; the case was reported in the *Boston Medical and Surgical Journal* for March 31, 1864. It is also referred to in items 3007-18 (pp. 653-657) in the previously mentioned *Descriptive Catalogue of the Warren Anatomical Museum,* with this statement: "Large photographs . . . taken by one of the best artists [James Black] in the city, whilst the patient was in the hospital. A duplicate of one of them is in the Army Med. Museum, at Washington." In the introduction to this catalogue, Dr. J. B. S. Jackson wrote that the museum possessed 60 photographs and an unspecified number of daguerreotypes. Several specimens of wet plate photography, including ambrotypes, are preserved in the MGH Archives. The ambrotype was merely an underexposed collodion glass negative backed with a dark surface so that the image could be viewed directly by reflected light, as in the daguerreotype.

The event that was to revolutionize photography occurred in 1871, when Dr. Richard L. Maddox, a British physician engaged in photomicrography, reported his "gelatino-bromide" emulsion, which could be spread on a glass plate, allowed to dry, and stored in quantity for future exposure. When Bennett of England, who ripened the gelatin emulsion by heat, took pictures in 1878 at snapshot speed (1/25 of a second), the collodion wet plate was doomed.

Orthochromatic emulsions had become possible when Vogel of Berlin discovered in 1873 that the addition of aniline and other dyes to the silver bromide emulsion would correct its relative insensitivity to green, thereby making more accurate the rendition of natural tonal values into the black-and-white scale. When critics attacked Vogel's theoretical basis, Dr. Robert Amory of Brookline, Massachusetts, was able to demonstrate its validity by spectrum analysis of an emulsion sensitized with eosin.

Rapid serial photography of figures in motion was begun in America by Muybridge, who set up a battery of cameras, and in France by the physiologist Marey, who devised a camera gun with a revolving shutter. Their work, together with the improvement of the focal plane shutter, opened the way to motion pictures.

The newly organized George Eastman Company marketed the paper roll film, the transparent celluloid film, and the Kodak camera, which brought push-button picture-taking to a host of amateurs who formed clubs everywhere. The Boston Camera Club was organized formally in 1886.

Articles on the applications of photography were appearing in the medical journals. At the M.G.H. the new photography began to assume the status of an institutional function in 1887, when Mr. Waldo March donated $100 for the purchase of photographic apparatus. According to Washburn's history of the Hospital (p. 136), the task of clinical photography was first assigned to the pharmacy. William A. Cameron was then the Hospital apothecary and his assistant was Charles H. Sampson, who probably did most of the photography. At least, there is a card in the MGH Archives with a notation that Sampson was doing such work for the staff in 1891.

A house pupil named George L. Kingsley donated about $800 in 1890 for a small building to house a photography studio. Before completion of the structure he became ill and died, and the building was named the Kingsley Studio in his memory. It was located near the western end of the Bulfinch Building, beside the corridor that connected the Bulfinch with the 1868 surgical building; in 1901 the Kingsley Studio was moved to a one-story ell in the then new Domestic Building, at the location of the present Blood Bank. Sampson became head apothecary in 1892, with Walter J. Dodd as assistant. In the MGH *Annual Report* for 1895, the year when Walter Dodd became head, the Hospital treasurer began to report expenditures under the account of "Photographic Materials", the sum being $49.53. Dodd was an excellent photographer. When the Roentgen ray was discovered in December 1895, he and his assistant, Joseph Godsoe, immediately became interested. It was taken for granted that the production of X-ray pictures would be a branch of photography, since the silver halide emulsion was sensitive to the newly discovered radiations. Dodd later obtained a medical degree (1908) and became head of what is now the Department of Radiology. He succumbed eventually to the complications of radiation dermatitis, first acquired in 1896 — a martyr to science. Radiography was done on glass plates until about 1920, when these were replaced by the double-coated film. Mr. Godsoe became head apothecary and photographer in 1908, and served the Hospital until 1943.

In the meantime, photography had maintained its steady advance. Various methods of taking and projecting motion pictures were devised, one of them being Thomas Edison's kinetographic camera, which was designed to take 16 pictures per second — a rate in accord with the physiological principle known as persistence of vision. About 1904 Lauste, a former associate of Edison, found a way to record sound and visual images on the same film, which led eventually to optical sound recording. Panchromatic emulsions began to appear after German chemists had discovered that the addition of isocyanine and other complex dyes would extend the sensitivity of emulsions to red and infrared radiations.

About the time of World War I, the MGH pharmacy dropped its side line of photography, and the Hospital then engaged the services of a commercial photographer (Nutting) upon a commission basis. In the middle 1920's the versatility of photography was increased by the extremely fast lenses of the 35 mm. precision cameras, such as the Leica. Their speed was somewhat offset, however, by loss of detail in the image. The development of powerful flashbulbs in 1929 compensated for the lower light transmission of the lenses to which the larger cameras are restricted.

The MGH Board of Trustees, perhaps influenced by the technical advance of photography and by the prospect of an increased volume of clinical photography after the opening of the forthcoming Baker Memorial Hospital (1930), voted to establish a photography laboratory in 1927, although it was not until 3 years later that Mr. Wilbour C. Lown was appointed our first full-time staff photographer. Space was provided in the basement of the Bulfinch Building, which now seems so cramped.

The work was limited at first to black-and-white processes, although workable color processes had already appeared on the market. The first widely successful color process was Kodachrome (1935). After the Cocoanut Grove fire of November 28, 1942, numerous photographs in Kodachrome were taken (mostly by Mr. Bruno Micheleit) to depict the various aspects of the treatment of the burned victims brought to the M.G.H., and the classic symposium report that takes up the entire June 1943 issue of *Annals of Surgery* has an impressive color section containing forty-nine of these pictures.

When Mr. Lown joined the Armed Forces in 1944, Richard St. Clair was appointed head photographer and Donald C. Withee his assistant. Mr. St. Clair was replaced by Mark J. McCann in 1947. Mr. Withee succeeded McCann as department head in 1952, and since that time his staff has grown to 5 assistants and associates. Frank T. McCarthy and Stanley M. Bennett have alternating schedules, so that while one is taking pictures in the studio, wards, operating rooms, or laboratories, the other is busy with the developing and printing. Miss Gerdi A. Loeser is the department's expert on 35 mm. transparencies. The 2 young ladies who greet callers with a smile are Miss Mary T. Burke, secretary, and Miss Dorothy R. Gabardi. They follow each order from its initial requisition form to final delivery of the finished product.

Present-day medical photography requires elaborate equipment and materials, and in the MGH Photo Lab use is being made of 8 types of camera and 20 types of film, the latter ranging from high-contrast lithograph film for photomechanical reproduction to soft film for delineating the minute features of skin tissue in patients or for routine portraiture. The production of black-and-white prints has increased about fourfold during the past 2 decades, many of them being reproductions of charts, diagrams, tables, and radiographs to accompany published works. During the past year, about 22,000 35 mm. slides were made, both in color and in black and white, largely for use as illustrative material for lectures and conferences. This figure represents a decided trend away from the old standard-sized slide. Photomicroscopy is done in the Photography Laboratory for many of the Hospital departments.

Motion picture photography is largely the province of Mr. Withee. In 1957, almost 22,000 feet of film were made, ranging from the time-lapse to the high-speed categories. Many sequences on 16 mm. color film are taken in the operating rooms. A current project, initiated by Dr. George L. Nardi, includes 2 film productions in color and magnetic sound — one showing sphincterotomy and sphincteroplasty in the treatment of pancreatitis, the other showing total esophagectomy with colon or gastric tube replacement. Other color films are produced in association with Dr. John W. Irwin's Microvascular Laboratory. Another type of motion picture is designed to study movement, gait, facial expressions, deformities, and other phenomena observed in patients. A documentary film was made of the treatment of the polio patients at the M.G.H. during the epidemic of 1955. Last year a film was made for the National Cystic Fibrosis Research Foundation, and it is being shown all over the country.

Radioautographs, which would have mystified the medical photographer of a decade ago, are now prepared in the Thyroid Laboratory and processed in the Photo Lab. Such films record tracer particles emitted from radioactive tissue sections and brought into contact with the grains of the silver halide emulsion — an "image" thereby being formed. Radioautography is one practical result growing out of the basic investigation into the most fundamental process in photography — the formation of the silver image. Such research, necessarily of a highly technical kind, is being done at centers such as the Eastman Kodak Company. The sensitivity speck theory of Sheppard (1925) and the Gurney-Mott theory (1938) are undergoing intensive re-examination and modification with the aid of X-ray diffraction analysis and electron microscopy. The theoretical basis of photography has come a long way since 1777, when Scheele exposed luna cornea to the spectrum cast by his prism.

Just as the functions of the Hospital as a whole have multiplied and expanded since its founding, so have those of the MGH Photography Laboratory. In all cases, the most important function is still the one related directly to the patient — clinical photography being a useful adjunct to medical care. In the field of education, a student of photography is often taken under wing; in addition, 7 or 8 students from the MGH School of Medical Illustration are given photographic instruction during their course. With respect to community relations, the services of the Photo Lab are often utilized by outside agencies, such as the newspapers. As for research — if those members of the Hospital staff who apply scientific photography to their research will continue to maintain close liaison with the Photography Laboratory, each function being complementary to the other, notable contributions to medical photography and medical science will be made in the name of the Massachusetts General Hospital.

George Jacobsen

The Board of Trustees, at their meetings on March 6 and 20, voted:

That the records be changed so that the first year of service of Dr. Harold L. May be considered in the rank of Third Assistant Resident in Surgery, rather than Intern in Surgery.

To promote:

Dr. Charles E. Huggins to the position of Resident in Surgery on the West Surgical Service, beginning August 1.

To appoint:

Dr. John R. Baringer as Intern in Medicine for one year, beginning July 1;

Dr. Robert W. Carey as Intern in Medicine for one year, beginning July 1;

Dr. James R. Carter, Jr. as Intern in Medicine for one year, beginning July 1;

Dr. Frank F. Davidoff as Intern in Medicine for one year, beginning July 1;

Dr. Karl Engelman as Intern in Medicine for one year, beginning July 1;

Dr. Paul F. Griner as Intern in Medicine for one year, beginning July 1;

Dr. Arthur L. Herbst as Intern in Surgery for one year, beginning July 1;

Dr. Frederick B. Hodges as Exchange Assistant Resident on the Children's Medical Service for the period March 1 through April 12;

Dr. Lewis P. James, Jr. as Third Assistant Resident in Pathology for one year, beginning July 1;

Dr. David Korn as Intern in Pathology, for the period September 1, 1959 through June 30, 1960;

Dr. Nelson R. Lampert as Intern in Surgery for one year, beginning July 1;

Dr. Lucian L. Leape as Intern in Surgery for one year, beginning July 1;

Dr. Cavin P. Leeman as Intern in Medicine for one year, beginning July 1;

Dr. Robert S. Lees as Intern in Surgery for one year, beginning July 1;

Dr. Raphael H. Levey as Intern in Surgery for one year, beginning July 1;

Dr. Kilmer S. McCully as Intern in Medicine for one year, beginning July 1;

Dr. Alfonso Mangoni as Assistant Resident in Psychiatry for one year, beginning July 1;

Dr. Mart Mannik as Intern in Medicine for one year, beginning July 1;

Dr. Robert W. Milam as Assistant Resident in Orthopedic Surgery for one year, beginning April 18;

Dr. Donald M. Muirhead, Jr. as Intern on the Children's Medical Service for one year, beginning July 1;

Dr. Eldred D. Mundth as Intern in Surgery for one year, beginning July 1;

Dr. Richmond Prescott as Intern in Medicine for one year, beginning July 1;

Dr. John B. Robbins as Intern on the Children's Medical Service for one year, beginning July 1;

Dr. Irwin H. Rosenberg as Intern in Medicine for one year, beginning July 1;

Dr. Kevin G. Ryan as Intern in Medicine for one year, beginning July 1;

Dr. David B. Skinner as Intern in Surgery for one year, beginning July 1;

Dr. William G. Stewart, Jr. as Intern in Surgery for one year, beginning July 1;

Dr. John Urquhart, III, as Intern in Surgery for one year, beginning July 1;

Dr. Elliot S. Vesell as Intern on the Children's Medical Service for one year, beginning July 1;

Dr. Karl H. Wegner as Intern in Pathology for one year, beginning July 1;

Dr. Richard H. Wohl as Intern in Surgery for one year, beginning July 1.

At their meetings on February 25 and during March, the General Executive Committee voted:

To accept the resignation of Elizabeth M. Sparrow, Ph.D. (Mrs. Cobb) from the position of Research Fellow in Medicine, effective as of April 7. It is our understanding that Mrs. Cobb is returning to England;

To extend the appointment of Dr. John B. Tallon as Senior Resident in Orthopedic Surgery from July 1 to August 31.

To promote:

Dr. Stanley P. Bohrer to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. Mortimer J. Buckley, Jr. to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. Willard M. Daggett, Jr. to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. M. Judah Folkman to the position of Second Assistant Resident in Surgery, beginning July 1;

Dr. Abdollah Gashgai to the position of Second Assistant Resident in Surgery, beginning July 1;

Dr. A. Erik Gundersen to the position of Second Assistant Resident in Surgery, beginning July 1;

Dr. John B. Herrmann to the position of Second Assistant Resident in Surgery, beginning July 1;

Dr. Mark M. Kartchner to the position of Second Assistant Resident in Surgery, beginning July 1;

Dr. John L. Lewis, Jr. to the position of Second Assistant Resident in Surgery, beginning July 1;

Dr. John W. Madden to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. Ronald A. Malt to the position of Second Assistant Resident in Surgery, beginning July 1;

Dr. Harold L. May to the position of First Assistant Resident in Surgery, beginning April 1;

Dr. Anthony S. Patton to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. Don C. Pearl, Jr. to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. John T. Porvaznik, Jr. to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. John P. Remensnyder, Jr. to the position of Second Assistant Resident in Surgery, beginning July 1;
Dr. Harold Simon to the position of First Assistant Resident in Radiology, beginning April 1;
Dr. Quentin R. Stiles to the position of Second Assistant Resident in Surgery, beginning August 1;
Dr. Harold C. Urschel to the position of Second Assistant Resident in Surgery, beginning July 1;
Dr. C. Gene Wheeler to the position of Second Assistant Resident in Surgery, beginning July 1;
Dr. G. Melville Williams to the position of Second Assistant Resident in Surgery, beginning July 1.

To reappoint:

Dr. Arthur E. Baue as Second Assistant Resident in Surgery, beginning July 1;
Dr. Donavin A. Baumgartner, Jr. as Second Assistant Resident in Surgery, beginning July 1;
Dr. David L. Collins, Jr. as Second Assistant Resident in Surgery, beginning August 1;
Dr. Laszlo L. Fekete, with a change of title to Research Fellow in Dermatology, effective as of January 23;
Dr. Ruth K. Freinkel as Clinical and Research Fellow in Dermatology for one year, beginning March 1;
Dr. Gilbert Hermann as Second Assistant Resident in Surgery, beginning July 1;
Dr. Walter E. Klingensmith as Second Assistant Resident in Surgery, beginning July 1;
Borge Larsen, M.S. as Research Fellow in Medicine for one year, beginning April 15;
Dr. John A. Mannick as Second Assistant Resident in Surgery, beginning July 1;
Dr. Anthony P. Monaco as Second Assistant Resident in Surgery, beginning July 1;
Annette M. C. Rapin, Ph.D. as Research Fellow in Medicine for one year, beginning February 1;
Dorothy K. Stearns, Ph.D. as Research Fellow in Medicine for one year, beginning January 23.

To appoint:

Dr. Harry S. Abram as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. William J. Adelson as Clinical and Research Fellow on the Children's Medical Service for one year, beginning July 1;
Dr. William C. Amman as Graduate Student Assistant in Medicine, assigned to Allergy, effective as of January 10;
Cecily P. Aronson, M.S. as Research Fellow in Psychology for one year, beginning April 1;
Dr. Jean R. Crabbe as Clinical and Research Fellow in Medicine, beginning July 1;
Dr. Ruben Dardano as Clinical and Research Fellow in Medicine, for a period of four months, beginning February 1;
Dr. David W. Florence as Clinical Assistant in Orthopedic Surgery, for the period April 18 through August 31, with the privilege of assisting Dr. Barr in the care of his private patients. It was further voted to reappoint Dr. Florence as Assistant Resident in Orthopedic Surgery, beginning September 1;
Dr. Robert E. Flynn as Clinical Fellow in Neurology, to act as Assistant Resident in Neurology, assigned to Pediatric Neurology, for one year, beginning July 1;
Dr. John W. B. Forshaw as Research Fellow in Medicine, beginning July 1;
Dr. William A. Hall as Clinical and Research Fellow in Medicine, beginning July 1;
Dr. Sigetosi Kamiyama as Research Fellow in Medicine for one year, beginning September 1;
Shelby Kashket, Ph.D. as Research Fellow in Medicine, beginning July 1;
Dr. Robert L. Kelley as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. William F. McCourt as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. Carlos P. Mora-Mora as Graduate Student Assistant in Orthopedic Surgery, for a period of six months, beginning March 9;
Dr. Alberto Salama as Clinical and Research Fellow in Neurology, for a period of six months, beginning March 1;
Jayantilal M. Shah, S.M. as Research Fellow in Biomechanics on the Orthopedic Service, for the period February 1 through June 15;
Dr. Philip R. Sullivan as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. John D. Turner as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1.

VOLUNTEER GROUPS

Distaff Club

On Friday, May 8, the Annual Spring Dance, sponsored by the Trustees and Directors of the Hospital and the Distaff Club, will be held at the Commonwealth Country Club. We all anticipate a very gay evening, dancing to the music of Sammy Eisen's orchestra.

Plans are being made for the Club's last event of the year. This will be the annual picnic, held some time in the early part of June. Husbands and children are invited.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Endoscopy

Benedict, E. B.
Medical progress: Endoscopy.
New England J. Med. 260:478;535.

General Medicine

Hardy, H. L.
Medical control of beryllium: Discussion of paper by Dr. Zielinski.
A.M.A. Arch. Indust. Health 19:203.

Hardy, H. L., and Stoeckle, J. D.
Beryllium disease.
J. Chron. Dis. 9:152.

Isselbacher, K. J.
Panel: Bilirubin metabolism, as related to other forms of conjugation.
Gastroenterology 36:175;177.

Isselbacher, K. J., and Dawson, A. M.
Nicotinic acid.
Practitioner 182:40.

General Surgery

Churchill, E. D., and Scannell, J. G.
Tumors of the chest.
In Cancer—Diagnosis and treatment, John B. Field, Editor, Boston, Little, Brown and Company, chap. 5.

Finkbiner, R. B., McGovern, J. J., Goldstein, R., and Bunker, J. P., with the technical assistance of Yanakis, A., and Langer, R.
Coagulation defects in liver disease and response to transfusion during surgery.
Am. J. Med. 26:199.

Laboratory Science

Gergely, J.
Muscle proteins and energy utilization.
Ann. New York Acad. Sciences 72:12;538.

Psychiatry

Benda, C. E.
Dysraphic states.
J. Neuropath. & Exper. Neurol. 18:56.

Benda, C. E., and Melchior, J. C.
Childhood schizophrenia, childhood autism, and Heller's disease.
Internat. Record Med. 172:137.

BIOGLETS

Dr. Barry G. W. Arnason, Assistant Resident in Neurology—born in Winnipeg, Manitoba, Canada, August 30, 1933; Intern, rotating, Winnipeg General Hospital, 1956-57; M.D., Manitoba Medical College, 1957; Assistant Resident in Medicine, Winnipeg General Hospital, 1957-58.

Dr. Donavin A. Baumgartner, Jr., Assistant Resident in Surgery—born in Cleveland, Ohio, March 10, 1930; A.B., Princeton University, 1952; M.D., Harvard Medical School, 1956; Intern and Resident in Surgery, Lakeside Hospital, Cleveland, Ohio, 1956-58; married.

Dr. Stanley P. Bohrer, Intern in Surgery—born in Washington, D.C., May 1, 1934; served as a Page in the House of Representatives, Washington, D.C., 1948-51; A.B., University of Michigan, 1954; M.D., Harvard Medical School, 1958.

Dr. Niels E. Brandstrup, Assistant Resident on the Children's Medical Service—born in Copenhagen, Denmark, February 23, 1929; M.D., University of Copenhagen, 1955; Intern in Medicine and Surgery, County Hospital, Randers, Denmark, 1955-56; Assistant Resident in Medicine, Blegdams Hospitalet, Copenhagen, 1956; Research Assistant, Washington University, St. Louis, Missouri, 1956-57; Clinical and Research Fellow in Children's Medicine, Massachusetts General Hospital, 1957-58.

Dr. Myron A. Hofer, II, Intern in Medicine—born in New York City, December 31, 1931; A.B., Harvard College, 1954; M.D., Harvard Medical School, 1958; married; one son.

New addresses:—

Dr. Thomas F. Broderick, Jr. (sr. r.s. *Or.* 1947), Medical Arts Bldg., 697 Cambridge St., Brighton, Mass.
Capt. Carl N. Brownsberger, MC, USAR (a.r.p. 1957), Madigan Army Hospital, Tacoma, Wash.
Dr. Joseph A. Capps (*E.M.* 1896), 21 Woodley Rd., Winnetka, Ill.
Dr. Paul H. Case (*Oph.* 1938), 461 W. Catalina Drive, Phoenix, Ariz.
Dr. Lincoln D. Clark (*M.* 1948), Salt Lake County General Hospital, Salt Lake City. Utah
Capt. Nathan T. Griscom, MC, USAR (*C.M.* 1957), U.S. Army Hospital, Fort Sill, Okla.
Dr. Gerald N. Hoeffel (*C.M.* 1922), Edgewood Farm, Truro, Mass.
Dr. Fleming McConnell (r.p. *R.* 1956), Montreal General Hospital, Montreal, Canada
Dr. Russell M. Nelson (a.r.s. 1954), Salt Lake Clinic, 115 E. South Temple, Salt Lake City. Utah
Dr. Renée B. O'Sullivan (*C.M.* 1957), Veterans Administration Hospital, 150 S. Huntington Ave., Boston, Mass.
Dr. Kenneth J. Ryan (*M.* 1953), Boston Lying-in Hospital, 221 Longwood Ave., Boston, Mass.
Dr. William D. Shorey (*E.S.* 1946), 112 S Michigan Ave., Chicago, Ill.
Dr. Arthur S. Spangler (r.p. *D.* 1945), 1101 Beacon St., Brookline 46, Mass.

Correction: The address for Dr. Katharine Spreng Waldmann (*M.* 1955), which appeared in the March issue of THE NEWS should have read 307B Dawson Ave., Rockville, Md.

⁂

Brief bits:—

Dr. Henry F. Allen lectured before the Ophthalmological Section of the American College of Surgeons, at their meeting held in St. Louis on March 12. His subject was "Infectious agents, exogenous and endogenous".

Dr. Henry K. Beecher has recently been lecturing as a guest of the Polish Academy of Sciences at Warsaw and Kraków. He also spoke to a group in Professor Moruzzi's Department at the University of Pisa.

Dr. George Kelemen has been appointed Consultant to the Department of Research at the New York Eye and Ear Infirmary.

Miss Mary Ruth Wolf, Director of Volunteers at M.G.H., will serve as consultant and guest speaker at the Hospital Auxiliary Workshop, sponsored by the Pennsylvania Association for Hospital Auxiliaries, the Hospital Association of Pennsylvania, and the Pennsylvania State University, held from June 16 through 19, at the Pennsylvania State University, University Park, Pa.

⁂

Dr. Robbins has very kindly handed over to us this interesting letter from Dr. Paul M. G. St. Aubin, who has been serving as a member of the Atomic Bomb Casualty Commission, APO 354, c/o Postmaster, San Francisco. The letter was written last February and says, in part:

I expect the remaining months here to be hectic, to say the least, with a number of projects in the process of termination. The one project that appears to have borne some fruit, relative to the ABCC study, has been the local Hiroshima X-ray dosimetry study in which, in certain instances, we have found as much exposure in some radiological procedures as was received by some of the more distally exposed groups of patients being examined. I have just completed a rather strenuous project of taking X-ray studies on some 4,000 patients, made up of an equal number of control and exposed patients matched for sex, age, and economic status. These were distributed amongst the radiologists in Hiroshima, in order to check the radiological diagnostic ability of these men against ABCC. Also, to pick up errors and inaccuracies in diagnosis at ABCC, a better survey of this group of patients for incidence of disease can be made.

I am up to my neck in diagnostic summaries on these films, written partly in Japanese, German, and English; and with my two assistants am in the process of getting them all translated into English, so that we can make some sense out of them.

In addition, I am trying to complete the study of child growth from the hand films taken at yearly intervals on a group of matched control and exposed children. I hope you appreciate from this that, together with my routine duties here, I am somewhat swamped.

Dr. Darling will be returning to America this spring for conferences in Washington regarding the ABCC program. Under his leadership, this organization has developed a research direction such as it has not enjoyed before, and now, with a sound population-study program, a more substantial research productivity is assured. Dr. Darling will possibly visit Boston and if he can get there would like to have the opportunity of seeing you, to give you better insight into the present program. In relation to this visit, I would like to ask you if you have two residents about to finish their training or a young Board radiologist who would like to come to Japan to work for the ABCC to replace me, bringing with them a technician trained in your department who can further train the Japanese technicians. The type of radiologist I would like to see here is one who is interested in continuing the present dosimetry survey, extending it to the Nagasaki area, and who would also exploit the tremendous opportunity available for film review of the many disease processes that turn up in this population survey.

Would you also let me know if you hear of any radiology departments which would accept Japanese for residency training. I would like to get decent radiological and pathological training for the two men who have been working as my associates for the last year and a half. Their training in Japanese hospitals has been inadequate and, since they have ability and could be of greater value to this organization and Japanese radiology, I would like to see them receive further American training.

I would like to digress from business to tell you about my Christmas vacation. On 21 December I flew to Hong Kong, where I spent three very pleasant days enjoying a delightful change in climate from wintery Japan. Although Hiroshima rarely has freezing temperature, this winter has been a succession of cold days with several inches of snow. On landing in Hong Kong I was overwhelmed by the delightful summery weather and the bright and clear atmosphere. The three days of rest that I had planned were disturbed by many sightseeing trips round the island of Hong Kong, the city of Victoria, and the fishing village of Aberdeen. My hotel was in Kowloon, which is on the mainland, and from there I took a second trip to the New Territories at the Red Chinese border. Things looked rather glum on the other side of the border, although they didn't look very much better in Hong Kong. The little colony which had a population of about half a million right after the war has had its population swelled to somewhere near three million, made up of poverty-stricken Chinese refugees from all parts of Red China. What I saw really broke my heart.

While I was in Hong Kong I telephoned C.C.'s brother. We had a very pleasant talk but, unfortunately, I did not get hold of him until the day I was leaving so missed seeing him.

After this three-days' whirlwind in Hong Kong I flew to Rangoon, where I spent Christmas with some friends. Rangoon is without doubt the filthiest and most vile-smelling place I have ever been in. Decaying refuse is seen everywhere. A revolution occurred a few months back and the chief of the army who took over and who assumed the role of guard-

MR. DONALD WITHEE — DIRECTOR OF MEDICAL PHOTOGRAPHY

ian for a period of six months, guaranteeing a parliamentary system of government following this time, has made great efforts to clean up the country. He has outlawed betel nut chewing, but the crimson red stains from spittle are still seen marring the street surfaces. Beggars are everywhere. Leprosy is an exceedingly common disease and is claimed by some local physicians to afflict somewhere between 10% and 30% of the population. I am somewhat inclined to believe the latter figure, since I was startled at the number of deformed individuals with nose, hand, and various and sundry portions of the body missing.

The people of Southeast Asia are mostly Buddhist, varying in devoutness, of course. Many saffron-robed priests are seen wandering about in the morning until about 10 o'clock, begging for their food for that day. The Buddhist nuns wear salmon-colored robes and carry their begging bowls on their heads. The Shwe Dagon is the holy of holy pagodas in Burma and, since it represents one of the stopping-off places of the Buddha, is one of the shrines of Buddhism in the southeast. The magnificent central spire of the pagoda is covered with gold leaf and sparkles beautifully in the sun. Numerous smaller pagodas encircle the Shwe Dagon and at the base of the pagoda is a flat walk where only the unshod may walk. Fortunately for me, the clean-up campaign had extended rather scrupulously to this particular location, so that taking off shoes and walking in bare feet was made more pleasant by virtue of the relative cleanliness of the plaza. The soles of my feet, however, are still itchy from this experience.

The American Embassy counsellor and his wife, with whom I was staying, have a lovely home on an artificial lake just on the outskirts of Rangoon and, fortunately, during the few days I was there I was spared the experience of much contact with the people. One of the pleasant customs on this lake is punting, and one evening when the moon was full we went punting across to the British Ambassador's home, a distance of about half a mile. About halfway there, as we were passing the Burmese Air Minister's estate on a point of land, a guard hailed us from the shore, inquiring who we were. At the same time the sound of rifle bolt clicking was heard. He warned us to keep our distance and to move away or he would be required to shoot at us. We punted like mad and were much relieved to hear reassurance from him that we were no longer trespassing. Apparently all the higher officials in Burma are terrified of assassination. To say the least, I was happy to depart from this unhealthy climate.

My next port of call was Bangkok, where I spent three wonderful days visiting temples, early morning floating markets on the canals, jewelry and silver shops, and a classical Siamese theatre that was one of the most amusing experiences I have ever had.

My next stop-off was at Angkor Wat. We flew from Bangkok to Siem Reap by Air Vietnam since Thailand and Cambodia were having a border dispute and had broken off diplomatic relations. I believe these relations have been restored since I have returned to Japan. Air Vietnam is tied up in some way with B.O.A.C. but uses French pilots and flies D.C.3's. The plane I was in was filled with some 24 American elementary school teachers from Okinawa, mostly women. The flight started off well but, although the time in the air was only an hour and a half, by the end of the first hour the pilot had consumed a large quantity of beer and wine and the flight became somewhat wobbly. We landed safely, however, and for three days toured the ruins of Angkor Wat, Angkor Thom, and many lesser ruins. These represent the height of Cambodian culture, extending from the 8th century B.C. to the 15th century A.D. This culture, like Thai and Burmese cultures, was the result of Indian influence, and these ruins, which were discovered by a Frenchman round 1865, are the remains of buildings constructed during the period indicated above by successive Cambodian kings who were influenced strongly by Buddhism — some very purely Buddhist, others a mixture of Buddhist and Hindu. The temples and palaces are entirely built on the square and the land area covered is incredible. The carving and architecture is, to say the least, breath taking. It is hard to describe in words the magnificent experience and the feeling of awe one has in the presence of these ancient ruins.

For many years the secret of these ruins was not understood, but today it is pretty well accepted that in the 15th century the Thais plundered this civilization, forcing the Cambodians to flee to the southeast. After sacking and plundering the city, the Thais returned to Siam, but the Cambodians never returned to Angkor, leaving it to the jungle. On fleeing, the Cambodians apparently took most of the articles of value with them, except for the troupe of Court dancers who were carried away by the Siamese. These presumably represent the forefathers of the present Siamese classical dance troupe.

On leaving Angkor Wat I went to Saigon, which is a delightful sleepy French city. You would hardly suspect that you were in the orient in this city, except for the citizenry, who are very Chinese in appearance, unlike the Cambodians and Siamese who appear more like the Polynesians.

After this, back to Hong Kong, then to freezing Japan. It was actually delightful to get back. No more bargaining with cab drivers, such as is the custom in Bangkok; no more fear of being hit on the head and robbed; and no more fear of having pickpockets clean you out. The Japanese have a very high standard of honesty, which is certainly one of their higher virtues.

My best to everyone.

Dr. F. Gorham Brigham (*E.M.* 1910) wrote this letter to Dr. James M. Faulkner (*E.M.* 1925) along in January. Dr. Faulkner forwarded the letter to Mr. David C. Crockett, who has passed it along to us, knowing that Dr. Brigham's many friends will be interested in what he has to say.

It was most kind of you to send me the circular letter about the Treadwell Library and the Salute of the Massachusetts General. I, of course, was very disappointed not to be able to attend Ether Day, and I wrote thus to Dr. Means, but my health has been very poor these last four years and I am able to do nothing very much.

You mention Dr. Reed Harwood. I wonder if you know that I started the Diabetes Clinic at the General which he has taken over. It was the first Diabetes Clinic in this country. I was supervisor of it for twenty years, and then retired from the General to take Dr. Joslin's place at the Deaconess as Physician in Chief, Dr. Joslin having then reached the age of 66. He is now 93.

THE NEWS

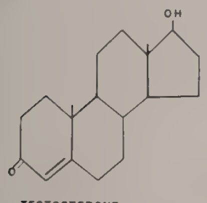
MASSACHUSETTS GENERAL HOSPITAL 1811

No. 187 Boston, Mass. June 1959

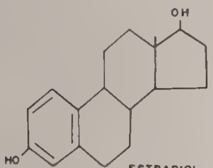
AN INTERDEPARTMENTAL PROGRAM IN THE VINCENT RESEARCH LABORATORY

THE OVARY

It is appropriate that the Vincent Research Laboratories should be concerned, at least in a restricted sense, with the question, "What makes women the way they are?" It has been remarked (not the writer's opinion, of course) that the essential difference between male and female is only a matter of four hydrogens and a carbon atom:



TESTOSTERONE



ESTRADIOL

This is, after all, the difference between the principal sex hormone elaborated by the testis and the most potent of the hormones thought to be elaborated by the ovary. When the shouts of "Vive la différence!" have died down, let us quickly note that Dr. Billy Baggett and Dr. Lewis L. Engel in this Hospital have published work which for the first time proves that in the test tube the ovary, the testicle, the adrenal, and the placenta can all convert testosterone to estradiol. This, fitted together with other evidence in the literature, makes plausible the hypothesis that testosterone is a necessary intermediate step in the normal manufacture of estrogenic hormone.

It may be surprising that these basic matters of sex remain as a frontier at all, in view of the fact that by 1935 Doisy had isolated estradiol from the ovary and had characterized it with the structure shown above. The method he used—the extraction of a ton of sow ovaries—has not been duplicated with human material for obvious reasons. Determinations on twenty-four hour urine collections have given the most information about human estrogen secretion, and yet, obviously, it is not satisfactory to assume that any material present in the urine is identical with any one secreted in the body, particularly since both ovary and adrenal seem to be able to make similar hormones. There remains for the investigator even today, then, the challenging question, *"What is the chemical nature of the estrogen the human ovary normally secretes?"* After this comes the endless chain of questions which confront the biochemist, the endocrinologist, the cancer specialist, and even the surgeon; and in the Vincent Memorial operating rooms the surgeon, for very good reasons, removes human ovaries and, so to speak, holds the enigma in his hand. Among these are perfectly normal ovaries which are being taken out in order to help patients who are the victims of cancer of the breast. That ovarian removal can help these patients has been known since 1896, but, as indicated by the foregoing, the exact mechanism involved is not yet clear.

It is worth remarking at this point that this question, among many others, was uppermost in the mind of the late Dr. Ira T. Nathanson at the time when Dr. Lewis L. Engel first came to the Huntington Laboratories, bringing to this Hospital the powerful and elegant tools which are necessary for this kind of hormone research; and that it is because of the inspiration of Dr. Nathanson and the instruction of Dr. Engel that it has been possible for the writer to proceed with a restricted aspect of this research.

How to isolate the ovary, and find out what it secretes? The ovary, with all due respect to women, is a tough, dense tissue, inactive at any given time except in the small zone where each month's egg has developed. It is not convenient to homogenize it, as has been done most fruitfully in biochemical work with other tissues—for example, the outstanding work of Dr. Kenneth J. Ryan (*M.* 1953) on the placenta. The work of Drs. Baggett and Engel was accomplished with tissue slices. We have chosen, however, to *perfuse* it, hoping to take advantage of the vessels which are poor in the rest of the organ but surround the developing egg like a basketwork. There is an appealing simplicity to the notion of keeping the ovary alive the way the body does—by providing a continuous flow of well-oxygenated blood. Long ago, Carrel and Lindbergh worked on this idea, and it has been applied to the adrenal gland in a series of studies at the Worcester Foundation for Experimental Biology. Efforts at the same institution to work with the ovary were less rewarding, however. The method was elaborate and the results less satisfactory than those obtained with the simpler slice preparation. These workers in adrenal perfusion used backward perfusion—into the vein and out of the excoriated surface of the gland—with whole blood; while in ovarian perfusion they used whole blood half diluted with White's tissue-culture medium. The use of whole blood in most *in vitro* perfusion work has had to be abandoned for one reason or another: 1) vasoconstriction materials, commonly present in whole blood (serotonin, epinephrine) can cause an irreversible block to perfusion; 2) even in the presence of an excess of anticoagulant, minute clots can occur and obstruct flow; 3) unless flow is very rapid, red cells settle and may be presented to the organ in excess with too much viscosity, or in insufficient numbers; 4) blood and organ donors need to be cross-matched to eliminate hemagglutination in the system; 5) the blood contains steroids, and a "blank" determination must be done for steroid studies. We have followed a suggestion made by Dr. J. R. Pappenheimer at the Medical School and use a hemoglobin solution rather than diluted whole blood. The hemoglobin molecule (m.w. 68,000) is only slightly smaller than that of serum albumin (m.w. 69,000) and will remain within systemic capillaries quite well. If it is present in an amount equal to the normal total protein of plasma—about 6 gm.%—it will then exert a similar colloid osmotic pressure. In this concentration, if it is active hemoglobin, it has as much oxygen-carrying capacity as half-diluted blood—anemic, but capable of supporting life in a whole animal or man. Its viscosity is low, and it cannot clot. We have prepared it in bulk, using as many as 40 units of outdated bank blood at a time. We wash the red cells free of other protein, lyse them with distilled water, precipitate the cellular stroma, remove the excess of intracellular ions with an ion-exchange resin, filter, and then, by special arrangement with Dr. R. B. Pennell of the Protein Foundation in Jamaica Plain, have the whole batch Seitz-filtered and bottled under sterile conditions. This material then remains 90% or more active with respect to oxygen-combining power at ordinary icebox temperature for 6 months or longer. At the time of perfusion we add electrolytes and antibiotics to the solution.

The perfusion technique is almost ridiculously simple. The ovaries are resected in the operating room in such a manner as to preserve a long vascular pedicle without crushing it. They are flushed at once with heparin. The perfusion is carried out with a gravity head of about 100 cm. of water. The hemoglobin is kept refrigerated except just before entry into the ovary, where it is warmed to 37° C. Because of this, a single volume of 500 cc. can be repeatedly recycled through the gland and does not lose its activity even after several hours of perfusion. The solution enters the arteries which are cannulated and drips out of the open veins. By studies on the rabbit kidney, which has a simple artery and a simple vein, both of which can be cannulated, we know that the organ remains alive in terms of maintaining an arteriovenous oxygen difference for longer than six hours; and we have noted an over-all consumption of glucose in our ovarian perfusions of an order of magnitude comparable to that published for the rabbit ovary *in vivo*.

Our first steroid experiment undertaken with Dr. Engel's advice was to repeat the conversion of testosterone to estrogen. We have found this in post-ovulatory ovaries, obtaining 10% of our recovered steroid as estradiol. Although we extracted the ovaries themselves as well as the perfusion fluid, we did not recover any estradiol other than that newly formed from the testosterone we had provided. In other experiments we have had conversion of testosterone to unknown substances, some of which we are still in pursuit of. Initially we found that some of our radioactivity remained in water-soluble form, and we have studied this material under the guidance of Mr. Robert Purdy, whose thesis work under Dr. Engel has been on conjugated estrogen in human blood. Using his methods, we find that some testosterone sulfate has been formed in our perfusions. This is intriguing, since Purdy's work shows estrone sulfate to be a major form of estrogen in blood. Obviously, we need to do more experiments of the same type, but also some new ones. Ideally, we should like to dispense with precursor materials, radioactive or otherwise, and find what the ovary will do on its own.

Parenthetically, we are collaborating with Dr. Thomas C. Peebles, who works both on the Pediatric Service and in the Vincent Research Laboratory. We have found that his endometrial cells in tissue culture can convert estradiol into estrone.

It is also our pleasure to work with Dr. Engel in another project: a search for estrogen synergists and antagonists, more especially the latter. The steroid hormones are all alike in the way snowflakes are all alike. If we can find one with no hormonal activity, but which can fool the machinery of the body into thinking that it is an estrogen, then perhaps no more women will need to come in to have normal ovaries removed! A group of compounds have been synthesized by Dr. Anne M. Stoffyn in the Hormone Laboratory, with properties suggested by Dr. Lorna J. Langer's work with her purified estradiol-17 beta dehydrogenase. We have tested about a dozen such compounds in the Vincent Laboratory, using the uterine weight of the immature mouse as the test system. Three estrone-derived compounds have had some effect in preventing the normal response to estrone by this test. The mouse is very sensitive, responding with an increase of weight to a total dose of 0.3 micrograms of estrone. However, we are now in the process of shifting to a still more sensitive test: the response of the vaginal cells, as tested by the smear method, to the direct application of estrogen. According to published reports, this preparation is sensitive to as little as 0.0007 micrograms of estrone. Since test compounds are often available in only very small amounts, we may be able to obtain a biological measurement on materials which could be tested in no other way.

There is, finally, one other area in which we have designs on the ovary. Cancer of the ovary is a fairly common cancer, in the treatment of which there has been little improvement in comparison with that of other gynecologic cancers. We are surveying the cases which have been treated since 1943, when they were studied by Dr. Frank C. Wheelock, Jr. and Dr. Joe V. Meigs. Dr. Thomas H. Green, Jr. has had success in treating advanced cases with hemisulfur mustard, and we are now starting to carry out mustard treatment by perfusion with the pump-oxygenator in conjunction with the Hospital-wide program initiated by Drs. W. Gerald Austen and Anthony P. Monaco. The study of old cases has turned up interesting aspects, some of which we have had occasion to report in collaboration with Dr. Robert E. Scully of the Pathology Department: the possibility of hormonal activation of the postmenopausal ovary by cancer which contains cancerous metastasis.

The above-mentioned activities are, of course, only a fraction of the work now being conducted in the Vincent Memorial Laboratory under the aegis of Dr. Howard Ulfelder. In these particular projects we have had the excellent help of Dr. Laszlo O. Vincze, who came to us after the completion of a project in cytology carried out in collaboration with Drs. Priscilla D. Taft and Janet W. McArthur; and of Mrs. Heidi Duda, who previously worked on steroids at Johns Hopkins.

George S. Richardson, M.D.,
Assistant in Surgery

* * *

Miss Ida M. Cannon received the Lemuel Shattuck Award at the annual meeting of the Massachusetts Public Health Association, held at the Massachusetts Institute of Technology on April 30.

Miss Cannon, now in her 82d year, began her work at Massachusetts General Hospital in 1906 as a volunteer in Dr. Richard C. Cabot's newly organized Medical Social Service Department—the first such project in existence anywhere in the world. In 1907 Miss Cannon became the head of the Department, in which capacity she served until her retirement in 1945. As a veritable pioneer in this field of work, Miss Cannon has been recognized for many years as one of the best-known social workers in this country and abroad. Her book—*On the social frontier of Medicine: Pioneering in Medical Social Service,* published by Harvard University Press in 1952—is invaluable to all medical social workers.

Five hundred or more public health experts attended the afternoon sessions of the Association and the dinner. Dr. A. Daniel Rubenstein, Director of the Division of Hospitals, in conferring the Award, said to Miss Cannon: "Like Lemuel Shattuck, your untiring work, high aims, and signal accomplishments in the several public health disciplines associated with your inspired activities in medical social work were far in advance of your times."

Dr. James Howard Means was given a mastership in the American College of Physicians for outstanding contributions in medicine, at their 40th annual meeting, held in Chicago last April. The mastership symbolizes eminence in medical practice or research.

Dr. C. Sidney Burwell (*W.M.* 1919) was given one of three memorial awards for achievement in medicine.

* * *

Dr. H. Thomas Ballantine, Jr. has returned from a 7-weeks' tour, at the invitation of the U. S. State Department, as an American Medical Specialist in Haiti and several countries in South America. Dr. Ballantine lectured before and consulted with medical professors on problems relating to medical care and education, as well as the interchange of men and ideas between North and South America. We are looking forward to a report on Dr. Ballantine's mission which will appear in an early issue of THE NEWS.

Dr. Harriet L. Hardy has returned from a visit to Czechoslovakia, where she presented a paper on "United States' experience with proposed safe levels of exposure to toxic beryllium compounds", at the meeting of the Permanent Committee and International Association on Occupational Health. On the way back, she spoke in London, at St. John's Hospital for Skin Diseases, on the subject "Skin lesions of beryllium disease". Dr. Hardy tells us that she spoke in the same room in which Hutchinson first described to the staff of St. John's Hospital the skin lesions of Boeck's sarcoid, which are indistinguishable from those of beryllium disease.

The Board of Trustees, at their meetings on March 20, and April 3 and 17, voted:

To accept the resignation of Dr. Robert S. Richards from the position of Assistant in Radiology, as of June 30;

That the appointment of Dr. Roman W. DeSanctis as Resident in Medicine become effective July 1 rather than October 1;

That the appointment of Dr. Glenn A. Langer as Resident in Medicine become effective October 1 rather than July 1.

To appoint:

Dr. Henry G. Dunn as Visiting Physician pro tempore on the Children's Medical Service, for the month of June;

Dr. Nathan T. Griscom as Second Assistant Resident in Radiology, beginning July 1, 1960;

Dr. C. V. Harrison, Professor of Pathology at the Postgraduate Medical School in London, as Pathologist pro tempore, for the week beginning April 20;

Dr. Harriet A. Hughes as Exchange Assistant

Resident on the Children's Medical Service, for the period April 12 through May 21;
Dr. Guy W. Leadbetter, Jr. as Assistant in Urology, effective July 1;
Dr. Herbert O. LeVine as Assistant in Psychiatry, beginning April 1;
Dr. Walter G. J. Putschar as Consultant in Pathology, for a period of four months, beginning May 1;
Dr. Claire M. Stiles as Assistant Resident in Anesthesia for one year, beginning July 1, 1960.

At their meetings during April, the General Executive Committee voted:

That Dr. David W. Florence's appointment on the Orthopedic Service, beginning September 1, is to be that of Resident rather than Assistant Resident;
That Dr. C. Norman Shealy be assigned to serve as Junior Resident at the Boston V.A. Hospital, beginning May 1.

To promote:

Dr. Betty J. McClellan to the position of Second Assistant Resident in Pathology for one year, beginning July 1;
Dr. John Mealey, Jr. to the position of Senior Resident at the Boston V.A. Hospital, for the period May 1 through December 31;
Dr. Dagoberto Sosa to the position of Resident on the Neurosurgical Service, for the period May 1, 1959 through January 31, 1960;
Dr. Giles D. Toll to the position of First Assistant Resident in Pathology for one year, beginning July 1.

To extend the appointments of:

Dr. Ruben Dardano through January 31, 1960, and that his title be changed to Research Fellow in Medicine rather than Clinical and Research Fellow in Medicine;
Dr. Harilaos T. Sakellarides as Clinical Fellow in Orthopedic Surgery, for the period April 6 through June 30.

To reappoint:

Dr. Nancy A. Durant as Clinical Fellow in Psychiatry for one year, beginning July 1;
Karl Dus, Ph.D. as Research Fellow in Medicine for one year, beginning April 29;
Dr. David M. Klein as Assistant Resident in Neurosurgery, for the period May 1 through December 31;
Dr. George F. Kwass as Clinical Fellow and Acting Assistant Resident in Pathology for one year, beginning July 1;
Dr. Sanford I. Roth as Clinical Fellow in Pathology for one year, beginning July 1;
Dr. Richard H. Smith as Clinical Fellow in Psychiatry for one year, beginning July 1;
Dr. Nicholas T. Zervas as Assistant Resident in Neurosurgery, assigned to Neuroradiology, beginning May 1.

To appoint:

Dr. Cesare G. Coletta as Clinical Fellow in Anesthesia for one year, beginning November 1;
Dr. Bernard D. Grant as Clinical Fellow in Orthopedic Surgery for one year, beginning March 1, with the privilege of caring for the patients of Drs. Cave and Rowe in the Baker Memorial and Phillips House;
Dr. Lars W. F. Linden as Graduate Student Assistant in Surgery, for the period April 1 through June 30;
James W. Mayer, Ph.D. as Research Fellow in Medicine (Physics) for one year, beginning May 1;
Dr. Robert G. Ojemann as Clinical and Research Fellow in Neurosurgery, for the period May 1 through December 31, and to return to the resident staff on January 1, 1960;
Dr. Serge D. Orloff as Clinical and Research Fellow in Medicine for one year, beginning September 1;
Dr. Kenneth G. Potee as Clinical and Research Fellow in Medicine for one year, beginning March 1;
Dr. Victor J. Rosen, Jr. as Clinical Fellow and Acting Assistant Resident in Pathology for one year, beginning July 1;
Dr. Herbert C. Wimberger as Clinical and Research Fellow in Psychiatry, beginning July 1.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Cardiology

Christian, H. J., and Currens, J. H.
The carcinoid syndrome and related cardiac disease: Report of a case with predominant tricuspid disease.
New England J. Med. 260:629.

Dermatology

Lever, W. F.
Xanthomas.
In Current therapy, H. F. Conn, M.D., Editor, Philadelphia, W. B. Saunders Company, p. 482.

General Medicine

Graham, J. R.
Headache in systemic disease.
In Headache: Diagnosis and treatment, Arnold P. Friedman, M.D. and H. Houston Merritt, M.D., Editors, Philadelphia, F. A. Davis Company, chapter 7.

General Surgery

Daland, E. M.
Malignant melanoma: Personal experience with 170 cases.
New England J. Med. 260:453.
Darling, R. C., and Welch, C. E.
Tumors of the small intestine.
New England J. Med. 260:397.
McDermott, W. V., Jr.
Le traitement du coma hépatique.
Méd. et Hyg. 16:439.

Neurophysiology

Brazier, M. A. B.
The control of input from sensory receptors by output from the brain.
In Proceedings of the 1st International Congress on Cybernetics, p. 857.
Brazier, M. A. B.
The evolution of concepts relating to the electrical activity of the nervous system: 1600 to 1800.
In The brain and its functions, Oxford, England, Blackwell Scientific Publications, p. 191.
Dunlop, C. W., Killam, K. F., Brazier, M. A. B., and Adey, W. R.
Effects of gamma-aminobutyric acid and cerebellar activity in the cat.
Federation Proc. 18:38.

Orthopedic Surgery

Cave, E. F.
Complications of medullary fixation of fractures of long bones.
In The American Academy of Orthopaedic Surgeons: Instructional Course Lectures, Ann Arbor, J. W. Edwards, vol. 15, p. 86.

Psychiatry and Psychology

Palmer, R. S.
Ego crisis with recovery.
Pastoral Psychol. April 1959:27.
Sifneos, P. E.
Preventive psychiatric work with mothers.
Ment. Hyg. 43:230.

Radiology

Wang, C. C., Daland, E. M., and Gephart, T.
Carcinoma of the sigmoid colon: Report of two inoperable cases with favourable results five or more years following radiation therapy.
J. Faculty of Radiologists 10:50.

Books

Brazier, M. A. B., Editor.
The central nervous system and behavior.
New York, The Josiah Macy, Jr. Foundation.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The Warren Triennial Prize Lectures of the Massachusetts General Hospital for 1959 were delivered by Francis Crick, Ph.D., F.R.S., of the Medical Research Council Unit for Molecular Biology, Cavendish Laboratory, Cambridge, England, Visiting Professor of Chemistry at Harvard University, and James Watson, Ph.D., Associate Professor of Biology at Harvard. The lectures were given in the Morse Auditorium of the Museum of Science on the evening of May 18. Dr. Crick spoke on "The structure and replication of deoxyribonucleic acid". Dr. Watson's subject was "The role of nucleic acids in the viral induction of cancer".

The following notice, regarding the new arrangement in our Pharmacy Department, was issued by Dr. Clark last April:

> For the purpose of improving both the manufacturing and dispensing functions of the Pharmacy, each of which has now become so complex as to require separate administration, the two functions will be separated, effective Monday, April 20.
>
> Mr. John T. Murphy, Director of Pharmaceutical Research and Manufacturing, will be in charge of the manufacturing and development functions. Mr. John Webb, whose title will be changed to Director of the Pharmacy, will be in charge of the dispensing function. . . . Both will serve on the Pharmacy Committee. Mr. Murphy, in addition, will serve on the Surgical Instruments Committee.
>
> Mr. Murphy's duties will include, besides manufacturing and product development, research in pharmaceuticals, supervision of the Central Sterile Supply Room, supervision of the changing over of the drug rooms on all floors of the Hospital to the new "package" type already installed on some Baker floors, responsibility for requisitioning the raw materials needed in manufacturing, product development, and research in pharmaceuticals, and responsibility for requisitioning surgical instruments. He will also, in cooperation with Mr. Degen and Mr. Goff, make architectural plans permitting the physical separation of the manufacturing, product development, and research functions from the dispensing function. When these physical changes have been accomplished, Mr. Murphy's permanent office will be located in the new quarters for these functions.
>
> Mr. Webb will be responsible for the dispensing pharmacy. He will also be responsible for requisitioning all pharmaceuticals for later dispensing, for storing them, and for controlling them by means of keeping a perpetual inventory of them.

VOLUNTEER GROUPS

MGH STAFF WIVES ASSOCIATION

The Staff Wives Association of the Massachusetts General Hospital gathered on May 12 for their annual meeting. Reports from the various committees summarized another year of active service to the Hospital.

Mrs. Milford D. Schulz, chairman of the Music Committee, told about the 15 concerts for patients that have been given in the Chapel. The artists have ranged from concert pianists, to the M.I.T. Dames Chorus, to an ensemble playing old-time recorders.

The usual assistance to the many doctors from other lands who are studying in the Boston hospitals has continued with the activities of the Reception Center, directed by Mrs. Francis G. Barnum, Jr. and Mrs. Byron H. Waksman; the Furniture Exchange, under Mrs. Gerald S. Foster; and the Housing Committee, with Mrs. Richard G. Whiting, Mrs. H. Peter Mueller, and Mrs. Leslie J. DeGroot in charge.

Under the chairmanship of Mrs. H. Dunster Howe, a new service has been instituted for the distribution of tickets donated by friends of the Hospital. These symphony and theatre tickets are gratefully received by our foreign visitors or members of the Hospital staff.

Current and future plans of the Hospital were outlined for the group by Dr. Dean A. Clark.

A coffee hour, supervised by Mrs. Glenn E. Behringer and Mrs. Walter T. St. Goar, preceded the meeting. Mrs. C. Miller Fisher and Mrs. Charles B. Burbank poured.

The names of officers presented for next year are those of Mrs. Alfred Kranes, president, Mrs. Vincent P. Perlo, vice-president, Mrs. Avery D. Weisman, treasurer, Mrs. Edwin P. Maynard, III, corresponding secretary, and Mrs. Gerald Caplan, recording secretary.

DISTAFF CLUB

On June 7, the Distaff Club program for the year ended with a family picnic at Punktasset Farm in Concord. Mrs. Jens G. Rosenkrantz was hostess for the day, and planned a wonderful time for all the children and husbands who were able to join us.

This spring, some members of the Club redecorated the waiting room across from the Emergency Room. This project was made possible by the financial help of the Ladies' Visiting Committee. With bright curtains, a new rug, and some modern chairs, the room is now comfortable and pleasant.

Another one of our projects—the publication of a "Welcome pamphlet", to be sent to new Distaff Club members before their arrival in Boston—passed its final stage of printing and was mailed out on May 21. It includes general information about housing, employment, shopping, amusements, etc., and will (we hope) assure newcomers of the many opportunities the Boston area offers.

BIOGLETS

Dr. Caesar Briefer, Jr., Intern in Medicine—born in New York City, December 4, 1929; B.S., Allegheny College, Meadville, Pennsylvania, 1950; University of Massachusetts, Physical A.E.C. Fellow at Brookhaven National Laboratories, 1951-52; military service: Corporal in the American Medical Service, 1952-54; M.D., University of Chicago Medical School, 1958; married; one child.

Dr. Mortimer J. Buckley, Jr., Intern in Surgery—born in Worcester, Massachusetts, July 1, 1932; A.B., Holy Cross College, 1954; M.D., Boston University School of Medicine, 1958; home: Worcester, Massachusetts.

Dr. William T. Butler, Intern in Medicine—born in Boston, Massachusetts, August 10, 1932; has lived for the most part in St. Louis, Missouri; A.B., Oberlin College, Oberlin, Ohio, 1954; M.D., Western Reserve Medical School, Cleveland, Ohio, 1958; married.

Dr. Fernando A. Cardenal, Assistant Resident in Orthopedic Surgery—born in Madrid, Spain, July 31, 1925; as an undergraduate, served for 3 years as Intern Student (by public competition) in the surgical ward of Professor M. Benzo at the Hospital Provincial de Madrid; Licenciado en Medicina y Cirugia (the standard medical degree in Spain), University of Madrid, 1952; postgraduate course at the Institute de Patologia Medica, Hospital Provincial de Madrid, under Professor G. Marañón, 1952-53; House Physician and House Surgeon, Accrington Victoria Hospital, Lancashire, England, 1953; 3 months in Paris, on a French Government Scholarship, as a foreign visitor to various clinics and medical institutions, 1954; Senior House Surgeon and Orthopaedic Registrar, Durham City Hospital (an accident hospital), England, August-November, 1956; Senior House Surgeon, Harlow Wood Orthopaedic Hospital, Nottinghamshire, England, 1956-57; Fellow in Orthopedics, Boston City Hospital, 1957-58.

Dr. Habibolah Davanloo, Assistant Resident in Psychiatry—born in Tehran, Iran, October 8, 1928; entered elementary school at the age of 7 and finished at the age of 14; attended Iranchahr High School for 5 years, studying general subjects; premedical course at Alborz College for 1 year; M.D., Medical School of Tehran University, 1955; private practice for a few months, working during the day as a Resident at Pahlavi Hospital, which is affiliated with Tehran Medical School; military service: served in the Medical Ward of Tehran Military College for 4 months, then was transferred to the hospital of the 8th Division, with which he was affiliated for 18 months, finishing military service in 1957; Intern, rotating, Memorial Hospital, Albany, N. Y., 1957-58.

Dr. Thomas E. Gaffney, Assistant Resident in Medicine—born in East St. Louis, Illinois, November 5, 1930; A.B., University of Missouri, Columbia, Missouri, 1950; M.A., University of Missouri, 1952; M.D., University of Cincinnati, Cincinnati, Ohio, 1957; Intern in Medicine, Harvard Medical Service, Boston City Hospital, 1957-58; married.

Dr. Alan H. Goldberg, Assistant Resident in Anesthesia—born in Boston, Massachusetts, November 29, 1931; A.B., Brown University, Providence, Rhode Island, 1953; M.D., Boston University School of Medicine, 1957; Intern in Surgery, Massachusetts Memorial Hospitals, Boston, 1957-58; married; temporary home: Boston.

Dr. Peter J. Gomatos, Resident in Medicine—born in Cambridge, Massachusetts, February 13, 1929; S.B., Massachusetts Institute of Technology, 1950; M.D., Johns Hopkins Medical School, Baltimore, Maryland, 1954; Intern in Medicine, Johns Hopkins Hospital, Baltimore, 1954-55; military service: Lieutenant (s/g), U.S. Navy, attached to the Marine Corps in Kaneohe, Hawaii, 1955-57; Assistant Resident in Medicine, 4th Medical Service, Boston City Hospital, 1957-58.

Dr. Mehran Goulian, Assistant Resident in Medicine—born in Weehawken, New Jersey, December 31, 1929; A.B., Columbia College, New York City, 1950; M.D., Columbia University College of Physicians and Surgeons, 1954; Intern in Medicine, Barnes Hospital, St. Louis, Missouri, 1954-55; National Institutes of Health, P.H.S., Bethesda, Maryland, 1955-57.

Dr. Herbert A. Haessler, Assistant Resident on the Children's Medical Service—born in Milwaukee, Wisconsin, March 20, 1926; B.S., University of Wisconsin, Madison, Wisconsin, 1950; made educational film strips for classroom teaching aids, 1950-53; M.D., Marquette University School of Medicine, Milwaukee, Wisconsin, 1957; Intern in Medicine, New England Center Hospital, Boston, Massachusetts, 1957-58.

Dr. Ken Hashimoto, Assistant Resident in Dermatology—born in Niigata, Japan, June 19, 1932; M.D., Niigata University Medical School, 1955; Intern in Dermatology, Tokyo Army Hospital, U.S. Army, 1955-56; Assistant Resident in Dermatology, University Hospital, University of Maryland, College Park, Maryland, 1956-58; a 3-year Fulbright Scholarship extended through 1958.

Dr. George A. Jacoby, Jr., Intern in Medicine—born in Bronxville, N. Y., September 20, 1932; B.A., Yale University, 1954; M.D., Harvard Medical School, 1958; married; one son.

Dr. Marvin M. Lipman, Resident in Medicine—born in New York City, November 6, 1928; B.A., Columbia College, New York City, 1949; M.D., Columbia University College of Physicians and Surgeons, 1954; Intern in Medicine, Columbia-Presbyterian Medical Center, 1954-55; Resident in Medicine, Columbia-Presbyterian Medical Center, 1955-56; military service: Captain, Medical Corps, U.S. Army, stationed in Ulm, Germany; married; two children.

Dr. Arthur S. Lurie, Assistant Resident in Dermatology—born in Boston, Massachusetts, April 30, 1928; attended Boston Latin High School; A.B., Tufts College, 1949; M.D., Tufts University School of Medicine, 1953; Intern, University of Chicago Clinics, 1953-54; Assistant Resident in Medicine, New England Center Hospital, Boston, 1954-55; military service: Captain, U.S. Air Force, Strategic Air Command, Schilling Air Force Base, Kansas, and on rotation in England in Internal and Preventive Medicine, 1955-57; Assistant Resident in Medicine, New England Center Hospital, March-June, 1957; Senior Assistant Resident in Medicine, 1st and 3d Tufts Medical Services, Boston City Hospital, 1957-58.

Dr. William T. McCoy, Assistant Resident in Radiology—born in Adelaide, South Australia, August 30, 1932; St. Peters College, Adelaide, 1940-49; M.B., B.S., Adelaide Medical School, 1955; Intern, Royal Adelaide Hospital, 1956; Intern, Adelaide Children's Hospital, 1957; Resident, Repatriation General Hospital, Adelaide, 1958; married.

Dr. John W. Madden, Intern in Surgery—born in Glendale, California, June 3, 1933; B.S., Yale University, 1955; M.D., Harvard Medical School, 1958; married.

Dr. Herbert A. Newman, Assistant Resident on the Children's Medical Service—born in Newark, New Jersey, May 24, 1933; University of Michigan, Ann Arbor, Michigan, 1950-53; M.D., Yale University School of Medicine, 1957; Intern, Hospital of the University of Pennsylvania, Philadelphia, 1957-58.

Dr. Joseph C. Oakley, Intern in Dentistry—born in Bardstown, Kentucky, October 28, 1932; A.B., Harvard College, 1954; D.M.D., Harvard School of Dental Medicine, 1958; married; one son.

Dr. John T. Porvaznik, Jr., Intern in Surgery—born in Duquesne, Pennsylvania, June 14, 1933; A.B., Dartmouth College, 1955; Dartmouth College Medical School, with transfer to Harvard Medical School; M.D., Harvard Medical School, 1958; married; home: Duquesne, Pennsylvania.

Dr. R. Wyman Sanders, Intern on the Children's Medical Service—born in Boston, Massachusetts, October 4, 1931; A.B., Williams College, 1954; M.D., University of Rochester Rochester, N. Y., 1958.

Dr. John W. Saville, Assistant Resident in Orthopedic Surgery—born in Cleveland, Ohio April 1, 1929; A.B., George Washington University, Washington, D.C., 1949; M.D., George Washington University, 1953; military service: Lieutenant, U.S. Navy, Intern, U.S. Naval Hospital, Bethesda, Maryland, Assistant Medical Officer, Navy Tissue Bank, Orthopedic Staff, U.S. Naval Hospital Medical School, Bethesda, and National Cancer Institute, Bethesda 1953-56; Assistant Resident in General Surgery, 3d Surgical Division, Bellevue Hospital, New York City, 1956-57; Assistant Resident in Orthopedic Surgery, Children's Medical Center Boston, Massachusetts, 1957-58; married; one son; home: Bethesda, Maryland.

Dr. N. Ty Smith, Assistant Resident in Anesthesia—born in Fort Madison, Iowa, May 5, 1932; Harvard College, 1950-53; M.D., Harvard Medical School, 1957; Intern, Children's Medical Center, Boston, Massachusetts, 1957-58; married; home: Fort Lauderdale, Florida.

Dr. Rodman D. Starke, Intern in Medicine—born in Dover, New Hampshire, February 3, 1933; A.B., Williams College, 1954; M.D. Harvard Medical School, 1958; married; home: Durham, New Hampshire.

New addresses:—

- Dr. Norman R. Bernstein (a.r.p. *Psychiat.* 1954), Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.
- Dr. William R. Blade (r.p. *R.* 1958), 545 Fern St., Fresno 4, Calif.
- Dr Harry A. Bliss (*M.* 1945), 840 S. Wood St., Chicago 12, Ill.
- Dr. John M. Carey (*W.S.* 1946), 2221 N.W. 54th St., Oklahoma City, Okla.
- Dr. R. Clement Darling, Jr. (*C.M.* 1954), 1180 Beacon St., Brookline, Mass.
- Dr. Gardner F. Fay (a.r.s. *Or.* 1957), 1180 Beacon St., Brookline, Mass.
- Dr. Edward L. Ferguson (*S.* 1954), 159 Essex St., Holyoke, Mass.
- Dr. James J. Ferguson, Jr. (*M.* 1951), 516 Westminster Ave., Swarthmore, Pa.
- Dr. Robert P. Fornshell (sr. r.s. *Or.* 1958), 85 Osborne St., Danbury, Conn.
- Dr. Craig S. Lichtenwalner (*M.* 1950), Division of International Health, U.S. Public Health Service, Washington 25, D.C.
- Dr. Robert S. Richards (r.p. *R.* 1958), Dept. of Radiology, Lankenau Hospital, Lankenau and City Line Ave., Philadelphia 31, Pa. (after July 1)
- Dr. Margaret S. Shipley (*E.M.* 1943), 1109 Sunset Blvd., North Canton 20, Ohio
- Dr. Porter H. Smith (a. an. 1959), 1005 Haywood Drive, Madison, Wis.
- Dr. Clifford J. Straehley, Jr. (*W.S.* 1947), 1200 E. Genesee St., Syracuse 10, N. Y.
- Dr. Arthur E. Strauss (*E.M.* 1916), Beaumont Bldg., 3720 Washington Ave., St. Louis 8, Mo.

Brief bits:—

- Dr. Joseph S. Barr has been promoted to the rank of Rear Admiral in the U.S. Naval Reserve, effective as of October 1958.
- Dr. Mary A. B. Brazier has returned from a 3-months' Visiting Professorship at the University of California in Los Angeles.
- Dr. Thornton Brown became Editor and Chairman of the Board of Editors of the *Journal of Bone and Joint Surgery* last January 1. He succeeded Dr. William A. Rogers, who is now Editor-in-Chief *Emeritus*.
- Dr. Benjamin Castleman was elected Vice-President of the International Academy of Pathology at the annual meeting of the Academy here in Boston last April.
- Dr. Lewis L. Engel has been awarded an American Cancer Society professorship to continue basic studies in hormone research. Dr. Engel is working on the role of hormones in the problem of normal and abnormal growth.
- Dr. John R. Huckell (a.r.s. *Or.* 1958) is now in practice with two other orthopedic surgeons, and has sent us an office address — 916 McLeod Bldg., Edmonton, Alberta, Canada. He will be affiliated with the University of Alberta Hospital.
- Dr. Erich Lindemann addressed the Psychotherapy Conference in Lindau, Germany, and also visited and spoke at the psychiatric centers in Freiburg and Heidelberg during the first weeks of May.
- As of January 1, Dr. John W. Raker became Surgical Consultant to the Advisory Committee on Civil Defense of the National Research Council — National Academy of Sciences, Washington, D.C.
- Dr. Milford D. Schulz concluded his term as President of the American Radium Society by presiding at its 41st annual meeting, held in Hot Springs, Va., last April. Dr. Schulz addressed the Society on the subject "The choice of modality in the treatment of cancer".
- Dr. Donald N. Wysham (*M.* 1954) has left America to begin practice in Ludhiana, India. Dr. Wysham is one of a new group of 59 United Presbyterian missionaries and fraternal workers who have left this country for overseas duty. The group, sponsored by the Commission on Ecumenical Mission and Relations, includes teachers, doctors, dentists, nurses, agriculturalists, and ministers.

* * *

This letter has come from Dr. Robert N. Buchanan, Jr. (r.p. *D.* 1941), 326 Doctors Building, Nashville 3, Tennessee:

> I cannot begin to tell you how much I enjoy receiving The News each month. The two years I spent at the Massachusetts General Hospital could not have been pleasanter at the time, nor more rewarding at that time and for the future. To be able to have a monthly reminder — not that one is necessary — is very pleasant.
>
> I see some of the people who were connected with the Department of Dermatology almost every year at the national meetings but, unfortunately, do not have the opportunity to see many of my friends who are in other fields.
>
> Within the next few years I hope to get back to Boston, and of course to The General. I am looking forward with great eagerness to Dr. Fitzpatrick's coming, and know he will have a very productive department. Walter Lever and others have certainly made outstanding contributions from your Department of Dermatology.

This note has come from Dr. Anthony A. Arzimanoglu (a.r.s. *Or.* 1952), written from 1 Neofytoy Vamva St., Colonaki Square, Athens, Greece:

> I recently received the last two issues of THE NEWS, which you had the kindness to mail me. It is really nice, when far away from the environment for which I have so many pleasant memories, to be able to follow the news of M.G.H. Believe me, the days I lived in the Hospital are unforgettable from the scientific point of view as well as for the friendly environment.
>
> The only reason I cannot keep up with my subscription is because of the red tape of my country which makes it practically impossible to send abroad even the two dollars. However, there are many possibilities that I may visit the Massachusetts General for a couple of months this summer and thus I will get the opportunity to subscribe again.

Dr. Clark has received this enthusiastic letter from a most grateful parent of a child who was admitted to Burnham Memorial for a tonsillectomy. The letter

No. 83 in a series of Staff photographs
Dr. George S. Richardson—Assistant in Surgery

reads:

The enclosed description of his recent stay in the Burnham wing of Massachusetts General Hospital was given me in three installments by my six-year-old son, Geoffrey. I had suggested that we write a little story of what happened in order that his older brother, Chris, would have an idea of what took place. Geoff thought this was a fine idea, and even asked me to write down the middle section at a time when I am certain he was not feeling his best.

My reason for sending this is to indicate, through his simple story, my feeling about being able to stay with Geoffrey throughout the entire experience. He is totally blind, and this first hospital visit might well have been a very frightening thing. As a result of patience and understanding on the part of everyone on the staff — the nurses, house doctors, technicians, anesthetists, and even the fine young man who wheeled Geoff up to the operating floor — added to the fact that I was able to be with him every step of the way, Geoff has only good impressions of the time he had his tonsils out.

There were so many moments when I knew my presence made the difference between complete panic and calmness:

1) During the visit of the technician who came for blood samples.
2) That first night, when we talked out the fact that he would go up to the operating floor in the morning.
3) The long wait on the morning of the operation, when my son realized he could not have any breakfast.
4) The trip on the rolling bed up to surgery.
5) While anesthesia was being administered, Dr. Lurie made it possible for me to put on a surgical dress and stay with my son until he was asleep.
6) The uncomfortable hours immediately following surgery, when I could devote my time exclusively to reassuring him and tending to his needs.
7) The second night, when sleep did not come so easily.
8) The third morning, to encourage him to take liquids and wait patiently for our doctor to come.

I cannot express, adequately, my gratitude to your hospital for making it possible for a mother to remain with her child. Your understanding and progressive attitude in this matter are to be commended, as I understand it is extremely difficult to make such arrangements in any other hospital in Boston.

Then follow Geoffrey's comments, as recorded at the time by his mother.

Sunday evening

Chrisie, I've had a nice time, so far. When we got here, I first walked around. Then we went upstairs to the sixth floor and found our room there. Then I looked around and I was very happy. Then we had my temperature and blood pressure and I liked that lady, and I said, "I hope you come another time." I wanted to go out to the playroom and I went out with Daddy and saw a little hobbyhorse. Then I went over to a table and stood there. And then Daddy showed me something very interesting — one of those blue Scotty dogs we had for Easter. And then I saw this dump truck and then I went over and saw this little kitty and another dog. Then I saw blocks and I looked at them, and I saw an engine. Then there was nothing I wanted to play with, so Mother came here and we went back to my room, and I liked to look around. I looked around and I found the two beds myself. Mother took my slippers off and I said I could get off the bed myself. And then, guess what I had for supper. I had meat, baked potatoes, beans, and bread and cake, and I had a nice big drink of milk I could pour myself. After supper we went and played records and then read a story about the trained circus seal, and it was the funniest story. We were playing with Peg Village and a nice doctor came in. He had to prick my finger, and you know what he said? If I sat still he'd only have to prick me once, so I did, only kind of shaked. And then I washed and had my chocolate milk with a straw in it, when a doctor came in. He was a nice, nice doctor. First, he took my blood pressure with a little machine. There's a little soft cuff that goes around your arm. He pumps and it gets tighter and tighter, but it doesn't hurt. He listened to my back and my tummy. His name was Dr. Hicks. Then we wrote this story.

Monday afternoon — postoperation

I was awake this morning at quarter of six when the nurse came in and took my temperature. Then we played with the Peg Village and Mother got her clothes on. I had to stay in bed and I wanted to get up very much, but I didn't. And then I played. The nurse came in and gave me a shot to make me sleep and dry my mouth. We had a story. Then I went into the operating table and had my tonsils out. And then my throat was very sore. Then I threw up and fell asleep, and all of a sudden I woke up and I talked to Mother. And then I listened to my orchestra record and in the afternoon I had nothing to do. I had my temperature taken and I just lay there, and I almost threw up. Later it was time to throw up only I couldn't. Then I took a rest and we talked together, and now it's late in the afternoon.

Tuesday morning

I played with that rabbit on skis and I played with the Jingle Train. I went to the bathroom and took a walk down the hall. They brought some jello but I didn't care for it. Then they brought me some apple juice and I drank it. We were waiting for Dr. Lurie but instead, guess who came? Daddy came! And then Dr. Lurie came and we asked whether I could go home and he said, "Yes." He said I couldn't have any bananas and bacon and I couldn't have any fruit juice except grape and apple, and no hot dogs. Then we got dressed and I went in a wheel chair and I went home in the car.

I liked the lady who took my temperature. I'll always think of her. Wasn't she a nice lady? I wish I could go to that General Hospital again.

* * *

IMPORTANT NOTICE

Will all members of the House Staff who are ending service at Massachusetts General Hospital on June 30 (or at any other time, for that matter) please make sure that the Office of The News and Archives receives your new temporary or permanent office address before you leave M.G.H. or as soon thereafter as is possible. One of the duties of this office is to prepare the Directory section of the *Annual Report*, and unless we are notified of new addresses and future changes in addresses the Directory cannot be kept up to date.

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 188 Boston, Mass. October 1959

MEDICINE IN THE TEACHING HOSPITAL OF TODAY AND TOMORROW

Presidential Address, Association of American Physicians,
Atlantic City, New Jersey, May 5, 1959

To serve as President of the Association is both an honor and a privilege. My most awesome duty has been this Presidential Address. I found it an even more lonely task than I had expected. Not until I shared my thoughts and ideals with some of my colleagues did it become a rewarding experience. On reviewing the pace of human progress and the many resulting problems, one becomes increasingly aware that the potentiality for future progress has never been so great. There is, however, a wide disparity between achievement and potential. It is this theme that I wish to develop.

We are living in an exciting period of great change and transition. Contemporary political, cultural, economic, and scientific upheaval is affecting every facet of human existence — and in no sphere, I submit, are these forces more complexly interwoven than in the science, or art, or profession of medicine in the world of today. Yes, the circumstances of daily life are changing more rapidly than they have ever changed before in man's experience. We must reckon with these many forces if we are to supply stability of purpose to our teaching hospitals. We must also be promptly and delicately responsive to changes in our environment, as well as to changes in objectives.

I should like, this morning, to discuss certain aspects of this problem as they concern medicine, for I feel deeply that some of our difficulties may be unique to our times and the moment is at hand for forthright consideration of how best to meet them now and in the future. I will address myself to some of the problems now facing the university teaching hospital and its department of medicine.

We must keep in mind the special role of the teaching hospital in contemporary medicine. *Its function is a creative one.* Here, new physicians are trained and graduated. Here, the character and content of medical practice are continuously reshaped as new researches are conducted and new ideas are conceived and tested. And here, last but not least, the patient is cared for in a manner that not only gives him the best that medicine has to offer, but also displays a standard and style of care that students and house staff may strive to emulate in the years beyond their training. This should be patient care in medicine's grand tradition, embodying humanity, wisdom, dignity, and compassion. But it is something more: It is razor-edged scientific analysis, probing, observing, recording, doubting, alert to every aberration — from the patient's demeanor to the enzymes in his serum. The teaching hospital does indeed have a special creative role, placing upon it responsibilities, both grave and inescapable. What we do and think in our teaching hospitals will influence the thought and practice of our colleagues everywhere, and, in turn, the health and happiness of our generation.

The great problem we now face is: How can we provide and maintain a properly balanced program of patient care, teaching, and research in the face of the torrential outpouring of new knowledge? Much of this knowledge has clear relevance for medicine, and more could have relevance if the right person were on hand to perceive and exploit its latent importance. Problems never come earmarked as problems. How, then, can we investigate an unknown in medicine if it has to be approached in biochemical terms by men who must both recognize a clinical problem and conceive a biochemical solution? If we are to promote meaningful and competent research at the more fundamental levels of biological organization, how can we simultaneously imbue our students with the chief humanistic aim of medicine — which is, that the patient's interest comes first and the investigator's second? How can we best integrate the new movement in scientific medicine with the work and thought of our experienced clinicians, who may be alienated by its esoteric techniques and minute concern with the capers of carbon atoms?

These are the questions to be answered and the problems to be faced. Few would deny the major premise that a new scientific revolution is upon us. Starting soon after the second World War, there has occurred an incredible output of basic biological research in fields adjacent to or potentially adjacent to medicine. The factors inciting this revolution — the advent of radioactive isotopes, perfection of chromatographic procedures and methods of protein purification, increased financial support of research, etcetera — are beyond the scope of this discussion. Suffice it to say that many of our young physicians have participated in this development. Some of them have had a period of formal scientific training at our universities or similar institutions. Others have somehow managed to train themselves in scientific disciplines even while working in clinical areas. This is mirrored in our medical journals and the content of our

(*Continued on page 2*)

MEDICINE AS A CULTURAL AND POLITICAL FORCE IN LATIN AMERICA

Both the United States and Russia have recently intensified their efforts to win the support of the peoples as well as the governments of the so-called neutral nations. To this end many activities other than those of strictly military or economic importance have been inaugurated. One of these is the Cultural Program of the U.S. State Department, within which there is a branch known as the International Educational Exchange Service. This Service has as one of its subdivisions the American Specialists Program, about which the State Department has said: "The American Specialists category was established to make it possible for our posts abroad to have the services of certain Americans to assist them in developing good will, understanding, and respect for the United States and its policies and institutions. In making annual plans for its Educational Exchange Program, each post decides which of its objectives could best be reached by the services of an American Specialist. For example, an American editor may be desired to hold seminars with local journalists; the Ministry of Education in a country may want an American educator to study problems of curriculum revision; an American athletic coach may be needed to hold clinics and assist local coaches in preparing for international athletic events; local literary circles may wish an opportunity to discuss American literature with an American author. From this, it is seen that American Specialists go abroad for the purpose of rendering a specific service for the United States rather than to work on a project of their own choosing."

In 1958 slightly over one-half million dollars were made available for 168 Specialists to visit 65 countries. For 24 Specialists to visit South America, $92,000 was allocated. Of this latter sum, $23,000 was allotted to various athletic activities and $3,914.57 was divided among three medical projects!

About February 1, 1959, an official of the State Department invited me by telephone to serve as an American Specialist in South America for a period of seven weeks. The high point of my trip was to be attendance at the VIIIth Latin American Congress of Neurosurgery in Santiago, Chile. Before and after those dates I was to give lectures, attend conferences, and visit medical schools in other medical centers. At the last moment Haiti was added to my itinerary, but my experiences

(*Continued on page 4*)

(*Continued from page 1*)

research meetings — fully illustrated by yesterday's program, where we noted that "the Syndrome" is giving way to what might be called "the Gospel according to Saint Geiger".

We are standing in the middle of what might reasonably be called a blizzard of scientific progress. The rate at which progress is being made has led to increasing difficulty in keeping abreast of the published reports of that progress. The inevitable consequences have been an increase in specialization, a tendency toward separation of practice from research, and, as some would say, the invasion of one field by individuals whose backgrounds and training have been in other areas. In addition to this increase in specialization, there has arisen an increasing difficulty of communication not only between individuals in different scientific disciplines but also between individuals within a given field. How, in the face of these difficulties, can we achieve and maintain a high standard of patient care, teaching, and research — a *modus operandi* which will enable us to preserve the unity of the whole of internal medicine? How can we mount this whirlwind and make it take us where we want to go?

I am sure there are no *right* answers to these questions — that is, no answers that are right for each department of medicine or for each member of such a department.

The major purpose of our annual meeting is to consider together the results and implications of experimental medicine. It is because of this that I am encouraged to outline for you, in the form of a progress report, the results of an experiment in progress at the Massachusetts General Hospital — an experiment in how to accommodate ourselves most effectively to meet the challenges and opportunities of present-day academic medicine. The approach which I shall outline is neither new nor unique, and the validity of its results can never be unassailably fortified with the armor of standard deviations and chi squares. Nevertheless, I am convinced that this experiment or some parallel approach must be vigorously pursued in every teaching hospital.

This program has been based upon two general premises. The first is that specialization is necessary, and that it is here to stay. Himsworth has phrased this point very aptly:

> The present situation has arisen because medical knowledge has grown to such an extent that it is no longer, and never again will be, within the capacity of any individual man to master more than a small fraction of it. Specialization has become a necessity. To decry this not only ignores fact; it is to deny the very means that have made our recent progress possible. Specialization is a natural phenomenon. It is comparable in human affairs to differentiation of function in biology. . . . It is the same with human organizations. Specialization holds out to them — be they intellectual or social — the promise of vast extensions in power; but it does so only on condition that *integration keeps pace with specialization.*

According to Himsworth, then, the difficulties arise, not from specialization, but from failure of integration.

This leads to our second general premise — that integration must exist both among individuals and within individuals, particularly those key men who lead team efforts. Unless it does, the results may be disappointing.

Our Medical Service is composed of autonomous units, each covering one of the specialties of internal medicine. Thus, we have a Hematology Unit, a Gastroenterology Unit, a Cardiology Unit, and various others — twelve in all — covering most of the categories into which internal medicine has been divided.

In medicine, as in all of biology, we are primarily concerned with the details of structure and its relationship to function. Therefore, one may well ask: What is the composition of these specialty units, what responsibilities do they assume within the Department of Medicine, and how do their structures help them to attain their avowed goals?

Each unit is a group, of variable but workable size, made up of full- and part-time physicians, clinical investigators, and, in some instances, basic scientists.*

Each unit must serve as a miniature Department of Medicine, dedicated to total competence within its designated area of interest. The sweep of its activities must carry from basic laboratory research to the imaginative application of its discipline to the cure of the ill. This is no less than an injunction to these units to maintain a high standard of excellence in mastering the skills of their specialty areas, in applying these skills effectively, in the acquisition of new facts, and in the teaching of its discipline to other students of medicine.

Where can the harassed chief of a medical service find a physician to carry out all of these activities effectively within a specialty area? In American medicine — the answer comes back clearly — it is "nowhere". A specialty unit can no longer be the lengthening shadow of one gifted individual, miraculously adapted to the laboratory, the lecture hall, and the clinic. Basic laboratory research in all medical specialties obsessively demands the devoted attention of first-rate minds for maximal returns. Alternatively, seasoned clinical wisdom based on critical evaluation of experience, which is the hallmark of the excellent physician, cannot be acquired as a gratuitous by-product of laboratory research. Proficiency in clinical medicine is painfully acquired and must be constantly cultivated, or else it degenerates into the marketing of shopworn sophistries. Faced with this dilemma, we have accepted the fact that it is the unit, not the individual, which must responsibly insure the pursuit of medicine in its broadest sense as an area of both theoretical and applied biology.

How is this carried out in practice? One of our smallest units, for example, is composed of physicians who have had extensive training in organic or biological chemistry, physicians who have had experience in the physiological and metabolic techniques of classical clinical research, and clinicians in private practice who maintain an interest in this medical specialty. The weekly activities of this unit attempt to correlate these various approaches. There is a seminar at which the basic scientific foundations of the discipline are explored, led by either a member of the unit or by a guest speaker. The unit holds its own weekly "Grand Rounds" at which the clinical problems of one or two patients are explored in detail, attempting the most precise scientific analysis of the illness, its pathogenesis and treatment. Finally, there is a specialty clinic and a consultation Rounds at which a large number of specific clinical problems are met in the daily evaluation and care of patients. All of these functions are attended by students and all members of the unit, irrespective of their primary interests. Each makes his major contribution within the area of his greatest competency, but serves further to challenge the accuracy and significance of observations and traditional teaching of the other areas of the discipline.

One of the larger groups, the Connective Tissue Unit, is comprised of a group of individuals representing a wide variety of backgrounds and disciplines, who share a common interest in the connective tissue, its components and its diseases. Senior members include practicing physicians, four clinical investigators, a biologist, a protein chemist and an organic chemist interested primarily in the carbohydrates. Together with a number of clinical and research fellows and students, these individuals share the responsibilities previously mentioned, and, of course, conduct their own research.

The physician members of each unit also visit on the general medical wards and participate in the teaching of general internal medicine to second-, third-, and fourth-year students. Each of the senior investigators is responsible for determining the direction of, and conduct of, his own research work. Collaborative research problems are undertaken when they spring from common interest.

To present one's work and ideas, either formally in a conference or informally over a cup of coffee, before this group of individuals whose interest is keen and whose backgrounds are so varied, has proved to be a privilege which each member values above all others.

Is such a unit just another malignant example of the "togetherness" so increasingly evident on the contemporary American scene? Does any interreaction occur when the scientist and the clinician are brought together? Here lies the crux of the problem, to my way of thinking. For the successful functioning of this system, we have attempted to appoint a particular type of man to head each unit — a man who by some means has managed to plant a solid foot in a scientific discipline beyond the scope of clinical medicine, generally in biochemistry, biophysics, or physiology. I have the very strong conviction that in the careful selection of unit heads lies the key to the success of this plan. By combining clinical medicine and basic science in their training, and by displaying superior competence in both fields, they represent a new breed of physician. Just as the biochemist once was a strange breed, trained in both chemistry and biology, he managed, nevertheless, to survive and flourish. Likewise, this new breed of physician, born of necessity, the product of modern medicine's complexity, will also survive and flourish. They will flourish along with their conventionally-trained colleagues — in teaching hospitals where, we hope, their unique viewpoint will promote strong leadership and progress. They will respect the achievements of the clinicians and talk their language. Their scientific background and training should enable them to produce research of competence, comparable to that of the non-clinically-trained scientist.

---

*In a personal communication received on May 19, 1959, Dr. Dana M. Atchley wrote as follows: "I think we should speak of the 'clinical scientist' and the 'basic scientist' because no clinician these days can be a good clinician if he is not a scientist in his attitudes and training."

It is true that such men are hard to find and a chief of medicine who wishes to develop a unit system of this sort must take the time and make the effort to find, to nurture, and to encourage this small but important group of young physicians who show promise of development in this direction. This may be one of his most important responsibilities. Equally important, he must also recruit the much-needed quota of able part-time physicians — clinicians who, because of previous training, wish to maintain an interest in a given medical specialty, as well as to participate in the teaching of students and house staff. He must also do everything in his power to attract top-flight scientists.

Through the efforts of such people, it should be possible to mount a team effort that will develop cohesion and direction. Each unit should be designed as a balanced one, with due attention paid to all levels of work. Each member should select and occupy his own position in the spectrum, from pure science to clinical medicine, and should command respect for his abilities and accomplishments. We would like to believe that in such units, the whole may be greater than the sum of its parts. There should be little room in such units for suspicions and condescending attitudes so often marring the relationships between scientists and clinicians.

In this way, viewpoints can be shared, horizons broadened, and opportunities increased for individuality and self-development. By cooperative effort, members of a unit may take time off in sabbatical leaves or other changes of pace, so necessary for the maintenance of a fresh point of view. In this way, a better appreciation of the many roads that lead to medical knowledge may be achieved. It is already becoming clear from our experience with this plan how exciting and fruitful the results of such team efforts can be when guided by the sort of men about whom I have been talking.

You may well ask how these units relate to one another and function as an integrated Department of Medicine. The Head of the Department meets with the Chiefs of Units at stated intervals. Here, problems are aired with candor and sometimes heat. This helps us not only in effecting unity of purpose in the care of patients and teaching, but also familiarizes each unit with the research interests and aims of the others. These and other regularly held exercises help to further our common objectives without encroaching upon individuality of expression or action.

Such a department of medicine has all the specialty subdivisions in medicine for purposes of investigation and teaching, yet the foundation of internal medicine is the general medical ward in which all of the various specialty members participate in the care of the sick, no matter whether or not the patients have the diseases in which they are well versed. It is the general medical ward that is the basic area of integration, both of the individual and of the discipline itself. I, personally, deplore the departments of medicine that have arthritis wards, gastroenterology wards, pulmonary disease wards, etcetera, and distribute their patients on admission to these specialized services. In my opinion, medicine can't be done that way in the last analysis. It can be and must be studied in the specialty areas, but the care of the patient in the final integration has to be done by an internist working in a general medical service. I emphasize this point because there is a trend in the other direction in this country and abroad.

We return, then, to our original question: How can a teaching hospital effectively carry out a program of medical care, teaching, and research? How does the integration achieved in the units help in the pursuit of these three goals? Let us consider them one by one.

As for teaching, the exposure to the unit teams provides superb opportunities for building into medical students and house staff a broad point of view. We have long since conceded that the undergraduate phase of medical education can no longer turn out physicians ready for the practice of medicine. It has to be satisfied with the building of general competence, leaving the acquisition of special knowledge and skills to the graduate training program — especially residency training. Much has been written in recent years about integrating the medical curriculum. Is it not reasonable to expect that this goal will be more closely approached if our teachers are better integrated? This must surely be a prerequisite for the success of an integrated curriculum, no matter how carefully it is planned.

Education is a simple process. It begins when two people of different life experiences meet and talk. It is this communication between those who are willing to learn from one another which is the essence of the educational experience. Obviously, we cannot teach our students all of medicine. What we can teach them, however, is the habit of being self-taught. As has recently been said, "It is our job as educators to see to it that our students, on graduation, be not rifle bullets, constantly decelerating, but self-propelled missiles."

What about research — such an essential component of the modern university medical center? As physicians dedicated to the prevention and treatment of disease, we are vitally interested in furthering this goal. This we can attain by a better understanding of our patients, their diseases, their disturbed physiology, the biology of the involved tissue, and the chemistry and/or biology of potential etiological agents. Having assumed responsibility for teaching, we must imbue our students with an intellectual curiosity at all these levels. Finally, what better antidote for the dangers of cant and dogmatism than research? The unfounded statement, the unsupported conviction, or the traditional belief are not likely to survive long in the questioning attitude engendered by research. To paraphrase an Elizabethan dramatist — research does make better doctors of us all.

I believe that most medical research can be carried out more effectively within a teaching hospital than in a research institute devoid of an association with medical care and teaching. This is obviously true for traditional clinical research, of whatever variety. It is becoming increasingly evident that this is also true for the more basic scientific disciplines. In recognition of this fact, research institutes such as the Rockefeller Institute and the National Institutes of Health have seen fit to provide themselves with hospital facilities to further their research programs. Within the hospital setting, the scientist is made constantly aware of the problems involved in medical care, while being stimulated by association with students and physicians concerned with the validity and application of medical knowledge. It is our hope that more scientists will do their research in hospitals. If they do, the unit system may be the means by which they will become aware of the unsolved problems of clinical medicine. We also hope that our units will attract scientists to them, for this would add as much to medicine as it would to science. We believe that fundamental research should be an integral part of the modern teaching hospital and can no longer be considered a luxury. The full-time scientist in the hospital must be regarded as the professional equal of the clinician and *not his handmaiden*. We trust that some of these important men will wish to remain permanently in the hospital research setting. Undoubtedly, some will return to other academic departments in medical schools and universities, carrying with them a new awareness of the applicability of their scientific disciplines to medicine.

Finally, last to be mentioned but surely not least, we come to patient care — the goal and purpose of the whole complicated enterprise. This remains our primary concern. There are many opportunities in this area for self-delusion and cant. We must impress upon our students and house staff the importance of thinking of each patient as a whole human being, a man or a woman of certain social and economic background, with hopes and fears and feelings of guilt and pride. Students so indoctrinated will be mindful of the fact that all the symptoms of a given patient are not necessarily due to a genetically determined enzyme deficiency, however crisply revealed before our eyes by the incontestable techniques of biochemistry. Unless our students are so trained, they will not bring to bear in future years the wisdom and vision needed in helping patients attain better health and more happiness.

I believe we must face this problem honestly. We must avoid the pitfalls of lip service and inconsistency. Here again is where I think the unit system can be of help. Beyond the scope of any single individual, it has the potential for demonstrating that no sharp boundaries can be drawn between the scientific analysis of disease and the compassionate care of the sick. We trust the unit chiefs will always keep clearly in mind that the primary concern of a teaching hospital is the care of the sick and that it is within this framework that the activities of the unit must be carried out. For the same reasons, they should be aware that the definition of good medical care is as elusive as good medical care itself. Whatever criteria we use must constantly be reviewed and rigorously judged from the standpoint of their effects on the patient rather than on the education or convenience of the physician. Good medical care, even in a scientific age, must still depend on the dedicated and well-trained physician. If we cultivate this attitude and create an environment in which it is commonplace, our medical students should learn that a good medical history is characterized as much by detailed knowledge of the personality of the patient as by an accurate analysis of the physical manifestations of his disease. With interest focused on the individual, our goals must still be health and happiness. Each member of our house staff must still keep one thought uppermost as he approaches each new patient: How can I help this individual, and as I do so, what can I learn?

Walter Bauer, M.D.,
Chief of Medical Services

* * *

Miss Ruth Sleeper, R.N., Director of our School of Nursing and Nursing Service, was one of three American nurses who were awarded Florence Nightingale medals by the International Committee of the Red Cross last May.

The Nightingale medals, awarded biennially, are given in recognition of "exceptional devotion in the care of the wounded and sick during dangerous and difficult situations in time of war and public disasters."

The Hotel Lincolnshire, 20 Charles Street, was sold to the Massachusetts General Hospital last May. It will be used as a residence for our student nurses. Some of the larger rooms may be used for classrooms and library.

MEDICINE IN LATIN AMERICA

(*Continued from page 1*)

in that country will not be included in this report.

Although the State Department made it quite clear that the American Specialists were to render "a specific service to the United States rather than to work on a project of their own choosing", there seemed to be no bar to recording independent observations. I was greatly interested in trying to learn as much as possible about the general level of attainment in medicine in the countries which I was to visit. Also, I wished to discover whether medicine and the medical profession were or could be an important cultural and political force in Latin America.

Although my tour included visits to eight cities in the countries of Colombia, Peru, Chile, and Uruguay, the Neurosurgical Congress gave me an opportunity to speak also with physicians from Venezuela, Argentina, and Brazil. In all, about one thousand doctors were spoken to and of that number it was possible to informally and frankly exchange views with over one hundred. The opinions of this latter group, together with the remarks of citizens engaged in politics, law, teaching, and business and, finally, my own observations, form the basis for my conclusions. A typical "working day" was seventeen hours in length, including the time necessary to record my impressions on a Gray Audograph dictating machine.

The hospitality and kindness shown to me by every South American with whom I dealt is one of the very happy memories of this trip. This was equally true of the Indians and Mestizos in Central Peru and the well-born descendants of the original Spanish grandees in Chile. Although my friends would discuss frankly the presence of anti-American sentiment, it always seemed to be another group of people who were guilty of it! Of course, I did not visit Bolivia; and while I was in Lima, all of the women and children of the American Embassy in La Paz were evacuated to Lima because it was felt that their lives were in danger. There seemed to be incontrovertible evidence at the time that the anti-United States actions in La Paz, as well as the April riots in Buenos Aires, were the direct result of communist propaganda and finance.

It was, of course, possible to sample only a small proportion of the cultural aspects of a continent measuring six million eight hundred thousand square miles and having a diverse population of over one hundred twenty million people, but I did gain certain broad general impressions. First, it seemed that the social structure, in most if not all of these countries, is one of a small aristocracy dominating a large, mostly illiterate peasant class. Mining and farming are the most important economic pursuits, and an individual's social status is determined primarily by wealth and lineage, and, to a much lesser extent, by education. Attendance at the universities was until recently the prerogative of the well-to-do and for this reason had not tended to augment the numbers of the middle or upper classes. However, the present younger generation has recognized the advantages accruing to a higher education and is increasingly crowding the doors of the few universities in South America, even though many of the students must live on the verge of starvation.

That portion of the population which lacks economic advantages is becoming increasingly restless. The average South American, through his reading, his radio, and the many examples of material wealth which he sees on the street (most of which have been imported from North America), is awakening to the fact that a more abundant life is somehow possible. The desire for automobiles, radios, electric kitchens, etc. has led to dollar buying which, coupled with the economic shambles characteristic of the aftermath of dictatorships, has been a tremendous inflationary factor. Furthermore, in many South American countries the population is rising faster than economic productivity, leading to a still lower standard of living. The disparity in living standards and income, which is so apparent among the various social groups, is a prime factor in causing current political unrest, since from the desire for a better life comes the urge for immediate radical social changes and the attractiveness of the communist line of propaganda.

The Latin American physician apparently plays an important cultural role in this special situation. As in other societies old and new, he is held in some respect simply because he is a physician. He is essentially an upper middle-class citizen who, in many instances, has his origin from the lower middle-class and is thus a factor in broadening the base of the social structure. As an educated member of society he is often a leader in fields outside of medicine. His outlook (as seems to be the case with most physicians in all countries) is likely to be a conservative one. His medical contacts, if he is at all prominent in his field, are apt to broaden his understanding of problems of international significance.

Another important cultural consideration is the fact that the majority of the leaders in medicine have had some foreign education and in most instances they identify themselves with the medical and social cultures of the country in which they were trained. Furthermore, for many reasons they tend to deprecate the level of medical attainment and the cultural attributes of the countries other than their own and the one in which their training was received.

For example, an outstanding medical figure in South America was trained in Europe and since his return (about twenty years ago) has sent his own pupils to various South American cities. This man and his students have been not only pro-European but, unfortunately, anti-United States in their medical thinking; and this point of view has inevitably entered into their political thinking as well.

Again, at the university in Arequipa I met a young medical instructor who had been trained in Paris. He spoke good French but no English, and was going to school at night to learn German. It seems reasonable to deduce that this young doctor feels that English-speaking countries have little to offer him medically, culturally, or politically. It is probable that his viewpoints on all of these matters will in some measure be communicated to his students.

At this point we might consider the political implications of certain medical activities. If this aspect of the healing art seems strange, remember that our Congress is currently deciding how much of your tax dollar shall go for health purposes and that recently the Massachusetts Legislature carried out an investigation of the cost of private health insurance.

In all of the South American countries which I visited, the governments are deeply involved in education, health, and welfare. Most of the medical schools, virtually all of the hospitals, and all of the practicing physicians are dependent upon the State for all or part of their income.

When these governments face a financial crisis (which is a practically continuous situation), the health and teaching budgets are the first to suffer. The medical schools and the hospitals are then poorly financed and the physicians feel underpaid for their services. The populace, which looks to the State for good doctors and good hospitals, becomes unhappy when these are not provided. The medical students are unhappy because adequate teaching facilities are not available. The teachers feel insecure and the practicing physicians are apt to neglect the patient for whom the State pays the bill, in order to care for the individual who can afford to pay a private fee.

So — medical teaching and medical care become political issues; and medical research, which is thought by the State to be an expendable item, virtually disappears.

The physicians, whether teachers, investigators, or practitioners, have for these reasons a vital interest in politics. Many of them become influential in the political parties and a surprising number attain high government positions. In Brazil, for example, the President and two of his cabinet ministers, as well as the Mayor of São Paulo, are physicians. In Haiti, the President is a general practitioner and his foreign minister a psychiatrist. In all Latin American countries, the Minister of Health is usually a physician.

Whether this mixture of politics and medicine is a good thing is a matter of opinion but it is a fact of which we should be cognizant. Furthermore, if my thesis that the foreign-educated physician is loyal to the country that provided that education is valid, then this national problem of the physician as a politician takes on international significance.

The South American university, of which the medical school is a part, plays a very important role on the political scene. For this reason, I should like to comment briefly concerning this problem which is an inextricable combination of culture and politics.

With perhaps three exceptions, all South American universities look either to the State or the Church for their support. The faculties, such as medicine, law, engineering, and teaching are virtually independent one from the other. A student enters one of these faculties at about the age of seventeen and may in six years receive a degree. If, at the end of two years of instruction he decides that medicine is not really his field and that he would be happier as an engineer, he finds that he must repeat his first two years in the university, as there is no mechanism for crossing over from one school to the other. This leads to the production of men trained for special careers who, in many instances, are unfit and unhappy in their specialty and thus turn to other pursuits.

Since university education is virtually free, the universities are overcrowded, and in many of them there is no provision for forcing a student to leave if his work is unsatisfactory. There are a number of individuals who have been students for ten, twelve, and fourteen years. These "professionals" are usually more interested in politics than in education, are usually leftists and in many instances communist trained, with great influence within the students' unions which they use as forums. These students' unions are international in organization, and almost all university students are members.

The political activity within the universities is well illustrated by the situation in Peru, where the students, through their union, have demanded "co-gobierno" — that is, a voice in administrative affairs. They have demanded one-third representation on the university and faculty councils, which means that expenditures of funds, election of deans and professors, even the choice of courses offered to the students would be voted upon by their representatives.

According to one of my Peruvian colleagues, this agitation for co-gobierno grew out of the complaint of the students that the professors were in large measure neglecting their teaching duties. This situation is apparently due to the fact that professorships, particularly in the State-dominated universities, are prestige appointments, often given for political reasons and carrying no salary. Many professors are, therefore, forced to earn their living in ways other than teaching, and their responsibilities in that latter regard are indeed often neglected. Unfortunately, the students have attempted to remedy one bad situation by creating another.

This pedagogical problem has, however, a much deeper significance. The students' union in Peru is dominated by APRA, a national left-wing political group containing a strong pro-communist element. It seems to be the intention of this element to gain control through co-gobierno of San Marcos University in Lima — the oldest teaching institution in the Western Hemisphere. If this effort should succeed, then APRA would be in an excellent position to indoctrinate the population, from school age through the university level, with pro-communist anti-United States propaganda.

You will recall that it was at San Marcos that Mr. Nixon had the first of his unfortunate experiences during his visit to Latin America. My friends in Lima assured me that the "spontaneous demonstration" of students, to which Mr. Nixon was subjected, was organized and financed by the communists. Nevertheless, it was with some trepidation that I addressed 120 members of the third year class in medicine at San Marcos on the occasion of the opening of the course in surgery. Actually, the students received me most politely.

Co-gobierno is subject to ratification by the Peruvian legislature but, as of May 1, 1959, tacit consent had been given to this principle by all the teaching disciplines but one: the Faculty of Medicine. Here there is a strong, intelligent dean, who has the unanimous support of his teaching staff. They have given him permission to present their mass resignations to the Rector of the University should co-gobierno be forced upon the School of Medicine. In effect, the Dean can say, "Do you want co-gobierno or do you want a medical school?" This unyielding stand may be one of the most important recent contributions to the cause of democracy and freedom in Peru.

From my experiences with medicine and the medical profession in Latin America, only a portion of which I have recorded here, came the conclusion that the medical schools, the physicians, and the health programs were potent cultural and political forces in Latin America — more important there, perhaps, than in many other parts of the world. It seemed to me that we had already influenced the culture and politics of these countries by our medical activities. I was interested, however, to find out how other persons and certain of the organizations active in the international field felt about these conclusions.

It is possible that our State Department is not greatly impressed with the importance of medicine as a cultural and political force. A glance at the amounts of money allotted to various categories in the American Specialists program for South America may provide some factual evidence on this score.

Specialty	Persons	Money
Education, humanities, and journalism	7	$24,327.49
Athletics	4	$23,766.95
Social sciences	2	$17,961.86
Economics	3	$15,913.23
Law and political sciences	4	$ 4,030.42
Medicine	3	$ 3,914.57
Engineering and pure science	1	$ 2,009.89

Furthermore, our governmental efforts in the foreign medical field seemed somewhat disorganized, with no real fundamental concept behind the expenditure of funds and with little realization of the broad impact of our medical programs. Indeed, one State official admitted frankly to me upon my return that he had no idea that physicians, either North or South

American, were ever really interested in issues or events outside their specialty!

The great charitable foundations such as Rockefeller and Kellogg, on the other hand, appear to have been much more effective. In Colombia, the town of Cali has a modern, well-equipped teaching hospital supported by one of these foundations. Its young chief of medicine was trained at the Presbyterian Hospital in New York. Many of his staff are also graduates of teaching centers in the United States, thanks to fellowships from Rockefeller and Kellogg. The faculty of the medical school and the staff of the hospital are organized in the best tradition of American medicine. The teachers in the basic sciences devote themselves full time to instruction and research because their salary scale is adequate. Not only are the hospital and medical school an example of good medical practice to the community, but their students, interns, residents, and the graduates of its nursing school provide the means of bringing to all Colombians an ever-increasing amount of some of the best products of American culture. Furthermore, the medical faculty will inevitably strengthen the university because of its belief in academic independence and the dignity and value of a teaching career.

Our foundations and the government, through Fulbright scholars, have been most helpful in exporting for various periods of time medical teachers from the United States to Latin America. The importance of such a teacher, if he is wisely chosen, goes far beyond the technical aspects of his specialty. In his out-of-classroom conversations with students he can often correct misconceptions about the American way of life. With the faculty he is frequently helpful as an advisor on problems of curriculum and administration. In the community he is an example of the fact that the United States is not wholly oblivious of the importance of the scholar. At the same time he is never in economic or professional competition with his colleagues. It is unfortunate, however, that the foundations and the government not only have no coordinated program, but that there is not even an effective exchange of information about their current activities.

My visit to South America has convinced me that a vigorous extension of our efforts, governmental and otherwise, into the international field of medical teaching and research would be most helpful to the foreign policy objectives of the United States. These efforts should be equally a matter of export and import of students and teachers, but this must be done with the full realization that there is a cultural and political point of view to be considered. Senator Lister Hill has recently introduced into the Senate a resolution calling for the expenditure of fifty million dollars annually for an international medical research program. In presenting his bill Senator Hill said in part, "The interesting thing is how the doctors and scientists, themselves, emphasize not only the importance of this legislation to the cause of scientific advance against disease and disability but its importance to the cause of peace." I would fully agree with this but would add that, as a governmental activity, promotion of the cause of peace is a major responsibility of our State Department. It seems rather ironic, therefore, to read recently that the Health and Welfare Committee of Congress, when considering the Hill bill, had rejected the idea that this program be directly under the President. It preferred to assign the funds and authority to the National Institutes of Health in order to keep the effort from being "mixed up with cold war politics". If the International Medical Research Program does come into being, it will inevitably influence the cold war whether we wish it or not. In my opinion it is an obligation of our government to see that the activities of this program work efficiently for us in promoting peace, good will, and understanding on the international level.

Whether or not international medical activities become in large measure a function of the National Institutes of Health, it would seem advisable to have in the Department of State a high-ranking official, perhaps an Assistant Secretary of State, for medical affairs. He and his staff would have the task of directing, guiding, and advising on the cultural and political aspects of our efforts in the international medical field.

We should have North American medical investigators and teachers in every major teaching center in Latin America. The State Department should know who these men are and should perhaps have a voice in their selection, since they must be chosen as much for their understanding and sympathy for the country in which they work as for their professional competence. They should have a grasp of the political situation and the problems of the Latin American university, and whenever possible they should be chosen for their ability to speak Spanish. More young Latin Americans should be studying in our hospitals and medical research laboratories, and the State Department must be made aware that whether these students come on government grants, foundation grants, or on their own resources they will be an asset or a liability to our cultural and political program depending on our treatment of them.

In this respect we, as private citizens, can make a valuable contribution. Recall for a moment the actions of the Dean of Medicine at the University of San Marcos — the man who stands like a rock against the wave of co-gobierno and the domination of the University by the students. I am certain that his present stand is in part due to the fact that he was once at the Harvard Medical School. Yet he almost left Boston a homesick, lonely, and embittered young man. The understanding, sympathy, and financial assistance of one of his teachers kept this man here until he had finished his training and made of him a true friend of the United States. All of us can, if we make the effort, create an opportunity for a foreigner to feel a little more at home in the United States, a little more friendly toward us and our institutions. Furthermore, we should seek out and bring to the United States for "eye-opening" purposes those key Latin American students who seem anti-United States. Again it will be the function of the State Department to identify these individuals in order to be certain that they are worth-while material and then make it possible for them to visit here. Most of the time the prejudice that they have stems from the influence of communist propaganda, and a short tour in this country will do wonders to set the record straight. We should not concentrate exclusively upon individuals whose loyalty to the United States is unquestioned.

It should also be possible for the Latin American professor of medicine to come to the United States to see our work and our institutions. In 1961 a World Congress of Neurosurgery will be held in Washington. Our State Department should, even now, be offering its services in order to be certain that visitors from foreign lands gain the most favorable impression of the United States. It is not, to my knowledge, doing so; and it seems to lack the machinery to be effective, as well as the realization that medicine can be important as a cultural and political force. Finally, once the United States has trained a foreign physician, every effort should be made to keep in contact with him when he returns to his country of origin. Time and again I heard of young men who became discouraged and bitter when they found themselves unable for various reasons to practice medicine or carry on research as they were accustomed to do in the United States. Many of them were in competition with men trained in other countries whose teachers did maintain close contact with their pupils. Our trainees, feeling forgotten by their teachers and friends and unable to achieve professional satisfaction, became bitter toward this country, which had opened the golden door and then slammed it shut. Here again, the State Department can be of immeasurable assistance through its Cultural Affairs Officers. If we are to choose from a cultural and political point of view the right policies for gaining and maintaining the good will of the Latin American physician, we need the help of our State Department and it needs the staff and funds to give that help.

In conclusion, I would like to speak of the inescapable feeling which I had of being welcome and wanted in South America. The people in these countries seem to be searching for a culture — a way of life. As one of my Latin American friends phrased it, "The majority of the citizens of my country are just now emerging from the jungle." It seemed that we had an opportunity (although perhaps a fleeting one) to influence the peoples of this great continent to the south of us. Whether in the end they adopt the cult of the citizen enslaved by the State or turn to our philosophy of the State serving the citizen will greatly depend, I am sure, upon our efforts. In the medical field a unique opportunity exists. By increasing our aid, both public and private, to medical schools and teaching hospitals in Latin America, we can transplant a segment of our culture. An increased exchange of professors and students will continually strengthen that tie. Inevitably, then, will we reap the political benefits.

Such an effort as I have outlined has, however, another and in essence a greater reward. By pursuing this policy of enlightened self-interest, we will have contributed immeasurably to the health and happiness of mankind.

H. Thomas Ballantine, Jr., M.D.,
Associate Visiting Neurosurgeon

* * *

Dr. Churchill was awarded the honorary degree of Doctor of Science by the University of Alabama on May 31. The citation which accompanied the award reads:

EDWARD DELOS CHURCHILL — World-renowned surgeon. Born in Illinois. Bachelor of Arts and Master of Arts of Northwestern University and Doctor of Medicine, cum laude, of Harvard University. Now Professor of Surgery of the Harvard Medical School and Chief of Surgical Services at Massachusetts General Hospital. He has held many positions and has been highly honored by many personal and professional distinctions and decorations, in peace and in war — at home and abroad, for great professional knowledge and skill, and for large international service. A dedicated, patriotic, and eminent citizen who is truly an adornment to the medical profession of the world.

Dr. Varaztad H. Kazanjian was presented with a plaque on May 15, in recognition of his many contributions to plastic surgery and his many years of leadership in the field. The award was made by the American Association of Plastic Surgeons, during their three-day annual meeting.

Dr. Kazanjian was a pioneer in the development of plastic surgery in the United States. He was Chief Dental Officer of the Harvard Unit, which served with the British Expeditionary Unit in World War I. King George V awarded him high honors at that time for his treatment of facial wounds.

The Board of Trustees, at their meetings during May, June, and July, voted:

To accept with regret the resignation of Dr. John A. Benson, Jr. from the position of Assistant in Medicine, effective June 30;
To accept the resignation of Dr. Henry P. Pendergrass from the position of Assistant Radiologist, effective June 20;
To accept the resignation of Dr. Porter H. Smith from the position of Assistant Anesthetist, effective April 23;
To change the appointment of Dr. George Chalpin from Clinical Assistant in Psychiatry to Assistant Attending Psychiatrist at McLean Hospital, effective May 15;
To change the appointment of Dr. John G. Clark, Jr. from Clinical Assistant in Psychiatry to Assistant Psychiatrist at McLean Hospital, effective July 1;
To change the appointment of Dr. Jacqueline Gauthier from Assistant in Psychiatry to Clinical Fellow in Psychiatry at McLean Hospital, effective July 1;
That the appointment of Dr. Harold L. May as First Assistant Resident in Surgery be retroactive to October 1, 1958 rather than beginning April 1, 1959;
That the title of Dr. Renée Bennett O'Sullivan be changed from Intern to that of Second Assistant Resident on the Children's Medical Service for her year of service, July 1, 1956 through June 30, 1957;
To appoint Drs. Daniel S. Ellis and Howard Ulfelder as Members-at-Large on the General Executive Committee for one year, beginning July 1;
That the Children's Medical Service be granted one additional Assistant Resident, that is, a total of six Assistant Residents, with the understanding that one such Assistant Resident will always be on rotation at the Pediatric Unit of the Massachusetts Mental Health Center;
That the invitation extended to Professor Theodore Gilman to give a Richardson Lecture at the Hospital on April 28 be approved;
That Professor R. J. Turner Warwick, Hunterian Professor of the Royal College of Surgeons of England, be invited to give a Richardson Lecture at the Hospital on June 10.

To promote:

Dr. Myron Lotz to the position of Assistant Resident in Medicine for one year, beginning July 1;
Dr. William T. McCoy to the position of First Assistant Resident in Radiology, beginning July 1.

To reappoint:

Dr. Farrokh Saidi as First Assistant Resident in Surgery.

To appoint:

Miss Phyllis Ackman as Assistant Psychologist at McLean Hospital, beginning September 1;
Dr. Elroy E. Anderson as Assistant Resident on the Children's Medical Service for one year, beginning July 1;
Dr. Homer L. Ash as Intern on the Dental Service for one year, beginning July 1;
Mr. William Caudill as Associate Social Anthropologist and Acting Chief of the Department of Social Sciences at McLean Hospital, beginning September 1;
Dr. Virginia L. Clower as Assistant Attending Psychiatrist at McLean Hospital, beginning August 1;
Dr. Pierre M. Dreyfus as Assistant Neuropathologist in the Research Department and Assistant Neurologist at McLean Hospital, beginning June 26;
Dr. Nathan H. Fearer as Assistant to the Children's Medical Service for one year, beginning July 1;
Dr. Edward L. Ferguson as Clinical Associate in Surgery, beginning May 1;
Dr. Thomas B. Fitzpatrick as Chief of the Dermatology Service, beginning July 1;
Dr. George A. Glines as Assistant to the Children's Medical Service, beginning July 1;
Dr. Henry U. Grunebaum as Resident in Psychiatry at McLean Hospital, beginning September 1;
Dr. Andrew D. Guthrie, Jr. as Assistant to the Children's Medical Service, beginning July 1;
Dr. Floy C. Helwig as Exchange Assistant Resident on the Children's Medical Service, for the period July 1 through August 10;
Dr. Kenneth E. Jones as Assistant in Medicine for one year, beginning June 1;
Dr. Martin Kantor as Assistant Resident in Psychiatry for one year, beginning July 1;
Dr. Melvin M. Kayce as Assistant in Psychiatry, beginning July 1;
Dr. William Kornfeld as Assistant in Psychiatry, beginning May 1;
Dr. Padmakar P. Lele as Consultant in Neurophysiology in the Department of Neurosurgery, for a period of one year, beginning September 1;
Dr. Edward Lowenstein as Assistant Resident in Anesthesia, beginning July 1, 1960;
Dr. Alexander S. MacDonald, Jr. as Clinical Associate in Children's Medicine, beginning May 1;
Dr. Edward F. McGrath as Clinical Associate in Children's Medicine, beginning May 1;
Dr. Edwin J. Madden as Assistant Resident in Orthopedic Surgery for one year, beginning July 1;
Dr. Jack H. Mendelson as Assistant in Psychiatry, beginning July 1;
Dr. Eugene J. Morrissey as Assistant Resident in Orthopedic Surgery for one year, beginning July 1;
Dr. Barbara Gurd Mueller as Clinical Fellow in Psychiatry at McLean Hospital, beginning July 17;
Dr. Charles W. Neville, Jr. as Clinical Fellow in Psychiatry at McLean Hospital, beginning July 17;
Dr. George M. Perrin as Clinical and Research Fellow in Psychiatry, to act as Resident, for one year, beginning July 1;
Dr. Jalna A. Perry as Clinical Fellow in Psychiatry at McLean Hospital, beginning August 1;
Dr. John T. Pollard, Jr. as Assistant in Radiology, beginning January 1, 1960;
Dr. Robert N. Rapoport as Consultant in Social Science at McLean Hospital, beginning September 1;
Dr. Earle H. Rosenberg as Resident on the Dental Service for one year, beginning July 1;
Dr. Mahmoud Sadrieh, Chief of Surgery at Saadi Hospital, Shiraz, Iran, as Consultant in Surgery pro tempore for one year, beginning July 1;
Dr. Richard E. Senghas as Assistant Resident in Orthopedic Surgery for one year, beginning July 1;
Dr. William R. Shelton as Assistant in Psychiatry, beginning July 1;
Dr. John H. Sisson as Assistant in Medicine for one year, beginning June 1;
Dr. Robert T. Spalding as Clinical Fellow in Psychiatry at McLean Hospital, beginning July 1;
Dr. James H. Stempien as Intern on the Dental Service for one year, beginning July 1;
Richard A. Sternbach, Ph.D. as Assistant Psychologist in the Department of Psychiatry, beginning July 15;
Dr. Suzanne T. van Amerongen as Assistant Attending Psychiatrist at McLean Hospital, beginning August 1;
Dr. Herbert C. Wimberger as Clinical Fellow in Psychiatry at McLean Hospital, beginning August 1;
Dr. Morey Wosnitzer as Assistant Resident in Urology for one year, beginning July 1.

At their meetings on April 29, during May, June, and July, and on August 5 and 19, the General Executive Committee voted:

To reinstate Dr. Geza F. P. Kaplany de Kaplanyhaza as Clinical Fellow in Anesthesia, effective as of June 7;
To change the title of Dr. Arthur D. McGugan to that of Clinical and Research Fellow in Dermatology, effective as of July 1;
To rescind the appointment of James W. Mayer, Ph.D. as Research Fellow in Physics (Medicine), as Dr. Mayer decided not to accept the appointment;
To accept the resignation of Dr. Claus W. Reichle from the position of Clinical Fellow in Anesthesia, effective June 30;
To rescind the appointment of Dr. Victor J. Rosen as Clinical Fellow in Pathology, as of July 1;
To change the title of Dr. Giles D. Toll from that of Assistant Resident in Pathology to that of Clinical Fellow in Pathology and Acting Assistant Resident in Pathology for one year, beginning July 1.

To promote:

Dr. Luis L. de Mola to the position of First Assistant Resident in Pathology for one year, beginning July 1;
Dr. James H. Duxbury to the position of Resident in Urology for one year, beginning July 1;
Dr. Charles S. Keevil, Jr. to the position of Clinical Assistant in Medicine for one year, beginning July 1;
Dr. Bernard F. Mach to the position of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Stuart E. Price, Jr. to the position of Senior Assistant Resident in Urology, beginning July 1;

Dr. Stefan C. Schatzki to the position of Resident in Radiology, beginning July 1;

Mary L. Stephenson, Ph.D. to the position of Assistant Biochemist (Medicine), beginning July 1;

Dr. Donald W. Sutherland to the position of Resident in Medicine for one year, beginning January 1, 1960.

To extend the appointments of:

Dr. Fernando A. Cardenal as Clinical Fellow in Orthopedic Surgery, from September 1 through December 31;

Dr. Jacques E. Dumont as Clinical and Research Fellow in Medicine to November 30;

Dr. Ira A. Ferguson, Jr. for one month, through July 31;

Dr. William H. Harris as Senior Resident on the Orthopedic Service from April 1 through May 15: during the period May 1 through May 15 he will be granted the privilege of assisting in the care of Dr. Otto E. Aufranc's private patients;

Thomas Nussbaumer, Ph.D. as Research Fellow in Medicine to September 30;

Dr. Harilaos T. Sakellarides as Clinical Fellow in Orthopedic Surgery for an additional six months, through December 31;

Dr. Beatrice E. Sleigh as Clinical Fellow in Anesthesia, from June 1 through August 31;

Kathleen Stratton, Ph.D. as Research Fellow in Physics (Medicine) through September 30.

To reappoint:

Dr. Khalil Abi-Torbey as Clinical and Research Fellow in Urology for one year, beginning July 1;

James E. Anliker, Ph.D. as Research Fellow in Anesthesia for one year, beginning July 15;

Bronius Baskys, Ph.D. as Research Fellow in Dermatology for one year, beginning July 1;

Dr. William H. Batchelor as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. John F. Bertles as Clinical Assistant in Medicine, beginning July 1;

Dr. Paul H. Black as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Robert L. Bragg as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Willi Burgi as Research Fellow in Medicine for one year, beginning September 1;

Dr. James J. A. Cavanaugh as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Alan S. Cohen as Clinical and Research Fellow in Medicine for one year, beginning July 1:

Dr. Frederick J. Duhl as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Edwin H. Eylar, Ph.D. as Research Fellow in Medicine for one year, beginning September 1;

Dr. Daniel D. Federman as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Howard S. Frazier as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Lamont W. Gaston as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Alan H. Goldberg as Assistant Resident in Anesthesia for one year, beginning July 1;

Dr. Richard M. Hays as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Dale G. Johnson as Second Assistant Resident in Surgery for one year, beginning July 1;

Marvin R. Lamborg, Ph.D. as Research Fellow in Medicine for one year, beginning July 1;

Dr. Myron B. Laver as Clinical Fellow in Anesthesia for one year, beginning July 1;

Dr. Melvin Lederman as Clinical and Research Fellow in Surgery for one year, beginning July 1:

Dr. Federico G. Lopez, with a change of title from Fellow in Neuropathology to that of Clinical and Research Fellow in Neurology, for one year, beginning September 1;

Dr. Jesus S. Manlapaz as Clinical and Research Fellow in Neurosurgery for one year, beginning July 1;

Dr. Pierre A. Maurice as Clinical and Research Fellow in Medicine, beginning September 1;

Dr. Hans Nevinny-Stickel as Clinical Fellow in Medicine for one year, beginning July 1;

Mr. Emery Nyilas as Assistant Physicist (Medicine) for one year, beginning August 5;

Dr. Richard C. Packert as Clinical Fellow in Radiology, beginning July 1;

Charles J. Parker, Jr., Ph.D. as Research Fellow in Medicine for one year, beginning September 1;

Dr. Hugues Ryser as Clinical and Research Fellow in Medicine for one year, beginning September 15;

Dr. Alberto Salama as Clinical and Research Fellow in Neurology, for a period of six months, beginning September 1;

Dr. Charles A. Sanders as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;

Dr. Elihu M. Schimmel as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Nathan T. Sidley as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Gene M. Smith, Ph.D. as Research Fellow in Anesthesia for one year, beginning September 1;

Dr. Norman T. Smith as Assistant Resident in Anesthesia for one year, beginning July 1;

Leonard B. Spector, Ph.D. as Assistant Biochemist (Medicine), beginning July 1;

Dr. Robert G. Spiro as Research Fellow in Medicine for one year, beginning July 1;

Anne M. Stoffyn, Ph.D. as Research Fellow in Medicine for one year, beginning May 13;

Pierre J. J. Stoffyn, Ph.D., as Research Fellow in Medicine for one year, beginning September 1;

Zofia Tarasiejska, Ph.D. as Research Fellow in Medicine for one year, beginning September 1;

Dr. Lloyd B. Tepper as Clinical Fellow in Medicine, assigned to Occupational Medicine, for one year, beginning July 1;

Dr. Robert G. Willocx as Clinical Fellow in Medicine for one year, beginning July 1.

To appoint:

Dr. Sudhawit Anekamaya as Clinical and Research Fellow in Surgery, beginning July 1;

Dr. Harold B. Anstall as Clinical and Research Fellow in the Blood Bank, beginning October 1;

Dr. Jason A. Aronson as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Anthony A. Arzimanoglu as Clinical and Research Fellow in Orthopedic Surgery, for the period July 1 through September 30;

Dr. John A. Baldwin as Clinical and Research Fellow in Psychiatry for one year, beginning October 1;

Dr. Marcel Bellemare as Graduate Student Assistant in Surgery for one year, beginning July 1;

Dr. Bernard Bihari as Clinical Fellow in Neurology, to act as Assistant Resident in Neurology, for one year, beginning July 1;

Dr. John A. Bolzan as Clinical Fellow in Medicine for one year, beginning July 1;

Dr. Laurids K. Christensen as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. George H. Collins as Clinical and Research Fellow in Neurology for one year, beginning July 1;

Dr. Adolfo C. Coussirat as Clinical Fellow in Anesthesia, beginning June 25;

Dr. William L. Curwen as Clinical and Research Fellow in Dermatology for one year, beginning July 1;

Dr. Alvin Essig as Clinical and Research Fellow in Medicine, beginning July 1;

Dr. William J. Foley as Clinical Fellow in Pathology, beginning July 1;

Dr. Dorothy E. Ford as Clinical Fellow in Physical Medicine for one year, beginning July 1, 1960;

Dr. Joseph E. Geary as Clinical and Research Fellow in Surgery for one year, beginning July 1;

Dr. Giovanni Giuliano as Clinical and Research Fellow in Medicine, beginning December 1;

Dr. John Hedley Whyte as Clinical Fellow in Anesthesia, acting as Resident, beginning July 1, 1960;

Dr. Rauno J. Heikinheimo as Research Fellow in Anesthesia, for the period May 1 through August 31;

Dr. Manuel Hernandez as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Thomas F. Hewes as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Peter R. Holt as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Tai S. Hwang as Graduate Student Assistant in Surgery, for the periods July 1 through October 1 and from December 1, 1959 through June 30, 1960;

Dr. Sophus H. Johansen as Clinical Fellow in Anesthesia for one year, beginning August 10;

Dr. Earl F. Jordan as Clinical and Research Fellow in Neurosurgery, for the period July 1, 1959 through August 31, 1960;

Dr. Bogdan Kamiński as Clinical Fellow in Anesthesia, beginning December 1;

Dr. Edmund Klein as Clinical and Research Fellow in Dermatology, beginning September 1;

E. M. Christine Kris, Ph.D. as Research Fellow in Physics (Medicine), for a period of four months, beginning August 1;

Dr. Susanne J. Lamdin as Clinical Fellow in Anesthesia, beginning September 1;

Dr. William H. Langhorne as Clinical and Research Fellow in Surgery for one year, beginning August 1;

Robert S. McCarger, M.A. as Research Fellow in Sociology in the Department of Psychiatry, beginning August 1;

Koscak Maruyama, D.Sc. as Research Fellow in Medicine for one year, beginning September 1;

Dr. Oscar E. Masetto as Graduate Student Assistant in Surgery, for a period of nine months, beginning August 4;

Dr. Marion C. More as Clinical Fellow in Anesthesia for one year, beginning August 24;

Dr. Jose M. Mullen as Clinical Fellow in Medicine for one year, beginning July 1;

Dr. Ian P. C. Murray as Clinical and Research Fellow in Medicine, beginning September 1;

Dr. Teruyuki Nakashima as Research Fellow in Pathology for one year, beginning July 20;

B. S. Narasinga Rao, Ph.D. as Research Fellow in Physics (Medicine) for one year, beginning November 1;

Dr. Paul F. J. New as Clinical Fellow in Radiology, beginning June 15;

Dr. Fioravante N. Nora as Clinical Fellow on the Children's Medical Service, to work in the Out-Patient Department, for a period of six months, beginning July 1;

Dr. Teruo Okuma as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Juan L. Pimentel as Graduate Student Assistant in Orthopedic Surgery, for a period of three months, beginning July 22;

Dr. A. David Roth as Clinical and Research Fellow in Neurosurgery, for the period July 1, 1959 through August 31, 1960;

Dr. Henry I. Schweppe, Jr. as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Makoto Seiji as Research Fellow in Dermatology, beginning August 1;

Dr. John R. Senior as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Dagoberto Sosa as Clinical Assistant in Neurosurgery, for a period of eight months, beginning May 1, this appointment to run concurrently with his Residency in Neurosurgery;

Harish C. Srivastava, Ph.D. as Research Fellow in Medicine for one year, beginning

January 1, 1960;

Dr. Oscar E. Starobin as Clinical Fellow in Medicine, assigned to Cardiology, beginning July 1;

Dr. Willem Storm van Leeuwen as Research Fellow in Neurology, assigned to Neurophysiology, for a period of three months, beginning May 1;

John B. K. Sur, M.S. as Research Fellow in Biomechanics on the Orthopedic Service, for the period June 15 through August 14;

Dr. Alfonso Z. Tohen as Graduate Student Assistant on the Orthopedic Service, for the period June 8 through August 31;

Dr. Barbara E. Waud as Clinical Fellow in Anesthesia, beginning July 1;

Dr. Alfred L. Weber as Clinical Fellow in Radiology, beginning July 1;

Dr. Alfred D. Weiss as Clinical and Research Fellow in Neurology for one year, beginning July 1;

Dr. Louis Wener as Clinical Fellow in Radiology, beginning January 1, 1961;

Dr. George F. Wilgram as Research Associate in Dermatology, beginning June 1;

Dr. Ralph C. Williams, Jr. as Clinical and Research Fellow in Medicine, for the period October 1 through December 31;

Dr. Raleigh L. Wright as Clinical and Research Fellow in Neurosurgery, for the period August 1 through December 31.

* * *

A new workshop for directors of hospital volunteers, sponsored by the Committee of Directors of Hospital Volunteers of Metropolitan Boston, will be conducted at Boston University. The course will be given on Tuesdays, from 4 to 6 P.M., October 6 through December 8.

This, the first workshop of its kind in the New England area, has been developed after considerable research and study by a committee, under the direction of Miss Mary Ruth Wolf, Director of our Volunteer Service, and Professor Carol Hills of Boston University, Coordinator for the course.

The workshop is designed to provide the professional director of hospital volunteers, the chairmen of volunteers, and other participants in hospital services with specialized training. The workshop will emphasize the organization and administration of a hospital volunteer department and its role in community and public relations.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Allergy & Immunology

Waksman, B. H.
Allergic encephalomyelitis in rats and rabbits pretreated with nervous tissue.
J. Neuropath. & Exper. Neurol. 18:397.

Anesthesia

Beecher, H. K.
Measurement of subjective states.
In Quantitative methods in human pharmacology and therapeutics, New York, Pergamon Press, p. 98.

Smith, G. M., and Beecher, H. K.
Amphetamine sulfate and athletic performance. I. Objective effects.
J.A.M.A. 170:542.

Smith, G. M., and Beecher, H. K.
Effect of morphine on the subjective response of hunger in normal subjects.
J. Pharmacol. & Exper. Therap. 126:63.

Smith, G. M., and Beecher, H. K.
Measurement of "mental clouding" and other subjective effects of morphine.
J. Pharmacol. & Exper. Therap. 126:50.

Biochemistry

Briggs, F. N., Kaldor, G., and Gergely, J.
Participation of a dialyzable cofactor in the relaxing factor system of muscle. I. Studies with single glycerinated fibres.
Biochim. et Biophys. Acta 34:211.

Gergely, J., Kaldor, G., and Briggs, F. N.
Participation of a dialyzable cofactor in the relaxing factor system of muscle. II. Studies with myofibrillar ATP-ase.
Biochim. et Biophys. Acta 34:218.

Gergely, J., Martonosi, A., and Gouvea, M. A.
The role of SH groups in the interaction of myocin with phosphate compound and with actin.
In Sulfur in proteins: Proceedings of a Symposium held at Falmouth, Massachusetts, May 1958, Reinhold Benesch and others, Editors, New York, Academic Press, p. 297.

Kaldor, G., and Gergely, J.
The effect of pyridoxal phosphate and its inhibition by carnos ATPase activity and syneresis of myofibrils.
Arch. Biochem. & Biophys. 80:393.

Kaldor, G., Gergely, J., and Briggs, F. N.
Participation of a dialyzable cofactor in the relaxing factor system of muscle. III. Substitution of pyrophosphate for the cofactor.
Biochim. et Biophys. Acta 34:224.

Biological Chemistry

Fekete, L. L., Lever, W. F., and Klein, E.
Characteristics of cobalt-induced hyperlipemia in rabbits.
Federation Proc. 18:388.

Klein, E., Lever, W. F., and Fekete, L. L.
Inhibition of pancreatic lipase by serum of hyperlipemic & hypercholesteremic patients & by extracts of human tissues.
Federation Proc. 18:82.

Cardiology

Graybiel, A., Malt, R. A., Colehour, J. K., Barlow, G., and Spurr, G.
Comparison of the cardiovascular dynamics and the size and fat content of the heart in lean and fat dogs.
Am. J. Cardiol. 3:647.

Morgan, W. L., and Bland, E. F.
Bacterial endocarditis in the antibiotic era, with special reference to the later complications.
Circulation 19:753.

Thurlbeck, W. M., and Currens, J. H.
The aortic arch syndrome (pulseless disease): A report of ten cases with three autopsies.
Circulation 19:499.

Dermatology

Matz, M. H., and Blank, I. H.
Contact dermatitis from 4-tertiary butyl catechol in Thermo-Fax paper: Report of a case.
New England J. Med. 260:1076.

Tolman, M. M., Moschella, S. L., and Schneiderman, R. N.
Dermatitis herpetiformis — specific entity or clinical complex?
J. Invest. Dermat. 32:557.

Endoscopy

Benedict, E. B.
Diagnosis of diseases of the stomach by gastroscopy and gastroscopic biopsy.
G. P. 19:84.

Benedict, E. B.
Gastritis — a plea for rational nomenclature based on pathologic findings. (Editorial)
Gastroenterology 37:215.

Benedict, E. B.
Gastroscopic diagnosis.
Klin. Wchnschr. 37:473.

Benedict, E. B.
The value of bronchoscopy in determining the inoperability of carcinoma of the lung.
J. Thoracic Surg. 37:646.

Joske, R. A., and Benedict, E. B.
The role of benign esophageal obstruction in the development of carcinoma of the esophagus.
Gastroenterology 36:749.

General Medicine

Bauer, W., and Bartter, F. C.
Diseases of the bones.
In Diseases of metabolism, ed. 4, Garfield G. Duncan, Editor, Philadelphia, W. B. Saunders Company, p. 1388.

Isselbacher, K. J.
Galactose metabolism and galactosemia.
Am. J. Med. 26:715.

General Surgery

Garcelon, G. G.
Salivary gland tumors: Management and results.
A.M.A. Arch. Surg. 78:12.

Hospital Hygiene

Allen, H. F.
Air hygiene for hospitals. I. Arrestment of airborne and dustborne staphylococci by a hospital vacuum cleaner.
J.A.M.A. 169:553.

Allen, H. F.
Air hygiene for hospitals. II. Efficiency of fibrous filters against staphylococcic droplet nuclei and bacteria-bearing dust.
J.A.M.A. 170:261.

Laboratory Science

Waksman, B. H.
A histologic study of the auto-allergic testis lesion in the guinea pig.
J. Exper. Med. 109:311.

Neurophysiology

Brazier, M. A. B.
The historical development of neurophysiology.
In Handbook of Physiology — Neurophysiology, Washington, D. C., American Physiological Society, John Field, H. W. Magoun, and Victor E. Hall, Editors, chap. 1.

Sweet, W. H.
Pain.
In Handbook of Physiology — Neurophysiology, Washington, D. C., American Physiological Society, John Field, H. W. Magoun, and Victor E. Hall, Editors, chap. 19.

Neurosurgery

Hirsch, O., in cooperation with Hannibal Hamlin.
Symptomatology and treatment of the hypophyseal duct tumors (craniopharyngiomas).
Confinia neurol. 19:153.

Orthopedic Surgery

Aufranc, O. E., and Sweet, E. B.
Study of patients with hip arthroplasty at Massachusetts General Hospital.
J.A.M.A. 170:507.

Wang, C. C., Lowrey, C. W., and Severance, R. L.

Fatigue fracture of the pelvis and the lower extremity.
New England J. Med. 260:958.

Otolaryngology

Kelemen, G., and Gotlib, B. N.
Pathohistology of fetal ears after maternal rubella.
Laryngoscope 69:385.

Pediatrics

McGovern, J. J., Jr., Russell, P. S., Atkins, L., and Webster, E. W.
Treatment of terminal leukemic relapse by total-body irradiation and intravenous infusion of stored autologous bone marrow obtained during remission.
New England J. Med. 260:675.

Psychiatry

Talland, G. A.
Psychological studies of Korsakoff's psychosis: III. Concept formation.
J. Nerv. & Ment. Dis. 128:214.

Radiology

Millard, D. G., and Wyman, S. M.
Periureteric fibrosis: Radiographic diagnosis.
Radiology 72:191.

Potsaid, M. S., and Robbins, L. L.
Diprotrizoate sodium.
Ann. New York Acad. Sciences 78:993.

Robbins, L. L.
George Winslow Holmes, 1876-1959.

VOLUNTEER GROUPS

DISTAFF CLUB

The first official meeting of the Club was held on September 9 in the Penthouse, with Dr. Clark as the guest speaker. He welcomed the old and new members to the MGH family, gave a brief history of the Hospital, and answered questions from the wives about M.G.H. and its routines.

Before Dr. Clark spoke, Mrs. Soma Weiss took us on a tour of the Hospital.

Officers for the coming year are: Mrs. George M. Williams, President; Mrs. Robert G. Ojemann, Vice-President; Mrs. Willard M. Daggett, Jr., Secretary; Mrs. Milton S. Grossman, Treasurer.

Brief bits:—

Dr. Henry F. Allen was elected Secretary of the Section on Ophthalmology of the American Medical Association, for a three-year term, at their June meeting in Atlantic City.

Dr. Mark D. Altschule, Director of Internal Medicine and Research in Clinical Physiology at McLean Hospital, has been appointed Editor of *Medical science*.

Irwin H. Blank, Ph.D. was given the Special Award for 1958 last May, by the Society of Cosmetic Chemists, "in recognition of his fundamental research and writing on factors controlling suppleness and flexibility of skin".

Dr. Bradford Cannon acted as Chairman of the Committee on Local Arrangements, which was host to the American Association of Plastic Surgeons, at their meetings in Boston, May 13-15.

Dr. Edwin F. Cave was elected President of the American Orthopaedic Association, at their meeting held in Lake Placid, N. Y., June 14-18.

Dr. Jack R. Dreyfuss presented a paper on "Infrapulmonary pleural effusion", at the Hammersmith Hospital in London on May 20.

Dr. John W. Irwin, Director of the Microcirculatory Laboratory, has been made Chairman-elect for the 1960 Microcirculatory Conference.

Dr. Fred G. Johnson (*Dn.* 1943) is now teaching in the Biology Department at the University of Bridgeport, Conn. He completed his graduate studies in the Public Health Department, Yale Medical School, and received his M.P.H. in June 1958.

Dr. Benson B. Roe (*W.S.* 1943) was appointed Chief of Cardiac Surgery at the University of California Medical Center in May 1958. His full-time University appointment became effective Dec. 1, 1958, with the temporary rank of Assistant Professor. His Associate Professorship became effective on July 1.

Dr. Paul M. St. Aubin has rejoined the staff of the Department of Radiology. Dr. St. Aubin has spent the past two years as Radiologist-in-Chief of the Atomic Bomb Casualty Commission in Hiroshima and Nagasaki.

Dr. Milton S. Thompson (*Or.* 1934) has been appointed Professor of Forensic Orthopedics at the University of Texas.

Dr. W. Taliaferro Thompson (a.r.p. 1941) has been appointed Professor and Chairman of the Department of Medicine at the Medical College of Virginia, Richmond, Va.

New addresses:—

Dr. H. Clarke Anderson (*Path.* 1959), Dept. of Pathology, University of Louisville School of Medicine, 101 N. Chestnut St., Louisville, Ky.

Dr. Richard H. Aster (*M.* 1958), National Institute of Arthritis and Metabolic Diseases, Bethesda, Md.

Dr. Frank K. Austen (*M.* 1955), c/o Dr. John Humphrey, Div. of Immunology, National Institute for Medical Research, The Ridgeway, Mill Hill, London N.W. 7, England

Dr. George P. Baker, Jr. (*M.* 1958), Metabolic Unit, Grace-New Haven Community Hospital, New Haven, Conn.

Dr. Ruth B. Beuscher (a. attend. psychiat. (*McL.*)), 1419 Beacon St., Brookline, Mass.

Dr. Harold Bowditch (*W.M.* 1911), 12 Pine St., Peterborough, N. H.

Dr. Niels E. Brandstrup (a.r.p. *C.M.* 1959). Hospital for Sick Children, 555 University Ave., Toronto, Ontario, Canada

Dr. Robert D. Breer (a.r.p. *C.M.* 1957), Farm Drive, Manchester, Conn.

Dr. Alexander Breslow (a.r.p. *Path.* 1959), Dept. of Pathology, University of Washington, Seattle, Wash.

Capt. Robert W. Chamberlin, Jr., MC, USAR (a.r.p. *C.M.* 1959), Womack Army Hospital, Fort Bragg, N. C.

Dr. Amoz I. Chernoff (*M.* 1948), Memorial Research Center, University of Tennessee, Knoxville, Tenn.

Dr. Stewart Clapp (*N.S.* 1939), 3921 Ingomar St., N.W., Washington 15, D.C.

Lt. Cecil H. Coggins, MC, USNR (*M.* 1959), Nav Fac Am Con Gen, Cyprus, FPO 539, New York, N. Y.

Dr. John D. Constable (*S.* 1953), Donner Laboratory, University of California, Berkeley, Calif.

Dr. Willard Dalrymple (*M.* 1947), Glass Hall, Harvard Graduate School of Business Administration, Boston, Mass.

Dr. R. Clement Darling, Jr. (*C.M.* 1954), Veterans Administration Hospital, 2002 Holcombe Blvd., Houston 31, Tex.

Dr. Habibolah Davanloo (a.r.p. *Psychiat.* 1959), Metropolitan State Hospital, Waltham, Mass.

Dr. Harry A. Derow (*Path.* 1928), 1136 Beacon St., Brookline 46, Mass.

Dr. Harold T. Dillon, Jr. (*Path.* 1958), Dept. of Legal Medicine, Harvard Medical School, Boston 15, Mass.

Capt. Harry B. Ditmore, Jr., MC, USAR (*S.* 1954), 11th Evacuation Hospital, APO 59, San Francisco, Calif.

Dr. Louis H. Edmunds, Jr. (*S.* 1957), Naval Medical Research Institute, Bethesda, Md.

Dr. Albert G. Engelbach (past a. dir.), c/o Joseph R. Phillips, 18 Browne St., Brookline 46, Mass.

Dr. Nathan H. Fearer (*C.M.* 1957), 25 Conant St., Danvers, Mass.

Dr. Ira A. Ferguson, Jr. (*S.* 1953), Emory University Clinic, Atlanta, Ga.

Dr. Robert P. Fornshell (sr. r.s. *Or.* 1958), 85 Osborne St., Danbury, Conn.

Dr. John G. Freymann (*M.* 1947), Memorial Hospital, 119 Belmont St., Worcester 5, Mass.

Dr. Clarence F. Friedman (*C.M.* 1923), 770 Ocean Ave., Brooklyn 26, N. Y.

Dr. Leonard J. Friedman (*M.* 1956), Massachusetts Mental Health Center, 74 Fenwood Rd., Boston, Mass.

Dr. Thomas E. Gaffney (a.r.p. 1959), Dept. of Pharmacology, University of Cincinnati College of Medicine, Cincinnati, Ohio

Dr. Robert N. Ganz (*C.M.* 1925), Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.

Dr. George C. Gibson (*W.S.* 1944), 536 W. Commonwealth Ave., Fullerton, Calif.

Dr. Benjamin F. Gill (a. psychiat.), 168 Homer St., Newton Centre 59, Mass.

Dr. Peter J. Gomatos (r.p. 1959), Students' Residence Hall, Rockefeller Institute, New York 21, N. Y.

Dr. Mehran Goulian (a.r.p. 1959), Yale University School of Medicine, 333 Cedar St., New Haven, Conn.

Dr. John W. Grover (*S.* 1957), Strangeways Laboratory, Wort's Causeway, Cambridge, England

Dr. H. David Hall (*Dn.* 1958), Dept. of Oral Surgery, University of Alabama Medical Center, Birmingham 3, Ala.

Dr. William H. Harris (sr. r.s. *Or.* 1959), Royal National Orthopaedic Hospital, Great Portland St., London, England

Dr. Ken Hashimoto (a.r.p. *D.* 1959), 2-808 Suidocho, Niigata City, Japan

Dr. Stephen E. Hedberg (*S.* 1956), 10302 Brunswick Ave., Silver Spring, Md.

Dr. Joan Kazanjian Hiett (r.p. *C.M.* 1959), 1904 Hudson Drive, Altus, Okla.

Dr. Lee Jackson (r.p. *Psychiat.* (*McL.*) 1959), Judge Baker Guidance Clinic, 295 Longwood Ave., Boston, Mass.

Dr. Wallace A. Jones (a.r.p. *Path.* 1959), Dept. of Pathology, Cincinnati General Hospital, Cincinnati, Ohio

Dr. John W. Josse (*M.* 1957), 841 Sycamore Drive, Palo Alto, Calif.

Dr. Charles S. Keevil, Jr. (*M.* 1956), Concord Medical Center, Concord, Mass.

Dr. George Kelemen (res. assoc. *Otolar.*), Massachusetts Eye and Ear Infirmary, 243 Charles St., Boston 14, Mass.

Dr. Kazuo K. Kimura (*C.M.* 1955), 9 Stuart Terrace, Worthington Heights, Bel Air, Md.

Capt. Howard S. King, MC, USAFR (a.r.p. *C.M.* 1959), USAF Hospital, APO 633, New York, N. Y.

Dr. Richard N. Kleaveland (*S.* 1952), 207 Medical Center, Spokane, Wash.

Dr. Robert G. Knapp, Jr. (*Dn.* 1950), 258 Genesee St., Utica, N. Y.

Dr. John T. Lambert (*W.M.* 1942), 768 Park Ave., New York, N. Y.

House Staff — July 1959

Dr. Bernhard Laukenmann (clin. fel. *An.* 1958), Chir. Klinik, Heilbronn, West Germany

Dr. Robert B. Layzer (*M.* 1958), Neurologic Institute, Columbia-Presbyterian Medical Center, 622 W. 168th St., New York, N. Y.

Dr. Charles A. Leach, Jr. (a.r.p. *C.M.* 1951), 525 Southfield Rd., Birmingham, Mich.

Dr. Marie-Louise Levy (clin. & res. fel. *An.* 1959), George Washington University Hospital, Washington, D. C.

Dr. Kenneth E. Liffmann (*Dn.* 1956), 168 Lloyd Ave., Providence 6, R. I.

Dr. Z. Jerzy Lipowski (a.r.p. *Psychiat.* 1959), Allan Memorial Institute, Royal Victoria Hospital, Montreal, Canada

Dr. J. Drennan Lowell (a.r.s. *Or.* 1953), Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.

Dr. Arthur S. Lurie (a.r.p. *D.* 1959), 150 Bradlee Ave., Swampscott, Mass.

Dr. Robert B. McFarland (a.r.p. *Path.* 1959), Denver General Hospital, Denver, Colo.

Dr. Stephen L. Madey (*C.M.* 1944), 1401 N. Foster St., Baton Rouge 6, La.

Dr. John A. Malcolm (*S.* 1953), Presbyterian Hospital, 622 W. 168th St., New York 32, N. Y.

Dr. Richard F. Mayer (a.r.p. *N.* 1957), U.S. Naval Hospital, Chelsea 50, Mass.

Dr. John E. Mazuzan, Jr. (c.r.p. *An.* 1959), University of Vermont College of Medicine, Burlington, Vt.

Dr. Neuman S. Mittel (r.p. *Psychiat.* (*McL.*) 1959), Dept. of Psychiatry, Massachusetts Memorial Hospital, 750 Harrison Ave., Boston, Mass.

Dr. Walid A. Mnaymneh (a.r.s. *Or.* 1959), Children's Medical Center, 300 Longwood Ave., Boston, Mass.

Dr. Barbara Gurd Mueller (r.p. *Psychiat.* (*McL.*) 1959), Dept. of Psychiatry, Beth Israel Hospital, 330 Brookline Ave., Boston, Mass.

Dr. Gustave C. E. Mueller (*S.* 1958), Aero-Medical Research Laboratory, Wright-Patterson A.F.B., Dayton, Ohio

Dr. Gerhard Nellhaus (*C.M.* 1957), Neurologic Institute, Columbia-Presbyterian Medical Center, 622 W. 168th St., New York, N. Y.

Dr. Charles W. Neville, Jr. (r.p. *Psychiat.* (*McL.*) 1959), Dept. of Psychiatry, Beth Israel Hospital, 330 Brookline Ave., Boston, Mass.

Dr. Joseph C. Oakley (*Dn.* 1959), 64 Sagamore Rd., Worcester, Mass.

Dr. Edward Parnall (*Or.* 1932), 1 Medical Arts Sq., Albuquerque, N. M.

Dr. Donald P. Pederson (c.r.p. *An.* 1957), 650 S. Central Ave., Marshfield, Wis.

Dr. Jalna A. Perry (r.p. *Psychiat.* (*McL.*) 1959), Dept. of Psychiatry, Massachusetts Memorial Hospital, 750 Harrison Ave., Boston, Mass.

Dr. Joseph R. Petranek (*M.* 1954), 2 Poplar St., Ipswich, Mass.

Dr. David C. Poskanzer (r.p. *N.* 1959), 90 Parliament Hill Mansions, Lissenden Gardens, London N.W. 5, England

Dr. Désiré J. A. Rebello (a.r.p. *D.* 1954), "Kalleanpur", 130 Hill Rd., Bandra, Bombay, India

Dr. Claus W. Reichle (clin. & res. fel. *An.* 1959), Farbwerke Hoechst, Pharm.-Wissensch. Abt. 1, Frankfurt-Hoechst, Germany

Dr. John P. Remensnyder, Jr. (*S.* 1958), 4812 Edgefield Rd., Bethesda, Md.

Dr. Jack O. Rice (r.p. *Psychiat.* (*McL.*) 1959), Vanderbilt University Hospital, Nashville, Tenn.

Dr. Flaviu C. A. Romanul (fel. *N.P.* 1959), Johns Hopkins Hospital, Baltimore 5, Md.

Dr. Logan H. Roots (*W.S.* 1933), 475 Riverside Drive, New York 27, N. Y.

Dr. Patrick F. Rose (a.r.p. *C.M.* 1959), Southwestern Medical School, University of Texas, Dallas, Tex.

Dr. Victor J. Rosen, Jr. (a.r.p. *Path.* 1959) U.S. Naval Radiological Defense Laboratory, San Francisco 24, Calif.

Dr. E. William Rosenberg (r.p. *D.* 1959), Jackson Memorial Hospital, Miami, Fla.

Dr. Jens G. Rosenkrantz (*S.* 1954), Children's Medical Center, 300 Longwood Ave., Boston, Mass.

Dr. Bal Makund Sahay (a.r.p. *Psychiat.* 1959), Beth Israel Hospital, 330 Brookline Ave., Boston, Mass.

Dr. Morris B. Sanders (*E.S.* 1920), 8 Marmion Way, Rockport, Mass.

Dr. Stanley J. Sarnoff (a.r.s. 1947), Room 6-D-20, Bldg. 10, National Institutes of Health, Bethesda 14, Md.

Dr. John W. Saville (a.r.s. *Or.* 1959), Dist. of Columbia General Hospital, Washington, D. C.

Dr. Robert A. Schmidt (a.r.p. *An.* 1959), Minneapolis General Hospital, Minneapolis, Minn.

Dr. John W. Singleton (*M.* 1958), NIAMD, Room 8N-240, Bldg. 10, National Institutes of Health, Bethesda, Md.

Dr. Porter H. Smith (a. an. 1959), 1005 Haywood Drive, Madison, Wis.

Dr. Oscar E. Starobin (*M.* 1955), Massachusetts General Hospital, Boston 14, Mass.

Dr. Charles P. Summerall, III (*M.* 1956), University Health Service, Tulane University of Louisiana, New Orleans 14, La.

Dr. John B. Tallon (a.r.p. *R.* 1953 & sr.r.s. *Or.* 1959), 617 McConnell Ave., Cornwall, Ontario, Canada

Dr. Milton S. Thompson (*Or.* 1934), 1605 Nix Professional Bldg., San Antonio 5, Tex.

Dr. William H. Tingey, Jr. (*Dn.* 1959), 115 E. 4600 South St., Murray, Utah

Dr. David Van Buskirk (*M.* 1958), Massachusetts Mental Health Center, Boston, Mass.

Dr. James L. Vanderveen (c.r.p. *An.* 1955), Massachusetts Memorial Hospital, 750 Harrison Ave., Boston, Mass.

Dr. Arie C. van Ravenswaay (*Path.* 1934), 708 N. Country Club, Tucson, Ariz.

Dr. Frederick H. Verhoeff (cons. c. *Oph.*), 61 Monmouth St., Brookline 46, Mass.

Dr. Ludo von Meysenbug (*C.M.* 1917 & *W.M.* 1918), 123 New Haven Ave., Melbourne, Fla.

Dr. Jerome K. Walker (*Dn.* 1954), 42 W. Brook St., Manchester, N. H.

Dr. Ralph C. Williams, Jr. (*M.* 1955), Massachusetts General Hospital, Boston 14, Mass.

Dr. Herbert C. Wimberger (r.p. *Psychiat.* (*McL.*) 1959), Massachusetts General Hospital, Boston 14, Mass.

Dr. Herbert Wohl (a.r.p. 1959), Columbia-Presbyterian Medical Center, 622 W. 168th St., New York, N. Y.

Dr. Stanley M. Wyman (j.r.p. *R.* 1942), Cambridge Medical Bldg., 575 Mount Auburn St., Cambridge 38, Mass.

Dr. Alfred Yankauer (*C.M.* 1941), New York State Department of Health, 39 Columbia St., Albany, N. Y. (after Jan. 1, 1960).

Capt. Peter M. Yurchak, MC, USAFR (*M.* 1958), 7505th USAF Hospital, APO 232, New York, N. Y.

* * *

Mrs. Helen H. Cushing, for many years the courteous and genial hostess at Baker Memorial and more recently hostess in the Warren Building Lobby, was honored by a tea-and-coffee party on June 12. The occasion was Mrs. Cushing's retirement from active duty at the Hospital, and her many friends came to express to her their appreciation of her long years of service at M.G.H. and to wish her well for the future.

* * *

Dr. and Mrs. Dean A. Clark and the Distaff Club gave a party for members of the House Staff and their wives in the Warren Building Lobby on the afternoon of August 6. The party provided a very pleasant opportunity for the many invited guests to meet the new members of the House Staff.

Delicious and attractive refreshments were served.

* * *

Dr. Arnold M. Katz, Assistant Resident in Medicine on our House Staff, has contributed a unique and most valuable item for our Archives collection.

During his recent travels in the Near East, Dr. Katz visited Cos, one of the islands in the archipelago off the coast of Asia Minor, where Hippocrates was born and practised medicine round 300 B.C. From the plane tree, under which Hippocrates is said to have carried on his teaching, Dr. Katz carefully selected and removed a very small dead twig. This, along with a piece of pure white marble which he picked up near by, he had enclosed within a little plastic box.

We have all seen, in the Warren Building Lobby, the results of the seedlings from this same tree which Dr. Wilder G. Penfield of Canada sent to the Hospital. But *do* come in to the Archives Room and see this little gem-like gift from Dr. Katz. It would be well worth your while.

THE NEWS

No. 189 Boston, Mass. November 1959

ACTIVITIES OF THE DIABETES UNIT

Patient-care and research in the field of diabetes are well-established traditions at Massachusetts General Hospital. To verify this, one needs only to recall that one of the first reports of the successful management of severe diabetic acidosis with the then new and untried pancreatic factor, insulin, came from our Hospital in 1922 from the pen of Dr. Arlie V. Bock. It is also likely that Dr. Elliott P. Joslin received the initial spark of inspiration to devote his life's energy and efforts to the study of this disease while he was a House Pupil on our Medical Service in 1894 and 1895. In more recent years, the works of Drs. Allan Butler, Reed Harwood, Fuller Albright, Janet McArthur, and Nathan Talbot give testimony that research in this area of metabolism continued to advance under our roofs. On the surgical side, the management of gangrene of the toes and feet, seen all too frequently in the diabetic population, occupied the attention of Dr. Leland McKittrick and his associates, and many a patient owes his continued ability to walk to their contributions. The retinal and ocular complications of diabetes have been of enduring interest to Dr. William Beetham of our neighbor institution, the Massachusetts Eye and Ear Infirmary.

The physicians of this Hospital early recognized that the care of patients with diabetes required prolonged and concerted therapeutic attention, and a special clinic for their care was established as a unit of the old Out-Patient Department in 1916. Though a great many of our physicians participated in this primary function of a teaching hospital, the leadership of Drs. F. Gorham Brigham, Roy Wheeler, James H. Townsend, and Reed Harwood in this regard has been well established. In recent years, due to the increasing incidence and earlier recognition of diabetes in the ageing population we serve, the numbers of patients in our Diabetes Clinic has steadily increased and, at the present time, better than 3600 patient-visits per year are serviced by a devoted and energetic staff.

In the past, research and patient-care in diabetes were largely separated. The metabolic defect in diabetes is basic to the energy metabolism of the whole organism and the clinical manifestations involve every system of the body; therefore, it is not surprising that research contributions at the M.G.H. concerning the various facets of the disease came from study groups whose interest in diabetes was tangential to their main concerns. In order to concentrate research effort in this area and to enhance the possibility of gaining fundamental information from the copious clinical material, a Diabetes Research Unit, tied to the Diabetes Clinic, was formed in 1957 through the efforts of Dr. Walter Bauer. It has been the writer's privilege to serve as Program Director of this unit since its inception and to herewith present a report on some of our progress to date.

We became interested in the action of insulin on peripheral nerve metabolism because of two patients with mild diabetes which had been well controlled for many years by diet alone, who had the rather sudden onset of severe, primarily motor neuropathy. After several months had passed without clinical improvement in the neurological deficit, both patients were started on 10 to 15 unit doses of insulin and the carbohydrate content of their diets was increased appropriately. To our satisfaction, there was a prompt improvement in both objective and subjective manifestations. At about the same time, we had the opportunity to see another patient who had not been suspected of being diabetic and had rapidly developed so profound a motor radiculopathy of the lower extremities as to have become bedridden. A glucose tolerance test and careful examination of her eye grounds proved the presence of mild diabetes and she, also, experienced rapid reversal of symptoms and physical signs with the institution of insulin therapy.

Despite the fact that a direct action of insulin on the glucose metabolism of brain has been consistently denied by all who had investigated the problem, we undertook experiments with isolated, excised rabbit sciatic nerves on the hunch that peripheral nerve metabolism might be quite different from that of the brain. This proved to be the case and we were able to demonstrate, subsequently, a positive insulin effect *in vitro*, on glucose uptake from the incubation medium, on penetration of non-utilizable sugar into the intracellular water, on radio-CO_2 production from radio-glucose supplied in the incubation medium, and on lactic acid accumulation. Our experiments were controlled by incubating the sciatic from one leg with insulin in the medium and its opposite number in an insulin-free medium. We suspected that the Schwann cells were the site of the observed response to insulin and that the axons and myelin sheaths were indifferent to the presence of insulin. To test this hypothesis, we surgically divided both sciatic nerves of rabbits and ten days later excised the distal portions as experimental objects. To our surprise, the positive insulin effect could no longer be evoked despite the fact that our neuropathologist colleagues found Schwann cell hyperplasia and axon and myelin degeneration in specimens of the nerves used. Our tentative conclusion that the insulin response in a peripheral nerve is dependent on intact axons and myelin sheaths requires further verification and we are still working on this point.

On the basis of our clinical observations and the laboratory demonstration that insulin can influence the glucose metabolism of peripheral nerves, we suspect that patients with mild diabetes and a primarily motor affection of the nerve roots should be given insulin therapy. Our experience in the Diabetes Clinic leads us to agree with the widely-held concept that neuropathy in diabetes is of several distinct varieties, each of which may have an entirely different pathogenesis. At the moment we entertain the hypothesis that this type of motor, peripheral neuropathy is the result of insufficient glucose utilization by the nerves involved, due to an absolute or relative lack of insulin at its metabolic site.

Atherosclerosis has also caught our research interest. Sclerotic disease of the blood vessels seems to be an intrinsic part of the ageing process in all of us, but it is a well-established fact that the diabetic gets atherosclerotic changes earlier than the normal person and that the extent, progress, and severity of vascular degeneration are all increased by diabetes. Dr. William Waddell of the Surgical Service has had a keen interest in the fat and carbohydrate metabolism of relatively young patients who have experienced a disastrous vessel closure due to precocious atherosclerosis. His work suggested that many of these patients had an abnormal type of carbohydrate metabolism, not unlike that seen in diabetes. Working together with him on this problem, we have tested the responses of a group of ten precocious atherosclerotics and ten non-atherosclerotics as controls in regard to changes in the serum levels of non-esterified fatty acids. This relatively small fraction of the plasma lipids has been shown by Vincent Dole (*E.M.* 1941) and other investigators to be the main channel for the flux of material being mobilized from storage in the adipose depots of the body. The initiation and cessation of release of these acids into the blood by fat tissue are very sensitive to changes in the glucose utilization of fat cells, and presumably the brisk changes one can detect in levels of serum NEFA under the influence of insulin, glucagon, and glucose infusions reflect the changes in glucose utilization of adipose tissue. In diabetics, the NEFA responses to these various provocations are distinctly different from those seen in non-diabetics under similar conditions. The results of our NEFA response experiments with precocious atherosclerotics indicated that this group behaved in this respect in a manner one observes in diabetics. As a matter of fact, although they did not have glycosuria or elevated fasting sugars, most of them, in the atherosclerotic group, had a "diabetic type" of glucose tolerance curve. If weight reduction and a low fat diet were instituted, many of the atherosclerotics had changes in their NEFA responses away from the diabetic pattern, back to or toward a normal pattern. Although it is not possible to attach etiological significance to the NEFA peculiarities in this group of precocious atherosclerotics or in diabetics, we reason that measures which re-establish the usual pattern of response may impede the progress of the sclerotic degeneration. On this and other grounds, we recommend to our atherosclerotic and diabetic patients the curbing of dietary fat intake and the reduction of excessive body fat stores to normal.

The introduction of oral agents capable of controlling the hyperglycemia and glycosuria of a large number of patients with diabetes opened a new era in the clinical management of diabetes. During the last three years, we have evaluated carefully four of these agents and have gained much useful and practical information regarding their use. The three sulfonylurea compounds — tolbutamide (Orinase), chlorpropamide (Diabinese), and metahexamide (Euglycin) — are thought to act by stimulation of the release of insulin from the patients' own islets as well as by decreasing the liver's glucose output. They are ineffective in the severe diabetes most commonly seen in children and young adults where the capacity for endogenous insulin production seems to have been lost entirely. Our experience with this group of compounds agrees with those reported from other clinics. Tolbutamide appears to have the greatest margin of safety and the least possibility of toxicity, but it is relatively expensive and does not have the pharmacology for cumulative action. Chlorpropamide is more potent in equivalent doses than tolbutamide, and response, if evoked, is unequivocal. Although the literature reports a greater capacity for toxicity for this agent, we have not as yet seen a serious untoward effect in our group of 25 study patients on this drug. Metahexamide was abandoned because of its hepatotoxic properties, and a recent issue of the *New England Journal of Medicine* carries our report concerning the findings on liver biopsy in a non-fatal case of metahexamide jaundice which we observed.

The remaining agent under study belongs to an entirely different class of chemical compounds — the biguanides, and its mode of action has not been determined with any certainty. DBI (N^1-β-phenethyl formamidinylimino urea), is thought to lower blood sugar by increasing the utilization of glucose in the peripheral tissues and to suppress hepatic glucose release. In contrast to the sulfonylureas, it can act in the so-called labile or "juvenile" type of diabetes. Unfortunately, it causes gastrointestinal disturbances in many patients when given in large enough doses to be effective without insulin. We are currently trying it as a stabilizing agent in conjunction with the usual insulin therapy in a group of patients whose diabetes is very erratic, with frequent bounces of the blood sugar to high levels and interspersed insulin reactions. From the few cases we have had the opportunity to observe, this may prove to be a good use for this interesting agent.

It will take many years of observation before the merits, or lack of them, of the oral agents can be fully evaluated. We all are still a little apprehensive that perhaps in five, ten, or more years from now, a subtle toxicity of these agents, which we do not recognize now, will become apparent. Nevertheless, the chances of such an occurrence seem smaller as time passes and we are becoming more confident and appreciative of these agents. We still wonder if the agents merely lower the blood sugar or whether they really correct the faulty underlying metabolism in the same manner that administered insulin does.

The difficulties of one of our Clinic patients has led us into another project which promises to be very rewarding as well as informative. The patient was a young man, not yet 30, whom Dr. Harwood and others had followed in the Diabetes Clinic since he had acquired the disease some 18 years previously. His diabetes had been difficult to regulate, partly because of his inability to follow his therapeutic program in the early years, but primarily because of the erratic behavior of the disease process itself, which is so often the case in the so-called "juvenile" or labile type of diabetes. In the 13th year of his condition, retinal microaneurysms were noted for the first time, and the progression of this hemorrhagic degeneration continued relentlessly until the cumulative loss of vision threatened to make it impossible for him to continue his employment as a clerical worker and to support his wife and infant child.

We had been following the reports from Scandinavia concerning the employment of surgical and radiation-implantation hypophysectomy for the arrest of diabetic retinopathy. This approach followed the observation of Poulsen, in Denmark, that a woman with severe diabetic retinopathy had remission and healing of the retinal disease after the occurrence of post-partum pan-hypopituitarism (Sheehan's syndrome). Unfortunately, no general agreement as to the benefits or lack of them concerning this procedure had been reached by the handful of observers who had had some, albeit small, experience with this form of treatment. Not only had assessment of retinal changes proved difficult, but the ablative type of surgical hypophysectomy carried considerable operative morbidity. In a few cases, operative damage to the optic chiasm, which lies in close proximity to the pituitary, occurred, and what was being attempted as a sight-saving procedure turned out to be a sight-destroying maneuver.

It seemed to us that we could make a contribution toward the resolution of this problem and perhaps offer our patient some hope for his eyesight by exploiting the specialized skills of several groups who had a contingent interest in the problem.

Dr. Joel Contreras of the Retina Service proceeded to make maps of the patient's eye grounds at 2- to 4-week intervals. This painstaking and demanding technique of indirect ophthalmoscopy detailed every hemorrhage, every exudate, and every change which took place over a 6-month period. During this time, we obtained the patient's complete cooperation and kept him on the strictest medical regimen possible. It was quickly apparent that, in this patient, diabetic retinopathy was a highly dynamic process, with new hemorrhages constantly appearing, old ones resolving and being replaced by exudate along with a gradual increase of proliferative change. At this point in the series of observations, one could predict that complete loss of useful vision would occur unless the advance of the disease were interrupted within 6 months to a year, as early invasion of the macular region and the formation of traction rings around the maculae had begun.

We studied the patient on the metabolic ward and characterized his hormonal status, the severity of diabetes, and proved to our satisfaction that his renal lesion of Kimmelstiel-Wilson disease, which almost invariably exists in diabetics with severe retinopathy, was not too far advanced. After obtaining the advice of Dr. William H. Baker, who has had extensive experience with hypophysectomy in the treatment of metastatic breast cancer, the patient had his hypophyseal-stalk divided by Dr. William Sweet. Dr. Sweet, after sectioning the stalk, placed a gold cap on top of the sella so as to preclude the re-establishment of connections to the pituitary from the proximal stalk and to eliminate the hazard of radiation damage to the overlying optic chiasm should transnasal radiation-source implantation become desirable at some time in the future.

Six months have now passed since the procedure was performed and the results have, in this case, been very striking: A complete cessation of pituitary tropic activity has been shown in regard to thyroid, adrenal, and gonadal function; the diabetes has been much ameliorated, with a 50% drop in insulin requirement and about 75% curtailment of daily urinary sugar losses; the advance of the hemorrhagic retinal process appears to have ceased entirely and not one new hemorrhage has been noted as healing of the older lesions has taken place. Of interest has been the observed thrombosis of veins feeding clusters of microaneurysms, with eventual disappearance of these lesions. The proliferative changes appear to have regressed slightly and have not advanced. There has been some improvement in the patient's visual acuity, though pre-existent, permanent damage precludes complete restoration of vision. However, it is important to emphasize that there has been no further loss of acuity as had been the case prior to the operation.

We are much encouraged by the results obtained in this case and have under study several patients whom we are considering as candidates for the procedure. From our experience with the patient described, it has been possible to define criteria for the choice of suitable candidates. At the moment, we feel we are in a position to clarify the situation in regard to this radical approach to an otherwise insoluble problem in diabetes. This is possible since we have the trained experts and methodology for documenting the retinal changes with certainty; we have the skilled surgeons and a relatively innocuous, effective surgical procedure; and we have the facilities to study and document the metabolic changes which the operation produces. It is not too much to hope that from this type of clinical experience a lead will appear that will reveal, under laboratory study, valid information as to the fundamental chemical pathogenesis of diabetic ocular vascular disease.

In addition to these more clinically oriented projects, we have under way in our laboratory on the Fourth Floor of the Bulfinch, biochemical studies in the fundamental problems of carbohydrate and lipid metabolism. We hope to make contributions on this level of investigation as well, for without such basic information we shall never have a good understanding of diabetes and its complications. It is sad, but true, that despite the 37 years which have passed since Banting and Best discovered insulin and despite the prodigious efforts on the part of a multitude of talented investigators, the essential nature of diabetes remains obscure, and even more mysterious are the mechanisms by which its presence produces the dreaded complications. The answers to these pivotal questions will almost certainly come from fundamental laboratory research, but our diabetic patients can furnish us with the key clues as to how and where to attack the problems in the laboratories. The concept of a coordinated program of patient-care, clinical research, and basic investigation by a closely-knit but diversified group of individuals interested in a particular phase of Medicine was clearly enunciated by Dr. Bauer in his Presidential Address before the Association of American Physicians last May, the text of which appeared in the October issue of THE NEWS. We hope the Diabetes Unit will develop along these lines and be able to fulfill its assigned mission in this context.

Richard A. Field, M.D.,
Assistant Physician and *Program Director,*
Diabetes Clinic

THE KENNEDY FOUNDATION GIFT

A generous gift of $1,000,000 has been made by the Joseph P. Kennedy, Jr. Memorial Foundation to the 150th Anniversary Program of the Massachusetts General Hospital, to establish the Joseph P. Kennedy, Jr. Laboratories for Research on Mental Retardation. The gift was made on the occasion of the birthday, last September, of Joseph P. Kennedy, Sr. by Robert F. Kennedy and Mrs. Robert Sargent Shriver, President and Vice-President, respectively, of the Kennedy Foundation.

The million-dollar donation will be equally divided between construction and endowment. The laboratories will consist of two new floors to be built atop the Vincent-Burnham Building. Finished plans for the unit are being prepared by the architects, with construction scheduled to begin early in 1960.

* * *

Dr. Albert H. Coons (*E.M.* 1939) was one of seven scientists and laymen who received Albert Lasker Awards at the annual meeting of the American Public Health Association in Atlantic City on October 22. Dr. Coons was so honored "for his outstanding contributions in immunology and medicine and especially for his development of the fluorescent method of labeling proteins — a significant new tool for the study of infection in human beings."

An article describing Dr. Coons's work appeared in the October 3 issue of *Saturday Review.*

Dr. Joe Vincent Meigs was awarded an honorary degree of Doctor of Science by the Northwestern University Medical School, at a special Convocation on September 29. This date is Founder's Day at Northwestern Medical School, and this year marked the 100th anniversary of its founding.

Dr. Fresenius Van Nüys (*E.M.* 1907) has been named the Massachusetts "General Practitioner of the Year" by his colleagues in the Massachusetts Medical Society.

Dr. Van Nüys practised medicine in Weston, Massachusetts, from 1907 until 1951, when he retired to serve as Medical Officer at the Watertown Arsenal dispensary. He was Chief of Medicine at the Chelsea Naval Hospital during World War I, and was Chief of Medicine at Waltham Hospital for many years. Dr. Van Nüys has been active in civic affairs in his community and is a member of many medical associations.

The Board of Trustees, at their meetings on August 21, and September 11 and 25, voted:

That J. Gordon Millichap, at present Clinical and Research Fellow in Neuropathology, be given the title of Clinical Fellow in Neurology, to act as Assistant Resident in Pediatric Neurology for one year, beginning July 1;

To accept the resignation of Dr. Donald P. Pederson from the position of Assistant Anesthetist, effective August 15;

To change the status of Charles E. Rounds D.M.D. from Dental Surgeon to Clinical Associate in Dentistry.

To appoint:

Dr. Jose Barzelatto as Clinical and Research Fellow in Medicine, beginning October 1;

Dr. Abraham B. Bergman as Exchange Assistant Resident on the Children's Medical Service, for the period September 21 through October 31;

Dr. Robert B. Brendze as Assistant in Orthopedic Surgery, beginning September 1;

Dr. Thomas A. Carey as Second Assistant Resident in Radiology, beginning July 1, 1960;

Dr. William L. Curwen as Assistant in Dermatology, beginning September 25;

Dr. James H. Eldredge as Assistant Resident in Orthopedic Surgery for one year, beginning October 1;

Dr. Arnold Gilbert as Exchange Assistant Resident on the Children's Medical Service, for the period August 11 through September 20;

Dr. Frederick T. Hatch as Assistant Physician, beginning July 1;

Dr. Clement A. Hiebert as Assistant in Surgery, beginning September 14;

Dr. Lee Jackson as Clinical Fellow in Psychiatry at McLean Hospital, beginning September 1;

Dr. Robert H. Jones as Assistant in Medicine for one year, beginning August 1;

Dr. Thomas J. Keenan as Assistant in Anesthesia, beginning September 1;

Dr. Beatriz G. Requena as Clinical Fellow in Medicine for one year, beginning September 15;

Dr. Dwight R. Robinson as Clinical and Research Fellow in Medicine, beginning July 1;

Dr. William F. Soskin as Research Associate in Psychology at McLean Hospital, beginning September 1;

Dr. Janice R. Stevens as Clinical and Research Fellow in Neurology, for a term of nine months, beginning September 15;

Dr. Alfred D. Surtees as Assistant in Anesthesia, beginning July 25;

George Szabo, Ph.D. as Associate Biologist (Medicine), beginning August 1;

Dr. Rajendra Tandon as Assistant Resident in Medicine, for a period of four months, beginning September 1, 1959, and that on January 1, 1960, Dr. Tandon be appointed Resident in Medicine for one year;

Dr. Erik Vinnars as Clinical Fellow in Anesthesia, for a period of six months, beginning March 1, 1960;

Dr. Ralph C. Williams, Jr. as Chief Resident in Medicine, beginning January 1, 1960;

Dr. William E. Wilson as Assistant Resident in Orthopedic Surgery for one year, beginning October 1.

The Trustees also voted:

That Professor Eduardo C. Palma of the University of Montevideo Medical School be invited to give a Richardson Lecture at the Hospital on October 14;

That Dr. Meryl Rose of the University of Illinois be invited to give a Richardson Lecture at the Hospital on November 27.

At their meetings during September, the General Executive Committee voted:

That Dr. Myron B. Laver's title be that of Clinical Fellow and Acting Chief Resident in Anesthesia, beginning August 15;

To extend the appointment of Dr. Augusto D. Litonjua as Clinical and Research Fellow in Medicine, from November 17, 1959 through August 31, 1960;

That the promotion of Dr. Edwin T. Wyman, Jr. to the position of Senior Resident in Orthopedic Surgery become effective as of January 1, 1960 rather than April 1, 1960.

To accept the resignations of:

Dr. John K. Leach from the position of Clinical Fellow in Medicine, assigned to Cardiology, effective as of June 30;

Zofia Tarasiejska (Glaser), Ph.D. from the position of Research Fellow in Medicine, effective as of September 5.

To promote:

- Dr. W. Gerald Austen to the position of Resident in Surgery for one year, beginning January 1, 1960;
- Dr. Elwin W. Donnelly to the position of First Assistant Resident in Radiology, beginning October 1;
- Dr. Clinton B. Seeley to the position of Resident in Radiology, beginning October 1.

To reappoint:

- Dr. Ann B. Barnet as Clinical Fellow on the Children's Medical Service for one year, beginning September 26;
- Dr. Edgar S. Cathcart as Clinical and Research Fellow in Medicine for one year, beginning July 1;
- Dr. Oscar S. DePriest, III, as Second Assistant Resident in Surgery, beginning October 1;
- Dr. Ingrid Gamstorp as Clinical and Research Fellow in Neurology and Pediatrics for one year, beginning October 1;
- Dr. Maurice M. Pechet as Clinical and Research Fellow in Medicine for one year, beginning October 1;
- Dr. Gilberto Rebouças as Clinical Fellow in Medicine, for the period December 1, 1959 through May 31, 1960;
- Ascanio M. Rossi, Ph.D. as Research Fellow in Psychology for one year, beginning August 25;
- Dr. Juan F. Sotos as Clinical and Research Fellow in Pediatrics and in Pediatric Neurology, beginning October 1;
- Mary J. Spiro, Ph.D. as Research Fellow in Medicine for one year, beginning July 1;
- Dr. Alejandro H. Villegas as Clinical and Research Fellow in Surgery, for the period September 1, 1959 through February 28, 1960;
- Irving Weliky, Ph.D. as Research Fellow in Medicine for one year, beginning October 1.

To appoint:

- Dr. Ulf Å. Friberg as Research Fellow in Orthopedic Surgery, beginning November 1;
- Dr. Latifeh Ghandur-Mneimneh as Research Fellow in Pathology for one year, beginning July 1, 1960;
- Herbert Lange, Ph.D. as Research Fellow in Psychology for one year, beginning September 1;
- Dr. Rodolfo R. Llinás as Research Fellow in Psychiatry for one year, beginning October 1;
- Than Myint, Ph.D. as Research Fellow in Radiology, beginning September 17;
- John R. Newbrough, Ph.D. as Research Fellow in Psychology, beginning September 1;
- Mr. James L. Pinter as Research Fellow in Physics (Medicine), beginning September 1;
- Dr. Edwin T. Wyman, Jr. as Clinical Assistant in Orthopedic Surgery, from September 1 through December 31, with the privilege of assisting Drs. Barr and Aufranc.

The Coordinated Program conducted by Radcliffe College and the Massachusetts General Hospital School of Nursing since 1946 was studied in 1958 by Dr. Everett Hughes, Professor of Sociology, University of Chicago, at the request of and with the support of Radcliffe College and the School of Nursing.

In accord with the recommendations from the study and plans of the faculty of the program, certain changes have been initiated in anticipation of future developments.

Graduates of liberal arts colleges, in addition to those from Radcliffe, were admitted in July 1959. Undergraduates at Radcliffe will continue to enter the program this fall for their preclinical studies. As in the past, the requirements for entering the clinical phase of the program will have been met on graduation from Radcliffe College by carrying one course each term at the School of Nursing. The clinical phase of the program extends over two calendar years, and prepares the student for public health nursing as well as institutional nursing.

Committees have been working on plans for a new program which will make it possible for graduates of liberal arts colleges, who meet the admission requirements, to complete both the preclinical and the clinical phases of the program in two calendar years.

At present, four students, in addition to graduates of Radcliffe College, are enrolled in this new plan. A program for each is devised in terms of her undergraduate studies, therefore learnings are utilized on the level appropriate to the student, and needless repetition is avoided.

Since the need has become evident to identify these students as members of a program for college graduates, a committee of students and faculty has designed a uniform and cap which began to be worn this last September. The uniform consists of a one-piece blue dress, with white collar and vest. The blue is not as deep a shade as the MGH blue, nor are the dress and cap replicas of the MGH student uniform, but derivation from these has not been overlooked. White shoes and stockings are worn.

Classes will be admitted annually. The admissions and curriculum committees continue their work of refining requirements and program. The committee at Radcliffe resumed its planning functions this fall.

Sylvia Perkins, R.N.,
Assistant Director, School of Nursing

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

General Surgery

McDermott, W. V., Jr.
Hepatic coma and ammonia intoxication.
Quart. Rev. Surg., Obst. & Gynec. 16:139.

Nardi, G. L.
Liver blood flow in man; studies utilizing radioactive colloid. I. Normal values.
Gastroenterology 37:295.

Nardi, G. L.
Specific polypeptide substrates in enzymatic determination of pancreatic disease.
Surgery 46:30.

Waddell, W. R., and Williams, H. W., Jr.
The effect of antrectomy on gastric blood flow.
Ann. Surg. 150:529.

Neurophysiology

Barlow, J. S., Brazier, M. A. B., and Rosenblith, W. A.
The application of autocorrelation analysis to electroencephalography.
In Proceedings of the First National Biophysics Conference, New Haven, Conn., Yale University Press, p. 622.

Miscellaneous

Binger, C.
A child of enlightenment.
In Walter Lippmann and his times, Marquis Childs and James Reston, Editors, New York, Harcourt, Brace and Company, chap. 2.

Wolf, M. R., and Hamm, D.
Pilot studies on evening volunteers.
Hosp. Topics 37:34.

As a complete surprise on his birthday last August, Dr. Binger's family presented him with a volume of some of his poems, selected by his children and privately printed. The book is titled *Post meridian.*

MASSACHUSETTS EYE & EAR INFIRMARY

The Executive Committee of the Board of Managers of the Massachusetts Eye and Ear Infirmary, at their meetings during April, May, June, and August, voted:

To accept the resignation of Dr. John J. Sullivan from the position of Assistant in Ophthalmology.

To appoint:

- Dr. D. Robert Alpert — Assistant Surgeon in Ophthalmology;
- Dr. Hugo D. Angelini — Assistant Surgeon in Otolaryngology;
- Dr. Thomas Cavanaugh — Associate Surgeon in Ophthalmology;
- Dr. Peggy Clark-Roberts — reappointed Fellow in Anesthesiology, retroactive to July 1;
- Jean Dumas — Fellow in Ophthalmology, assigned to the Retina Service, for one year, beginning July 1;
- Dr. Alfred L. Hurst — Assistant in Otolaryngology;
- Dr. Rodney T. Irving — Resident in Otolaryngology, beginning July 1, 1961;
- Dr. Carl C. Johnson — Associate Surgeon in Ophthalmology;
- Dr. Charles Kent — Associate Surgeon in Otolaryngology;
- Dr. Robert E. Klotz — Assistant Surgeon in Otolaryngology;

Dr. Joseph Lentine — Surgeon in Otolaryngology;
Dr. Arthur M. Morrissey — Assistant Surgeon in Ophthalmology;
Dr. John H. Neame — Fellow in Otolaryngology for one year;
Herbert Novak, Ph.D. — Post-Doctoral Research Fellow in Chemistry, beginning approximately February 1960;
Mr. Donald F. O'Brien — Electrical Engineer in Otology, to work in the Eaton Peabody Laboratory;
Dr. Ichiro D. Okamura — Assistant Surgeon in Ophthalmology;
Dr. George M. Olive, Jr. — Assistant in Ophthalmology;
Dr. Uthai Rutnin — Fellow in Ophthalmology, attached to the Retina Service, for one year, beginning May 15;
Dr. Earl S. Seale — Associate Surgeon in Ophthalmology;
Dr. Robert R. Trotter — Assistant Surgeon in Ophthalmology;
Dr. J. B. Walter — Fellow in Otolaryngology for one year.

At their meeting held on September 21, the Executive Committee of the Board of Managers voted to appoint:

Dr. Norman E. Byer — Fellow in Ophthalmology, assigned to the Eye Pathology Laboratory, for six months, beginning September 1;
Dr. Raymond Harrison — Fellow in Ophthalmology, assigned to the Glaucoma Consultation Clinic, for one year, beginning September 1;
Dr. Sotiria A. Mourkidou — Fellow in Anesthesiology for one year, beginning October 1;
Dr. John G. Sebestyen — Fellow in Ophthalmology, assigned to the Ophthalmic Plastics Laboratory, for one year, beginning September 1;
Dr. Jorge Silva — Fellow in Ophthalmology for one year, beginning September 1.

Among the recipients of honor awards at the annual meeting of the American Academy of Ophthalmology and Otolaryngology, held in Chicago from October 12 to 16, were Dr. Henry F. Allen, Assistant Surgeon in Ophthalmology, and Dr. Edgar M. Holmes, Surgeon for Plastic Operations.

Dr. Philip E. Meltzer was appointed as Acting Chief of Otolaryngology at the Infirmary and Acting Head of the Department of Otology and Laryngology at the Harvard Medical School upon the retirement of Dr. LeRoy A. Schall last August 31.

BIOGLETS

Dr. Elroy E. Anderson, Assistant Resident on the Children's Medical Service — born in Brockton, Massachusetts, February 14, 1930; A.B., Harvard College, 1951; military service: U.S. Medical Service Corps, U.S.A. and Korea, 1951-54; M.D., University of Buffalo Medical School, 1958; Intern in Pediatrics, Boston City Hospital, 1958-59; married; two children.

Dr. Howard P. Baden, Assistant Resident in Dermatology — born in Boston, Massachusetts, February 23, 1931; A.B., Harvard College, 1952; M.D., Harvard Medical School, 1956; Intern in Medicine, Peter Bent Brigham Hospital, Boston, 1957; military service: Captain, U.S. Army, stationed in the U.S.A., 1957-59; married; two children; home: Boston.

Dr. Paul F. Griner, Intern in Medicine — born in Philadelphia, Pennsylvania, January 1, 1933; B.A., Harvard College, 1954; M.D., University of Rochester, Rochester, N.Y., 1959; Fellowship in Pathology, University of Rochester, 1956-57; married; one child.

VOLUNTEER GROUPS

DISTAFF CLUB

During October the Distaff Club held two meetings. A get-acquainted evening, with bridge, canasta, and scrabble, was held on October 13, and a square dance on October 31.

A child psychologist from one of Boston's stores will discuss the world of toys with us at our November 18 meeting.

A time will be set, closer to Christmas, for our annual wrapping of gifts for children in the Hospital.

New addresses:

Dr. Irving P. Ackerman (*M.* 1951), 226 Marlborough St., Boston 16, Mass.
Dr. John A. Benson, Jr. (a. *M.* 1959), 3935 S.W. 52nd Place, Portland 1, Oreg.
Dr. Horace K. Boutwell (*E.M.* 1905), 201 St. Paul St., Brookline 46, Mass.
Dr. Robert D. Breer (a.r.p. *C.M.* 1957), 17 Haynes St., Manchester, Conn.
Dr. Addison G. Brenizer, Jr. (*W.S.* 1942), 1012 Kings Drive, Charlotte 7, N.C.
Dr. Benjamin L. Brock (*C.M.* 1923), P. O. Box 1411, Southeast Florida Tuberculosis Hospital, Lantana, Fla.
Dr. Franklin L. DeBusk (*C.M.* 1947), Dept. of Pediatrics, Medical Center Clinic, 1750 N. Palafox St., Pensacola, Fla.
Dr. Lawrence J. Essember (a.r.p. *C.M.* 1953), 25 Conant St., Danvers, Mass.
Dr. Robert H. Jones (r.p. 1959), Massachusetts General Hospital, Boston 14, Mass.
Dr. Charles A. McDonald (hon. p.), 97 Huxley Ave., Providence 8, R.I.
Capt. Donald M. McKee, MC, USAR (*S.* 1957), Headquarters Detachment, U.S. Army Hospital, Fort Sill, Okla.
Dr. Saul M. Marcus (a.u. 1958), 270 Commonwealth Ave., Boston, Mass.
Dr. Irving L. Pavlo (a. *Oph.*), 330 Dartmouth St., Boston 16, Mass.
Dr. Bruce J. Sams, Jr. (r.p. 1958), 304 E. Huntingdon St., Savannah, Ga.
Dr. Yang Wang (*M.* 1953), University of Minnesota Hospitals, Minneapolis 14, Minn.

Brief bits:

Dr. William R. Brewster, Jr. (a.r.p. *An.* 1950) has accepted the position of Assistant Professor in Surgery (Anesthesia) at the J. Hillis Miller Health Center, University of Florida, Gainesville, Florida.

Dr. Benjamin Castleman conducted the annual Slide Seminar of the American Society of Clinical Pathologists at their annual meeting in Chicago on September 11. The subject of the Seminar was "Diseases of the mediastinum and lung".

Dr. Lamar Soutter (a.r.s. 1941), Clinical Associate in Surgery on our staff and Associate Dean and Professor of Surgery at Boston University School of Medicine, has been appointed Acting Dean of the School.

Dr. William P. Boger (a.r.p. 1942), Director of Research at Norristown State Hospital, Norristown, Pennsylvania, spent a month in Europe last spring, where he participated in several international medical meetings.

In Milan, Italy, Dr. Boger presented a paper entitled "A critique of long-acting sulfonamide drugs" before the Second International Congress for Infectious and Parasitic Disease. In Prague, Czechoslovakia, Dr. Boger was a guest of honor of the Czechoslovakian Medical Society and of the Ministry of Health, and was invited to participate in the Antibiotics Symposium with International Participation that was held from May 18 to May 23. He served as moderator of one of the sessions, and presented two papers: "An evaluation of tetracycline preparations" and "Diffusion of antibiotics into the cerebrospinal fluid". Acting for Dr. Henry Welch, Director of the Division of Antibiotics of the Food and Drug Administration of the United States, who was unable to attend the meeting, Dr. Boger read the concluding paper at this Symposium.

Dr. Boger also visited the First and Second Medical Services of the University of Vienna School of Medicine, and attended the sessions of the Austrian Medical Association of Internal Medicine and the meetings of the Swiss Medical Society of Internal Medicine held at the Burgenstock, Switzerland, May 29 to 31.

Dr. Boger also spoke at the University of Freiburg in Germany, and at the University of Basle and the University of Berne in Switzerland. At these last three universities, the topics discussed were antibiotics in the treatment of staphylococcal infections and the new, long-acting sulfonamide drugs.

In a letter to Dr. Means, Dr. Boger gives the following appraisal of his trip:

> I have recently had the privilege of visiting behind the Iron Curtain and also at a number of the leading medical centers of Europe. Such visits are totally inadequate, by definition, for getting anything like a complete understanding of what is going on, but at least they are a help in establishing some bonds of understanding. Any face-to-face meeting, even for a matter of minutes, is helpful in discovering some of the essentials of our fellow creatures. This was certainly true in the brief meetings I had with medical men and scientists in Czechoslovakia. At this symposium there were representatives of 23 countries, but the ones of greatest interest to me were those from Russia, Hungary, Rumania, and Czechoslovakia.
>
> The Czechoslovakians are doing high quality work and at least by my understandings are more averagely attacking fundamental problems than is the case in many of our own institutions. They are obviously working "under the handicap" of restricted contact with fellow workers round the world, but they are certainly in full measure reviewing our literature and getting to know us at long distance, better than some of us know each other right here in close geographical proximity to each other.
>
> It was good on this short trip to discover members of the MGH family. When I made the rounds in Rossi's clinic in Berne, I was much impressed by his Oberarzt, Gautier, and I was constrained to inquire where he had received his training. It was a real pleasure to discover that he had had some of it at M.G.H. Interestingly enough, one of the Russian academicians, Juan Planelles, was a close friend of Fritz Lipmann. You might have occasion to tell him I met this gentleman.
>
> Peculiar circumstances have favored my getting abroad much more than I ever had reason to expect, and I am hopeful that, in some small way, I can profit from the opportunities and pay back in appropriate areas as chances present themselves.

We have conferred the title of "singleton" upon each alumnus of M.G.H. who

No. 84 in a series of Staff photographs
Dr. Richard A. Field, Assistant Physician — Program Director, Diabetes Clinic

is the only practising physician in his particular city or town. Dr. Walter M. Bartlett (*C.M.* 1927) of 125 Michigan Avenue, Decatur, Georgia, is now eligible for the title. In response to a letter from us, telling him of that distinction and asking him for news of his activities, this very interesting reply has been received:

It was a great surprise and pleasure to receive your letter of 4 September. If I have any claim for distinction among MGH-ers, it would be (1) that I was the next University of Michigan graduate to come to M.G.H. after Walter Bauer (I believe), and (2) that I took my assistant residency at the Boston City Hospital's Thorndike Memorial Laboratory under Dr. Francis W. Peabody (*E.M.* 1908) prior to taking my internship in Children's Medicine, and (3) that my roommate at the City Hospital was Dr. William Castle (*E.M.* 1923). I applied for the MGH appointment because of my interest in metabolic diseases and research, and I desired to work under the famous Dr. Fritz B. Talbot (*E.M.* 1907), who was then using the ketogenic diet to control epilepsy in children. He also had an abiding interest in many vague affairs (at least in 1927) such as Mongolism.

After leaving Boston I served as Resident Physician at the Physiatric Institute under Dr. Frederick M. Allen, working almost exclusively in the field of diabetes and hypertension. (In fact, all the bread in the hospital, as well as the butter, was strictly salt-free, and we had to salt our own.) Later I served for two years as Resident Physician in Internal Medicine at the Blythewood Sanitarium in Greenwich, Connecticut. In 1934 I practised Internal Medicine in Benton Harbor, Michigan, was certified by the American Board of Internal Medicine, and became a member of the American College of Physicians in 1939, after several years of research in Cardiology and Electrocardiography at the University of Illinois under the late Dr. Jay Bailey Carter, co-discoverer of ethylene anesthesia (although I shouldn't mention that in writing to anyone in the shadow of the great Ether Dome, underneath which I lectured on Pediatrics to the nurses — our wards were then immediately beneath the Ether Amphitheatre in the Bulfinch Building).

Holding an Army Reserve commission as a 1st lieutenant, I was called to active duty in the Army in April and again in June of 1941 for what we thought would last one year! I received orders to report to the great new 2,000-bed Lawson General Hospital in Chamblee, Georgia, where a Regular Army colonel was named Chief of the Medical Service. When he saw my lieutenant's bars he said, "If you had a little more rank I would make you my assistant." So I completed all my required paper work and was made a captain in six months and a major six months later. In October 1942 I was sent to Camp Bowie, Texas, was assigned as executive officer of the 16th Hospital Center, and soon received my lieutenant colonel's silver leaves.

Things began to happen soon, then. The Hospital Center was suddenly made into the 315th Station Hospital, the Regular Army colonel in charge (who did not want to go overseas) asked for a transfer and was sent to Alaska (!), and I found myself in charge of a 750-bed Station Hospital with 75 officers, 125 nurses, and more than 500 enlisted men. We were put through very rigorous training and sent to the ETO. After operating the hospital in cantonment style buildings for a year, Dr. (then Colonel) William S. Middleton, Consultant in Medicine for ETO Headquarters, visited us in Axminster (in beautiful Devonshire, home of original Axminster rugs), thought that my time was being wasted as a CO of a hospital, and sent me to the 216th General Hospital in Warminster, where we handled enormous numbers of ill and wounded. We were sent to Germany after V-E Day, and I was sent to Bremen as Assistant to the Surgeon of the Bremen Port Command. This was a nice assignment, since I had an opportunity to visit all of our hospitals throughout Germany, Belgium, and France, and see quite a bit of the country, as well as study many interesting cases. Of interest was the fact that I went to the ETO on my birthday, September 20, 1943 and had an opportunity to fly home exactly two years later, also on my birthday.

I was discharged from active duty on November 9, 1946 and received an appointment (by General Hawley, who had been the surgeon in the ETO Headquarters and was then employed by the Veterans Administration as Medical Director) as Consultant in Internal Medicine for the Southeastern States. I had a busy schedule with the VA, covering 23 hospitals and 8 regional offices in the 7 Southeastern States, traveling most of the time by airline.

I was called back to active duty with the Army in October 1950, and was sent to Korea, where I served as Consultant in Internal Medicine to the 8th United States Army. Nearing the end of my 18 months there, I suffered a heart attack and then fell down a ladder on a landing craft in Inchon Harbor, which produced a slipped disc, but I still stuck to my job. When I got home I was operated on, but it was too late to do any good. So, with a bad electrocardiogram and painful sciatica bilaterally, I was finally retired on total and permanent disability at Walter Reed Army Hospital, with the rank of Colonel MC.

I have written quite a good many research papers, particularly on diabetes (while I was in Boston I belonged to the Joslin "inner circle"), and I have many medals and campaign ribbons, including the Bronze Star; but I was quite amazed a couple of years ago to receive the award of Honorary Commander of the Order of the British Empire from Queen Elizabeth for my work in the prophylaxis against "hemorrhagic fever", because we were able to reduce the death rate from this strange disease from an over-all 4% to 2% and eliminate the disease entirely in well-disciplined troops such as the 1st British Commonwealth Division.

It was always a pleasure to tour Korea with prominent Consultants from the United States — many from Boston (Drs. Francis D. Moore, Joe Hayman, Laurence B. Ellis, Donald S. King, F. A. Simeone, Richard Warren, Phil McCarthy). But it was an unexpected pleasure to be assigned to accompany Betty Hutton and her troupe during a two-week jaunt to entertain the troops. Among other things, she did an imitation of Blossom Seeley in "Way down yonder in New Orleans" (circa 1924).

I'm sure this is too expansive, but "you asked for it".

No. 190 Boston, Mass. December 1959

THE ROLE AND FUNCTION OF PSYCHOLOGICAL RESEARCH IN A GENERAL HOSPITAL

Not every psychiatrist or neurologist thinks of psychology as a basic science of his clinical specialty, in the sense that anatomy and physiology are basic to general medicine and surgery. Fortunately, however, this view is strongly enough held in our Hospital to have made possible the establishment and recent growth of an experimental psychology laboratory in the Department of Psychiatry. The orientation and program of this laboratory are clearly indicated by its placement on Warren 6 alongside the new laboratories for human and animal physiology, and for biochemistry on the Psychiatric Research floor.

The position of psychology as a basic science is frequently disputed, and the counterargument usually follows either or both of two lines: First, the laws of psychology, even of behavioristic psychology, are unlike those of the physical sciences in their probabilistic character, in their lack of generality, in the tentativeness of their applicability. They are more reminiscent of the laws of classical economics — their validity depending on "other things being equal", and in situations which really matter it is absurd to expect that other things will be equal. The nesting behavior of wasps can be predicted with machine-like accuracy at each stage and without information concerning the individual insect; but to predict man's behavior in any one situation, one can only make a good guess and needs more information about the person than is commonly available. The other argument against regarding psychology as a basic science is that most psychologists whom the average citizen meets are manifestly engaged on some service duty and, if confronted with the question whether they are basic scientists, would almost certainly deny that they are.

Of course, the greater number of psychologists are applied scientists, and many may not even wish to be known as scientists. But this is not evidence against a basic science of psychology. The business ventures of manufacturers of detergents or soft drinks do not demolish the position of chemistry as a basic science. While it should be easy enough to refute the second counterargument given above, it nevertheless deserves some consideration, especially in a hospital setting where tradition and practice often conspire to place the psychologists in the ranks of technicians. In some places psychologists may acquiesce in this role assignment, in others they may fight it in vain, in yet others their position is strongly established, thanks to the backing of an academic department. Since neither the Massachusetts General Hospital nor the Harvard Medical School has an autonomous department in psychology, the function of psychology in our Hospital depends chiefly on what it can offer, and the trend of late has been markedly away from routine testing and toward independent research — basic research. Testing and research do not represent a dichotomy of incompatible activities. Most psychological tests, if administered in a scientific frame of mind, can contribute to research. It is true, though, that many clinical psychologists are content with counseling or with reporting on diagnostic testing procedures, and do not question the assumptions which underlie their work nor aspire to a systematic development of their techniques. Yet, there is nothing in clinical psychology which excludes the questioning, hypothesizing, verifying, and experimental methods of science. The true division in psychology occurs not along such lines as clinical versus experimental, but according to temperament and value orientation. Among psychologists, the tender-minded and tough-minded have often drifted into activities so diverse that the unity of the profession sometimes appears as a legal fiction contrived to puzzle the outsider and to exasperate those it binds in uneasy comradeship. A case could be made and has been made for creating two professional bodies, e.g., psychologists engaged in research and psychotechnicians active in the various applied fields. It is unlikely that this solution would be acceptable to both groups, and would probably lead to further subdivisions and pose yet other dilemmas to the general public which has difficulty enough in learning the difference between psychiatrist and psychologist. While the profession embraces all whose training or proclivities are within one or another area of psychology, it is well to bear in mind the divisions within it. At the one extreme, psychologists in advertising, personnel management, or child guidance, to take a few examples, apply their skills principally in an intuitive manner, and may achieve success without reference to any theoretical system or by adhering to one which, at best, only partially satisfies the criteria of a scientific test. At the other extreme are those who pay little attention to immediate results in practical application, and are concerned with the more remote, more fundamental, laws of behavior and experience. They, too, have a place in a general hospital.

Now we must briefly consider the argument against psychology as a basic science, founded on a comparison with the physical sciences. To him who regards physics as the only model of science, psychology appears either as a rudimentary science or not at all as a science. One need not question or belittle the very considerable achievements of psychological research while admitting that it has furnished no laws as universal as those which pertain to falling bodies or even to bones and muscles subjected to strain. Though one frequently hears about a person losing his mind or breaking down under severe strain, nobody would venture to define, even within wide limits, the magnitude of strain which necessarily results in a breakdown. But science is an ongoing process; it is an attitude and discipline rather than an accomplishment. It is often said that psychology as a science, at any rate, is very young, and that this is the reason it lags behind physics or chemistry in the precision, universality, and systematic coherence of its laws. The reason given, if eyebrows are raised, is that all that had passed as psychology until about a hundred years ago was idle armchair speculation and not science. This does not seem to be a very convincing argument. Armchairs do not inevitably stifle the scientific mood — in fact, science probably thrives best with a judicious mixture of speculation and experimentation. Now, men and women have certainly thought seriously and systematically about the problems of behavior and experience for at least as long as they have thought about motion and matter, and they certainly dissected minds long before they dissected bodies. Also, in the last few decades there has been such a spate of psychological experimentation as to make up for the omission for centuries. It is in experimentally-anchored theory that psychology lags behind — not because all the brightest men go into physics, but because the problems of psychology are so much more complex. Behavior and experience in man involves the action of the nervous system, and the brain alone consists of some 10,000 million cells which are in communication with one another. "As a result the number of ways in which they can interact is vastly more than the number of electrons in the whole universe."(1)

Psychological theory has also labored under a second handicap — not its youth, but its hoary antiquity. Its problems always were of general interest to men and women, and most of these problems are still not regarded as the preserve of specialists. Moreover, many of them are invested with emotional or value loadings. Few people think of mental retardation, insanity, or even of perceptual illusions with the detachment with which they view the orbits of the stars or the patterns of magnetic fields. Pressing questions call for immediate answers, and if no really good answer is at hand almost any answer will do. Complex problems must be simplified to satisfy the anxious or the curious, and simplification often results in distortion. Someone observed, at some time, that most juvenile delinquents he had encountered came from a domestic background which fits into the vague category of "broken home". There is, of course, reason and almost justice in attributing the evils of juvenile delinquency to moral depravity or, in more up-to-date language, the behavior disorder to the unhealthy climate of the home. So this and many other esthetically or ethically appealing laws about the effects of interpersonal relations on antisocial behavior, or even on symptoms of illness, have gained wide currency. Probably most of them are not untrue, but neither are they simply true, for the problems are not simple. This statement is not made because psychologists have decided that the laws of their science are always complex, and therefore they turn up their noses at simple explanations. Initial observations provide valuable hunches or hypotheses, but in psychology few, if any, have as yet stood the test of time without some refinement, qualification, or indeed modification. Having made an observation, one must state it in such a form that it either fits or contradicts subsequent observations. "Heads I win, tails you lose" is not only an unsporting proposition — it is unscientific, and psychology must rid itself of its likes, for they have neither explanatory or predictive value. Having stated a proposition in the proper — i.e., hypothetical — form, the psychologist must then count incidents or otherwise check whether his initial observation is tenable, whether it is representative of the population under consideration, and he must introduce controls to eliminate other reasonable explanations. If, for example, a survey at one college should find that classical students attend school far less regularly than science students, it would be tempting but rash to draw conclusions about such personality traits or general habits of either group as conscientiousness or studiousness.

It might be advisable to look into the matter at some other colleges, and even if much the same distinction should be observed everywhere, some other situations ought to be investigated. Then it might transpire that in attending other college functions classical students are just as regular or more so than students of science, and that their differential habits at school are merely due to the fact that physicists and chemists cannot easily make up for what they miss at the laboratory, while classicists can find in books almost anything they are taught in class. Now, if this is the case, any initial hypothesis about the character or habits of the two groups of students would be reformulated, probably into this form: "In situations which are important to them, students of classics and students of science do not differ in regularity of attendance." This proposition, of course, involves more complex problems. Sorting out scientists from classicists is as easy as dividing children into boys or girls, or adults into those who have a record of criminal conviction and those who have none. To decide what is a "situation of importance to a person" one has to make rational or arbitrary decisions, weigh and balance considerations, and altogether impose on oneself certain rules adopted for the occasion. Problems of self-disciplining of this kind very often occur in psychological research, and are not always observed. It seems particularly tempting to evade them if they involve some retrospective judgment, like deciding about a happy or unhappy childhood, about the quality of some defunct personal relationship.

Psychologists must contend not only with the over-simplified, over-generalized, or over-popularized tentative laws, but with the half-truth or less-than-half-truth (if that has any meaning) of common notions and the stumbling blocks of metaphysical or vitalist concepts. So many of the proverbs, famous quotations or maxims, and not so famous clichés fall within the province of psychology, from "Still waters run deep", "Yond Cassius has a lean and hungry look; He thinks too much: such men are dangerous"(2), or "Dans l'adversité de nos meilleurs amis, nous trouvons quelque chose qui nous ne deplaît pas"(3), to "dumb blonds". The sayings are not so hard to deal with, for people do not model or direct their actions according to these patterns as much as they quote them in justification of decisions reached for quite different reasons. The trouble with the vitalist concepts or even with mentalist terms is more difficult. It is almost impossible to talk sensibly without resort to such mentalist terms as "will" or "consciousness" or "purpose". The attempt to do away with them altogether has resulted only in shirking the issue and not in any widely acceptable solution. True enough, "mind" is far too wide a term to be definable by any operation or set of operations, or to provide a precise description, let alone an explanation, of an example of behavior or experience; yet, there is no satisfactory substitute for denoting a general area of function in the human organism. The use of such terms as "mind" and "consciousness" or "will" sets traps for the unwary, but the traps can be avoided. The trouble starts when "mind" is used in contrast with "body", when people suggest — often shamefacedly — that they have acted in a manner contrary to the dictates of their brain, or contrast the "reasons of the heart" or of other anatomical areas with the supposedly more rational or more "spiritual" attributes of the higher nervous centers.

It is hard to give up "the ghost" as an explanatory concept, for it seems to fit the job so much better than the machine. The task of psychology is precisely to design a machine which will fit the job better still. Just as physics has depended for its spectacular recent advances on a rejection of the traditional image of matter, psychology can progress only by discarding some confusing ancient concepts and terms. The dualist distinction between mind and body is slow to disappear, not least because of its ethical implications. Yet it must be recognized that the brain is just as much involved in the "reasons of the heart" as in those for which it receives direct credit; the lowest instincts remain pretty ineffective without action coordinated at the highest levels; the most spiritual person ceases to be so without a more or less intact central nervous system. Anyone who has observed the disintegration of the behavior, of the "moral personality", of a patient with severe brain injury will find it difficult ever again to trace that fine division between body and mind.

The study of brain-injured patients shakes our confidence in other, seemingly much less disputed, concepts as well — memory, for example. Work in our own laboratory on the cognitive defects in the Korsakoff syndrome has shown that patients who appear to have little else the matter with them than an inability to remember names, events, or even personal experiences and to have lost count of time, if examined more closely will show various other defects which cannot be attributed to their inefficient memory. Moreover, their memory often functions tolerably well if it is tested after very short intervals. Now, this suggests that in some instances, at least, we ought to call short-term memory and longer-term memory by different names. If a specific damage in the brain can be discovered in these patients with a memory disturbance, as is the usual case, then some mechanism or neural system must be involved in longer-term remembering but is not concerned, or not so much concerned, with immediate memory. Furthermore, if other defects systematically accompany severe memory derangements, then the neural system which appears to be involved with long-term memory is also involved in other processes, in other aspects of behavior. For example, patients with severe memory defects are invariably more or less devoid of spontaneity; they react, but rarely initiate action. Following the lead of this particular disease, we ought not only to distinguish immediate- from longer-term memory, but think of the latter as also implying initiative and spontaneity in behavior. The problem is yet further complicated by the fact that very old memories — for events, names, or other information dating back beyond the patients' illness — are usually available for recall, and such old skills as dressing, eating, even engaging in polite conversation and expressing rational judgment are barely affected.

The study of a disease like severe memory disturbance has, of course, little immediate bearing on the psychology of normal everyday life, and it would be rash to advocate a radical revision of our linguistic habits because they do not conveniently fit its symptoms. However, if it confirms theories about normal functioning based, e.g., on evidence obtained from the animal laboratory, it deserves more serious consideration. Physiological or psychological studies of animals are extremely valuable in suggesting theories about the laws of human behavior, but they can neither explore the full complexity of problems which the human organism is capable of handling, nor its experiential laws. In any case, they can only suggest laws; their applicability to the human organism must be tested by human evidence. Obviously enough, most of the experiments which form the brilliant contribution of animal psychologists cannot be duplicated on human subjects. The misfortunes of accident and disease, however, provide every so often an example or even a group of examples which match closely enough the preparation experimented upon in the animal laboratory. It is by studying these patients that the clinical research psychologist can make his unique, and possibly crucial, contribution to the science of psychology. His attitude, though always ruled by the primary consideration of furnishing what help he can to the patient, is nevertheless process oriented. He does not study the patient only as a total person in a particular social setting, but also as a very complex organism in which one or more, possibly distinct, systems have been deranged. If he succeeds in isolating such a system, he may find that it coincides with a function known from everyday language, like blindness or intelligence. He may also circumscribe some system which is damaged and which cuts across several common concepts, like the memory disorder sketchily described above. Then he will look for other evidence to test the accuracy of his formulation — perhaps a behavior disturbance in some other disease, or anatomical or physiological hints. He may experiment with drugs which might influence the same, possibly as yet unnamed, processes he has found damaged in a patient or group of patients, and if he is fortunate enough to have hit on an accurate formulation, he has enriched psychological theory with a new concept. After that, it is only a matter of time before this concept enters our everyday language, either as a newly coined term or under the cloak of some old word destined to lose its previous connotation. More often, a first formulation or guess fails to gain sufficient support by subsequent research, and is modified or completely rejected by the evidence of later tests.

This has been a long and roundabout way to illustrate psychological research in a general hospital. Moreover, the example from our laboratory is not widely representative. It illustrates our policy and program on Warren 6 and exemplifies what we here regard to be the most important task in psychological research. It reflects a point of view which is both experimentally and neurophysiologically oriented. Not all psychology, and certainly not all clinical psychology, is committed or even receptive to these points of view. We believe that only experimental techniques can adequately test certain formulations about the processes involved in normal and disturbed human behavior; we also believe that psychology and neurophysiology are mutually dependent for formulating theoretical models and for testing the accuracy of these formulations. Furthermore, a hospital offers exceptionally favorable opportunities for joint ventures in psychology and physiology. Let it be noted, though, that extensive research which proceeds along different lines is in progress in various hospitals. Neither does our laboratory exhaust all of the psychological research in this Hospital; important experimental work is being done in the psychology laboratory of the Anesthesia Department, and some pioneer studies in social psychology have been sponsored by the Department of Psychiatry apart from the work in our experimental laboratory. The general hospital presents possibilities for and places demands on psychologists with various interests and methodological equipments, and their attempts to meet this challenge will help to establish a science which spans the gap between the other biological and the other social sciences. Psychology has by tradition been in, and probably will continue to belong to, both camps.

George A. Talland, Ph.D.,
Associate Psychologist

EDITH MORTIMER TERRY

(1879 - 1959)

Miss Edith M. Terry died in her eightieth year on September 17 at the Massachusetts General Hospital — the institution she had served in a unique capacity for twenty-seven years. Poor health had forced her retirement in 1952. Born in New Bedford, she studied at the Museum of Fine Arts, Boston, and at the Rhode Island School of Design.

In 1925 Miss Terry joined our Social Service Department as head of the Children's Cardiac Program. The problems of those confined to bed for many months, especially the children and adolescents with rheumatic fever, presented to her a special challenge and led to a series of notable contributions. Her home care program was outstanding, with such ingenious devices as the "In-Bed Club", the *In-Bed Club News* with articles and illustrations by the patients themselves, a comprehensive craft and educational program including summer camps, and, important for the parents, a "Mothers' Club" which met once a month at the Hospital for tea, instructions, and encouragement. In many subtle ways she extended hospital social service in its full implication into the homes and lives of both patients and parents. Throughout this long period of service she received loyal support and aid from our Committee for the Home Care of Children with Heart Disease.

In later years it must have been a great satisfaction for her to see the methods she devised at the M.G.H. acclaimed and adopted at home and abroad. She will be remembered by those who knew her as a devoted and enthusiastic worker, and because of her unique contributions in a special field she will be honored in the annals of the Social Service Department, along with Isabel Pelton, Ida Cannon, and Richard Cabot. Hers was a full life dedicated to the hearts and the happiness of children.

E. F. B.

DR. ROBERT F. LOEB

First James Howard Means Visiting Physician Pro Tempore

The Massachusetts General Hospital was privileged to have Dr. Robert F. Loeb (*W.M.* 1920) as the first James Howard Means Visiting Physician Pro Tempore during the week of November 2. It was most fitting that this distinction was conferred upon Dr. Loeb, who also received the first Treadwell Award at the M.G.H. House Pupils Association Reunion on Ether Day, 1958. The citation on that occasion read in part, "Your life has shown that a passionate love of truth can bridge generations in family and in profession, without pretense or compromise and that no conflict exists between the humanitarian, the scientific and the educational undertakings of a great physician."

On November 3, Dr. Loeb, Dr. Means, and Dr. Bauer conducted Ward Rounds on Bulfinch 6. It is to be regretted that all MGH medical alumni could not have had a glimpse, at least, of this memorable event by some unobtrusive type of television.

The James Howard Means Fund was also established in 1958, honoring Dr. Means — physician, teacher, author, artist, and friend, who for three decades influenced the lives of many people.

Through the generosity of more than three hundred of Dr. Means's friends, the endowment is now $30,000 and is increasing by new additions from time to time. This Fund will make it possible for one or two distinguished physicians to visit the Hospital each year, spending time with the Staff, "discoursing on whatever matters may be uppermost in their minds on the never-ending problem of alleviating human suffering." It also may make it possible occasionally for gifted members of the MGH Staff to visit abroad.

Dr. Loeb came from the University of Chicago to the Harvard Medical School, where he received the degree of Doctor of Medicine in 1919. This was followed by a one-year internship at the Massachusetts General Hospital and a residency at Johns Hopkins Hospital. He has been associated with the faculty of Columbia University and the Staff of the Presbyterian Hospital since 1921. At present he is the Bard Professor of Medicine on leave of absence, Columbia University College of Physicians and Surgeons, and is Attending Physician and Director of the Medical Service, Presbyterian Hospital, New York, on sabbatical leave.

From 1950 to 1954, Dr. Loeb was a member of the Massachusetts General Hospital Scientific Advisory Committee. As an active member of numerous important professional societies and committees, his many achievements in the field of medicine have been recognized by universities in this country and abroad.

Dana L. Farnsworth, M.D.,
Physician

Dr. Severo Ochoa of New York University College of Medicine and Dr. Arthur Kornberg of Washington University School of Medicine, St. Louis, who delivered the Warren Triennial Prize Lectures of the Massachusetts General Hospital in 1956, have been awarded the Nobel Prize in Medicine for 1959. Dr. Ochoa is a member of our Scientific Advisory Committee.

* * *

Dr. Ernest M. Daland was honored by a citation from his alma mater, Brown University, during its recent three-day convocation on "Man's contracting world in an expanding universe". Only 19 citees were chosen from more than 500 alumni and alumnae of Brown who were nominated for the honor. Dr. Daland's citation reads:

> Surgeon and pioneer in cancer research, as Chief of Staff at the Pondville State Cancer Hospital and in your private practice, you have a long list of grateful patients and, as a teacher at Harvard Medical School, a long list of grateful students. Your balanced career of practice, teaching, and research has been an inspiration to many who have followed you. For your manifold accomplishments, Brown salutes you.

* * *

Dr. Jerome Gross of the Lovett Memorial Unit here at the Hospital received the Ciba Award last August for his paper entitled "Research related to problems in aging".

* * *

Dr. David D. Rutstein was one of two Boston doctors to receive Gold Heart Awards for 1959, for outstanding contributions to cardiovascular medicine. This highest award of the American Heart Association was presented to Dr. Rutstein at the annual dinner of the Association last October.

The Board of Trustees, at their meetings on October 9 and 23, voted:

To accept the resignation of Dr. James F. Patterson as Assistant in Dermatology, effective August 31;
To change the title of Dr. Erik Vinnars to Visiting Consultant in Anesthesia for six months, beginning February 1, 1960;
To appoint Dr. Robert F. Loeb as the first James Howard Means Visiting Physician pro tempore, to come to the Hospital round the first of November;
To continue the appointment of Dr. Franco R. Dinale as Clinical Fellow in Anesthesia, effective as of September 30.

To appoint:

Dr. Ivor W. Browne as Clinical and Research Fellow in Psychiatry, effective March 1, 1960;
Dr. Paul J. Catinella as Assistant Dermatologist, effective as of September 1;
Dr. Thomas R. Hackett as Clinical Fellow in Anesthesia for one year, beginning December 1;
Dr. Wallace A. Jones as First Assistant Resident in Pathology for one year, beginning July 1, 1960;
Dr. Alberto F. Mondet as Clinical and Research Fellow in Surgery, effective as of August 1;
Dr. Samuel L. Moschella as Assistant in Dermatology, effective as of September 1;
Dr. Hart deC. Peterson as Assistant Resident on the Children's Medical Service, effective July 1, 1960;
Dr. Murray K. Rosenthal as Junior Assistant Resident on the Children's Medical Service, effective July 1, 1960;
Marianne L. Simmel, Ph.D. as Assistant Psychologist in Neurosurgery, effective November 1.

The Trustees also voted to invite Dr. Hermann Knaus of Vienna to give a Richardson Lecture round the end of November.

At their meetings on October 7, 14, and 21, the General Executive Committee voted:

To accept the resignation of Dr. Roger E. Monier as Research Fellow in Medicine, effective as of October 24.

To promote:

Dr. John F. Barlow to the position of Second Assistant Resident in Pathology for one year, beginning July 1, 1960;
Dr. Alan M. Bornstein to the position of Second Assistant Resident in Pathology for one year, beginning July 1, 1960;
Dr. Norris B. Finlayson to the position of First Assistant Resident in Pathology for one year, beginning July 1, 1960;
Dr. Lewis P. James, Jr. to the position of Second Assistant Resident in Pathology for one year, beginning July 1, 1960;
Dr. Herbert I. Krickstein to the position of Second Assistant Resident in Pathology for one year, beginning July 1, 1960;
Dr. David J. Lang to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1960;
Dr. Donald M. Muirhead, Jr. to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1960;
Dr. John B. Robbins to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1960;
Dr. R. Wyman Sanders to the position of Chief Resident on the Children's Medical Service for one year, beginning July 1, 1960;
Dr. Joseph F. Stocks to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1960;
Dr. Karl H. Wegner to the position of Third Assistant Resident in Pathology for one year, beginning July 1, 1960.

To reappoint:

Dr. Geza F. P. Kaplany as Clinical Fellow in Anesthesia for one year, beginning October 31.

To appoint:

Dr. Elroy E. Anderson as Out-Patient Resident on the Children's Medical Service for one year, beginning July 1, 1960;
Dr. James P. Bell as Clinical Assistant in Orthopedic Surgery, for the period November 1, 1959 through April 30, 1960, with the privilege of assisting Dr. Barr in the care of his private patients;
Selma Rappaport, Ph.D. as Research Fellow in Psychology, in the Department of Psychiatry, beginning September 1.

To appoint the following doctors as Graduate Student Assistants in Medicine, assigned to Cardiology, for the period October 1, 1959 through September 30, 1960:

Dr. Joseph Fisher — New York City
Dr. Jean-Marcel Gagnon — Granby, Quebec, Canada
Dr. Hubert Hofmann — Heidelberg, Germany
Dr. Ernesto R. Lima — San Salvador, Central America
Dr. John H.-J. Ludwig — Canada
Dr. Donald McCaughan — Ireland
Dr. Soekaman Soemarjono — Kjakarta, Indonesia
Dr. Robert C. Tarazi — Cairo, Egypt

Two votes passed by the General Executive Committee at their meeting on July 1 failed to reach the office of THE NEWS until October 23. At that meeting the Committee voted to promote:

Dr. Joseph Albert to the position of Resident in Dermatology, effective July 1, rather than have him begin his service as Assistant Resident;
Dr. D. Glyn Millard to the position of Resident in Radiology, effective June 1.

90th ANNIVERSARY
OF THE LADIES' VISITING COMMITTEE

The Ladies' Visiting Committee celebrated its 90th birthday with a luncheon in Bartlett Hall, on October 16. On this occasion, the Committee presented $10,000 to the Hospital Trustees — the accumulated profits from the General Store, which is operated by the Committee for the benefit of the Hospital.

Dr. Nathaniel W. Faxon, Director *Emeritus* of the Hospital, spoke on the origin and history of the Ladies' Visiting Committee. Here are some of the informative and entertaining facts that Dr. Faxon reviewed for us:

Probably many of you have heard the interesting story of how the Ladies' Visiting Committee came into being, but it is such a good story it will bear repetition.

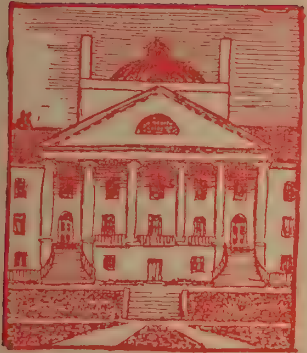
On March 19, 1869, the Trustees appointed a committee to consider and report on the subject of appointing female visitors to the female wards. The Committee reported "that they are in favor of the appointment of such visitors. They agree that the measure must be regarded as an experiment . . . which is likely to prove a benefit to the Hospital, and that it ought to be tried.

"We are able to think of no objections to the plan except that the Hospital is very well managed as it is, and that it is unwise to disturb what is satisfactory. But it seems to us that, although the Hospital is probably just about as well managed as men can manage it, it may be found that with the help of judicious women it may be managed better. Difficulties arising from a possible want of tact or judgement among lady visitors seem to us no more likely to occur than among the Trustees themselves; and to be obviated in the same manner, by care in the selection of individuals. . . .

"The Committee therefore recommend the appointment of not less than six, nor more than twelve, ladies to act as visitors in the female wards of the Hospital.

"Their duty shall be to visit those wards not less than once a week (perhaps they will do so every day) to inspect their condition, and to afford such sympathy & aid to the patients as they may deem proper.

"In case they find subject of complaint or



Harvard University Press announces a book of equal interest to physicians and historians, by Nathaniel W. Faxon, Director Emeritus of

HE MASSACHUSETTS GENERAL HOSPITAL

WARD 4: The Mallinckrodt Research Ward of the Massachusetts General Hospital

James Howard Means, M.D.

"Ward 4 is a ten-bed unit in that wonderful and historically famous Bulfinch Building at Massachusetts General Hospital. It is a place for patients with incompletely understood illnesses which may be studied in a very favorable medium. For many years James Howard Means . . . directed the activities of this ward. . . . Those who have struggled, and are continuing to struggle with hospital research budgets will be most appreciative of the well-stated and substantiated plea for freedom in research. . . . In this book can be found the excellent results of following such a policy for over a quarter-century."—*Hospital Administration.* Dr. Means is Jackson Professor Emeritus of Clinical Medicine at Harvard. 187 pages. Name:

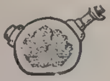
Address:

remark it shall be their duty to communicate the same either to the Resident Physician or to the Trustees."

In June of that year the Board appointed four lady visitors. In 1935 the Ladies' Visiting Committee numbered forty-two members; in 1959, seventy-one.

For ninety years the Ladies' Visiting Committee has more than fulfilled the hopes of those early Trustees that their experiment might prove a benefit to the Hospital and that because they have been "judicious women" it has been managed better.

One could go on indefinitely and still not exhaust the list of their good works, which can be summed up in Dr. Washburn's words: "The Hospital has reason to bless the day the Trustees favorably considered the radical suggestion of appointing 'female visitors to the female wards'."



The 113th anniversary of Ether Day was observed this year, as usual, on October 16. There was the customary awarding of service pins for 5, 10, 20, and 30 years of continuous service at the Hospital, with Dr. Clark presiding and awarding the pins. Mr. Francis C. Gray, Chairman of our Board of Trustees, brought greetings from the Board and expressed appreciation for the years of faithful service on the part of so many who are associated with the Hospital. Nearly 200 pins were awarded, including 10 for 30 years of service.

The Reverend William B. Spofford, Jr., Supervisory Chaplain at the Hospital, addressed the group. His subject was "The heart of the matter". Mr. Spofford did not read from a prepared copy, but what he said held the entire assembly in such wrapt attention from the beginning to the end of his talk that we urged him to reconstruct his address from memory, so that all who heard it might have it in printed form and all who missed it might avail themselves of it through THE NEWS. In substance, this is what he said:

It is a challenge to talk with you today because, I am confident, most of the persons whom we are honoring in these ceremonies could deliver this speech more adequately. Most professions have their occupational hazards and that, at least, protects you. The occupational hazard of ministers is that they talk too much and I have strict orders to keep this brief. And brief it shall be.

One of the great *"faux pas"* of history was enunciated by that American social philosopher, Lawrence "Yogi" Berra. The fans of New York City were gathered in the Yankee Stadium to give their favorite catcher a "Day". Following the presentation of gifts, Yogi stepped up to the microphone to deliver his carefully rehearsed speech. It came out simply — and backward. His words were: "I wish to thank all you people who made this day necessary."

Although those words didn't fit then, they do today. We are to here to say to those who have established marks of tenure in the MGH family: "Thanks to all you people who made this day necessary."

Any good hospital has several functions. Basic to the existence of such an institution are the following three: 1) the administration of sound, skilled, serious medical care to persons who have been broken by life — physically, emotionally, or spiritually; 2) the education of the "helping professions" who will, in the future, do such administering; and 3) the carrying on of research, whereby the realities of existence are explored by the scientific method so that the previous two functions may be undergirded with wisdom and knowledge.

I have discovered that not all of the research carried on at M.G.H. is done formally in the laboratories of the Warren or Research Buildings. About two months ago, I met a lady in the hall between the Phillips House and the White Building who seemed lost. I paused and asked if I could give her any help and she replied that she was looking for the store. I explained where it was. And then she said: "Well, really, I'm not looking for the store; I'm doing research." Being interested, I took her into the Chapel and asked what kind of research this was. Her reply was interesting. She said that her husband, from another large city, was a patient here but, at home, he was a trustee of a hospital. While here, they had been struck by the friendly spirit of M.G.H. which seemed to be missing in their home-town hospital. Hence, her research. She was pretending to be lost and confused, to see who might speak to her. She reported that during the fifteen minutes prior to our conversation. she had been offered friendly help by a doctor, the boy who delivers papers, two nurses, a member of the Dispatch Service, an occupational therapist, a social worker, and, now, a chaplain.

Such research, I think, tells us something important about ourselves. We are a community — and this has meaning in the "healing process". I once ruminated on the thought that, if anyone were silly enough to want to do so, he could come into Massachusetts General Hospital on any day and lead the rest of his life within these confines and have all of the resources that make for community. We have beds; we have dining rooms; we have a store; we have a baseball team which, while not of the quality of the Yankees may be worthy of the Red Sox; we have a drama group which hasn't tackled "My fair lady" yet, but is willing to do so; we have libraries; we have a Chapel. A community is people working together and having customs and traditions that are held to be important. Those whom we honor today are well aware of this, because they have been round here long enough to appreciate it. In fact, it is these people who work at their vocations for long periods of time, who transmit the traditions and customs of Massachusetts General.

At the center is the fact that we are a "healing community". And healing is not something which is done just at the bedside or in the laboratory. It is also done through the community — through the way we pass food over the cafeteria counter, the way we say "Good morning", the way we clean floors, stick in needles, make beds, walk through the halls. It was this dimension which my "researching" lady seemed to be talking about. It's hard to describe, but it is something that seems to be a part of Massachusetts General Hospital. I am fortunate in my function round here to be free to wander all over the Hospital and I can attest to that lady's findings.

The word compassion, I am told, comes from *com-patoir* — "to suffer with". And, in essence, this is what our community is dedicated to as a "healing family" — to work with *persons* who happen to have a bad kidney or a faulty heart or bad circulation and not to work with a kidney, heart, or circulatory system which happens to be attached to a person. As we keep this "person-orientation" at M.G.H. (and the Archives Room at my right contains many mementos and curios which attest that this has always been a part of our community). we seem to administer, educate, and research more wisely and thoroughly.

That seems to be the heart of the matter.

Following these ceremonies in the Rotunda of the Moseley Building, refreshments were served in the Brick Corridor.

But the observances of the day were by no means terminated at this point. Invitations had been sent out to all who had served at M.G.H. in any capacity whatever for 20 years or more, to attend an Old Timers' Dinner. Husbands or wives of the group were included. The invitation itself, written by Mr. Francis W. Hatch, a member of our Board of Trustees and now dubbed "Official MGH Lyricist and Balladeer", read:

On October 16th at six-thirty p.m.,
Dr. Clark is inviting all of them
Who have worked at the M.G.H. of yore
For twenty years (a score or more)
To dinner at The Nurses' Cafeteria
Giving up all dates inferior
Old Timers' Night is what it's called
It's hoped you'll come and be enthralled.
So remember the date, get on your hoss
The entire treat is on the boss.

Two hundred eighty-five guests who gathered for the dinner were greeted by Dr. and Mrs. Clark, Mr. and Mrs. Francis C. Gray, and Dr. and Mrs. Nathaniel W. Faxon. The dinner was delicious — from sea food newburg to the chocolate cakes topped with circles of lighted birthday candles.

Following the dinner, the guests were invited by Dr. Perry Culver, Master of Ceremonies, to listen in on a "meeting of the Board of Trustees" which took place many years ago. (As a matter of fact, these deliberations of the "early trustees" had been tape-recorded during the preceding week!) Many in the audience who "remembered when" amplified with clarity and wit the deliberations of the "early trustees". Among those who added to the merriment with their pictures, lantern slides, and anecdotes of bygone days were Dr. Francis M. Rackemann (Chairman of the Program Committee), Dr. Faxon, Dr. J. Howard Means, Dr. Paul D. White, Miss Josephine C. Barbour, Dr. Edward D. Churchill, Dr. Chester M. Jones, Mrs. Edith Harrison Jones, and Dr. F. Dennette Adams.

Mr. Hatch not only led the singing during the evening (lyrics by "F. W. H.", sung to such tunes as "I've been working on the railroad", "My old Kentucky home", "East Side, West Side", "Take me out to the ball game", and—at this point —the inevitable "Sweet Adeline"), but captured the spirit of the celebration admirably in his "Ballad for a birthday", written and rendered in his inimitable style.

To attempt to mention by name everybody who helped to make this a gala affair would be to risk oversight, for there were so many who participated. It was a delightful evening for all who were there.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Anesthesia

Aprahamian, H. A., Vanderveen, J. L., Bunker, J. P., Murphy, A. J., and Crawford, J. D.
The influence of general anesthetics on water and solute excretion in man.
Ann. Surg. 150:122.

Biochemistry

Earle, D. P., Hutt, M. P., Schmid, K., and Gitlin, D.
Observations on double albumin: A genetically transmitted serum protein anomaly.
J. Clin. Investigation 38:1412.

Gergely, J.
The relaxing factor of muscle.
Ann. New York Acad. Sciences 81:490.

Dermatology

Klein, E., Lever, W. F., and Fekete, L. L.
Defective lipemia clearing response to heparin in idiopathic hyperlipemia.
J. Invest. Dermat. 33:91.

Lever, W. F., and Klein, E.
Hemmung des Klärungsfaktors und der Pankreaslipase durch das Serum von Patienten mit idiopathischer Hyperlipämie.
Hautarzt 10:352.

Saunders, T. S., Fitzpatrick, T. B., Seiji, M., Brunet, P., and Rosenbaum, E. E.
Decrease in human hair color and feather pigment of fowl following chloroquine diphosphate.
J. Invest. Dermat. 33:87.

Endoscopy

Benedict, E. B.
Gastroscopic biopsy.
Gastroenterology 37:445.

General Medicine

Isselbacher, K. J., and McCarthy, E. A.
The influence of pyridine nucleotides on galactose-1-C^{14} oxidation to $C^{14}O_2$ *in vitro.*
Biochem. & Biophys. Research Communications 1:49.

Medical Science

Leaf, A., Page, L. B., and Anderson, J.
Respiration and active sodium transport of isolated toad bladder.
J. Biol. Chem. 234:1625.

Maffly, R. H., and Leaf, A.
The potential of water in mammalian tissues.
J. Gen. Physiol. 42:1257.

Neurophysiology

Dondey, M., and Brazier, M. A. B.
Remarques á propos de l'enregistrement dans les différentes couches corticales de la réponse primaire a l'éclair lumineux chez le chat légèrement anesthésié.
Rev. neurol. 100:366.

Otolaryngology

Kelemen, G.
Aural embryopathies.
Ann. Otol., Rhin. & Laryng. 68:798.

Physical Medicine

Banks, O. M., and Watkins, A. L.
The Bay State Medical Rehabilitation Center.
J. Rehabil. 25:12.

Watkins, A. L.
Prevocational evaluation and rehabilitation in a general hospital.
J.A.M.A. 171:385.

Books

Nevinny-Stickel, H. B.
Störungen des Wasser- und Elektrolythaushaltes: Diagnostik und Therapie — translation into German of *Clinical recognition of disturbances of body fluids,* 2nd edition, by John H. Bland, M.D.
Stuttgart, West Germany, Georg Thieme Verlag.

VOLUNTEER GROUPS
MGH Staff Wives Association

Fall activities commenced for the Staff Wives Association with a series of Community Coffees, directed by the following Community Chairmen:

Belmont, Watertown — Mrs. J. Gordon Scannell
Boston — Mrs. Louis Bakay
Brookline — Mrs. Leo B. Burgin
Cambridge — Mrs. John F. Bertles
Chestnut Hill — Mrs. Robert J. Joplin
Concord, Lexington, Lincoln, Waltham, Wayland, Weston — Mrs. Albert C. England, Jr
Dedham, Milton, Needham, Braintree, Quincy — Mrs. Farahe Maloof
Newtons, Auburndale, Waban — Mrs. Vernon H. Mark
North Shore — Mrs. James M. Shannon
Wellesley, Natick — Mrs. Bartlett H. Stone
Winchester, Arlington, Malden, Melrose, Stoneham, Wakefield, Woburn — Mrs. Alexander Leaf

---

Mrs. Alfred Kranes, President of the Staff Wives Association, recently sent out her annual letter and a questionnaire which will aid in organizing activity within the Association and at the Reception Center.

The Staff Wives Association wishes to emphasize that its membership is open to all interested women. Anyone wishing to become a member should contact the Reception Center at the Hospital. We especially hope that the wives of Clinical and Research Fellows will join us.

BIOGLETS

Dr. John F. Barlow, Assistant Resident in Pathology — born in Glen Ridge, New Jersey, March 12, 1933; A.B., Dartmouth College, 1955; 2-year diploma in Medicine, Dartmouth Medical School, 1956; M.D., Harvard Medical School, 1958; Intern, rotating, Mary Imogene Bassett Hospital, Cooperstown, N. Y., 1959; married; one child.

Dr. Theodore C. Barton, Assistant Resident in Surgery — born in Dearborn, Michigan, February 2, 1929; B.S. in Chemistry, University of Michigan, Ann Arbor, Michigan, 1949; M.D., University of Michigan, 1953; Intern, Rochester General Hospital, Rochester, N.Y., 1953-54; military service: U.S. Navy Submarine Force, New London, Connecticut, atmosphere control studies on the nuclear submarines, 1954-57; Research Fellow in Obstetrics, Biophysical Laboratory, Harvard Medical School, 1957-59; Teaching Fellow in Anatomy, Harvard Medical School, 1958-59; present address: Needham, Massachusetts.

Dr. Alan M. Bornstein, Assistant Resident in Pathology — born in Louisville, Kentucky, March 28, 1934; A.B., Indiana University, Bloomington, Indiana, 1954; M.D., University of Louisville, 1958; Intern, Hospital of the University of Pennsylvania, Philadelphia, 1958-59; married.

Dr. James R. Callison, Assistant Resident in Surgery — born in Columbia, Kentucky, January 9, 1933; B.S., Western Kentucky State College, Bowling Green, Kentucky, 1955; M.D., Vanderbilt University School of Medicine, Nashville, Tennessee, 1958; Intern in Surgery, Gynecology, and Obstetrics, Vanderbilt University Hospital, 1958-59; married.

Dr. Robert W. Carey, Intern in Medicine — born in Harrisburg, Pennsylvania, June 17, 1935; B.A., Williams College, 1955; M.D., Harvard Medical School, 1959.

Dr. Monroe Cole, Assistant Resident in Neurology — born in New York City, March 21, 1933; B.A., Amherst College, Amherst, Massachusetts, 1953; M.D., Georgetown University, Washington, D.C., 1957; elected to Alpha Omega Alpha, 1957; Intern and Assistant Resident in Medicine, Seton Hall College of Medicine, Jersey City, New Jersey, 1957-59; identical twin brother, Malvin, serving as Resident in Neurology at Boston City Hospital; married; one daughter; home: Needham, Massachusetts.

Dr. Frank F. Davidoff, Intern in Medicine — born in New York City, August 9, 1934; B.A., Harvard College, 1955; M.D., Columbia University, 1959; married; two children; home: New Canaan, Connecticut.

Dr. Karl Engelman, Intern in Medicine — born in New York City, June 23, 1933; B.S., Men's Colleges, Rutgers University, New Brunswick, New Jersey, 1955; M.D., Harvard Medical School, 1959; married.

Dr. Norris B. Finlayson, Assistant Resident in Pathology — born in Philadelphia, Pennsylvania, March 8, 1932; lived in Price, Utah, and Seattle, Washington; B.A., Yale University, New Haven, Connecticut, 1953; M.D., Harvard Medical School, 1957; Intern and Assistant Resident in Pathology, University of California Medical Center, San Francisco, 1958; married; two children.

Dr. David W. Florence, Resident in Orthopedic Surgery—born in Cleveland, Ohio, April 7, 1930; John Carroll University, Cleveland 1948-51; accepted in Loyola University Medical School, Chicago, Illinois, after 3 years of college and no degree; M.D., Loyola Medical School, 1955; Intern, St. Luke's Presbyterian Medical Center, Chicago, 1955-56; Resident in General Surgery, St. Francis Hospital, Evanston, Illinois, 1956-57; Assistant Resident in Orthopedics, Children's Medical Center, Boston, Massachusetts, 1957-58; married; one son and one daughter.

Dr. Robert G. Frost, Assistant Resident in Anesthesia — born in Beverly, Massachusetts, April 17, 1928; military service: Sergeant, U.S. Air Force, U.S.A. and Panama, 1946-49; Boston University College of Business Administration, 1949-51; Boston University College of Liberal Arts, majoring in Biology, 1951-53; A.B., Boston University, 1953; M.D., Boston University School of Medicine, 1958; Intern rotating, Highland-Alameda County Hospital, Oakland, California, 1958-59.

Dr. Arthur L. Herbst, Intern in Surgery — born in New York City, September 14, 1931; A.B., Harvard College, 1953; military service: U.S. Navy, Line Officer, U.S.S. *Witek* (DD 848), 1953-55; M.D., Harvard Medical School 1959; married; home: Cambridge, Massachusetts.

Dr. Murray L. Janower, Assistant Resident in Radiology — born in Detroit, Michigan, October 28, 1934; University of Detroit, 1954; M.D., Wayne State University College of Medicine, Detroit, Michigan, 1958; Intern, rotating, Philadelphia General Hospital, 1958-59.

Dr. Richard T. Johnson, Assistant Resident in Neurology — born in Grosse Pointe Farms, Michigan, July 16, 1931; A.B., University of Colorado, Boulder, Colorado, 1953; M.D., University of Colorado School of Medicine, Denver, 1956; Intern in Medicine, Stanford University Hospitals, San Francisco, 1956-57; military service: Clinical Pathologist, Department of Virus Diseases, Walter Reed Army Institute of Research, 1957-59, and Assistant Chief, Medical Affairs, Department of Virus Diseases, 1958-59; married.

Dr. Herbert I. Krickstein, Assistant Resident in Pathology — born in Salt Lake City, Utah, April 28, 1934; A.B., University of Michigan, Ann Arbor, Michigan, 1954; M.D., University of Michigan, 1958; Intern in Ward Medicine, Barnes Hospital, St. Louis, Missouri, 1959; home: Hamilton, Ohio.

Dr. David J. Lang, Assistant Resident in Children's Medicine — born in New York City, September 24, 1932; B.A., Swarthmore College, Swarthmore, Pennsylvania, 1954; M.D., Harvard Medical School, 1958; Intern in Internal Medicine, Beth Israel Hospital, Boston, Massachusetts, 1958-59; married; one daughter.

Dr. Lucian L. Leape, Intern in Surgery — born in Pittsburgh, Pennsylvania, November 7, 1930; A.B., Cornell University, Ithaca, N.Y., 1952; military service: Lieutenant (jg), U.S. Navy, serving in the Mediterranean, Caribbean, and U.S. East Coast areas, 1952-55; M.D., Harvard Medical School, 1959; married; two sons.

Dr. Robert S. Lees, Intern in Surgery — born in New York City, July 16, 1934; A.B., Harvard College, 1955; M.D., Harvard Medical School, 1959.

Dr. Raphael H. Levey, Intern in Surgery — born in Brockton, Massachusetts, December 29, 1933; Phillips Academy, 1951; A.B., Princeton University, 1955; M.D., Harvard Medical School, 1959.

Dr. William J. McIlroy, Assistant Resident in Pathology, assigned to Neuropathology — born in Toronto, Canada, June 7, 1932; M.D., University of Toronto, Canada, 1956; Junior Intern, rotating, Toronto General Hospital, 1956-57; Assistant Resident in Medicine, Sunnybrook Hospital, Toronto, 1957-58; Fellow in Neurology, Toronto General Hospital, 1958-59; married; two children; home: Toronto, Canada.

Dr. Alfonso Mangoni, Assistant Resident in Psychiatry — born in Salerno, Italy, March 6, 1929; M.D., University of Rome Medical School, 1952; Institute of General Physiology, University of Rome, 1953-57; Research Laboratory, Institute of Living, Hartford, Connecticut, 1957-59.

Dr. Eldred D. Mundth, Intern in Surgery — born in Janesville, Wisconsin, March 18, 1933; B.S., Yale University, New Haven, Connecticut, 1955; M.D., Harvard Medical School, 1959; married.

Dr. Clement E. Papazian, Assistant Resident in Children's Medicine — born in Philadelphia, Pennsylvania, July 16, 1926; A.B., University of Michigan, 1950; M.A., Columbia University, 1951; M.D., Boston University School of Medicine, 1957; Intern, rotating, Meadowbrook Hospital, Hempstead, Long Island, N.Y., and Junior Assistant Resident in Pediatrics, Children's Hospital of Los Angeles, Los Angeles, California, 1957-59; married; two children.

Dr. Richmond Prescott, Intern in Medicine — born in New Bedford, Massachusetts, July 29, 1927; military service: Quartermaster (3/c), U.S. Naval Reserve, 1945-46; A.B., Harvard College, 1949; LL.B., Harvard Law School, 1952; practised law in New York City, 1954-55; M.D., Columbia University, 1959; married; three children; home: Dedham, Massachusetts.

Dr. Irwin H. Rosenberg, Intern in Medicine — born in Madison, Wisconsin, January 6, 1935; B.S., University of Wisconsin, 1956; two years at University of Wisconsin Medical School before transfer to Harvard; M.D., Harvard Medical School, 1959.

Dr. Kevin G. Ryan, Intern in Medicine — born in New York City, July 4, 1934; B.A., Dartmouth College, 1956; two-year diploma from Dartmouth Medical School, 1957; M.D., Harvard Medical School, 1959; married.

Dr. Richard E. Senghas, Assistant Resident in Orthopedic Surgery — born in Cleveland, Ohio, June 30, 1928; A.B., Harvard College, 1950; M.D., Harvard Medical School, 1954; Intern, Cleveland City Hospital (now Cleveland Metropolitan General Hospital), 1954-55; military service: Orthopedic Ward Medical Officer in the Yokosuka Naval Hospital, Yokosuka, Japan, 1955-57; Assistant Resident in Surgery, Cleveland City Hospital, 1957-58; Assistant Resident in Orthopedic Surgery, Children's Medical Center, Boston, Massachusetts, 1958-59; married; three children; home: Natick, Massachusetts.

Dr. David B. Skinner, Intern in Surgery — born in Joliet, Illinois, April 28, 1935; B.A., University of Rochester, Rochester, N.Y., 1955; M.D., Yale University Medical School, New Haven, Connecticut, 1959; married; family home: Cedar Rapids, Iowa; temporary home: Newton, Massachusetts.

Dr. Joseph F. Stocks, Assistant Resident in Children's Medicine — born in Pittsfield, New Hampshire, September 7, 1929; B.S., Tufts College, 1951; M.D., College of Physicians and Surgeons, Columbia University, 1955; Intern, rotating, Mary Imogene Bassett Hospital, Cooperstown, N.Y., 1955-56; military service; General Medical Officer, 4050th USAF Hospital, Springfield, Massachusetts, 1956-58; Resident in Medicine, Maine Medical Center, Portland, Maine, 1958-59; married.

Dr. Rajendra Tandon, Assistant Resident in Medicine—born in Gonda, Uttar Pradesh, India, January 27, 1931; attended high school, 1944; Intermediate examination, 1946; B.Sc. in zoology, botany, and chemistry, 1949; entered medical school, 1949; M.B., B.S., 1954; M.D., 1958; served as Junior and Senior House Officer, Medical Tutor, Resident cum Registrar and Chief Resident at Gandhi Memorial and Associated Hospitals and King George's Medical College, Lucknow University, Lucknow, U.P., India, 1958-59.

Dr. Elliot S. Vesell, Intern in Children's Medicine — born in New York City, December 24, 1933; Juilliard School of Music, 1942-46; Phillips Exeter Academy, 1951; A.B., Harvard College, 1955; Rockefeller Institute for Medical Research, 1956-58; M.D., Harvard Medical School, 1959.

Dr. Karl H. Wegner, Intern in Pathology — born in Pierre, South Dakota, January 5, 1930; A.B., Yale University, 1952; military service: 1st Lieutenant, USMC, 1952-54; Fellow in Pathology, Massachusetts General Hospital, 1956-57; M.D., Harvard Medical School, 1959; married.

Dr. Richard H. Wohl, Intern in Surgery — born in Birmingham, Alabama, February 6, 1934; A.B., Harvard College, 1955; Vanderbilt Medical School, 1955-57; M.D., Harvard Medical School, 1959; married; one child.

Dr. Morey Wosnitzer, Assistant Resident in Urology — born in Passaic, New Jersey, September 4, 1929; B.S., Rutgers University, New Brunswick, New Jersey, 1951; M.S., Rutgers University, 1952; M.D., College of Physicians and Surgeons, Columbia University, New York City, 1956; Intern in Surgery, Mount Sinai Hospital, New York City, 1956-57; Assistant Resident in Surgery, Mount Sinai Hospital, 1957-58; Assistant Resident in Urology, Presbyterian Hospital, Columbia-Presbyterian Medical Center, New York City, 1958-59.

MASSACHUSETTS EYE & EAR INFIRMARY

The following appointments were made at the meeting of the Executive Committee of the Board of Managers of the Massachusetts Eye and Ear Infirmary, held on October 19:

Dr. James G. Dobbie — Fellow in Ophthalmology, assigned to the Retina Service, for one year, beginning January 1, 1960;
Dr. Kiyoshi Ishii — Fellow in Anesthesiology for one year, beginning January 1, 1960;
Dr. Henry G. Ring — Assistant in Ophthalmology;
Dr. Michael Vallinas — Fellow in Anesthesiology for one year, beginning January 1, 1960.

The Committee also voted to grant leave of absence to:

Dr. S. James Bullington, for one year, beginning October 1;
Dr. Edwin B. Goodall, for one year, beginning November 1.

The following appointments were made at the meeting of the Board of Managers, held on October 21:

Dr. J. Charles Drooker — Surgeon in Otolaryngology;
Dr. Philip E. Meltzer — Acting Chief of Otolaryngology, as of September 1;
Dr. Aram Roopenian — Associate Surgeon in Otolaryngology;
Dr. LeRoy A. Schall — Consulting Surgeon in Otolaryngology, as of September 1;
Dr. Francis L. Weille — Consulting Surgeon in Otolaryngology.

New addresses:

Dr. Norman W. Andrew (r.p. *An.* 1956), New England Center Hospital, Boston, Mass.
Lt. David W. Bailey, MC, USN (*C.M.* 1959),

No. 85 in a series of Staff photographs
George A. Talland, Ph.D. — Associate Psychologist

U.S.S. *General G. M. Randall* TAP-115, c/o Fleet Post Office, New York, N. Y.

Dr. Carl N. Brownsberger (a.r.p. 1957), Massachusetts Mental Health Center, 74 Fenwood Rd., Boston 15, Mass.

Dr. Albert H. Coons (*E.M.* 1939), Dept. of Bacteriology and Immunology, Harvard Medical School, 25 Shattuck St., Boston 15, Mass.

Dr. Charles B. Fowler (*Or.* 1929), 526 Soquel Ave., Santa Cruz, Calif.

Lt. Jack J. Greenberg, MC, USNR (*S.* 1957), Naval Medical Research Institute, National Naval Medical Center, Bethesda, Md.

Dr. Albert I. Holtz (*C.M.* 1958), National Institutes of Health, Bethesda, Md.

Dr. Richard F. Jackanich (a.r.p. *An.* 1959), U.S.P.H.S. Hospital, San Francisco, Calif.

Dr. Ezra Lamdin (clin. & res. fel. *M.* 1959), Veterans Administration Hospital, 150 S. Huntington Ave., Boston, Mass.

Dr. LeRoy H. Maffly (clin. & res. fel. *M.* 1959), Cardiovascular Research Institute, University of California Medical Center, San Francisco, Calif.

Dr. Robert W. Milam (a.r.s. *Or.* 1959), Scott and White Clinic, Temple, Tex.

Dr. Edgar M. Neptune (*E.S.* 1928), 726 W. Onondaga St., Syracuse, N. Y.

Dr. Madan M. Singh (*M.* 1952), 32 Quarters, Gandhi Memorial & Associated Hospitals, Lucknow, U.P., India

Dr. Tetsuo Sugiyama (j.r.s. 1944 & r.s. *U.* 1946), 2524 Belknap N.E., Grand Rapids 5, Mich.

Brief bits:

Dr. Louis Bakay conducted seminars on the exchange of various isotopes between brain and circulating blood, at the Galesburg (Illinois) State Research Hospital on October 27 and 28. He then gave the opening lecture in a series of conferences in basic science at the Forest Hospital, Des Plaines, Illinois, and at the University of Chicago, on October 28 and 29. His subject was "New aspects on the concept of the blood-brain barrier".

On June 3, Dr. Edward B. Benedict attended the Editorial Board Meeting of *Gastroenterology* in Atlantic City. Following this, he attended meetings of the American Gastroenterological Association and the American Gastroscopic Society, where he took part in a symposium on instruments and techniques for esophagoscopy, presenting a paper on "The rigid esophagoscope and conventional technique". He also discussed papers presented in a symposium on endoscopic biopsy of the stomach.

On November 4, Dr. Edward D. Churchill left for Beirut, where he expects to spend the next six months as Acting Professor of Surgery at the American University there.

On November 5, Dr. Oliver Cope served as moderator for the panel on "Medical and surgical treatment of diseases of the thyroid gland" at the Joint Meeting of the Sections on Medicine and Surgery of the New York Academy of Medicine.

On October 27, Dr. Jerome Gross gave the first Bernardine Becker Memorial Lecture of the New York Rheumatism Association, at the New York Academy of Medicine. He spoke on "Basic research in the hospital setting".

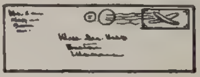
Dr. Roger W. Jeanloz of the Lovett Memorial Unit recently addressed the Convocation of the University of Geneva, held in honor of its 300th anniversary. He was one of two alumni in the field of chemistry who were invited to speak at the Convocation. Dr. Jeanloz has also been invited by Israel's Weizmann Institute of Science at Rehovot to spend two weeks there as a visiting scholar this coming spring.

Dr. Alexander Leaf served as Visiting Professor of Medicine at the University of Bahia, Bahia, Brazil, from June 23 to September 15. On November 3, he delivered a lecture entitled "Transcellular electrolyte transport" at the American College of Physicians Postgraduate Course in Syracuse, N. Y.

Liberty Mutual Insurance Company recently sponsored a symposium on "The growing challenge of disability control in an era of comprehensive medical care". MGH members of the panel on "Connective tissues and the degenerative diseases of aging" were Dr. Francis O. Schmitt (of M.I.T. and a member of our Board of Trustees), moderator, Dr. Joseph S. Barr, Dr. Melvin J. Glimcher, and Dr. Jerome Gross.

Dr. Champ Lyons (*W.S.* 1933) saw his dream materialized on October 18, when the new L. L. Hill Heart Center, at the University of Alabama Medical Center, was dedicated. Dr. Lyons, who is Professor and Chairman, Department of Surgery at the Medical Center, gave an address at the dedication ceremonies. He spoke on "The Luther Leonidas Hill Heart Center: Its purpose and objectives".

Dr. Oglesby Paul (*W.M.* 1943) was appointed President-elect of the American Heart Association at the recent meeting of the Association, held in Philadelphia. Dr. Paul will assume his presidential duties in 1960.



Dr. William V. McDermott, Jr. received this letter from Dr. Nathan D. Munro (*E.S.* 1942). It should be of interest to all MGH-ers.

It was very good to see you and many of the other MGH-ers, especially those of my vintage, but I enjoyed meeting some fine younger ones, too.

I have long thought that there should be an MGH dinner in association with the College of Surgeons meetings. One of the reasons for going to the meetings is to renew old friendships. I think this idea would be much appreciated by those of us who are out in the "Heartland of America" and even further away. I always seem to miss seeing several good friends, since the meetings are so large. Many other groups meet for dinner. I assume they have a continuing organization set up to make arrangements ahead of time each year. The tickets could be sold by mail, so that a firm commitment could be made with a hotel or restaurant.

I have never written to The News, even though I am the only MGH alumnus in this vicinity. My activities are mostly pleasant but not newsworthy. Two years ago I was elected to the Charter Commission to write a new Charter for the city. Nine of us labored mightily and brought forth a new Charter which the voters recently turned down. Now I am back to just cutting and sewing.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 191 Boston, Mass. January 1960

CLINICAL AND LABORATORY RESEARCH IN SURGERY

Within the Department of Surgery a research group, with its main base of operations on the Fourth Floor of the White Building and with tentacles extending into the Thyroid Clinic, Record Room, Physics Laboratory, and Hospital wards, and with antennae bristling in many different directions, is known as Dr. Cope's Laboratory and is directed by Dr. Oliver Cope. This laboratory has been the home of a number of diverse clinical and laboratory investigations in relation to surgical problems over the years, with a continued interest in electrolytes, burn patient therapy, and endocrine disorders. As is well known to the readers of our columns on surgical research, many laboratories in the Hospital endeavor to achieve a satisfactory balance between clinical research and more basic laboratory research. There are always pressures and demands extending from the necessities of patient care in a modern hospital that favor time and energy being spent on the solution of many practical problems of everyday significance in the treatment of patients. On the other hand, it is generally recognized that major advances in our understanding and treatment of disease today must come from a more basic approach, an approach commonly requiring extensive laboratory support. How to balance these complementary interests is always a challenge, and the research groups throughout the Hospital are often characterized by the balance they achieve between applied clinical research and investigation directed toward a more fundamental comprehension of disease. Each is essential for the best of patient care. Certainly the work conducted in Dr. Cope's Laboratory since 1955, the period of personal experience of the current reporter, is no exception to the experience of other laboratories in equilibrating these types of investigative endeavor. As an example of the diversity of surgical investigation today, it might be of interest to present briefly some of the projects that have been developed over the past four years. The clinical topics will be stressed somewhat more, only because of their general interest to those caring for patients throughout the Hospital.

During the years of the second World War and the Korean War a considerable amount of time and effort was spent in evaluating and defining the best treatment for burn patients. In this period of time many basic concepts were developed in regard to the physiological adjustment a patient with a severe burn must make if he is to survive, in regard to the type of protection most effective in decreasing the problem of post-burn infection, and in regard to the many plastic procedures necessary to achieve final healing in the care of these patients. The gross metabolic stress was defined, and supportive therapy was provided a rationale. In 1955 the time had come for an evaluation of these methods and to present a record of the treatment of burns at this Hospital as judged by mortality statistics. The record of a group of 949 burns that were treated here during the years of 1939-1954 inclusive was accumulated. There were 86 deaths in the series, and the individual burns represented a very wide range in severity, with a few patients presenting a total body burn and with some of the older patients being well into their ninth decade. From this group it was possible to measure rather precisely the increased resistance that a young adult has to an extensive burn in comparison with an elderly patient. It could be shown that for a burn of a given extent it was twice as lethal an injury for an elderly patient as for a young adult, and this increased mortality was apparently the consequence of the general physiological inflexibility that encompasses everyone approaching the later decades of life. Furthermore, the burn experience at the Hospital could be broken down into burns in different age groups and of different extent, and in comparison with studies reported from other institutions throughout the world it would appear that the results here, based on mortality statistics, are as good as any. In the care of burns at the Massachusetts General Hospital it has not been possible to provide treatment in the type of unit advocated by Dr. Leonard Colebrook in England, where a burn patient would be isolated in an environment as carefully controlled bacteriologically as the operating rooms are in this Hospital today. The precautions practised in isolating a burn patient from the rest of the Hospital to prevent contamination extending in either direction are not as bacteria-proof as those advocated by Colebrook. On the other hand, certain groups at other burn centers today feel that such precautions are overrated and they have favored a more open method and a vastly simpler method of treating burns without elaborate dressings or elaborate nursing precautions being involved. That such divergent types of care in different countries apparently give rather similar results in terms of mortality is not without interest and may suggest that the isolation of a burn patient may not be as critical as other features of the patient's illness and management. It was also possible to determine the decrease in mortality over the 15-year period of the study. The decrease in mortality after 1942, at which time many of the current methods of treatment were introduced, is significant but does not tell the entire story of improvement in treatment inasmuch as it was not possible to measure the favorable trends in such factors as morbidity, cosmetic results, nutrition, etc. One important lesson from this study was to emphasize again the well-known difficulty in clinical medicine in evaluating results of therapy when the disease itself is very much in control of the clinical situation. The age of the patient and the extent of the burned area remain as important variables in determining the outcome which is modified critically by therapy in a rather restricted group of patients. Careful secretarial work and cooperation from the Record Room were indispensable to the completion of this project.

Another clinical study completed by a group of nurses and four surgeons was concerned with the documentation of the amount of sepsis occurring on the general surgical services. This study was an outgrowth of the Committee on Cross Infection which requested, over a year ago, that an effort be made to establish the incidence of sepsis on the surgical services, in view of the then current impression that the risk of sepsis was increasing. This could be due to a laxity in the observance of conventional barrier nursing techniques by doctors and nurses alike or due to some perverse effect of the antibiotics reversing in some inexplicable manner the risk of sepsis in this Hospital. In considering this request it was realized clearly that an enumeration of all surgical cases that had septic complications in the postoperative period would not be particularly informing. The incidence of sepsis determined in this manner would in part reflect the number of serious or critical operations that were performed. For example, if in a given year or in a given month there were more operations performed on ischemic extremities, on elderly debilitated patients, and on individuals requiring gastrointestinal surgery with the well-recognized concomitant higher risk of sepsis, then the over-all incidence of sepsis would rise in response to the type of surgery being performed. Indeed, it would be surprising if over the years the over-all incidence of sepsis did not rise because of the increasing complexity of the surgical procedures being carried out and because of the greater debility seen in many surgical patients. Consequently, a review of the septic complications was restricted to two rather straightforward operations over a 21-year period. The two operations chosen were elective procedures indicated only when a patient was otherwise in general good health and executed by the rather standardized techniques that have not appreciably altered during 21 years. They were inguinal herniorrhaphies and abdominal hysterectomies for benign disease. The careful review of the records of 3,336 inguinal herniorrhaphies and 6,111 abdominal hysterectomies was carried out by Terry Ginwala, Susan Peterson, Audrey Hoverkamp, and Peggy Simons, all registered nurses, and by Drs. Glenn E. Behringer, Earle W. Wilkins, Jr., and Frank C. Wheelock, Jr. After a preliminary review of these records by the nurses, who had been carefully coached in regard to their interpretation and in regard to the purpose of the study, all the septic records identified were further reviewed by the surgeons and classified into major and minor sepsis depending on whether or not purulent drainage developed at any time. In addition, data were obtained on the "prophylactic" use of antibiotics in these clean surgical procedures to prevent postoperative incisional sepsis. To verify that the interpretation of the records given by the nurses was in agreement with that of the surgeons, over 10 percent of the records screened as negative by the nursing group were chosen at random and reviewed again. Fortunately, complete harmony prevailed in the two professional interpretations.

By this method it was possible to record the incidence of sepsis in a group of clean operations over a period of 21 years, extending from 1937 to 1957 inclusive. It was supposed that if the impressions of increasing sepsis were actually due to some major alteration in the execution of aseptic techniques in clean operations or due to an increase in the bacteria present in the patient's environment, there might be noted a significant rise in the incidence of septic complications following clean surgery. On the other hand, if the incidence of sepsis was found to be quite stable over the years in this simple type of surgical procedure, then it might be presumed that the impressions of increasing sepsis were more likely a reflection of the type of patient now presenting himself to the Hospital for surgical care in a debilitated and depleted state, with a disease requiring an extensive and prolonged operative procedure. The proper explanation is of interest to all concerned with the surgical care of patients, and, to our knowledge, previous studies of surgical sepsis do not provide an answer.

During the above years at the Massachusetts General Hospital the over-all incidence of septic complications in the combined group of 9,447 inguinal herniorrhaphies and abdominal hysterectomies was 4.3 percent. One-half of the septic complications required surgical drainage or were associated with the spontaneous drainage of pus. The remainder were examples of nonsuppurative cellulitis. This incidence of sepsis following clean surgery is about in the middle of the range of septic complications reported from other institutions in this country and Europe. Therefore, it is shockingly high or pleasingly low, depending on one's point of view, but in either case this current basic rate of sepsis serves as a rough reminder that more hard work needs to be done to extend our understanding of wound healing and of the genesis of sepsis before we can boast of an Aseptic Utopia in surgery. It is difficult to compare rates of postoperative sepsis following surgery in different hospitals, inasmuch as the definition of sepsis varies from one institution to another and oftentimes is not stated in the reports. What differencies do exist in the better reports in the medical literature could easily be explained by such prejudicial factors as the definition of sepsis, the length of postoperative follow-up, unstandardized case material, etc., rather than by some important difference in the surgical environment of the patient. Of particular interest to this institution is the fact which clearly emerged from this study: that there has been no increase or decrease in the incidence of sepsis over the years in this clean type of surgery for 21 years. Such yearly fluctuations in the rate of sepsis as were noted were not significant and could be accounted for by chance alone. This consistency in the risk of sepsis suggests that the environment a patient now finds himself placed in for a standard, clean surgical procedure at this Hospital does not lead to any greater risk of developing septic complications now than in the preantibiotic era. This in turn implies that we should devote our energies to a more careful assessment of the preparation of a patient for operation and of the selection of the patient for operation, if our septic problems stem from the prolonged procedures now carried out and from the state of lowered resistance that many patients are in as they face up to a major surgical exploration today. In the genesis of postoperative sepsis it is obviously extremely difficult to distinguish between the contribution made by the patient's condition and the contribution made by the hospital environment. Certain investigations reported in the medical literature have clearly incriminated breaks in technique and reservoirs of antibiotic-resistant bacteria in the hospital personnel. However, few studies have been directed to a more careful appraisal of the patient himself and his disease in relation to postoperative sepsis.

Another comparison was made in this study of the incidence of postoperative sepsis in 1,200 cases that had antibiotics given on a "prophylactic" basis on the assumption that such drugs would ward off postoperative sepsis, and of the incidence of postoperative sepsis in 5,600 cases in which antibiotics were not so employed. In these two groups the development of postoperative sepsis was not influenced by the use of antibiotics, and this surgical experience provides proof that the "prophylactic" use of antibiotics in these operations is not justified. Although the "prophylactic" use of antibiotics in clean surgery has long been questioned by surgeons, proof based on such standardized material and in such numbers had not previously been available.

Turning from these clinical studies to certain laboratory problems, mention should be made of studies now in progress to elucidate the metabolism of magnesium, a mineral present in the human body that is almost as common as potassium and concerning which little is known today. Although magnesium is present in virtually all tissues, with half of it located in the skeleton and the remainder in the soft tissues of the body, the paucity of information about its role in health and disease is a direct consequence of the analytical difficulties inherent in its chemical determination. Many areas in clinical medicine have been rapidly developed as tools became available to make needed measurements, but it may be said today that our understanding of magnesium metabolism is hampered by the inadequacies of current analytical techniques. Despite these difficulties which make a study of magnesium metabolism at once more arduous and also of great interest, certain progress has been made. The research has developed three different types of experimental technique: the classical balance technique as exemplified by the studies carried out on Ward 4 by many Hospital groups, tissue analysis techniques, and radioisotope techniques similar to those employed by other groups in the Hospital with a variety of isotopes. Turning to the balance technique, it was apparent at the outset that to place a patient on a meaningful balance study required a diet of very low mineral content so that the intake in the food and output in the excreta could be compared. The reason for this is a basic principle that applies to virtually all balance experimentation. It was exploited at this Hospital by the research in calcium metabolism 30 years ago by Drs. Joseph C. Aub and Walter Bauer and has since been a cardinal feature in the design of many balance studies carried out on Ward 4. In brief, it may be explained as follows: If there is an experimental error of a certain percent in determining the intake of a particular element or its output in the excreta due to such uncontrollable variables as alteration in the composition of foods, difficulty in the complete collection of specimens, analytical errors in the chemical determinations, etc., this percentage error may make it impossible to identify a significant difference between intake and output if these are large. On the other hand, if the intake is reduced to as low a value as possible and then compared with a greatly reduced output, a positive or negative balance thus determined may then exceed the percentage error in the balance method and permit more penetrating interpretations of the balance study. The old experimental adage that a modest difference between small numbers is more readily interpreted than the same difference between large numbers is another way of stating the same principle. So it was apparent that a diet had to be devised low in the particular mineral to be investigated, and in the work at hand it was necessary to devise a diet low in magnesium. Advantage was taken of the properties of cation exchange resins that combine firmly with calcium and magnesium and less so with potassium and sodium. Such resins may be used to remove calcium and magnesium from blood to prevent clotting, and this use at once commended them for processing a liquid diet to remove the calcium and magnesium and to enrich the diet with sodium and potassium in exchange. Preliminary experiments were completed, using a resin column to process a commercial dairy product known as Pream. The unique feature of Pream is that its unusual property of going promptly into solution without forming curds is because of its relatively low calcium and magnesium content, although it is rich in protein, fat, and carbohydrate. By reconstituting this powder to a convenient consistency with water and by running it through a cation exchange resin column, a palatable although monotonous diet could be obtained virtually free of magnesium and greatly reduced in calcium content. The concentration of magnesium of about 1 part per million was verified by different chemical techniques and bioassay methods. The caloric and protein content of the diet was entirely adequate for balance studies on hospitalized patients. Employing this diet on Ward 4 and also on ambulatory volunteers, it was possible to demonstrate the extraordinary powers of the body to conserve calcium and also magnesium when placed on an extremely low intake. This conserving mechanism, not previously demonstrated, goes a long way toward explaining why a magnesium deficiency is not likely to be observed clinically because of the extraordinary powers the body has of retaining this element when it is deficient in the diet and when renal conservation is functioning normally. This is in contrast with potassium, for example, which continues to be lost from the body when absent from the diet, and herein lies a significant clinical difference between these two minerals, since the renal conservation of magnesium and the reservoir of this element in bone will prevent deficiencies from developing, and, on the other hand, the obligatory urinary loss of potassium will favor the development of a deficiency. Currently, studies are being extended to patients with parathyroid disease and to patients with metastatic malignant disease in the skeleton, to compare the losses of magnesium with those of calcium in an effort to define what relationship exists between these minerals under conditions of forced, high level, pathologic losses. These investigations could not be completed without the fine analytical hand of Mrs. Esther Gordon, known to many of the Hospital staff, because of her extensive experience in clinical chemical determinations. Miss Ruth Moore's tenacity and prehensile capacity in shepherding various and sundry specimens from patient to laboratory bench have been greatly appreciated in all our balance studies.

A second approach to the problem of defining the role of magnesium in human metabolism was that of direct tissue analysis. This would appear to be a fruitful way to crack certain problems of magnesium metabolism since half the magnesium of the body is located within the cells. Only a small percentage of the magnesium is located outside the cells or outside the skeleton. In general, serum analyses for magnesium have not been helpful in the past in the management of various diseased states, and this may be because the serum magnesium is rather insensitive to other changes in the magnesium balance of the body or it may be that our methods for analyzing serum magnesium are too crude to detect the subtle differences that could be meaningfully correlated with health and disease. In any event, because of a large reservoir of magnesium in the muscle of the body, a program of skeletal muscle biopsies was initiated. After validating techniques in autopsy specimens, the control material from normal muscle and skeletal muscle derived from a variety of endocrine disorders were analyzed concomitantly. The studies were unusual in that instead of considering the composition of muscle in relation to a single reference base such as dry weight or nitrogen content or water content, the results were interpreted by relating the various components of muscle to two different reference bases. Thus, a more meaningful interpretation of the results was constructed in much the same way as the description of the Hospital in terms of the number of patients per doctor and the number of patients per nurse would be more meaningful and complete than by considering either one alone in presenting an analysis of patient care. By these time-consuming techniques it could be shown that the chemical architecture of muscle from patients with hyperparathyroidism was different from that of the control material and from that derived from other diseased states. At once the question may be asked if these abnormalities are a proper explanation for the fatigue and weariness patients with hyperparathyroidism commonly claim as their leading complaint. The future may provide further data to establish a convincing association yet to be recognized. The reason for these departures in composition is not known, and we plan to determine why the relative amounts of the minerals present in muscle, including magnesium, appear to be altered in this disease in contrast to the other diseases investigated. Because of the precision of these techniques that have been validated in the investigations of skeletal muscle, they are now being applied to the analysis of cardiac muscle obtained at heart operations, with the cooperation of Drs. J. Gordon Scannell and Melvin Lederman. These specimens will be among the first to have chemical analysis without having gone through the terminal phases of an acute or chronic illness. It will be possible to correlate the composition of the muscle with various functional states, as documented by gross observation and by electrocardiogram. This program has depended very heavily on the meticulous care that Mrs. Etta Horblit has given to many of the more involved analyses which have been custom-tailored in the laboratory for the particular analytical problem.

Finally, a third approach to the evaluation of magnesium metabolism is through the application of an isotope of magnesium. A late arrival on the medical scene is a radioisotope of magnesium with a half life of 21 hours. This necessitates expeditious air transportation from the Brookhaven National Laboratory, where it is generated in the neutron pile by the irradiation of stable magnesium in the presence of lithium. Magnesium-28 is a gamma and beta emitter, and its detection is relatively simple. The only major drawback in its use is the relatively low specific activity now achieved in its manufacture, so that the isotope must be used with some stable magnesium-24. Little was known concerning the distribution of this isotope in mammals; therefore, the first studies carried out were in rabbits to determine whether or not there might be a specific localization for this ion in the various tissues of the body. On the basis of previous analyses stating the composition of the body, it was not supposed that there would be a specific localization in the sense that iodine is localized in the thyroid gland. Studies on a number of rabbits confirmed a non-specific distribution, and with the help of Dr. Timothy S. Harrison our attention was directed to evaluating the distribution of this isotope in dogs in conjunction with isotopes of calcium and potassium. In view of the fact that magnesium-28 is a bone-seeking and a soft-tissue-seeking isotope, it seemed appropriate to compare its distribution to that of potassium-42 and calcium-45 in the same animal, since the former is an isotope equilibrating with stable potassium located predominantly in soft tissues and since the isotope of calcium goes directly to bone where virtually all the stable calcium is located. These studies, repeated in many dogs, indicated that the magnesium in soft tissues is not available for early exchange, as potassium is. The potassium-42, given simultaneously with the magnesium-28, promptly exchanged with the potassium present in the cells, but the magnesium-28 did not do so and exchanged sluggishly with the mineral present in the skeleton. In these results we see a reason why possible magnesium deficiencies or disturbances in magnesium metabolism may not readily arise. Magnesium apparently is not easily displaced from the cells in view of its poor exchangeability with the isotopic magnesium injected. Consequently, in deficiency states or in various metabolic disorders it may be that magnesium is locked quite securely in the cells, preventing any cellular deficiency to develop. After the preliminary experimental work had been completed in animals, attention was directed to studying the distribution of these isotopes in humans with various advanced diseases that might cause a distortion of the distribution of these minerals. Dr. Rafael M. Casas was responsible for collecting data on the uptake of magnesium-28 by human bone obtained at amputations or rib resections. Again it was noted that the magnesium-28 injected could not equilibrate with the magnesium in the soft tissues of these individuals, indicating that in humans the cellular magnesium was inaccessible for exchange in comparison with potassium. The planning and execution of the earlier studies were completed under the careful tutelage of Dr. Gordon L. Brownell, whose experience and advice were indispensable in the application of the isotope techniques.

In cooperation with Dr. Jack H. Mendelson a program was completed on alcoholic patients in view of the reports in the medical literature that have described aberrations in the metabolism of magnesium in alcoholics. These studies were carried out on patients admitted to B-8 for a two-day period of observation, during which time the isotope measurements were made and their renal response to injection of a test dose of stable magnesium was determined. From these studies it was possible to describe the exchangeable magnesium present in alcoholics and their renal conservation of injected magnesium. To obtain a proper physiologically normal group to serve as a control for the alcoholic patients, a study was made of the magnesium metabolism in a group of six volunteers who were inmates of the State Correctional Institution at Walpole, Massachusetts. These volunteers submitted to our studies after the methods and goals were carefully explained to them. Incidentally, the work provided an unusual opportunity to observe the enlightened way in which a modern correctional institution is operated and to participate in one of the many programs of medical research being conducted in cooperation with the inmates of this institution. Despite the claims made in many reports about the relationship of disorders of magnesium metabolism to chronic alcoholism, our techniques do not reveal any striking changes. These results will be part of an invaluable background for future studies in more advanced alcoholics. The technical help of Miss Gertrude Merrill and Mrs. Alice Mackay and of Mr. Harold Carter enabled these studies to be completed successfully, and the inexorable physical decay of the radioisotope required many determinations to be made late at night before the evanescent radioactivity became lost in the background radiation of the laboratory.

More than a year ago Dr. W. Milo Keynes participated in the work of the laboratory, helping in many of the balance studies and collecting for further review by Dr. Cope and Dr. Benjamin Castleman a group of cases of hyperparathyroidism with a previously undescribed pathological entity at first noted grossly at operation and subsequently correlated with certain clinical features and with a characteristic microscopic architecture.

Dr. Ann Wight Phillips has accepted for several years the difficult assignment of evaluating the clinical course of all well-documented serious burns in the records of the Hospital. This study should provide quantitative and semi-quantitative data that would amplify and give more perspective to our understanding of the complex problem of clinical care of these unfortunate patients. The results will make amends in large measure for the shortcomings of the burn mortality study, mentioned before, that did not attempt to weigh such factors as location of the burn, related pulmonary injury, renal and cardiovascular function as influenced by intravenous therapy, etc.

The brief listing of these major projects has not permitted an extended acknowledgment of the large measure of cooperation obtained from different departments with which we have worked. In such endeavors, requiring specialized knowledge in many fields, one can only be grateful for the opportunities available at a teaching institution for designing and completing experimental projects requiring the high-power focusing of numerous skills and abilities on questions posed, in the first instance, by the patient and his disease.

Benjamin A. Barnes, M.D.,
Assistant in Surgery

* * *

On September 30, 1959, Dr. Howard B. Sprague concluded four years of membership on the National Advisory Heart Council of the U.S. Public Health Service.

On December 5, Dr. Sprague was awarded a citation by the American Heart Association for "Distinguished service to research". This was in recognition of five years of service on the Research Committee of the American Heart Association.

The Board of Trustees, at their meetings on November 6 and 20, and December 4, 1959, voted:

To accept the resignation of Dr. Francis C. Hersey as Assistant Attending Psychiatrist at McLean, effective November 20, 1959;
To accept the resignation of Dr. S. Louis Mogul as Clinical Assistant in Psychiatry at McLean, effective November 20, 1959;
That Dr. Stanley P. Bohrer, Third Assistant Resident in Surgery, be granted an indefinite leave of absence, retroactive to July 27, 1959, because of reasons of health;
To grant Dr. Erich Lindemann leave of absence for about three months, beginning December 1, 1959, and further voted that during his absence Dr. John C. Nemiah should serve as Acting Chief of the Psychiatry Service and as a member of the General Executive Committee;
That appointments to the Obstetrical Staff be not renewed and that the Department of Obstetrics be abolished rather than as is now the case, suspended;
That the category of Clinical Associates in Obstetrics be created under the Associate Staff and that the following men be appointed to this category: Drs. Robert H. Barker, A. Gordon Gauld, John L. Newell, Charles P. Sheldon, and Bartlett H. Stone.

To appoint:

Dr. John E. Adams as Second Assistant Resident in Pathology, beginning July 1;
Dr. Arturo L. Aranas as first year Resident in Psychiatry at McLean, beginning July 1;
Dr. Jason A. Aronson as Assistant in Psychiatry, beginning December 1, 1959;
Dr. George P. Baker, Jr. as Resident in Medicine for one year, beginning July 1;
Dr. Kathryn S. Beck as first year Resident in Psychiatry at McLean, beginning July 1;
Dr. Paul H. Black as Resident in Medicine for one year, beginning July 1;
Dr. Kurt J. Bloch as Resident in Medicine, for a period of thirteen months, beginning December 1;
Frank M. Buckley, D.Ed. as Assistant Psychologist, beginning September 1, 1959;
Dr. Charles E. Burden as Assistant Resident on the Children's Medical Service for one year, beginning July 1;
Dr. Herman Buschke as first year Resident in Psychiatry at McLean, beginning July 1;
Dr. George B. Carter as Second Assistant Resident in Radiology, beginning January 1;
Dr. Giulio Carugo as Clinical Fellow in Anesthesia for one year, beginning January 1;
Dr. Roy M. Coleman as first year Resident in Psychiatry at McLean, beginning July 1;
Dr. Albert Damon as Clinical Fellow in Medicine, beginning September 1, 1959;
Dr. John R. David as Resident in Medicine for one year, beginning October 1;
Dr. Bruce W. Fischberg as Clinical and Research Fellow and Acting Assistant Resident in Psychiatry for one year, beginning January 1;
Dr. F. Daniel Foley as Third Assistant Resident in Pathology, beginning July 1;
Edna M. Follensby, Ph.D. as Assistant Immunologist in the Department of Medicine for one year, beginning November 1, 1959;
Dr. Richard F. Gibbs as Assistant Resident in Anesthesia, beginning July 15;
Dr. Gordon G. Globus as first year Resident in Psychiatry at McLean, beginning July 1;
Dr. Mehran Goulian as Resident in Medicine for one year, beginning January 1, 1961;
Dr. John B. Isom as Clinical Fellow and Acting Resident in Pediatric Neurology for one year, beginning July 1;
Dr. Earl F. Jordan as Assistant Resident in Neurosurgery, beginning September 1;
Dr. William L. Kermond as Clinical Associate in Orthopedic Surgery, beginning November 6, 1959;
Dr. Samuel B. Kirkwood to the Board of Consultation;
Dr. Susanne J. Lamdin as Assistant in Anesthesia, beginning October 16, 1959;
Dr. Lawrence M. Leonard as Assistant Resident in Orthopedic Surgery for one year, beginning January 1;
Dr. Bernard Levey as first year Resident in Psychiatry at McLean, beginning July 1;
Dr. Sara F. Lewis as Junior Assistant Resident on the Children's Medical Service, beginning July 1;
Dr. John B. McGinty as Assistant Resident in Orthopedic Surgery for one year, beginning January 1;
Dr. Guy M. McKhann as Clinical Fellow and Acting Assistant Resident in Neurology for one year, beginning July 1;
Dr. Arthur W. McMahon as Clinical Associate in Psychiatry, beginning December 1, 1959;
Dr. Bucknam ~~McPeak~~ as Assistant Resident in Anesthesia, beginning July 15;
Dr. William L. Miller as Third Assistant Resident in Pathology, beginning July 1;
Dr. Arthur J. Moss as Assistant Resident in Medicine, beginning July 1;
Dr. Robert K. Osborne as Assistant Resident in Medicine, beginning July 1;
Dr. Ernest H. Picard as Clinical Fellow and Acting Resident in Pediatric Neurology for one year, beginning July 1;
Dr. Giuseppe G. Pietra as Third Assistant Resident in Pathology, beginning July 1;
Dr. Dwight R. Robinson as Assistant Resident in Medicine, beginning July 1;
Dr. Hussein E. Samiy as Resident in Medicine for one year, beginning July 1;
Dr. Louis W. Sullivan as Clinical Fellow and Acting Assistant Resident in Pathology for one year, beginning July 1;
Dr. Judith A. Tassie as Clinical Fellow in Anesthesia, beginning August 1;
Dr. Nathan S. Taylor as Clinical and Research Fellow and Acting Assistant Resident in Pathology for one year, beginning July 1;

Dr. Benjamin Tenney, Jr. to the Board of Consultation;

Dr. William M. Thurlbeck as Clinical and Research Fellow in Pathology for one year, beginning November 1, 1959;

Dr. James L. Weber as Exchange Assistant Resident on the Children's Medical Service, for the period November 1 through December 11, 1959;

Dr. Hubert J. Wolfe as Third Assistant Resident in Pathology, beginning July 1;

Dr. Gilbert F. Young as Clinical Fellow and Acting Assistant Resident in Neurology for one year, beginning July 1.

At their meetings on October 28, November 4, 18, and 25, 1959, the General Executive Committee voted:

To accept the resignation of Dr. Hugo M. Palazzi as Clinical and Research Fellow in Surgery, effective November 15, 1959.

To promote:

Dr. J. Richard Baringer to the position of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Arthur E. Baue to the position of First Assistant Resident in Surgery, beginning November 1, 1959;

Dr. Robert W. Carey to the position of Assistant Resident in Medicine for one year, beginning July 1;

Dr. James R. Carter, Jr. to the position of Assistant Resident in Medicine for one year, beginning July 1;

Dr. David L. Collins, Jr. to the position of First Assistant Resident in Surgery, beginning November 1, 1959;

Dr. Frank F. Davidoff to the position of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Karl Engelman to the position of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Paul F. Griner to the position of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Gilbert Hermann to the position of First Assistant Resident in Surgery, beginning November 1, 1959;

Dr. Walter E. Klingensmith to the position of First Assistant Resident in Surgery, beginning November 1, 1959;

Dr. John B. Little to the position of First Assistant Resident in Radiology, beginning January 1;

Dr. John A. Mannick to the position of First Assistant Resident in Surgery, beginning September 1, 1959;

Dr. Mart Mannik to the position of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Yosh Maruyama to the position of First Assistant Resident in Radiology, beginning January 1;

Dr. Richmond Prescott to the position of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Irwin H. Rosenberg to the position of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Walter T. Weylman to the position of Resident in Radiology, beginning January 1.

To extend the appointment of:

Dr. Joseph H. Dimon, III, as Senior Resident in Orthopedic Surgery, from January 1 through March 31.

To reappoint:

Mary D. Albert, Ph.D. as Research Fellow in Medicine for one year, beginning November 1, 1959;

Dr. Edgardo G. Carrasco as Clinical and Research Fellow in Medicine, for the period December 11, 1959 through April 30, 1960;

Dr. John Denovian as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning December 1, 1959;

Dr. Paul R. Dinsmore as second year Resident in Psychiatry at McLean, beginning July 1;

Dr. Gerhart A. Duda as second year Resident in Psychiatry at McLean, beginning July 1;

Lorna J. Langer Gilmore, Ph.D. as Research Fellow in Biochemistry in the Department of Pathology for one year, beginning October 1, 1959;

Dr. Sara S. Hafter as second year Resident in Psychiatry at McLean, beginning July 1;

Dr. James C. Healey as third year Resident in Psychiatry at McLean, beginning July 1;

Dr. Eda M. Kahana as second year Resident in Psychiatry at McLean, beginning October 1;

Dr. Robert E. Kahn as Clinical and Research Fellow in Medicine for one year, beginning November 1, 1959;

Dr. John M. Kuldau as second year Resident in Psychiatry at McLean, beginning July 1;

Dr. Jacob C. Wolterbeek as second year Resident in Psychiatry at McLean, beginning July 1.

To appoint:

Anthony L. Andrikides, Ph.D. as Research Fellow in Orthopedic Surgery, beginning November 1, 1959;

Dr. Paul J. Binette as Research Fellow in Medicine for one year, beginning November 1, 1959;

Dr. Jacques Penot as Graduate Student Assistant in Orthopedic Surgery, for the period November 9, 1959 through January 9, 1960;

Leighton B. Richards, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning December 1, 1959;

Dr. Chuan-Tao Yu as Research Fellow in Medicine for one year, beginning November 2, 1959.

To change the appointments of:

Dr. Wallace A. Jones from the position of First Assistant Resident in Pathology to that of Clinical and Research Fellow and Acting Assistant Resident in Pathology for one year, beginning July 1;

Dr. Bruce W. Konigsmark from the position of Clinical Fellow in Neuropathology to that of Clinical Fellow and Acting Assistant Resident in Neurology, retroactive to July 1, 1959;

Dr. Merrill K. Wolf from the position of Assistant Resident in Neurology to that of Research Fellow in Neurology, as of October 19, 1959.

♣ ♣ ♣

MASSACHUSETTS GENERAL HOSPITAL'S 150TH ANNIVERSARY CAMPAIGN

A goal of $20,000,000 for the Massachusetts General Hospital's 150th Anniversary Campaign was announced at a special dinner of the Corporation, held on December 3 at the Harvard Club.

Mr. Francis C. Gray, Chairman of our Board of Trustees, greeted the more than 200 guests, who included sponsors of the 150th Anniversary Program and some members of the Hospital Staff.

Mr. Gray said, "It gives me great pleasure to be able to announce that Bishop Henry Knox Sherrill has returned to give the Hospital a hand at this time and has accepted the Honorary Chairmanship of the 150th Anniversary Program.

"At the same time, two Trustees have agreed to serve as Co-Chairmen of the drive," Mr. Gray added. "Both are well known to the community, as each has served as a Red Feather General Chairman. They are Mr. Philip H. Theopold and Mr. Francis W. Hatch."

Bishop Sherrill was a former Trustee of the Massachusetts General Hospital for 18 years and Chairman of the Board for 12 years until 1946, when he resigned upon being elected Presiding Bishop of the Protestant Episcopal Church in the United States of America. His retirement in 1958 has permitted him to assume again an active part in the affairs of the Hospital — this time a leading role in the 150th Anniversary Program.

Mr. Hatch has been a member of the Board of Trustees since 1947. He brings a wealth of experience to his position as Co-Chairman of the 150th Anniversary Program from his various activities in connection with the Red Cross, the Harvard Alumni Association, and the Boy Scouts of America.

Mr. Theopold has been a Trustee of the Massachusetts General Hospital since 1955. The Anniversary Program will benefit greatly from his experience as Trustee and Treasurer of St. Mark's School and as National Alumni Chairman of A Program for Harvard College.

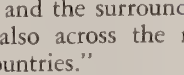
Following Mr. Gray's remarks, Mr. Theopold said, "Improved care of the patient is our primary objective. In every instance, as we formulated our plans for the 150th Anniversary Program, whether in planning the Clinics Building or the Radiation Center, the patient was given the major consideration. The same holds true with the new operating rooms, which will offer every possible advantage to the surgeon to serve his patient better.

"It is easy to understand a goal of $20,000,000 when you add capital improvements for the McLean Hospital and endowment for research to a new Clinics Building, Radiation Center, and a building for Surgical and Special Services.

"We are well aware that $20,000,000 is a big goal, but these projects are big and important. The 150th Anniversary gives us the opportunity to keep the Massachusetts General Hospital in the forefront as one of the greatest hospitals in the world, and to provide the facilities to meet the demands of the patient, not only in Boston and the surrounding communities, but also across the nation and in foreign countries."

Mr. Hatch, Co-Chairman of the drive, said, "Toward the goal which has already been mentioned, I am pleased to report that $4,364,222.48 has been received in the past twelve months. This includes gifts and pledges from the Staff and Trustees of the M.G.H. Of the amount received to date, 31% has come from outside New England."

The schedule for the 150th Anniversary program, which terminates in 1961, was announced in detail at the dinner. The first three steps are a new Clinics Building, a Radiation Center, and a Surgical and Special Services Building. Together with endowment and other capital improvements, these buildings will enable the Massachusetts General Hospital to enter its second one hundred fifty years strengthened and better equipped to render greater service.



STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Biophysics

Balazs, E. A., Bothner-By, A. A., and Gergely, J.
Proton magnetic resonance studies on water in the presence of various macromolecular substances.
J. Molec. Biol. 1:147.

Neurology

England, A. C., Jr., and Schwab, R. S.
The management of Parkinson's disease.
A.M.A. Arch. Int. Med. 104:439.

Scholl, M. L., Abbott, J. A., and Schwab, R. S.
Celontin — A new anticonvulsant.
Epilepsia 1:105.

Schwab, R. S.
Problems in the treatment of Parkinson's disease in elderly patients.
Geriatrics 14:545.

Schwab, R. S.
Über die Parkinsonsche Krankheit.
Deutsche med. Wchnschr. 84:1485.

Neurophysiology

Brazier, M. A. B.
Impressions of the colloquium on electroencephalography and higher nervous activity held in Moscow, USSR, Oct. 6 to 11, 1958.
In Transactions of the Second Conference on the Central Nervous System and Behavior, M. A. B. Brazier, Editor, New York, Josiah Macy, Jr. Foundation.

Neurosurgery

Hirsch, O.
A patient with a pituitary tumor operated on by the cranial method, re-operated four years later for a recurrence by the trans-sphenoidal method and followed for 37 years.
Confinia neurol. 19:398.

Otolaryngology

Meltzer, P. E., and Kelemen, G.
Pyocyaneous osteomyelitis of the temporal bone, mandible and zygoma.
Laryngoscope 69:1300.

Psychology

Talland, G. A.
Age and the effect of anticipatory set on accuracy of perception.
J. Gerontol. 14:202

Talland, G. A.
The interference theory of forgetting and the amnesic syndrome.
J. Abnorm. & Social Psychol. 59:10.

Talland, G. A.
Inter-sensory perceptual set.
Brit. J. Psychol. 50:231.

Talland, G. A., and Ekdahl, M.
Psychological studies of Korsakoff's psychosis: IV. The rate and mode of forgetting narrative material.
J. Nerv. & Ment. Dis. 129:391.

Talland, G. A., and Miller, A.
Perceptual sets in Korsakoff's psychosis.
J. Abnorm. & Social Psychol. 58:234.

Radiobiology

Oyama, T., Potsaid, M. S., and Slingerland, D. W.
Effect of Di-ethyl ether anesthesia on thyroid function of rats: Pituitary, adrenal and thyroid relationship.
Endocrinology 65:459.

Radiology

Millard, D. G.
A Richter's hernia through the inferior lumbar triangle of Petit. A radiographic demonstration.
Brit. J. Radiol. 32:693.

Surgery

Austen, W. G., Monaco, A. P., Richardson, G. S., Baker, W. H., Shaw, R. S., and Raker, J. W.
Treatment of malignant pelvic tumors by extracorporeal perfusion with chemotherapeutic agents.
New England J. Med. 261:1037.

Monaco, A. P., and Austen, W. G.
Treatment of Kaposi's sarcoma of the lower extremity by extracorporeal perfusion with chemotherapeutic agents.
New England J. Med. 261:1045.

Books

Beecher, H. K.
Measurement of subjective responses: Quantitative effects of drugs.
New York, Oxford University Press.

Brazier, M. A. B. (Editor)
Transactions of the Second Conference on the Central Nervous System and Behavior.
New York, Josiah Macy, Jr. Foundation.

Faxon, N. W.
The Massachusetts General Hospital, 1935-1955.
Cambridge, Mass., Harvard University Press.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

Arieti, S. (Editor)
American handbook of psychiatry, vol. 1.
New York, Basic Books, Inc., 1959.
(19S)

DEPARTMENT OF RADIOLOGY

At the Annual Meeting of the Radiological Society of North America held in Chicago, November 15 through 20, 1959, a Certificate of Merit was awarded the scientific exhibit "Fibrous dysplasia", presented by Drs. Roy Barry (deceased April 1959), H. Robert Dudley, Jr., and William H. Harris.

Dr. Laurence L. Robbins presided at the Annual Meeting. The title of his Presidential Address was "The future of radiology".

Dr. Stanley M. Wyman recently visited ten hospitals in the Michigan Peninsula, as an inspector for the American Board of Radiology.

◆ ◆ ◆

VOLUNTEER GROUPS

MGH STAFF WIVES ASSOCIATION

The many activities of the Staff Wives Association, which are carried on throughout the year, include the Chapel Concerts. Every other Wednesday afternoon at 3 o'clock there is a half-hour concert given in the Chapel by professional musicians for the enjoyment of patients of the Hospital. Mrs. Milford D. Schulz is in charge of this major activity, assisted by a committee of twenty-five, who help to plan the programs and are present at the concerts to bring the many wheel-chair patients to the Chapel from the various floors of the Hospital and return them to their respective areas.

The first program this past autumn featured a pianist, Mina Kessler, a former teacher at the Juilliard School of Music. She gave the premier performance in this country of a Kabalevsky rondo.

The second program was a record concert.

The third program featured Mrs. Nathan B. Talbot, mezzo-soprano, who has appeared several times at Chapel Concerts. The fourth program featured a flutist, Anton Winkler, formerly with the Minneapolis Symphony Orchestra.

The fifth concert was a Christmas program by pupils from the Beaver Country Day School. Girls from Beaver have appeared many times at the Chapel Concerts.

Following the holiday season, the concerts resumed on January 6 and will continue through next May.

Anyone interested in helping with this important activity is asked to get in touch with Mrs. Schulz.

DISTAFF CLUB

The Distaff Club had a busy and happy holiday season. A bake sale held on November 24 was most successful in helping to finance the delightful Christmas Party, held in the newly decorated Penthouse on December 11, for husbands and their wives as well as for bachelor members of the House Staff and their dates. Dr. and Mrs. John W. Madden were the host and hostess.

On December 15, a gift-wrapping party was held, also in the Penthouse, to wrap presents for the MGH Children's Christmas Party. Mrs. Rodman D. Starke was the hostess.

We are looking forward to going to Boston City Hospital in January, to meet with the Boston City Wives and to hear Dr. Wislocki, from Vassar College, speak on "The parents' responsibility in education".

The annual Christmas tea in honor of our Volunteers was given in Bartlett Hall by the Trustees and the General Director of the Hospital on December 2. Not only was tea served and not only did Arlène Andrew and Dick Wulf play the piano delightfully, as always, but also there were exhibits this year to show what some of our Volunteers are doing for us in addition to their usual clinic and patient-care services.

Portrait drawing was demonstrated by Mrs. Royce Baker, with several charming models who were present.

Members of the Institute of Contemporary Art exhibited the Art Wagon, with Mrs. William G. Constable in charge, assisted by Mrs. Shepherd Brooks and Mrs. Jose Luis Sert.

A familiar sight in the corridors and rooms of the Hospital — the Traveling Store, sponsored by the Ladies' Visiting Committee — was shown by Mrs. Karl Riemer and Mrs. Francis B. Haydock, members of the Committee.

Members of Red Cross Arts and Skills, Nurses' Aides, and Gray Ladies who were present included Mrs. Norman Goehring and Mrs. Morris Rosenthal, who showed textile painting, while creative work with shells was demonstrated by Mr. William Fleming. Representatives of the workers in ceramics on the Children's Recreation Service, Burnham Memorial, were Mrs. Joseph Trainor and Mrs. Nelson Vogelsohn. Mrs. Albert L. Fisher explained certain aspects of the Junior Red Cross Service and its exhibits.

Members of the Board of Trustees and the Hospital Staff stood in the receiving line to welcome the invited guests.

MASSACHUSETTS EYE & EAR INFIRMARY

The following appointment was made at the meeting of the Executive Committee of the Board of Managers of the Massachusetts Eye and Ear Infirmary, held on November 16, 1959:

Dr. Robert C. Lawlor — Assistant in Ophthalmology

THE GROWTH OF MEDICAL SCIENCE IN ANCIENT GREECE

The growth of medicine in ancient Greece is an interesting and challenging area of medical history. During this period mysticism, inductive philosophy, and careful observation influenced the analysis of diseases and their causation. The cult of Asklepios attempted to cure diseases through religious ceremony, philosophers sought to explain disease in terms of rational concepts, and the writings attributed to Hippocrates contained a highly developed observational science. These apparently conflicting doctrines coexisted in time and place, and may even have been practised by the same men. A recent trip to Greece provided the stimulus to our interest in this subject, and while we have not been able to find a satisfactory explanation for the interrelationships of these three apparently inconsistent approaches, a good deal of data is available and certain hypotheses can be formulated.

Recorded Greek history begins with the works of Homer, which probably date from the 9th century B.C. The *Iliad* and *Odyssey* describe a 12th century B.C. Bronze Age civilization in the Eastern Mediterranean regions, long thought to be legendary. However, the excavations of Schleimann at the end of the 19th century uncovered two of the principal cities of ancient Greece — Mycenae and Troy. The city of Mycenae is now deserted and stands on a sun-baked hill on the plain of Argos. One can still see the Lion Gate through which Agamemnon led his army to lay siege to Troy, over 3,000 years ago. Greek guides even point to the small room in which Agamemnon was murdered, on his return home, at the instigation of his wife Clytemnestra.

Homer regarded diseases as coming from the gods. The *Iliad,* for example, begins with a description of a pestilence inflicted upon Agamemnon's army by the angry god Apollo. In addition to this and other allusions to the magical causation of disease, the Homeric writings describe rudimentary battlefield surgery. According to Fröhlich, one hundred forty wounds are mentioned (with a mortality rate of 77.6%), and some rather accurate anatomic observations are given and extraction of foreign bodies as well as the therapeutic use of bandages and compresses to stop bleeding are described. Although the great heroes were themselves endowed with some knowledge of the healing art,

> A wise physician, skill'd our wounds to heal
> Is more than armies to the public weal.
> (*Iliad*)

The plane tree, growing in the lobby of the Warren Building

Thus, even in this legendary era both a mystical art and a practical science existed.

In the 12th century B.C. the Mycenaean civilization was overrun by Dorian invaders from the north, whose iron weapons gave them the advantage over the more civilized people of southern Greece. Very little history was recorded for the next four centuries, and it was not until the 7th century B.C. that the beginnings of the great Hellenic civilization emerged from these Dark Ages.

The reawakening of culture was accompanied by the appearance of philosophers whose influence dominated Western thinking for over 2,000 years. Geometry and astronomy were introduced into Greece by Thales of Miletus, who was born in about 640 B.C. Pythagoras, a century later, described the universe as being composed of four elements — Earth, Air, Fire, and Water. Each element was endowed with a quality — dry, cold, hot, and moist, respectively. From these four elements either Pythagoras or his pupil, Alcmaeon of Croton, evolved the doctrine of the four humors — *blood* which was hot and moist, *yellow bile* which was hot and dry, *black bile* which was cold and dry, and *phlegm* which was cold and moist. Disease was believed to be the result of an excess of one or more of these humors and health was restored by the removal of this excess. Thus arose the practices of bleeding and purging, and the terms bilious, phlegmatic, sanguine, and melancholic (melancholy = black bile). The dogma of the humors dominated medical thought in ancient Greece and Rome, and continued on in Europe through the Middle Ages. It was only with the emergence of the great anatomists of the last hundred years that it was superseded by the currently accepted ideas of the origins of disease.

After the defeat of the Persians in 479 B.C., Athens became the leading naval power of the Mediterranean world. In 461 B.C. Pericles, a man of culture and learning, became the ruler of Athens. Under his government, the arts and sciences flourished and Athens became the center of Greek artistic and philosophic growth. The remains of the magnificent temples of the Acropolis — the Parthenon, Erechtheum, Propylaea, and the Temple of Nike Apteros — still stand today, though sculptures have been destroyed, stolen, or moved away to museums, leaving only the bare skeletons of Attic marble. Stained a dull orange color by two thousand years of exposure to the elements, these marble temples are an overpowering tribute to the art of ancient Greece.

During this "Golden Age" medicine flourished in Greece. There can be no doubt that a great physician named Hippocrates lived in the 5th century B.C., for he is mentioned by two of his contemporaries — Plato and Aristotle. Unfortunately, the earliest biography of Hippocrates was written by Suidas in the 11th century A.D., by which time most of the details of his life had become legendary. He was born in approximately 460 B.C. on Cos, a small Greek island just off the coast of Asia Minor. After a boyhood spent on Cos, where he began his study of medicine, he traveled through Greece, and his fame grew until he came to be regarded as the greatest of the Greek physicians. There is now an ancient plane tree on Cos, the trunk of which is over ten feet thick. Legend has connected this tree with the most famous of the Greek physicians. Unfortunately, it is very doubtful whether this was the tree under which Hippocrates saw patients and taught his students. A slip from this tree is growing in the lobby of the Warren Building here at the Massachusetts General Hospital, thanks to Dr. Wilder G. Penfield of Montreal, Canada, who sent us the seedling.

The writings of Hippocrates have been preserved through the efforts of many translators; the oldest manuscript extant was done in the 4th century A.D. Among the works attributed to Hippocrates are writings which are undoubtedly the work of a number of authors, and some historians believe that the Hippocratic Collection is actually the collected works of the medical library of Cos. It does seem likely, however, that the finest of these descriptive accounts of disease were recorded by the great physician of the 5th century B.C.

Hippocratic medicine is characterized by careful descriptions of disease; the religious theories of causation and cure also prevalent at the time were scarcely mentioned. Indeed, the divine origin of epilepsy is specifically denied. Philosophic doctrines did influence the discussions of Hippocrates, but these, too, were subordinated to detailed observations. The Hippocratic physician recognized that collections of signs and symptoms made up a disease, that each disease ran a somewhat predictable course, and that alterations within the body and its environment could influence the occurrence and prognosis of the disease. An excellent example is the following description of tetanus:

> The master of a ship mashed the index finger of his right hand with an anchor. Seven days later a somewhat foul discharge appeared; then trouble with his tongue — he could not speak properly. The presence of tetanus was diagnosed, his jaws became pressed together, his teeth were locked, then symptoms appeared in his neck: on the third day opisthotonos appeared with sweating. Six days after the diagnosis was made he died.
>
> (Hippocratic Collection)

The therapy of the Hippocratic physician was rather benign, compared with that practised elsewhere in the ancient world. Since recovery was thought to be the natural process, the physician attempted only to remove obstacles to healing and let nature take its course. Treatment included changes in evironment, baths, purgatives and emetics, venesection, barley water and barley gruel, wine, oxymel (honey and vinegar), and hydromel (honey and water). These mild therapeutic agents may be compared with pork fat, dog feces, and human urine given orally by the ancient Assyrians.

If the Hippocratic Collection described the true state of Greek medical knowledge in the 5th century B.C., this brief survey would now be complete. However, a magical religion apparently also played a leading role in the practice of medicine at this time. This mystical and superstitious form of medicine was widely disseminated under the supervision of the influential cult of Asklepios. (Socrates's last words, recorded by Plato in *Phaedo,* were: "Crito, I owe a cock to Asklepios; will you remember to pay the debt.")

Asklepios is mentioned by Homer as a chieftain from Thessaly who was renowned for his knowledge of medicine. By the 8th century B.C. he was endowed with divine powers, and in the 5th century B.C. a complex legend had grown up around him. He was said to have been a demigod born of a union between Apollo and Coronis, the daughter of the King of Boeotia. As a newborn child, he was exposed on the slopes of Mount Thittion, near Epidauros. He escaped death by being suckled by a goat, and went as a pupil to Chiron, a physician who was transformed by legend into a centaur. Asklepios became a famous physician of Thessaly and, according to legend, was killed at the instigation of Pluto, the god of the underworld whose realm was being depopulated by the wonderful healing arts of Asklepios. The Temple of Epidauros was erected near Mount Thittion, and preserved there is a semicircular theater, built on a hillside which faces the sacred mountain. With a seating capacity of 14,000 people, its acoustics are so perfect that a whispered voice from the stage can be heard in the topmost seats. The invaders of two millenia have left this wonderful theater almost undamaged, and it is now the site of an annual festival, at which ancient Greek plays are performed.

The cult of Asklepios spread throughout Greece until there were more than two hundred temples dedicated to his worship. Each temple attempted to treat the sick by an elaborate ritual centered around a dream experienced by the patient as he slept in precincts sacred to Asklepios. The temples were built near springs from which pure water flowed, and each usually consisted of an altar on which sacrifices were made to the god, a theater for religious ceremonies, and a dormitory or abaton where the patients slept and awaited their healing dreams. Later, in the time of the Roman Empire, baths, gymnasia, stadia, and even hippodromes were added. As one walks among the ruins of these temples, the mixture of Greek and Roman structures can be seen, for it seems to have been the practice of the Romans to build their own healing baths near the already centuries-old Greek temples of medicine. On Cos, even a Christian church was erected at the site of a Temple of Asklepios.

Francis Adams wrote of these temples: "Every means that could be thought of was used for working upon the imagination of the sick, such as religious ceremonies of an imposing nature, accompanied by music and whatever else could arouse their senses, conciliate their confidence and in certain cases, contribute to their amusement." Before entering the precincts of the god, the patient was obliged to fast and often abstain from wine. Only after he was bathed and rubbed with odoriferous herbs was the patient permitted to carry out a sacrifice to Asklepios. After the sacrifice, the patient went into the abaton to sleep and await the healing dream. Some of these dreams may have been natural, some were probably induced by drugs or hypnosis, and some appear to have been feigned by priests and priestesses masking as Asklepios and the lesser gods and goddesses of medicine. The dreams were interpreted later by the priests — a practice which gave them control over the treatment which was to be given.

Tablets have been found at the excavations of some of these temples which give us some idea of the cures they advertised. These were usually miraculous in nature. Two tablets found at Epidauros will serve as examples:

No. 86 in a series of Staff photographs
Dr. Benjamin A. Barnes — Assistant in Surgery

> A man came to the god as a suppliant, he was one-eyed, he had eyelids but nothing was in the sockets which were completely empty. Some of the people in the sanctuary laughed at him because of his simplemindedness in believing that he could see when he had no trace of an eye but only a place for it. As he slept in the abaton a face appeared to him; he dreamed that the god cooked a medicine, opened his eyelids and poured it in. As the day came he walked away seeing with both eyes.
>
> Hermos of Pasos: The god cured him of his blindness, but when he refused to pay the honorarium to the sanctuary, the god made him blind again as a punishment. When he returned again and slept once more in the temple, the god healed him again.

The latter inscription seems to serve as a reminder that the bills should be paid. Other inscriptions allude to the competition between temples, and their reputations were probably enhanced by the cures described on these tablets.

What was the relationship of the Hippocratic physician to these temples? Two Roman writers, Strabo and Pliny, the Elder, state that Hippocrates gained some of his medical knowledge by reading the tablets at the Temple of Asklepios on Cos. However, these uncovered tablets describe magical healing and are quite different from the accurate observations of Hippocrates. Furthermore, archeological excavations on Cos have so far uncovered no tablets or inscriptions dating from the time of Hippocrates. The oldest altar to Asklepios was erected here in 350 B.C., and the great Temple of Cos was built in the 3rd century B.C. The Temple of Asklepios at Epidauros dates from the 5th century B.C., however, so it is clear that both observational and religious medicine flourished during this period.

Hippocrates is described as one of a group called Asklepiadae in Plato's *Phaedo* and in the writings of the following centuries. W. H. S. Jones, in his translation of the Hippocratic Collection, suggests three possible organizations of the Asklepiadae which are not mutually exclusive: that they were priests of the temples, that they were a clan of hereditary physicians, or that they were a guild of physicians tracing their origin to Asklepios. The last two are probably correct, as the Hippocratic Oath describes an hereditary guild, a member of which was pledged to teach the art of medicine only to his own sons, the sons of his teachers, and "to disciples bound by a stipulation and oath according to the laws of medicine, but to none others". Whether or not they were also the priests of the temples is not clear. It seems reasonable that a flourishing temple would benefit from a consultant like Hippocrates, and that the mystical façade could have served only to attract patients. On the other hand, a secular group of Asklepiadae may have competed with the priests of Asklepios. At present, we have not been able to find conclusive evidence for either hypothesis, but further research, perhaps including another trip to Greece, may reveal the answer.

Arnold M. Katz, M.D.,
Assistant Resident in Medicine

New addresses:

Dr. Wilfred Bloomberg (r.p. *N.* 1931), State Office Bldg., Hartford 15, Conn.
Dr. Mahlon T. Easton (s. *Oph.*), 70 Carlton St., Brookline 46, Mass.
Dr. H. Louis George, Jr. (*C.M.* 1929), 100 Stone St., Watertown, N.Y.
Dr. Timothy S. Harrison (a.r.s. 1959), Dept. of Physiology, Karolinska Institutet, Stockholm 60, Sweden
Dr. Harlin G. Knierim (clin. fel. *D.* 1959), 327 Park Ave. West, Mansfield, Ohio
Dr. H. Eugene Macdonald, Jr. (*N.S.* 1931), Majuro, Marshall Islands
Dr. Arthur J. Moss (*M.* 1958), 419 Shoemaker St., Pensacola, Fla. (through June 30)
Dr. Boris Senior (*C.M.* 1950), 3 3d Ave., Lower Houghton, Johannesburg, South Africa
Dr. John B. Tallon (a.r.p. *R.* 1953 & sr. r.s. *Or.* 1959), 57 Roy St., Kitchener, Ontario, Canada
Dr. William M. Thurlbeck (a.r.p. *Path.* 1958), Massachusetts General Hospital, Boston 14, Mass.
Dr. Howard S. Yaffee (a.r.p. *D.* 1953), 60 Brattle St., Cambridge 38, Mass.

Brief bits:

Dr. Edward B. Benedict, at the invitation of Dr. Harold O. Peterson (a.r.p. *R.* 1936), Chief of Radiology at the University of Minnesota, took part in the Continuation Course in Gastrointestinal Radiology, given at the University of Minnesota Center for Continuation Study, November 2-6, 1959. His two subjects for discussion were "Varices of the esophagus" and "Inflammation of the stomach".

At the recent meeting of the American Society of Plastic and Reconstructive Surgery, held in Miami Beach, Dr. Bradford Cannon was elected Vice-President.

Dr. James C. White will serve as Chairman of the Program Committee of the Second International Neurosurgical Congress, which is to meet in Washington, D.C., in October 1961. Dr. White went to Copenhagen last September to meet with the officers and delegates of the Congress. From there he went on to Stockholm to present a paper on "Intrasellar aneurysms simulating hypophyseal tumours" before the Scandinavian Neurosurgical Congress.

THE ROBERT W. LOVETT MEMORIAL UNIT

STUDIES PERTAINING TO CONNECTIVE TISSUE AND ITS DISEASES*

Research in subjects related to connective tissue in general and rheumatic diseases in particular have been conducted at the Massachusetts General Hospital for the last thirty years, since the founding, by Dr. Walter Bauer, of the Unit which has become known as the Lovett Memorial Unit for the Study of Crippling Disease. The name derives from the orthopedic surgeon, Dr. Robert W. Lovett, in whose name an endowment fund was established at Harvard Medical School.

The aim of the Unit is threefold. The first is to provide, through its clinics and consultative service, the best possible medical advice and care for patients with rheumatic and other connective tissue diseases who are referred to this Hospital. In its attempt to accomplish this objective the staff of the Unit acknowledges the active participation of members of many other Services and Departments of the Hospital. The second objective is to explore many facets of the anatomy, growth and development, chemical composition and physiology of mesenchymal tissues in order to learn more about the nature, cause, prevention, and cure of its diseases. It is, however, the firm conviction of members of the Unit that basic investigation is equally justified on the grounds of the pursuit of knowledge for its own sake. The third objective is to conduct an active teaching program at both undergraduate and graduate levels.

Although these three objectives are closely interwoven, and each one contributes to the others, this report will attempt to focus primarily on the research program. The other activities of the Unit will be summarized in a subsequent publication.

One of the strongest examples of the intertwining of research and teaching is the record which is established by former investigators of the Unit who, after obtaining research (and often clinical) training, have gone to other institutions, often in academic capacities. Thus, in the last three years, Dr. Morris Soodak has become Assistant Professor of Biochemistry at Brandeis University; five men who served as clinical and research fellows during this period are now directors of connective tissue study units—Dr. Curtland C. Brown, Jr. at Albany Medical School; Dr. John J. Calabro at Seton Hall Medical School, Jersey City; Dr. John L. Decker at the University of Washington, Seattle; Dr. Adalbert F. Schubart at the University of Maryland; and Dr. John ~~L.~~ R. Ward at the University of Utah.

Three members of the group who came to us from England have returned to their home universities—Drs. Charles I. Levene and John H. Fessler to Oxford, and Dr. Sylvia Fitton Jackson to Cambridge. Two others, who came from Holland and Belgium, have also returned to their almae matres—Dr. Arnold van den Hooff to Leyden and Dr. Guy J. Isaac to Louvain. Dr. Nathan Sharon has returned to the Weizmann Institute, Israel; Dr. Sen-itiro Hakomori to Tohoku University, Japan; Dr. Willi Burgi will soon become a member of the Department of Pathology at the University of Zürich; while nearer home, Dr. Zofia T. Glaser and Dr. Thomas Nussbaumer are working at the Worcester Foundation, Shrewsbury. Dr. Renee G. Naves is Professor of Chemistry at Newton College of the Sacred Heart, and Dr. Karl Dus will soon join the Department of Biochemistry at Brandeis University. We wish them well in their new positions.

To take the places of these individuals, new people have joined the Unit from their former positions at Yale, the Universities of Arkansas, Brussels, Geneva, Montreal, Sendai (Japan), and Pennsylvania, and the Departments of Biological Chemistry and Physical Chemistry at Harvard. Dr. John A. Mills, formerly Resident in Medicine at the Massachusetts General Hospital is receiving training at the Lister Institute, London, in preparation for rejoining the Unit, as a senior member in October 1960.

The constant presentation of new ideas by the newcomers, and the stirring up of old ideas, represent some of the most stimulating facets of this exciting environment. To facilitate this, the administrative positions within the Unit rotate to a large degree. Different people coordinate the various seminars and rounds, and senior members take turns acting as Chairman of the Laboratory Committee. For 1959-60 the Chairman is Dr. Karl Schmid.

Since research in the Unit is conducted by a number of independent investigators, a review of the current work is best divided according to the interests of these men.

I. Connective Tissue Biology—Dr. Jerome Gross

One of the prime concerns of this laboratory is the attempt to correlate events taking place in the connective tissues at the level of a) interaction between large molecules, b) biosynthesis of these molecules, and c) tissue organization in terms of the normal pattern and disease.

Most of this work has related to the composition, structure, and physical chemical properties of the fibrous components, principally collagen, and mechanisms of fibril formation *in vitro*. The initial observations concerning means of reconstituting collagen from solution have already been reviewed in these pages. Briefly, it can be stated that collagen can be extracted from tissues by a number of solutions, of which the simplest is cold neutral salt solution. The evidence is strong that the fraction soluble in cold neutral solutions is newly synthesized, probably produced less than 48 hours before extraction. The amount of collagen extractible in neutral salt is sharply reduced when the animal is fed on a limited diet such that he does not gain weight. The collagen isolated from these and other tissue extracts, and purified, may be readily polymerized to typical fibrils without further enzymatic modification or the intervention of any other substances, including mucopolysaccharides or glycoproteins, at least *in vitro*.

These and other studies support the hypothesis that the fibroblast secretes the collagen molecules into the amorphous, extracellular ground substance and there, under the influence of the physiologic ionic atmosphere, temperature, and perhaps certain rate-regulating factors, the molecules aggregate spontaneously to form fibrils.

Studies on *in vitro* fibrogenesis of collagen from solutions of the purified protein have led to the observation of the time-dependent loss of solubility of newly formed fibrils. This could explain the solubility changes observed *in vivo* consequent to cessation of growth and of aging. It has also provided some experimental support for the hypothesis of decreasing solubility of biocolloids as a general time-dependent factor in biologic aging.

The work outlined above provided the basis for a productive investigation into the pathogenetic mechanism of an experimental mesenchymal disease, lathyrism. Classically this disease, produced in growing rodents and birds by feeding them a high dietary percentage of the common sweet pea or the active lathyrogenic agent β-aminopropionitrile, is characterized by marked skeletal deformities, herniae, and dissection of the aorta. Dr. Gross, in collaboration with Dr. Charles I. Levene, observed that the application of lathyrogenic agents to the chick embryos produced dosage-dependent increase in tissue fragility, quantitatively paralleled by increase in neutral salt-extractible collagen. No collagen is extractible in the normal embryo, whereas more than 50% of the total can be removed from bones, skin, and aorta within 72 hours of administering β-aminopropionitrile. The extracted molecules are normal in that they can be transformed *in vitro* to fibrils typical of the normal tissue simply by warming the cold extract to body temperature.

---

*This is Publication Number 266 of the Robert W. Lovett Memorial Unit for the Study of Crippling Disease, Harvard Medical School at the Massachusetts General Hospital.

These studies were extended, in collaboration with Dr. Arnold van den Hooff, to morphologic examination of the changes in lathyrism. It was conclusively demonstrated that collagen fibrils laid down prior to administration of the drug were profoundly altered by the agent. The chick embryo has provided a quantitative assay system for lathyrogenic agents and is being used to track down the biochemical mechanism of the disease. Dr. Serge Orloff is now taking part in this program.

It was also shown that this agent could induce the reappearance of extractible collagen in skin of non-growing and aged guinea pigs where none is normally present.

These studies provide the basis for understanding the manifestations of one experimental disease on the tissue level in terms of macromolecular interactions. These studies on experimental lathyrism have provided an experimental approach to congenital and hereditary disease affecting mesenchymal tissues. In collaboration with Drs. Alan S. Cohen and Evan Calkins, our new knowledge is being applied to investigations of human congenital and hereditary disease.

One phase of an investigation of another experimental disease, vitamin-C-deficiency, has recently been completed. It was shown that neutral salt soluble collagen, the precursor of the fibrils, is not formed in the intact skin of vitamin-C-deficient guinea pigs under conditions of growth which stimulate its formation in the normal animal. No evidence could be found for an abnormal precursor collagen postulated by others.

On the tissue level, studies on the mechanism of wound contraction are being conducted in collaboration with Dr. Hermes C. Grillo of the Department of Surgery and the Huntington Memorial Laboratories. Chemical analysis of contracting wounds in guinea pig skin revealed a lack of correlation between wound contents and contraction dynamics. It did suggest a simple morphologic approach to the problem, namely, the effect on contraction of excision of various parts of the wound. Results indicated that the machinery for contraction resides in a very narrow picture frame of new tissue which underlies the margin of skin at the edge of the wound. Further studies of the mechanism of this contraction process are now under way.

Studies on the phylogenetic comparative biochemistry of collagen continue. Quantitative and qualitative analyses of the bound sugars of the collagens of several species of three invertebrate phyla plus a number of vertebrate species have been completed. Total amino acid analysis, in collaboration with Dr. Karl Piez of the National Dental Institute, of five invertebrate collagens and five fish collagens has been accomplished. Results indicate considerable variation among the phyla of all amino acids excepting glycine, which provides important chemical support for current concepts of the structure of the collagen molecule. In addition, these studies have led to a new theory, namely, that the total imino acid content, proline plus hydroxyproline, is a major stabilizing factor in the collagen molecule by reason of its steric restriction on secondary structure, replacing the older idea that hydroxyproline was mainly responsible by reason of hydrogen bond forming capacity.

During their recent stay as research fellows in this laboratory, Dr. John L. Decker investigated the acid-soluble nucleotides in rapidly growing connective tissue; Dr. John H. Fessler worked on fractionation of neutral salt-soluble collagen and the physical interaction between hyaluronic acid and soluble collagen; and Dr. Sylvia Fitton Jackson studied the chemistry of the organic matrix of developing embryonic chick bone as it related to developmental morphology and calcification.

II. Protein Chemistry—Dr. Karl Schmid

One of the chief objectives of the group of investigators headed by Dr. Schmid is to isolate, purify, and characterize glycoproteins from serum, synovial fluid, and tissue of normal and diseased patients and animals. The importance of this work stems, in part, from the fact that elevations in the serum glycoproteins are almost universal concomitants of both acute and chronic inflammatory processes. Yet the nature of the glycoproteins involved, their physiology and function, are entirely unknown.

Previous work from this laboratory defined methods for obtaining from pooled normal human plasma an alpha$_1$-glycoprotein, the so-called alpha$_1$-acid glycoprotein or orosomucoid (MW 45,000) and an alpha$_2$-globulin fraction containing as major components three glycoproteins with in part similar properties. By procedures based on solubility differences and chromatography, the alpha$_2$-acid glycoprotein has been prepared in an extremely high state of purity as judged by physical chemical, chemical, and immunochemical analyses. Taking advantage of the specific interactions with metal ions, notably those of barium and zinc, it has been possible to separate the three alpha$_2$-glycoproteins from one another. Subsequent purification has been obtained by chromatographic fractionation on Amberlite IRC-50.

Further efforts to characterize the alpha$_1$-acid glycoprotein have been carried out in cooperation with Drs. Thomas Nussbaumer and Sigetosi Kamiyama. Determination of the terminal amino acids revealed only one mole of C-terminal serine, suggesting that this protein is built of one polypeptide chain to which probably 16 to 18 oligosaccharide chains are linked. Additional investigations concerning the three-dimensional structure of this protein involved measurement of the specific optical rotation in order to determine that portion of the protein that exists in helical configuration. Studies on the characterization of the alpha$_2$-glycoproteins in terms of their chemical composition and physical chemical and chemical properties and in terms of their chemical structure are presently being carried out in collaboration with Drs. Willi Burgi and Karl Dus.

While these studies will result in a precise description of certain specific glycoproteins, any physiologic interpretations must be based upon indication of the alterations in these components under different physiologic circumstances, including disease. Preliminary studies of this sort have been undertaken in cooperation with Dr. Burgi, and consisted in a quantitation of the individual plasma glycoproteins of Cohn's Fraction VI derived from a group of patients with rheumatoid arthritis and other diseases. The significance of this investigation lies in the fact that even relatively large changes in concentration of minor glycoprotein components are seldom reflected in the total protein-bound carbohydrate of plasma.

Studies of the proteins of synovial fluid were extended to include analysis of the proteins of post-mortem synovial fluid from patients clinically free of joint diseases. Here, as with the fluids from patients with rheumatoid arthritis, the identity of these proteins with those of blood plasma was demonstrated. It is of special interest, however, that certain joint fluids are characterized by their low, relative concentration of the alpha$_2$-globulins, as compared with serum or plasma. The implication of this observation on the permeability of connective tissue barriers is at present under investigation in collaboration with Dr. Paul J. Binette.

Another phase of the work concerns a hitherto unknown form of serum albumin. The discovery of a special form of normal albumin which was homogeneous on electrophoresis at acid pH values, in contrast with the heterogeneous behavior of the usual form of this protein, was the stimulus for studies on the stability of albumin in acid solution. In a further unrelated study, a double albuminemia was investigated in collaboration with Drs. David P. Earle and Martin P. Hutt (Northwestern University Medical

School) and David Gitlin (Harvard Medical School). From this investigation it was concluded that the anomalous albumin was transmitted genetically, and the genetic change probably involved a substitution of tyrosine for the carboxyl residues of normal albumin.

As an additional responsibility, the supervision of the analytical ultracentrifuge and electrophoresis of the Hospital has been entrusted to Dr. Schmid. These two apparatus are used by both basic investigators and clinicians. A typical application of the ultracentrifuge, often a benefit to clinicians, is the serum analysis for the detection of pathological macroglobulins such as those of the Waldenström type.

III. Bacteriology—Drs. Louis Dienes and John T. Sharp

Dr. Dienes has continued his study of the pleuropneumonia group of organisms and the L forms of bacteria and the investigation of their possible pathological significance.

The transition of bacteria into L forms is a more fundamental change in the structure and growth of bacteria than any bacterial variation previously studied. The basis of the transformation is a special growth process which may appear under widely different environmental conditions injurious to bacteria.

Dr. Dienes's recent interest has centered on the following problems: a) the morphology of the L forms of bacteria and of the pleuropneumonia-like organisms and the relation of these two groups; b) the different types of L forms and the conditions which induce their formation from bacteria and their growth in culture; and c) the possible significance of these forms in infectious disease.

Dr. John Sharp's research has been concentrated in three main areas. In collaboration with Dr. Byron H. Waksman of the Department of Neurology and Bacteriology, he has been studying a form of polyarthritis which can be induced in rats by the injection of adjuvants. This subject has aroused considerable interest because of the great need for an experimental disease which is analogous, at least in some respects, to rheumatoid arthritis. One of the questions raised concerning the polyarthritis in rats is the possible role which may be played by pleuropneumonia-like organisms. Drs. Sharp and Waksman have been unable to isolate these organisms from rats with arthritis of this type and believe that these organisms can be excluded as playing an etiological role in this experimental disease. Positive evidence has been obtained that immunological factors play a determining role and it has been deduced that the reaction is probably a systemic response to an antigen or antigens in the adjuvant mixture.

Dr. Sharp has also continued his studies on the structure of L forms and pleuropneumonia-like organisms. Effort has been concentrated on examination of aminosugars and especially muramic acid, a component of the normal bacterial cell wall. Muramic acid has been found in a component of the L form, but this material is present in a different form than in the bacterium in the one strain of L form investigated. These studies are being extended to other species of L form to determine whether this material is of general significance.

Studies on a streptococcal induced nephropathy of white mice have also been conducted during the past year. Much of the effort has been devoted to characterizing some of the clinical manifestations of this experimental condition. These studies have indicated that the experimental disease is clearly a nephrotic-like syndrome in spite of the atypical histology—namely, widespread tubular necrosis. Attention is now being turned to an investigation of the mechanism of the process.

Evan Calkins, M.D.,
Associate Physician and *Director of the Robert W. Lovett Memorial Unit*
Karl Schmid, Ph.D.,
Associate Biochemist in Medicine

(The conclusion of this article will appear in the next issue.)

* * *

Mr. Ralph Lowell, a member of our Board of Trustees, was presented with a citation of merit by the National Fund for Medical Education—the organization which raises funds for the nation's medical schools. Mr. S. Sloan Colt, President of the National Fund, made the presentation at a gathering of more than one hundred Boston industrialists and educators at the Algonquin Club on December 16. Mr. Sloan and the assembled group paid tribute to Mr. Lowell for his efforts in behalf of medical education.

DR. VIETS AND MYASTHENIA GRAVIS

At the Second International Symposium on Myasthenia Gravis, sponsored jointly by the National Institute for Neurological Diseases and Blindness at Bethesda, Maryland, and the Myasthenia Gravis Foundation, Inc. of New York, a special bronze plaque was presented to Dr. Henry R. Viets at a ceremony held on April 18, 1959. Mr. Sidney O. Raphael of New York City, President of the Foundation, presented the plaque to Dr. Viets to commemorate his outstanding contributions to the subject of myasthenia gravis over the past 25 years.

In his presentation address, Mr. Raphael pointed out that Dr. Viets introduced the treatment of myasthenia with neostigmine in 1935, immediately after the preliminary report of its effectiveness by Dr. Mary Walker of London. This was the first use of this substance for the treatment of myasthenia gravis in the entire Western Hemisphere. In that same year he organized the first Myasthenia Gravis Clinic in the world at Massachusetts General Hospital. Without the active and personal support of Dr. James B. Ayer, our Chief of Neurology at that time, this clinic could not have been started and its subsequent success could not have been achieved. The clinic has met weekly without interruption, for nearly 25 years.

Mr. Raphael further pointed out that Dr. Viets has been most helpful in advising and guiding the organization of the Myasthenia Gravis Foundation, Inc. since 1952. He was the first Chairman of its Medical Advisory Board and now holds the position of Chairman *Emeritus*.

Dr. Viets has published many important papers on myasthenia gravis, and a book on the subject of thymectomy, edited by him, will appear soon. To illustrate the influence of Dr. Viets's interest in this disease at the Massachusetts General Hospital, only 30 patients with myasthenia were seen here between 1900 and 1935. Since the opening of the clinic, we have compiled records of over 500 names in our special myasthenia gravis file. These patients have come to the Massachusetts General Hospital not only from all over the United States, but from as far away as South Africa. In spite of the fact that this condition is a relatively rare disease in the Department of Neurology at the present time, the following members of our Staff—all of whom have worked with Dr. Viets—now look after these particular patients, and are regarded as experts in the field of myasthenia gravis: Drs. Robert S. Schwab, Vincent P. Perlo, William H. Timberlake, Pierre M. Dreyfus, and Henry deF. Webster.

At a ceremony held on December 21, the bronze plaque honoring Dr. Viets was installed on a wall in the headquarters of the Nerve Clinic, which is on the 3d floor of the Clinics Building.

* * *

A ceremony, dedicating a new Chapel window in memory of Dr. W. Franklin Wood, was held on Sunday, January 17, in the Samuel Eliot Memorial Chapel at McLean Hospital.

The Board of Trustees, at their meeting on December 18, 1959, voted to appoint:

- Dr. Luther C. Hansbarger as an Exchange Assistant Resident on the Children's Medical Service, for the period December 12, 1959 through January 20, 1960;
- Dr. David T. Mahony as Assistant Resident in Urology, for a period of six months, beginning December 1, 1959;
- Dr. Alan C. Markland as Clinical Fellow, acting as Assistant Resident in Urology, beginning January 1;
- Dr. Perry F. Mullinax, Jr. as Clinical and Research Fellow in Medicine for one year, retroactive to July 1, 1959;
- Dr. James J. Pollard as Second Assistant Resident in Radiology, beginning January 1, 1961;
- Dr. Dorothy A. Wescott as Clinical Fellow in Anesthesia for one year, beginning January 16;
- Dr. Raleigh L. Wright as Assistant Resident in Neurosurgery, assigned to the Boston V.A. Hospital as Junior Resident in Neurosurgery.

At their meetings on December 9 and 23, the General Executive Committee voted:

To promote:

Dr. Chaim I. Mayman to the position of Resident in Neurology for one year, beginning July 1;
Dr. Edwin W. Salzman from Second to First Assistant Resident in Surgery, beginning January 1;
Dr. Gerald F. Winkler to the position of Resident in Neurology for one year, beginning July 1.

To extend the appointment of:

Dr. Fernando A. Cardenal as Clinical Fellow in Orthopedic Surgery, from January 1 through February 29.

To reappoint:

Dr. William C. Amman as Graduate Student Assistant in Medicine, assigned to Allergy, for one year, beginning January 10;
Laurence C. Bonar, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning January 1;
Dr. Leslie J. DeGroot as Clinical and Research Fellow in Medicine for one year, beginning January 1;
Dorothy K. Stearns, Ph.D. as Research Fellow in Medicine for one year, beginning January 23.

To appoint:

Dr. Sidney R. Cooperband as Research Fellow in Medicine for one year, retroactive to July 1, 1959;
Eubert J. Daniel, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning December 29, 1959;
Dr. John Mealey, Jr. as Clinical Assistant in Neurosurgery, this appointment to run concurrently with his position as Resident in Neurosurgery, for a period of eight months, beginning January 1;
Dr. Jan Trabka as Research Fellow in Neurology, assigned to Neurophysiology, for a period of eight months, beginning November 9, 1959.

SOCIAL SERVICE ADVISORY COMMITTEE

Our Social Service Advisory Committee observed its 50th anniversary at a Christmas coffee party on December 17. This was also an occasion to honor Dr. Edward L. Young, who has served for 20 years as Chairman of the Committee. Chaplain William B. Spofford and Dr. Edward F. Bland addressed the group. Mr. Spofford gave the following address:

To: Imperial Department of Public Welfare and Administration
From: Octavia Lucia Verus, worker in Bethlehem regional office
Date: Month of the Festivals of Winter —29th Day

In view of the Imperial census, ordered this month by the Supreme Pontiff, Caesar Augustus, all reports from this office will, in the immediate future, be tardy and limited. We will, however, seek to keep you informed as to the number of cases handled and give you indication of their dispensation, with notification as to whether they are to remain "open" or "closed" on our departmental books. Due to the requirement of the census that each Palestinian citizen be registered in his native town, our office has been overtaxed during the past fortnight, with both workers and the case-apprentice laboring to the limit of their capacities. The necessity of traveling to one's birthplace in the dead of winter in order to meet the census requirement has meant that we have had some unusual cases and, I'm afraid, has seriously overextended our local budget. Such expenses, we believe, were not disbursed contrary to departmental regulations and we welcome the annual audit in the spring to justify such expenditures.

Some typical cases might give you a clearer picture of what has transpired:

1. First, an ancient sheepherder, who, according to his papers has already exceeded his three-score and ten years, walked to Bethlehem from Hezron. He arrived here obviously suffering from extreme fatigue and malnutrition. We paid for five meals for him, plus medical care. Unfortunately, such extreme exertion was overwhelming for his ancient body and he died. Since he had no living kin, we paid for the burial in accordance with Rule 7-c of the department, which reads: "Workers may legitimately expend funds for burial services for indigent natives provided a. no blood-relatives can be located and b. said recipients are not listed in the criminal files of the state." Dispensation: Case closed due to death of client.

2. Secondly, a family of five arrived by mule from Joppa on the coast. The first night in town, the youngest son, aged three, took a chill and then a fever. We were called in, together with the medical man, who diagnosed his case as typhus. This necessitated payment for medical treatment, two funerals, and the rent of an isolation house for the three remaining members of the family. Dispensation: Case remains open until remaining members of the family return to Joppa or enter the life of the Shades.

It is to be pointed out that such cases meet the eligibility requirements established by the Department of Public Welfare and Administration. Others, however, were not so lucky, and the following case may supply us with statistics to show how unrealistic and unfair our present regulations often prove to be.

On the night of the 24th, which was exceedingly cold in this high mountainous region, we were visited by the keeper of the Imperial Eagle Hostelry. He informed us that a man from Nazareth, together with his young wife in advanced stage of pregnancy, had applied there for lodging. Due to the census and the holidays, he had no room available. He did make room for them in the stable of the inn and there, during the night, she gave birth to a son. Despite the unsanitary nature of the setting, both mother and child survived. We made a call to the stable (on my monthly statistics, you will see it is asterisked under the "house calls") to find that some members of the community—shepherds, strange merchants who happened to be in town, and others—had brought them some comforts—food, blankets, and, perhaps motivated by the spirit of the Imperial holidays, some rich gifts. We talked with the father, a carpenter from Galilee (town of Nazareth), who said that they had no funds, since his last savings had gone to purchase a poor donkey to bear his pregnant wife on the journey. We, however, were not able to help him any, since his legal eligibility was in Nazareth. The workers in this office, moved by the courage of the mother and father, and also the winsomeness of the baby, did collect some warm clothes and gave them to them. (I can see you shaking your head, Quintus, and saying, as you did in class: "The trouble with women workers is that they often think with their hearts and glands instead of with their heads!" So be it. We feel on occasion that compassion is more important than Imperial regulations. Please, as my former teacher and current supervisor, delete the above prior to recording this report in the departmental records. I would hate for it to be seen by the auditor.) We were unable to find more suitable lodging for the family, again due to the limitations of our eligibility requirements. Today, we made another call to the stable, only to find nothing there but the usual beasts. The innkeeper informed us that the party had left on the road to Egypt instead of north toward Nazareth. I have not had a chance to check further since things are in a turmoil here, with the local tyrant suddenly starting one of those recurrent blood-baths which seem to plague this section of the Empire. For some reason, he has been taking away all the first-born sons of all Jewish families. This crisis will, I am sure, further tax our office and our budget. Dispensation: Case closed due to disappearance of clients.

[We regret that Dr. Bland's remarks were not recorded, which makes it impossible to include them here.—*Editor*]

MASSACHUSETTS EYE & EAR INFIRMARY

The following appointments were made at the meeting of the Executive Committee of the Board of Managers of the Massachusetts Eye and Ear Infirmary, held on December 7, 1959:

Dr. Frank W. Brady—Fellow in Otolaryngology;
Dr. Julianna Fodor—Fellow in Ophthalmology;
Jacques Gosteli, Ph.D.—Fellow in Biochemistry, beginning March 1;
Dr. Donald K. Lewis—Director of the Winthrop Foundation;
S. Peter Marfey, Ph.D.—Director of the Biochemistry Laboratory;
Dr. Daniel Miller—Associate Surgeon in charge of the Otolaryngological Section of the Tumor Clinic;
Dr. John C. Trakas—Assistant in Otolaryngology;
Dr. Francis L. Weille—Surgeon to the Service for the Deaf.

At the Annual Meeting of the Board of Managers of the Eye and Ear Infirmary, held on December 9:

Dr. Hugh C. Donahue was not reappointed as a member of the staff;

Dr. George F. Reed was promoted to Associate Surgeon in Otolaryngology.

VOLUNTEER GROUPS

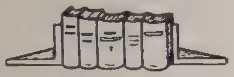
DISTAFF CLUB

On January 14, members of the Distaff Club were the guests of the Boston City Hospital House Officers' Wives Club, to hear Dr. Florence C. Wislocki speak on "The parents' role in education". Dr. Wislocki, Assistant to the President at Vassar, is a noted psychiatrist who has done considerable work with child guidance clinics.

Also in January, our Literary Club held its first meeting at the home of Mrs. G. Melville Williams, to plan its program for reviewing books in the future months.

On January 21, members of our Volunteer Project met at the Hospital with Miss Mary Ruth Wolf, Director of Volunteers at M.G.H., for instruction in orientation to our volunteer work here at the Hospital. Other Distaff members were baby sitters in the Penthouse for those doing volunteer work. They will continue to provide this service throughout the year.

Plans are coming along well for the Annual Spring Formal, to be held in May at the M.I.T. Faculty Club. This is the first year that there will be a dinner in addition to the dance. Mrs. Harold C. Urschel is the chairman of this hardworking committee.



STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material*, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Biochemistry

Katz, A. M., and Chernoff, A. I.
Structural similarities between nemoglobins A and F.
Science 130:1574, 1959.

Katz, A. M., Dreyer, W. J., and Anfinsen, C. B.
Peptide separation by two-dimensional chromatography and electrophoresis.
J. Biol. Chem. 234:2897, 1959.

Dermatology

Blank, I. H.
Protection against the invasion of bacteria and fungi.
In The human integument, Washington, D.C., American Association for the Advancement of Science, p. 47, 1959.

Griesemer, R. D.
Protection against the transfer of matter through the skin.
In The human integument, Washington, D.C., American Association for the Advancement of Science, p. 25, 1959.

General Medicine

Currens, J. H.
Medical progress: Evaluation and treatment of the patient with an elevated blood pressure: With special reference to specific conditions amenable to surgical correction.
New England J. Med. 261:1062, 1959.

Otolaryngology

Jako, G., Weille, F. L., Palmer, P. E., and Irwin, J. W.
An experimental study of the dynamic circulation of the labyrinthine fluids.
Ann. Otol., Rhin. & Laryng. 68:733, 1959.

Psychiatry

Weisman, A. D.
The psychodynamic formulation of conflict.
A.M.A. Arch. Gen. Psychiatry 1:288, 1959.

The next issue of THE NEWS will be the last one in which 1959 titles will appear.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

No. 87 in a series of Staff photographs
Dr. Evan Calkins, Associate Physician—Director of the Robert W. Lovett Memorial Unit

New addresses:

Dr. Scott Adler (sr. r.s. *Or.* 1959), 419 Maple St., N.E., Albuquerque, N. M.

Dr. George H. Carter (*M.* 1943), Boston University-Massachusetts Memorial Hospitals Medical Center, 750 Harrison Ave., Boston, Mass.

Dr. William P. Chapman (a. *M.* 1957), Medical Dept., Boston Globe, 135 William T. Morrissey Blvd., Dorchester, Mass.

Dr. Frederick H. Cummer, Jr. (sr. r.p. *Psychiat.* (*McL.*) 1950), Boston University-Massachusetts Memorial Hospitals Medical Center, 750 Harrison Ave., Boston, Mass.

Dr. Milton S. Grossman (*C.M.* 1958), Children's Medical Center, 300 Longwood Ave., Boston, Mass.

Dr. A. Erik Gundersen (*S.* 1956), Children's Medical Center, 300 Longwood Ave., Boston, Mass.

Dr. W. Hardy Hendren, III (*S.* 1953), Children's Medical Center, 300 Longwood Ave., Boston, Mass., or Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.

Dr. Mark M. Kartchner (*S.* 1958), USPHS Indian Hospital, Lawton, Okla.

Dr. Peter H. Knapp (a.r.p. *Psychiat.* 1947), Boston University-Massachusetts Memorial Hospitals Medical Center, 750 Harrison Ave., Boston, Mass.

Dr. Jan Koch-Weser (*M.* 1955), Dept. of Pharmacology, Harvard Medical School, 25 Shattuck St., Boston, Mass.

Dr. Raymond F. Kuhlmann (sr. r.s. *Or.* 1948), 80 Colchester Ave., Burlington, Vt.

Dr. Marvin M. Lipman (r.p. 1959), Columbia-Presbyterian Medical Center, New York, N. Y.

Dr. Donald B. Martin (*M.* 1955), National Heart Institute, National Institutes of Health, Bethesda, Md.

Dr. Harold L. May (a.r.s. 1959), Hôpital Albert Schweitzer, P.O. Box 4, St. Marc, Haiti

Dr. Anthony P. Monaco (*S.* 1957), Harvard Medical School, 25 Shattuck St., Boston, Mass.

Dr. Louis Nathan (*Or.* 1930), Veterans Administration Outpatient Clinic, 17 Court St., Boston, Mass.

Dr. Edward J. Ottenheimer (*E.S.* 1924), 132 Mansfield Ave., Willimantic, Conn.

Dr. Russel H. Patterson (*E.S.* 1919), 166 E. 63rd St., New York 21, N. Y.

Dr. Arthur Perkins (*E.S.* 1925), 813 Ogden Canyon, Ogden, Utah

Dr. David C. Poskanzer (r.p. *N.* 1959), 900 West End Ave., New York 25, N. Y.

Dr. John W. Smillie (*E.S.* 1944), Dept. of Ophthalmology, University of Michigan Medical Center, Ann Arbor, Mich.

Dr. Dagoberto Sosa (r.s. *N.S.* 1959), Centro Medico de Guatemala, Calle Real de Ciudad Vieja 91, Guatemala City, Guatemala, C. A.

Lt. William L. Strickler, MC, USNR (a.r.s.), U.S. Naval Hospital, Newport, R. I.

Dr. Chiu-an Wang (*W.S.* 1944), Room 310, Takshing House, 20 Des Voeux Rd., Central, Hong Kong, China

Dr. George D. Zuidema (*S.* 1954), Medical School, University of Michigan, Ann Arbor, Mich.

Brief bits:

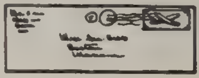
Dr. William S. Beck delivered the Bunker Leukemia Lecture at St. Luke's Hospital, New York City, on December 17, 1959. His subject was "Biochemistry and metabolism of normal and leukemic leukocytes".

Dr. Harvey E. Billig, Jr. (*Or.* 1935) has been elected President of the Los Angeles County Medical Association Surgical Section for the year 1960.

Dr. Allan L. Friedlich has been named President-elect of the Massachusetts Heart Association's Greater Boston Chapter.

Dr. Erich Lindemann has been appointed for a three-month period as Consultant to the Mental Health Section of the World Health Organization. Dr. Lindemann will be advisor to medical schools in India, helping to improve their program of psychiatric training. He reported to the World Health Organization on December 1, 1959.

Dr. Philip E. Meltzer, Surgeon in Otolaryngology at the Massachusetts Eye and Ear Infirmary, left on January 14 for Zurich, Basel, Freiburg, and Würzburg, to observe several special procedures pertaining to his field of work.



This nice letter has come from Dr. Edwin H. Mulford, II (a.r.s. *N.S.* 1947), written from 748 Post Road, Darien, Connecticut:

I am delighted to contribute an item to The News. I am not exactly a "singleton" as you suggest, however, as Dr. John P. Gens of the G-U Service [r.s.*U.* 1943] is practising in Fairfield County, also.

As you might assume from my letterhead, I am in the practice of neurological surgery, my activities confined to what we call Southern Fairfield County, which includes Greenwich, Stamford, and Norwalk areas. My office is in Darien.

As to hobbies, I find that my profession takes up most of my time these days and I must therefore bypass the several hobbies which I hope some day to have time to explore. However, my entire family (I now have four children) has one hobby in common and that is riding. We keep horses in a riding club close to our house in Darien, and this affords all of us a great deal of pleasure and is a year-round activity in this area.

Many of my happiest memories are of THE GENERAL and I always look forward to any opportunity to visit Boston and my old haunts.

The kindest regards.

The Hospital has purchased the former Mortuary property on North Grove Street, thereby completing the space from Fruit Street to Cambridge Street for the new Clinics Building.

THE NEWS

No. 193 Boston, Mass. March 1960

THE ROBERT W. LOVETT MEMORIAL UNIT

STUDIES PERTAINING TO CONNECTIVE TISSUE AND ITS DISEASES**

(Conclusion of the article on this same subject, begun in the February issue)

IV. Carbohydrate Chemistry—Dr. Roger W. Jeanloz

Dr. Jeanloz is currently in Europe on a one-year's sabbatical leave. One of the objectives of this sabbatical is the completion of a book of which he is co-editor, entitled *The amino sugars*. It will be published by the Academic Press.*

The general aim of the research of Dr. Jeanloz's laboratory is the determination of the chemical structure of biologically important carbohydrate-containing compounds, of both the high polymer type (such as mucopolysaccharides and glycoproteins) and the low molecular weight compounds (such as the aminosugar-containing nucleotides which are involved in synthetic mechanisms). The elucidation of the structure of these materials is an essential step in the direction of correlating chemical properties with biological behavior. It is also a necessary prerequisite to an understanding of the metabolism of these substances.

Among the mucopolysaccharides, chondroitin sulfate A, a main constituent of cartilage, and chondroitin sulfate B (also called β-heparin or dermatan sulfate) which has been isolated from skin, lungs, artery walls, and heart valves, have been submitted to extensive research by Dr. Pierre Stoffyn in order to establish their detailed chemical structure.

By nature of their main constituents (uronic acid and hexosamine), these substances are closely related to hyaluronic acid and alpha-heparin, the well-known blood anticoagulant. Whereas chondroitin sulfate B exhibits in certain conditions blood anticoagulant properties, chondroitin sulfate A is devoid of this property. It is hoped that the knowledge of the structures will allow an understanding of their physiological role and permit the correlation of their biological activity with a definite chemical structure. This, in turn, should lead to information which will be of great value in understanding disease mechanisms.

One of the most effective methods of establishing the sites of bonds of these structures is by the methylation procedure. This has required the synthesis, as reference compounds, of all of the twelve possible mono- and di-methyl galactosamines and glucosamines. All of these compounds have now been prepared—most of them in Dr. Jeanloz's laboratory, in collaboration with Drs. Dieter M. Schmid, Pierre Stoffyn, Dorothy K. Stearns, and Renee Naves. At the present time, this method has made it possible to establish, on the basis of isolation of crystalline derivatives, that in chondroitin sulfate A, as well as in chondroitin sulfate B, the uronic acid is linked to the position 3 of the galactosamine moiety and that the sulfate ester groups present in these two mucopolysaccharides are at position 4. In chondroitin sulfate A, the galactosamine residues are, on the other hand, linked to position 4 of the glucuronic acid.

It has also been demonstrated conclusively that the uronic acid component of chondroitin sulfate B is L-iduronic acid by the isolation of a crystalline derivative of L-idose and comparison with a synthetic sample.

Other work of this laboratory, started by Dr. Sen-itiro Hakomori, is a study of two glycolipids which have been isolated from the red cells of blood of type A+ and B+, and which possess definite blood group activities. These contain a fatty acid, sphingosine, and for each of these two components approximately five sugar molecules. The sugars have been identified as galactose, glucose, and galactosamine.

Dr. Nathan Sharon, investigating the chemical structure of an intracellular polysaccharide produced by a strain of Bacillus subtilis which synthesizes extracellularly large amounts of polyglutamic acid, has demonstrated the presence of a new diaminohexose and has studied its structure. The presence of this compound is of especial interest in that similar sugars have been discovered recently in certain antibiotics. In relationship with this work, Dr. Annette M. C. Rapin is engaged in the synthesis of this and other diaminosugars, starting from levoglucosan, and is studying the general chemistry of this interesting sugar.

As an increasing number of new aminosugars have been discovered in recent years, the synthesis of these compounds was undertaken in the laboratory. Thus, Dr. Glaser has synthesized D-gulosamine and D-talosamine and, with Dorothy Jeanloz, the syntheses of 3-amino gulose and 3-amino idose have been accomplished. The chemical structure of neuraminic acid, an important constituent of the glycoproteins, is under further study by Dr. Dorothy Stearns.

Two investigators have been interested in the chemistry of the serum glycoproteins, with special reference to the composition, and structural configuration, and point of attachment of the carbohydrate residues.

One of these is Dr. Robert G. Spiro, who has been engaged in the study of the chemistry of fetuin, an alpha$_1$-glycoprotein of fetal calf serum. Fetuin is present in the fetal serum of a variety of animals in very high concentration and may represent as much as 40% of the total serum proteins. It was isolated by Dr. Spiro from fetal calf serum by a low temperature ethanol fractionation in the presence of Zn and Ba. The resultant preparation was homogeneous by electrophoresis and in the ultracentrifuge over the pH range of 1.8 to 11.1. Its sugar constituents have been identified and quantitated. The sugars which are present in this molecule are mannose, galactose, glucosamine, galactosamine, and sialic acid, and make up about 26% of the protein by weight. Physical studies also have been carried out on this protein. Its molecular weight calculated from sedimentation and diffusion data is 48,000. This protein is very asymmetric in shape and very acid in nature, having an isoelectric point of 3.3. It has been shown that its acidic properties are due to the presence of 9% sialic acid, which is peripheral in location and can be removed selectively by mild hydrolysis conditions. The removal of the sialic acid raises the isoelectric point to a value of pH 5.3. By gradient hydrolysis it has been revealed that after the sialic acid, galactose is most external in location, while the glucosamine and mannose are located more internally. Present studies are concerned with further clarification of the sugar sequences and involve the degradation of the glycoprotein by proteolytic enzymes for the purpose of isolating carbohydrate-rich glycopeptides. It is felt that these peptides will give information with respect to the protein-carbohydrate bond.

The other individual interested in the glycoproteins is Dr. Edwin H. Eylar. His interest is focused upon the arrangement of the constituent sugar residues and the covalent linkage between the carbohydrate and the polypeptide part. Alpha$_1$-glycoprotein is being used as a model, and both enzymatic and chemical methods have been employed. The results sug-

---

*In Dr. Jeanloz's absence, the work of his laboratory is continuing under the direction of Dr. Pierre J. J. Stoffyn.

**This is Publication Number 266 of the Robert W. Lovett Memorial Unit for the Study of Crippling Disease, Harvard Medical School at the Massachusetts General Hospital.

gest that the polysaccharide portion is composed of a main chain of N-acetylglucosamine and mannose units, and 15-16 side chains with the sequence N-acetylneuraminic acid-galactose-N-acetyl-glucosamine. This hypothesis is in agreement with the results from oxidation of the alpha$_1$-glycoprotein with sodium periodate.

In order to study the polypeptide-polysaccharide linkage, efforts were made to hydrolyze the polypeptide part with proteolytic enzymes. With the exception of pepsin, the alpha$_1$-glycoprotein is quite inert to most proteolytic enzymes. However, it becomes reactive after neuraminidase treatment. After action of pepsin, papain, or subtilisin, in that order, about 90-95% of the degraded polypeptide portion can be separated by dialysis from the non-dialyzable polysaccharide core. The polysaccharide-amino acid residues can be purified and fractionated on DEAE cellulose. It is hoped that structural studies on this material will reveal the number and kind of amino acid-sugar linkages involved.

V. Chemistry of the Vascular Wall—Dr. William H. Batchelor

Work in this laboratory centers upon the motion of fluid through tissue in response to pressure differences. The inquiry seeks to relate the accumulation of serum lipids in arterial tissue to changes in connective tissue organization, notably the changes suggested by extraction experiments for the recovery of collagen and mucopolysaccharides. Two experimental systems are currently under study. One makes use of infusion of solutions into the skin of anesthetized guinea pigs to study the extent to which the distribution of fluid escaping from a fine needle into the dermis is subject to control. Infusion rate and viscosity have proved most useful, giving a range of fluid distributions extending from the dermal wheal to a pattern possibly physiologic. A second system consists of a porous bed of polyelectrolyte with the useful property of reacting selectively with serum β lipoproteins. The immediate objective in this system is to relate sequestration of lipids to conditions of flow.

VI. Amyloid and Related Subjects—Drs. Evan Calkins and Alan S. Cohen

Surrounded and stimulated on the one hand by the active group of basic investigators and on the other hand by their associates in the Clinic, this group of investigators has sought to direct its research in two ways. First, to select a problem presented in the Clinic which can be recreated in the laboratory, in experimental animals, to permit detailed study; second, to explore the physiologic problem, presented in these animals, by every appropriate technique; and, third, to attempt to apply what is learned from the animals to human patients, both as regards pathologic physiology and as regards prevention and cure. The problem of amyloidosis has proved to be well adapted to this approach. This disease is incurred in approximately 25% of patients with rheumatoid arthritis. It is a major cause of death in paraplegic veterans and in patients with leprosy; it often accompanies multiple myeloma; and in its so-called primary form it is a not infrequent cause of nephrosis in adults, as well as other, often baffling, clinical syndromes. The research has followed along several lines.

1. Chemical characterization: The initial studies conducted by Dr. Robert B. Giles, Jr. and Dr. Calkins on the chemical composition of this substance have been confirmed. It is predominantly protein, but also contains approximately 1.5% hexosamine (chiefly glucosamine) and 2% neutral hexose (galactose, glucose, mannose, fucose). It is markedly hydrophilic. Further characterization of the protein has been rendered difficult by its marked insolubility and resistance to enzymatic digestion. It is non-collagenous. Studies conducted in collaboration with Dr. David Gitlin of the Children's Medical Center indicate that it is not predominantly comprised of gamma globulin.

2. Experimental induction of the disease: Experimental amyloidosis, having nearly all the characteristics of the human disease, can be reproducibly induced in rabbits by means of serial subcutaneous injections of 10% sodium caseinate. During the induction of the disease, which takes from 3 to 4 months, the rabbits exhibit marked increases in serum concentrations of hexosamine and gamma globulin, and small but demonstrable amounts of circulating antibody to the casein (studies of Dr. Adalbert F. Schubart). The manner of injections of the caseinate can be modified, but two facts appear established. First—whatever technique is used, so long as the elevations of serum hexosamine and gamma globulin are maintained for a long enough period, amyloidosis will result. Second—the only injection procedures which are effective, using sodium caseinate, are those which yield at least minimal titers of circulating antibody. The administration of cortisone simultaneously with the administration of caseinate does not make the amyloidosis worse, and appears to decrease its incidence and severity. I^{131}-labelled caseinate, injected subcutaneously, is not broken down more rapidly from casein-immunized rabbits than from normal animals, and the caseinate, labelled by this means, cannot be identified in the amyloid.

3. Physical and histologic characterization: Amyloid is faintly autofluorescent, and is birefringent in polarized light. The latter property suggested that it had a more organized structure than was apparent by ordinary histologic techniques. Electronmicroscopic studies of amyloid from rabbits and from human patients with various types of the disease, conducted in this laboratory by Dr. Cohen, have indicated that amyloid contains minute fibrils, which appear different from collagen, elastin, and other readily identifiable tissue fibers. The group would like to express appreciation to Dr. Leon Weiss of the Department of Anatomy, Harvard Medical School, for collaboration on the study of the fine structure of the spleen in amyloidosis. Isolation of this fibrillar material and determination of its chemical and physical properties and of its metabolism are at present under way.

4. Physical chemical studies: During the last two years the work of this laboratory has been strengthened by the collaboration of Dr. Borge Larsen, formerly of Dr. Teilum's laboratory in Copenhagen. Dr. Larsen has extended his studies of the *in vitro* binding of Congo red by serum proteins. These studies have shown that there is a significantly decreased Congo red binding by sera from patients with rheumatoid arthritis, with a much more pronounced decrease by sera from patients with amyloidosis. It would appear that alterations in serum binding may contribute, to some extent at least, to the rapid disappearance of Congo red from the serum of patients with amyloidosis. Dr. Larsen has also been interested in possible alterations in sulfhydryl metabolism in amyloidosis and in chronic inflammatory disease. Preliminary results indicate that there is a consistent fall in serum SH concentration during the induction of amyloidosis, occurring simultaneously with the rise in serum hexosamine concentration. Administration of certain SH donor substances prevents both the SH fall and the hexosamine rise. The physiologic implications of this observation are at present under study.

5. Clinical investigation: An extensive study of the latex fixation test was conducted by Dr. Adalbert Schubart. Since the performance of this test does not require the use of heat-inactivated serum, this system presented an excellent opportunity to study the role of heat-labile components in the agglutinating phenomena which often are seen in serum from patients with rheumatoid arthritis. The studies showed that the sera of many patients with rheumatoid arthritis possess a heat-labile component, having many of the characteristics of serum complement, which partially or, in some instances, totally inhibits the agglutination phenomenon. The exact nature of this component, its mechanism of action, and its possible implications in the physiology of the disease, have been and are under intensive investigation, both in this Unit and, during the last six months, at the University of Maryland.

Although the above studies were established as an unrelated parallel investigation to the main stream of the work on amyloidosis, one observation was made which provides grounds for considering a possible relationship. Incident to a survey of various chronic diseases, twenty sera were studied from patients with leprosy at the U.S.P.H.S. Hospital in Carville, Louisiana. Ten of these sera exhibited positive latex fixation tests—nine of these were from patients with amyloidosis. Of the ten sera which exhibited negative tests, none were from patients with amyloidosis. A follow-up study on the clinical implications of this serologic abnormality in patients with leprosy is at this writing being undertaken at Carville by Drs. Edgar S. Cathcart and Ralph C. Williams, Jr. Dr. Williams thus enjoyed a final fling in the field of epidemiology before he commenced his service here as Chief Resident in Medicine in January.

Further clinical studies in patients with amyloidosis have concerned the varied serum abnormalities, histologic peculiarities, diagnostic methods, and clinical course in patients with this disease.

The work on amyloid and related subjects has been greatly strengthened by the addition to the group of Drs. Frank Mullinax, Sidney R. Cooperband, and, on part-time basis, Ellis L. Rolett, who is at present a Resident in Medicine. Dr. Mullinax is concerned with the mechanism for the increased antibody production in the secondary response. This work requires the establishment of *in vitro* systems of antibody synthesis. Dr. Cooperband is studying the abnormal pattern of glycoprotein synthesis in chronic inflammatory disease. Dr. Rolett is studying changes in Redox potential seen during prolonged inflammatory disease.

6. Pathologic anatomy: In addition to participating in the study of amyloidosis, Dr. Cohen has been conducting anatomic studies on other connective components. The nature of the lesion (involving elastic tissue) in a rare dermatologic disorder (elastosis serpiginosa perforans) was studied with Dr. Ken Hashimoto of the Dermatology Department. Together with Dr. Gross, Dr. Cohen has been studying the skin (dermis) of patients with heritable or acquired lesions of the connective tissue. Other cooperative studies where fine tissue structure investigation can help elucidate a physiologic or pathologic problem are under way.

VII. Clinical Investigation—Drs. Bauer, Calkins, Cohen, Ropes, Sharp, and Short

The enthusiasm for laboratory research, at either the basic or applied level, has not lessened the interest and enthusiasm for clinical investigation. Indeed, the number of studies undertaken in the Arthritis Clinic has greatly increased over the past three or four years, and the Unit is in the process of establishing a second clinic for the purpose of following patients with the heritable diseases of connective tissue.

The long-established objectives of Drs. Bauer, Short, and Ropes to define the manifestations of various rheumatic diseases and to document their life courses are still being actively pursued. Drs. Short and Bauer, having completed their monograph on *Rheumatoid arthritis*, based on the numerical study of 239 patients, have set about describing the natural course of this disease. The meticulous follow-up of all the surviving patients is still under way. In addition, Drs. Ropes and Bauer are continuing to describe the experience of the Arthritis Group with other connective tissue diseases. Detailed analysis of the manifestations and course of patients with disseminated lupus erythematosus and dermatomyositis seen by the Arthritis Group over the past 28 years is in progress. The patients will be classified by strict criteria, and comparisons made between the various groups and with comparable groups of patients with rheumatoid arthritis and the other connective tissue diseases.

A report on the systemic manifestations of rheumatoid arthritis, by Drs. Bauer, William S. Clark, and Mart Mannik, is in process of completion. A study of patients with Reiter's syndrome is almost ready for publication. A paper on the entrance of sugar into joints has been submitted for publication.

Dr. Ropes is also continuing her studies of the toxic level of salicylate as further evidence of probable therapeutic level. The toxic level is apparently much higher below the age of 15 and lower above the age of 55. She is also continuing her studies of the Congo red retention in patients with rheumatoid arthritis, with especial attention to the effect on it of treatment of patients with large doses of ascorbic acid. An apparent increase in the Congo red retention in individual patients has been noted. The results are now being evaluated statistically.

During the last two years a comprehensive study of the clinical laboratory and X-ray manifestations of rheumatoid arthritis, and of its course, in 150 patients with various forms of the disease was undertaken. This study, conducted by Drs. Calkins, Sharp, Cohen, Schubart, and Calabro, was designed primarily as a basis for our own future clinical investigation. The project has led to a number of rather exciting hypotheses which are now under further investigation. Among the results is the observation that the presence of rheumatoid factor is as apt to be noted in patients with disease of one year's duration as in patients with disease of ten, twenty, or thirty years' duration. On the other hand, the presence of this factor, in high titer, is usually associated with an unremitting course and with more severe involvement of both skeletal tissues and the reticulo endothelial organs. The observations suggest that the presence of rheumatoid factor, in high titer, early in the disease, may have adverse prognostic implications. The nature of this factor, and its physiologic significance, are at present under study.

In conclusion, the authors would like to express their appreciation to the many members of the Hospital staff, both professional and nonprofessional, who have contributed so generously to these projects; to the many patients who, by their loyalty to the Hospital and Clinic, have provided the stimulus for most of this work; and to Dr. Walter Bauer for his wise and forbearing supervision and for his constant encouragement.

We are also happy to acknowledge our indebtedness to those agencies, institutions, and individuals whose generous financial aid has made these studies possible. At present, our support comes in large part from the National Institute of Arthritis and Metabolic Diseases of the U.S.P.H.S., the National Science Foundation, the American Heart Association, the Helen Hay Whitney Foundation, the New England Chapter of the Arthritis and Rheumatism Foundation, and Eli Lilly and Company. Previous long-term support, covering a period of 20 years, was received from the Commonwealth Fund.

Evan Calkins, M.D.,
Associate Physician and *Director of the Robert W. Lovett Memorial Unit*
Karl Schmid, Ph.D.,
Associate Biochemist in Medicine

A LOYAL ALUMNUS

When Dr. Linn Fenimore Cooper (*W.M.* 1928) died, on November 13, 1959, in faraway Sarawak on the island of Borneo, the Massachusetts General Hospital lost a loyal and devoted alumnus and benefactor.

Linn Cooper, a great-grandson of James Fenimore Cooper, the famous American novelist, was born in Albany in 1900, and raised in Cooperstown, N. Y. He went to the Taft School and thence to Yale College, from which he graduated in the Class of 1921. In the autumn he entered the Harvard Medical School. After two years of medical school he took a year out, six months of which he spent at Hopkins, and six in Vienna and Paris. Returning to Boston, he completed his medical course at Harvard, getting his M.D. degree with the Class of 1926. After that he went on to his internship at the M.G.H.

I remember him vividly as an intern — tall, handsome, charming, but quiet and self-effacing. He was beloved by his fellow interns and admired for his deep interest in his patients, with whom he would work endlessly, trying to get at the root of all their troubles. A truly dedicated physician is what he was, with the highest ideals and utter humility.

Internship finished, Linn betook himself to the Johns Hopkins Hospital, where he was an assistant resident until 1930; after that, to Queen Square, London, in 1931, and in 1932 to New York, to become a clinical adjunct at the Neurological Institute. In 1934, he entered private practice in Washington, and concurrently became an instructor in clinical medicine at Georgetown University. In 1938, he was promoted to Associate Professor and was made a visiting physician at Georgetown University Hospital.

From 1942 to 1946 he was in the Army Medical Corps, retiring as Colonel. After the war, he became Professor of Medicine at Hsiang-Ya Medical College, at Changsha in Hunan Province, China. He remained there until driven out by the Reds, and then he traveled in Africa. From 1950 to 1951 he attended the School of Tropical Medicine in Liverpool.

As early as 1948 he became increasingly interested in hypnosis, from both a basic psychological point of view and, later, that of practical therapeutic application. Between 1948 and 1952 he published papers on time distortion in hypnosis which appeared in several journals — in the *Bulletin of Georgetown University Medical Center,* in *Science,* and in the *Journal of Psychology.* In 1954, a book was published by Cooper, together with Dr. Milton H. Erickson under the title *Time distortion in hypnosis.* A second edition appeared in 1959. (Baltimore, The Williams & Wilkins Company)

In June of 1952 I dined with Linn at the Chevy Chase Club in Washington. Appropriately over juleps on the lovely lawn that beautiful summer evening, Linn told me of his plans for going again to Africa. He wanted to make his medical skill useful where there was the greatest possible need for it. This would be where there were people quite deprived of such skill. After considerable investigation he had settled for a job with a Catholic Mission in the hinterland of Ghana, run by an order known as the White Fathers of Africa. They needed doctors urgently and assured him that his being a non-Catholic would offer no obstacle. His work in Ghana proved very satisfactory to him and his relations with the White Fathers very congenial. Back in Washington in 1958, he told a friend that he had developed a high esteem for the work of the Catholic missionaries in Africa.

Not because of any dissatisfaction with the African job, but because he wanted a wider experience, he next took off for Sarawak, to work in a different jungle and with a different population of natives, but again with Catholic missionaries. This time it was the Millhill Fathers — a Dutch Roman Catholic organization. The work in Kanowit, Sarawak, was as intriguing to him as had been that in Ghana.

I had some correspondence with him while he was there, and last summer he was home on leave and visited Boston. He came to lunch at my house, with David Crockett, on June 10. He was in fine spirits and eager to get back to Sarawak David took him to the Massachusetts General to show him all the new developments, which he very much wanted to see. A few days later he returned to Sarawak. Not long after, I received a very generous check from him for the Hospital, via his agents in New York, and hard upon that, quite out of the blue, the shocking news came that he was dead. Apparently he had succumbed to some fulminating type of encephalitis.

Linn Cooper's benefactions to the M.G.H. extend over a period of thirty years. Undoubtedly they were an expression of his love of the place. In each case the gift was designated for a special purpose that particularly interested him. Also, they came in ever-increasing amounts. The first, in 1929, was to aid the publication of the history of the Hospital; in 1943, there was one to be used toward the equipping of the Medical Staff Room; in 1952, a generous gift for thyroid research; and in 1958 and again in 1959, very shortly before his death, most generously of all, he gave to the James Howard Means Fund.

He also, we know, made substantial gifts to the Harvard Medical School and, no doubt, to many other institutions toward which he felt grateful for what they had done for him. His untimely death is a tragic loss to medicine and to humanity.

[James Howard Means, M.D.] J. H. M.

The Board of Trustees, at their meetings on December 31 and January 15, voted:

To reappoint:

Dr. Gordon L. Brownell as Associate Physicist (Medicine), as of January 1;
Dr. Jerome Gross as Associate Biologist (Medicine), as of January 1.

To appoint:

Dr. Frederick W. Ackroyd as Third Assistant Resident in Surgery, beginning January 1;
Dr. Arthur K. Asbury as Assistant Resident in Neurology for one year, beginning July 1;
Dr. Charles H. Banov as Clinical Fellow in Medicine, beginning July 1;
Dr. Estela O. Ching as Clinical Fellow on the Children's Medical Service, beginning January 1;
Dr. Herbert S. Cline as Assistant in Psychiatry, as of July 1, 1959;
Dr. T. Corwin Fleming as Assistant Resident in Neurology, beginning July 1;
Dr. Harris Hyman, III, as Clinical Fellow in Medicine, beginning July 1;
Dr. Jan Koch-Weser as Clinical Fellow in Medicine, beginning January 1;
Dr. Edward Los as Assistant Resident in Anesthesia, beginning January 4;
Dr. Thomas E. Macnamara as Clinical Fellow in Anesthesia, beginning January 18;
Dr. Francis D. Milligan as Clinical Fellow in Medicine, beginning July 1;
Dr. Arthur L. Prensky as Assistant Resident in Neurology, beginning July 1;
Dr. Lewis F. Scribner, Jr. as Clinical Fellow in Medicine, beginning July 1;
Dr. Mustafa L. Sipahi as Clinical Fellow in Radiology, beginning December 1;
Dr. Vincent W. Steward as Clinical Fellow in Neurology, to act as Assistant Resident, for one year, beginning July 1;
Dr. Ansgar Torvik as Clinical and Research Fellow in Neurology, assigned to Neuropathology, for one year, beginning July 1.

At their meetings on December 23 and 30, 1959, and during January 1960, the General Executive Committee voted:

To promote:

Dr. Edwin W. Salzman to the position of Resident in Surgery for one year, beginning July 1.

To extend the appointment of:

Dr. Harilaos T. Sakellarides as Clinical Fellow in Orthopedic Surgery, from January 1 through June 30.

To reappoint:

Dr. Michael H. M. Dykes as Clinical Fellow in Anesthesia for one year, beginning January 1;
Dr. Paul J. Kestens as Clinical and Research Fellow in Surgery, for an additional eight months, beginning January 1.

To appoint:

Dr. F. William Bora, Jr. as Clinical Assistant in Orthopedic Surgery, for the period February 5 through March 31, with the privilege of assisting Dr. Aufranc in the care of his private patients during this period. It was further voted that he be appointed to the position of Senior Resident in Orthopedic Surgery, for the period April 1 through July 31, assigned to the Shattuck Hospital, and that on August 1 he will return to the MGH Orthopedic Resident Staff;
Dr. Herbert A. Haessler as Research Fellow in Medicine for one year, beginning July 1;
Dr. Raymond N. Kjellberg as Clinical Assistant in Neurosurgery, effective as of January 1, with the privilege of occupying space in the office of Dr. William H. Sweet;
Dr. J. D. Gwynne McNeil-Smith as Graduate Student Assistant in Orthopedic Surgery, for the period January 4 through March 31;
Dr. Valentin Malagon as Graduate Student Assistant in Orthopedic Surgery, for six months, beginning January 6.

THE MASSACHUSETTS GENERAL HOSPITAL

1935 - 1955

by

NATHANIEL W. FAXON, M.D.

The life of the institutional organism which began in 1811 (at least its period of gestation began as early as that) has been duly chronicled to 1935, by Bowditch, Myers, and Washburn, successively. Now that invaluable sequence is extended again by the arrival of Dr. Faxon's fine work which continues the story to 1955.

Dr. Faxon's book is a labor of love. He has written of something of which he himself is a part. His first-hand account gains vividness because he has seen his subject from within. But also he has viewed it from afar, because while, together with the medical dean, George Hoyt Whipple, he was creating from the ground up, *de novo,* the great teaching hospital in Rochester, N. Y. — the Strong Memorial, he was constantly watching the behaviorism of his *alma mater* hospital — the M.G.H. On the subject of teaching hospitals he is, therefore, expert. No one could be found better equipped to write the history of these two decades in the life of the Massachusetts General than he.

His story is direct, clear, and readable. The book is arranged with the reader's convenience in mind. The difficult task of getting good perspective, both horizontally and vertically, is achieved by dividing it into two parts — one, a chronologic year-by-year account; the other, a collection of articles on special subjects which require concentrated attention, without limit of time, for full understanding of their significance in the evolution of the Hospital as a whole.

To anyone who, like this reviewer, has also spent the two decades in question, and perhaps more, as a member of the MGH family, to read Faxon is to live a happy life over again. The tale is one of events, of men and women, of policies, and of affairs. It is the picture of socio-economic and cultural evolution in action. It is a drama in twenty acts — each year an act. At least, so it will seem to all those who were part of it.

Part I. The chronological account runs along through the years smoothly and with good continuity. It must be remembered that Faxon is writing the history of the Hospital, not of the march of medicine itself, although he touches on the latter in Part II. He shows the role of the Hospital in the community and in the world. He indicates all the kinds of people that are necessary to make it serve its function. It takes many besides doctors of medicine to do this. The whole must be well integrated administratively, so that teaching and research can be utilized to improve the care of patients, which, after all, is the prime objective of any hospital.

If one gallops through Part I certain very high spots flash by, such as: 1935, M.G.H. joins Community Fund; Boston Hospital Council formed; 1939, Dedication of White Building; 1940, 6th General Hospital organized; Archives Department started; 1941, Defense organization set up; 1942, Cocoanut Grove disaster; 6th General Hospital activated; Huntington Memorial Hospital for cancer research transferred to M.G.H.; effects of war on the home front; 1943, 6th General at Casablanca; 1944, Penicillin arrives; 1945, V.E. and V.J. Days; return of doctors and nurses; 1946, Ether Centenary; Bishop Sherrill resigns as Chairman of the Board of Trustees, Mr. Gray replaces him; 1947, Vincent-Burnham Building opened; 1949, Dr. Faxon retires, Dr. Clark appointed to succeed him; 1950, Research Building begun; 1953, Bartlett Hall dedicated; 1954, New Pathology Building; 1955, Polio epidemic dealt with. If one goes through Part I at a more leisurely pace, a great wealth of other important and interesting material emerges.

Coming to Part II, which bears the illuminating title of "Care of the sick, teaching, and research", one finds first an account of structural growth and development, which begins actually in 1821. By word, map, and picture Faxon traces this expansion in a way to make it come alive. Then we find a chapter on the McLean Hospital (which is part of the M.G.H.), and one on affiliations with other hospitals. A good exposition of the growing research activities of the Hospital is given in Chapter 4, to which is added a supplement by Paul C. Zamecnik on the explosive expansion of research after World War II. The various kinds of teaching going on at the Hospital are described in Chapter 5 by the present General Director, Dean A. Clark, and a description of the development of the residency system is given by Oliver Cope.

A number of chiefs of service give particulars on their own services in Chapter 6 — Fritz B. Talbot on the early history of the Children's Medical Department and Allan M. Butler on the more recent events in that Service; Henry K. Beecher on Anesthesia; Laurence L. Robbins on Radiology; and Faxon himself on a number of other special activities — Tumor Clinic, Blood Bank, Physical Medicine, and Institute of Pastoral Care — completes the picture.

The author by no means neglects the ladies. Both volunteer and professional come in for good portrayal. The Ladies' Visiting Committee, the Staff Wives Association, and the Distaff Club are the chief organizations of the former, and the nurses, social workers, and dietitians of the professional group. He has evidently made a supreme effort to forget no one, and so in the next to the last chapter we find him winding up under the title of "Some other departments". Here he does justice by such indispensable "other departments" as Apothecaries, Photography and Medical Art, Medical Records and Record Librarians.

Part II ends with a chapter on the war effort of the M.G.H., which includes an authoritative history of the 6th General Hospital by its Commanding Officer, Colonel Thomas R. Goethals.

The book concludes with a battery of appendixes comprising a huge amount of factual material which will be of great help to persons who, in the future, are exploring the past history of the Hospital.

Altogether, this book serves well its first avowed purpose: to record the history of the Hospital during two decades, for the permanent use of posterity. But this book is also a living one which will be meaningful to contemporary readers in various ways. To members of the M.G.H. it will be a pleasant souvenir of their experience here. To all others who participate responsibly in the operation of great hospitals, especially in teaching hospitals, it will be an inspiration and guide.

James Howard Means, M.D.,
Honorary Physician

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it.

The following new titles have been received:

Anesthesia

Bunker, J. P., Bendixen, H. H., Sykes, M. K., Todd, D. P., and Surtees, A. D.
A comparison of ether anesthesia with thiopental — nitrous oxide — succinylcholine for upper abdominal surgery.
Anesthesiology 20:745, 1959.

Biochemistry

Dus, K., and Schmid, K.
The terminal amino acids of the barium-alpha$_2$-glycoproteins of normal human plasma.
Biochim. Biophys. Acta 37:172, 1960.

Schmid, K.
Electrophoresis of human serum albumin at pH 4.0: I. A systematic study on the effect of organic acids and alcohols upon the electrophoretic behavior of albumin.
J. Biol. Chem. 234:3163, 1959.

General Surgery

Barnes, B. A., Behringer, G. E., Wheelock, F. C., Jr., and Wilkins, E. W., Jr.
Surgical sepsis: An analysis of factors associated with sepsis in two operative procedures.
New England J. Med. 261:1351, 1959.

Churchill, E. D.
Origins of American surgery.
J.A.M.A. 172:219, 1960.

Neuro-ophthalmology and Neurosurgery

Hirsch. O.
Life-long cures and improvements after transsphenoidal operation of pituitary tumors (thirty-three patients, followed up for 20-37 years).
Acta ophth., supplementum 56, 1959.

Otolaryngology

Kelemen, G.
Germfree reared animals in otolaryngic experimentation.
Proceedings of the Second Symposium on Gnotobiotic Technology, 183, 1960.

Plastic & Reconstructive Surgery

Cannon, B., and Zuidema, G. D.
The care and treatment of the burned hand.
Clinical Orthopaedics 15, pt. II, 111, 1959.

Psychiatry

Lorenz, M.
Language as index to perceptual modes.
J. Project. Tech. 23:440, 1959.

Publications from the Tumor Clinic during 1959, in addition to those already reported:

Curtin, R. R., and Ulfelder, H.
Medical progress: Gynecology.
New England J. Med. 261:798, 849.

Green, T. H., Jr.
Hemisulfur mustard in the palliation of patients with metastatic ovarian carcinoma.
Obst. & Gynec. 13:383.

Reed, G. F., Mueller, W., and Snow, J. B., Jr.
Radical neck dissection.
Laryngoscope 69:702.

Ulfelder, H.
Radical vulvectomy with bilateral inguinal, femoral, and iliac node resection.
Am. J. Obst. & Gynec. 78:1074.

Ulfelder, H.
Reply to an editorial entitled "Carcinoma of the cervix is not a surgical disease".
Obst. & Gynec. 14:544.

This is the last issue of THE NEWS in which 1959 titles will appear.

VOLUNTEER GROUPS

MGH STAFF WIVES ASSOCIATION

Last year the Staff Wives Reception Center took over the distribution of all tickets donated to the Hospital for symphony concerts, theater, etc. Mrs. H. Dunster Howe and Mrs. Philip M. Dodge are in charge of this activity. A list of people wishing to receive tickets is kept at the Reception Center and is checked against donations given us by members of the Ladies' Visiting Committee, staff members, and other interested people. Very often a ticket given to a visitor from another country will provide him with his only opportunity to hear the Boston Symphony Orchestra while he is here. We have been able to place tickets with almost

No. 88 in a series of Staff photographs
Karl Schmid, Ph.D., Associate Biochemist in Medicine—Chairman (1959-1960), Laboratory Committee, Robert W. Lovett Memorial Unit

all visitors at least once. This year we have distributed 97 tickets compared with 80 last year. We also try to place tickets within the various departments of the Hospital — such as Dietary, Nursing, etc. We owe great thanks to the many donors of the tickets, and will welcome future contributions, especially for the Tuesday night Symphony Series. Anyone unable to use his tickets may telephone the Staff Wives Reception Center (MGH Extension 2366), giving the seat location. We will handle the rest, and some grateful soul will enjoy the concert.

Correction: In the January News we stated that the Staff Wives Music Committee numbered 25. Actually, the committee consists of 12 members, with 25 volunteers available for help with the concerts, such as conveying patients to and from the Chapel.

Distaff Club

Mrs. Richard T. Johnson was the hostess for a husband-wife game night, held February 9 in the Penthouse. A good time was enjoyed by all.

The Book Club has got under way by reading and discussing *Victory* by Joseph Conrad. The first meeting was held at the home of Mrs. Donald W. Sutherland on February 25, with Mrs. Sutherland as the leader of the discussion. The next book to be discussed will be *Courage to be* by Paul Tillich. Those who wish to become members of this group are invited to telephone Mrs. Edwin L. Carter for further details.

The Distaff Volunteer Project seems to be progressing well. The members have received a thorough orientation to the Hospital by other volunteers, and have chosen their specific areas of interest. This group meets Thursday mornings. Baby sitters are provided in the Penthouse from 9 to 12:30.

This month the Distaff-ers will hear Mr. Tom Payette, architect, discuss points to look for in buying or building a house.

On March 23, there will be a social evening of dinner and a fashion show at Filene's. Fashions for limited budgets will be stressed.

We are looking forward to hearing Dr. Paul Tillich on April 13, at which time husbands will be invited to attend.

New addresses:

Dr. Julia G. Arrowood (r.p. *An.* 1936), Harlan Memorial Hospital, Harlan, Ky.
Dr. Richard C. Batt (r.p. *R.* 1940), 83 Park St., Glens Falls, N. Y.
Dr. Edwin F. Cave (*E.S.* 1926 and *Or.* 1928), Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.
Dr. Stephen E. Hedberg (*S.* 1956), Dept. of Experimental Surgery, Walter Reed Army Institute of Research, Washington, D. C.
Dr. William J. James (r.s. *N.S.* 1949), 2929 Loma Vista Rd., Ventura, Calif.
Dr. A. Gedeon Matoltsy (assoc. biol. *D.* 1957), Dept. of Medicine, Jackson Memorial Hospital, Miami 36, Fla.
Dr. Albert J. D. Michel (a.r.p. *An.* 1950), 70 rue Parmentier, Lyon VII^{e}, France
Dr. Federico Mora (*M.* 1951), 717 Encino Place, N.E., Albuquerque, N.M.
Dr. Thomas W. Moran (a.r.p. *Path.* 1950), Mellon National Bank Bldg., Latrobe, Pa.
Dr. Olaf H. Pearson (*W.M.* 1941), Western Reserve University School of Medicine, Cleveland 6, Ohio
Dr. Philip Solomon (a. psychiat. 1937), 1824 Beacon St., Brookline 46, Mass.
Dr. Dagoberto Sosa (r.s. *N.S.* 1959), 11 Calle 2-37, Zone 1, Guatemala City, Guatemala, C. A.
Dr. Lionelle D. Wells (clin. assoc. *Psychiat.*), 82 Marlborough St., Boston, Mass.
Dr. Philip D. Wilson (*E.S.* 1914), 14 E. 90th St., New York, N. Y.
Dr. Alfred Yankauer (*C.M.* 1941), N. Y. State Dept. of Health, 84 Holland Ave., Albany, N. Y.

Brief bits:

Dr. H. Thomas Ballantine was elected President of the Boston Society of Psychiatry and Neurology at its annual meeting on January 14.

Dr. Evan Calkins spoke on "Amyloidosis" at the New York Academy of Sciences meeting, held in New York City on January 7. On January 25, he again spoke on this subject before the Department of Medicine at Johns Hopkins Hospital. Dr. Calkins has been invited to give the annual lecture of the Atlanta Clinical Society on March 23. He will speak on "Connective tissue diseases".

On February 4, Dr. Oliver Cope conducted a symposium entitled "The present-day surgical training of physicians, both intern and resident, in the non-university (Community) hospitals", before the Providence Surgical Society, Providence, R. I. On February 21-24, Dr. Cope participated as guest speaker in the postgraduate course of the California Medical Association. He spoke on "Nontoxic nodular goiter and thyroid therapy: The evolution of the responsibilities of the surgeon" and "Hyperparathyroidism — Surgical experiences in the treatment of 225 cases, over 25 years".

Dr. Jerome Gross presided as Chairman at the Biochemical Symposium on Structure and Metabolism of Collagen — a program sponsored by the Chicago section of the A.A.A. Chemical Society, held in Chicago on December 28, 1959. Dr. Gross also presided at a session of a Conference on Connective Tissue and Connective Tissue Diseases, sponsored by the New York Academy of Sciences (the section on Biological and Medical Sciences), held on January 7.

An article about the Massachusetts General Hospital, by Mrs. Frances Burns, medical writer for the *Boston Globe,* is to appear in an early issue of *Harper's magazine.*

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL
1811

No. 194 Boston, Mass. April 1960

THE PULMONARY DISEASE UNIT

The Trustees of the Hospital authorized the establishment of the Thoracic Clinic on June 20, 1925 and it began its operations the next year. The *Annual Report* for 1926 contains the following quotation:

"The Thoracic Clinic was organized during the first two months of 1926, and started work in April, 1926. Its purpose is to make an intensive study of certain thoracic conditions, by men especially trained and interested in this work, in order that more knowledge of these conditions may be acquired and thereby improve the individual patient's care." This purpose has not changed over the years and remains the same with the formation, as of July 1959, of the Pulmonary Disease Unit by Dr. Bauer, as a part of the Department of Medicine.

Earlier workers in the Clinic included Drs. Frederick T. Lord, Gerardo M. Balboni, Joseph H. Pratt, and Donald S. King. Dr. King was Chief of the Clinic from 1931 to 1942, when he left for military service with the 6th General Hospital. It was Dr. Balboni, along with Drs. Lord and Pratt, who introduced to the Hospital artificial pneumothorax in the collapse therapy of pulmonary tuberculosis and in 1934 an Artificial Pneumothorax Clinic was begun, which was finally discontinued in 1945.

Dr. Helen S. Pittman joined the Clinic staff in 1931 and became the Chief of the Clinic in 1942 when Dr. King entered the Service. It was her tireless devotion that kept the Clinic going during and following the years of the Second World War. She retired from her Clinic duties in July 1959, after serving continuously for twenty-eight years. She left a large group of devoted, well-cared-for Clinic patients. At a dinner in her honor at the Harvard Club in July 1959, her colleagues gathered and expressed their admiration and warm esteem. Fortunately for us, Dr. Pittman continues her lively interest in chest disease by attending the Pulmonary Disease Rounds.

During the 1930's, the Thoracic Clinic was attended by both medical and surgical staff members. It was during the 1930's and early 1940's that the major advances in diseases of the chest occurred as a result of the development and perfection of thoracic surgical procedures. During this era, tuberculosis, bronchiectasis, lung abscess, and bronchogenic carcinoma were the main problems. Various methods of obtaining collapse of the lung in pulmonary tuberculosis were developed and utilized, such as thoracoplasty, phrenic nerve crushing, and artificial pneumothorax. The techniques of lobectomy, segmental resection, and finally pneumonectomy were applied to the problems of bronchiectasis, lung abscess, and cancer of the lung. During the middle and later 1930's, Dr. Churchill demonstrated the successful use of lobectomy and segmental resection in the treatment of suppurative lung disease. During the early 1940's, Dr. Richard H. Sweet published his classic papers on the natural history and surgical treatment of lung abscess. Dr. Edward B. Benedict perfected the techniques of bronchoscopy and endoscopy in general. As the techniques of thoracic surgery were improved and the risks diminished, the training of the surgical house staff began to include this specialty, and today thoracic surgery is a routine part of the general surgeon's education.

With the advent of the antibiotics, chest medicine entered another rapid growth phase, beginning in the mid-1940's. At the present writing, lung abscess and bronchiectasis have become distinctly uncommon surgical problems and are usually managed successfully by medical means. Indeed, they have become uncommon diseases per se, relative to the pre-antibiotic era. Most of our present surgical problems in chest medicine, excluding cancer, involve the drainage of empyema. Only occasionally is segmental or lobe resection done for bronchiectasis.

The development of streptomycin and para-aminosalicylic acid therapy in tuberculosis, followed by the more recent discovery of isoniazid, has wrought a tremendous change in all aspects of chest medicine, including socio-economic factors (sanatorium versus home care) and the teaching and learning of the specialty. Tuberculosis is becoming more a part of general medicine and will become an increasing problem in general hospital and home care.

Cancer of the lung has become very prevalent and, along with pulmonary tuberculosis, presents the most common *diagnostic* problems with which we are faced in the specialty of chest medicine today. Surgery remains the chief hope in pulmonary cancer, and chemotherapy has radically altered the face of pulmonary tuberculosis.

What is the *commonest* and most pressing problem in chest medicine today? In the place of frank chronic suppurative disease of the lung, pulmonary tuberculosis, and cancer, there has appeared the sixty-year-old man complaining of shortness of breath with exertion. He has smoked heavily for years and has a productive cough. His heavy, sometimes wheezing, breathing can be heard easily as he *slowly* approaches the Clinic or office door. His eyes are bulging, his face reddish purple. The muscles around his neck are large, and the flesh around his shoulders sunken into his chest. He has the barrel chest. He comes because of his shortness of breath or he has another chest cold or even a frank pneumonia. More often than not he has been told nothing can be done and that he has a little "chronic bronchitis". There are no National Foundations or money-raising programs to publicize his plight, and, of all the common chronic afflictions of man, it is this one about which layman and physician alike know the least. The disease is obstructive pulmonary emphysema and it is the main problem in chest medicine today.

This brief review is admittedly inadequate, and presents only a bird's-eye view of one neophyte's impression of the problems of pulmonary disease, past and present. It is offered as an introductory orientation to the present and future plans and activities of the newly created Pulmonary Disease Unit, now one year old.

Present membership

The present full-time members of the Pulmonary Disease Unit are our two fellows, Dr. H. Irving Schweppe, Jr., from the University of Texas—the Medical Branch at Galveston, and Dr. Margaret A. Single, who came to us from the Children's Medical Service of this Hospital. We have been very fortunate to have two such outstanding individuals in our first year of operation, and they have been a tremendous help. On a part-time basis, Dr. Edgardo G. Carrasco, Research Fellow in Allergy, spends two days a week with us. During the summer months, Mr. Douglas Almond, H.M.S. II, worked with us. Dr. Eduardo Salazar, from the School of Medicine of the University of Mexico, has recently joined us for a period of six months, beginning in January 1960. Dr. William M. Thurlbeck (a.r.p. *Path.* 1958) has returned from a year in England, where he was studying pulmonary pathology and methods of examining emphysematous lungs, and is an active member of our group. Dr. Albert Damon (*M.* 1952 and now at the Harvard School of Public Health) will be working with us on a part-time basis and is a regular member of our weekly Pulmonary Clinic. We have had the continuing and invaluable support of the members of the Pulmonary Clinic—Dr. Kenneth T. Bird, Dr. Lewis W. Kane, and Dr. Arthur S. Pier, Jr.—much to the benefit of the Clinic, its patients, and the participating physicians.

Teaching and care of patients

The care of patients and teaching are inseparable activities and involve our consultative work, the Pulmonary Clinic, and the Pulmonary Rounds.

Our consultative activities are concerned mainly with patients on the Medical or Surgical Service, with occasional requests from the Pediatric and Neurologic Services and the Massachusetts Eye and Ear Infirmary. The problems we see are divided, nearly equally, into two main categories—1) diagnostic and therapeutic and 2) problems concerned with the abnormal physiology of chest disease and the functional evaluation of the patient. This latter category includes cases of acute respiratory failure, as well as problems in the genesis of dyspnea, the severity of obstructive emphysema and the effects of therapy in this disease, preoperative evaluation of risk for thoracic surgical procedures, the differentiation of primary and secondary polycythemia, and disability evaluation in patients with lung disease. The patients are seen first by Dr. Schweppe or Dr. Salazar or, in the case of pediatric problems, Dr. Single, and are then reviewed on Rounds every Wednesday and Friday morning at 8 o'clock. Beginning this past February, Drs. Kane and Bird and Pier will share the responsibility for the Rounds.

Since 1954, the Pulmonary Clinic had met on a bimonthly basis. Beginning in September of 1959, we have been meeting on a weekly basis between 1 and 3 o'clock on Wednesday afternoons. Drs. Bird, Damon, Kane, Knowles, Pier, Schweppe, and Single attend the Clinic regularly. We schedule no more than four patients for each physician and attempt to run the Clinic on a strict time schedule. From 2:45 to 3:30 we have our Clinic Conference, at which we all discuss the cases we have seen that day, reviewing the diagnosis, therapy, and radiographic findings. Occasionally, members of the medical house staff or private physicians bring their problem cases to these Rounds for a "quick" consultation. These Clinic Conferences have proved both popular and profitable for the members, and a good spirit has prevailed. Obviously, both patient and physician benefit immensely from such meetings. At present, we see between sixteen and twenty-four patients each week, of which usually four or so are new cases referred to our Clinic. The Clinic population consists mainly of cases of chronic bronchitis and emphysema, bronchiectasis (acquired in the 1930's, before the advent of antibiotics), and tuberculosis, with scattered cases of sarcoidosis, kyphoscoliosis, cancer, silicosis, and even a case of coccidioidomycosis!

We have obtained a new timed vital capacity machine and a set of six new X-ray view boxes which have been installed in our conference room (the antechamber of rooms 15-20 in the Medical Clinic) through the good graces of Dr. John D. Stoeckle and Miss Ruth M. Farrisey, R. N.

The Pulmonary Rounds retain their informal atmosphere and continue to center around problems of chest disease in patients in the Hospital. They remain "working Rounds" and are attended by surgeons, internists, pathologists, radiologists, and house staff. The time of the Rounds has been changed from Tuesday to Monday, from 4:30 to 6 P.M. We review between four and six cases at these Rounds each week. Occasional private patients as well as ward patients are presented. Changing the time of the Rounds has allowed more of the house staff to attend, as well as more of the visiting staff. The last three Monday meetings each month are devoted, from 5 to 5:30, to short "fairly formal" teaching sessions. One is devoted to an illustrated review of the preceding month's supply of pulmonary pathology. Dr. Thurlbeck's maiden voyage during February was a rousing success. The other two sessions, from 5 to 5:30 each month, are concerned with pertinent subjects of interest. Thus far, we have had Dr. Kane discussing "The pneumoconioses", Dr. Bird reporting on the Annual Tuberculosis Chemotherapy Conference, Drs. Knowles and Schweppe discussing the problems of artificial ventilation with Dr. Pontoppidan and the team of Banks, Guarino, and Hansen helping considerably, and Dr. Thurlbeck discussing "The pathology of emphysema". Those of you whose names are not on our monthly mailing list will have them added if you will let us know. The goals of these Rounds are 1) better service to the Hospital for its patients with chest disease, 2) wider dissemination of knowledge amongst the staff, 3) maximal extraction of benefit from a potentially tremendous educational opportunity, and 4) stimulation and exchange of ideas concerning lung disease, its pathogenesis, and treatment.

Our main teaching activities are those concerned with the consultations, the Pulmonary Clinic, and the Pulmonary Rounds. In addition, during our first year of operation, a small group of us have met weekly to study 1) the radiology of the chest, using interesting cases seen, as well as the teaching files of the Department of Radiology, 2) the segmental anatomy of the lung, and 3) the interpretation of bronchograms. In addition, we have a Seminar every Friday from 12:30 to 2, at which we discuss clinical and physiological problems.

We have attempted to increase interest in chest medicine as a clinical sub-specialty of medicine. This is not difficult in a hospital such as the M.G.H. where such a remarkable number of fascinating clinical problems are at hand, with an equally remarkable number of fascinated house staff members to care for the patients. What field of internal medicine can claim such an array of new diseases as pulmonary alveolar microlithiasis, alveolar proteinosis, formes frustes of cystic fibrosis in the adult, beryllosis, agammaglobulinemia with bronchiectasis, silo-filler's disease, farmer's lung, the atypical Mycobacteria—and at the same time be so closely allied to general medicine, with the chest the mirror (or window) of systemic disease, with all the problems of allergy, bacteriology, radiology, and physiology represented? In the field of respiratory physiology, what can equal the excitement of the problems concerned with altitude physiology and "space medicine" on the one hand, or gas exchange during hypothermia on the other? With the revolution in the care of patients with pulmonary tuberculosis, chest medicine in a general hospital setting becomes even more important, and, for the first time, the general physician must be able to assume more active responsibility in the care of this disease. It is hoped that in the future the use of fluoroscopy, bronchoscopy, and bronchography could be offered to students of pulmonary disease at this Hospital.

Yet, the teaching of chest disease has been relatively difficult in most medical schools and university hospitals and the specialty of chest medicine has not been as popular as other sub-specialties in internal medicine. This has occurred for several reasons, all interrelated. It begins with the standard American textbooks of medicine, where the Chest Disease Section of the text is stripped bare by other specialties. Tuberculosis and fungous disease are treated under Infectious Diseases, asthma and Loeffler's syndrome under Allergic Diseases, sarcoidosis as Diseases of Unknown Etiology (aren't most diseases?), and pulmonary vascular disease under Diseases of the Cardiovascular System. The section on Diseases of the Chest is left with, amongst others, bronchiectasis (a disappearing disease), chronic bronchitis and emphysema (not popular), pleural effusion (must be considered with pulmonary tuberculosis for proper perspective), cancer of the lung and mediastinal tumors (surgical exercises).

The problems of the specialty increased with the development of respiratory physiology and the use of pulmonary function tests. For some unknown reason, teaching and interpretation of the subject to medical students and doctors of medicine fell far behind the rapid advances in the basic science. Perhaps this was because much of the field is of no immediate or practical use to the doctor, while the clinical physiologists were busy trying to convince the doctor to the contrary. At any rate, the dust is settling on the clinical usefulness of pulmonary function tests and the truth of the matter is that determinations of the timed vital capacity, maximal breathing capacity, and arterial blood gases (oxyhemoglobin saturation and CO_2 tension) at rest and on exercise, coupled with functional fluoroscopy, will give all the information one needs in the usual clinical problem. Medical and surgical house staff members are now doing these tests themselves and interpreting the results. In certain instances we help with the interpretation and do more extensive testing where indicated. The new pathophysiology of pulmonary disease, which has developed because of the widespread use of pulmonary function testing in clinical investigation, has only just begun to be taught in medical schools, but has not been forcibly injected into textbooks of internal medicine or chest disease as yet. Thus, this problem is being solved, but slowly.

Still another problem which is being solved as a result of the therapeutic advances, is pulmonary tuberculosis. Pulmonary tuberculosis is to the chest physician what cutaneous syphilis was to the dermatologist. Because of the nature of the treatment of the disease and the place of the sanatorium in it, prior to the development of effective chemotherapy, the diagnosis and natural history of the disease was known chiefly to the physicians in residence at the sanatoria. Medical students and general physicians were not exposed to this knowledge, nor was it easy to come by in the setting of the medical school and university hospital. With the new chemotherapy and the deemphasis of the need for prolonged rest in the sanatorium, pulmonary tuberculosis is becoming more and more a part of general medicine. More cases will be seen and followed in the community in the setting of the general hospital, and, therefore, adequate teaching material will become available.

Finally, the teaching of chest medicine and its popularity as a specialty has been hampered because, of all the specialties of internal medicine, pulmonary disease relies most heavily on other specialties Thus, the complete chest physician is bacteriologist, radiologist, bronchoscopist, allergist, and physiologist. In addition, the chest being the window through which to see systemic disease, he must be well-trained in general medicine. He must be well-versed in cardiology because of the obvious important interrelationship of heart and lungs. Finally, he must be proficient in the techniques of occupational medicine because of the ever-present pneumoconioses. So, there is something of interest for everyone in chest disease. In our Unit, we attempt to retain proficiency in general medicine while we acquire what we need for the specialty from the neighboring specialties. At our Chest Rounds, we try to discuss subjects as well as show cases which illustrate the above specialties, without bearing too heavily on any one topic. In the future. it would be desirable to be able to offer all these special skills needed in pulmonary disease to students and fellows.

Research projects

We moved into our present laboratory in March 1959 and, as of this writing, we are able to carry out all the tests of pulmonary function and have shifted our research projects from first into second gear. Our investigations are concerned mainly with learning as much as we can about obstructive emphysema and, if possible, with adding to the knowledge of this disease. Our main project at present is to define the effects of aging on respiratory function, and for this purpose we are studying all the parameters of respiratory function in an aged population of healthy Spanish-American War veterans (ages 72-92, average 82 years) and comparing the results with control groups of children, young adults, and patients with obstructive emphysema. The investigation will provide extensive data from one laboratory on normal respiratory function in the very aged, much of which is unavailable at the present time. By detailed analysis of the patient's life history (occupation, smoking, lung disease, etc.), it may provide pathogenetic explanations for the changes found. The project may shed light on the pathogenesis of obstructive emphysema, which some investigators have considered an acceleration of the normal aging process in the lungs. To date, we have shown that the elderly individuals have (when compared with the young adult controls) a lower timed vital capacity, maximal breathing capacity, and maximal mid-expiratory flow rate; lower values in all subdivisions of the lung volume except the residual lung volume which is absolutely increased; tidal volume, respiratory frequency, and minute ventilation (per m^2 B.S.A.) are all greater as is the ventilatory equivalent; oxygen consumption per m^2 B.S.A. is less; arterial oxygen saturation is less; resting end-expiratory intrapleural pressure is less negative; index of intrapulmonary mixing is greater. These changes in themselves offer some fascinating leads for future investigation.

Dr. Single is studying the ventilatory response to graded degrees of hypercapnia and hypoxia in children. Although the ventilatory response to alteration of the various chemical determinants of ventilation has been determined in adult subjects. this has not been accomplished in children. Acquisition of this knowledge should allow us to determine whether the respiratory center responsiveness varies with age and we plan to compare the results with a normal adult control group as well as with our aged group of individuals. Simultaneously, we are determining the reproducibility of measurements of vital capacity, maximal breathing capacity, and maximal flow rates (as well as the reproducibility of ventilatory responses to hypercapnia and hypoxia). virtually unknown information of obvious importance. Children are very difficult to work with in terms of attaining a fairly "steady state", and Dr. Single has been particularly successful in developing reliable methods with the roughly twenty-five subjects she has studied to date.

Dr. Schweppe is reviewing cases of lung abscess seen at the M.G.H. since 1942—the last review having been written by Dr. Richard H. Sweet at that time. He will attempt to define more clearly the natural history of this disease since the advent of antibiotics. In addition, he has initiated a study concerned with pulmonary pathophysiology of rheumatoid spondylitis.

As part of a continuing interest in the problems of chronic obstructive emphysema, we are planning a project which will attempt to differentiate obstructive emphysema and intrinsic bronchial asthma.

In conjunction with Dr. Damon, we plan to begin a study of innate host or "constitutional" factors in pulmonary disease, beginning with pulmonary cancer and obstructive emphysema.

In collaboration with Dr. Thurlbeck, we are presently exploring methods of producing chronic lung disease in animals, beginning with the use of oxides of nitrogen—a very toxic exhaust product of great importance in problems of air pollution. We hope to be able to produce a disease state similar to obstructive emphysema in man.

The laboratory is called upon fairly frequently for help in clinical problems where testing of pulmonary function can give definite aid as regards diagnosis, disability evaluation, management of therapy (acute and chronic), and preoperative evaluation for thoracic surgical procedures. During the winter months we see many cases of respiratory failure where artificial respiration is required. The house staff is remarkably proficient in the management of these difficult cases, and the improvement in the care of these patients over the past five years or so is astounding. Seeing and studying these cases and aiding in their management is an important part of our work, combining patient care, teaching, and clinical investigation.

I have not resisted the tendency of those interested in the short-winded to be long-winded, and I suspect that, as we accomplish more, these reports will become correspondingly shorter. We are hopeful that with the passage of time the Pulmonary Disease Unit will be of value in improving the care of patients with chest disease and will contribute to the knowledge of diseases of the chest. Finally, we are vitally interested in the teaching of the subject and hope to contribute to the new look of a vigorous, broad-based specialty of internal medicine.

John H. Knowles, M.D.,
Assistant in Medicine
and *Chief, Pulmonary Disease Unit*

The Board of Trustees, at their meetings on January 29 and February 19, voted:

That the Radiology Department be allowed an extra residency for Dr. Stanley P. Bohrer, formerly of the Surgical Service, his appointment to begin March 1;

That Mr. Harold Dodd, Senior Surgeon, King George Hospital, Ilford Royal Hospital, Richmond, England, be invited to give a Richardson Lecture at the Hospital on June 16;

To change the appointment of Dr. Clement A. Hiebert from Assistant in Surgery to Clinical Associate in Surgery.

To appoint:

Dr. Anton T. Appels as Clinical and Research

Fellow in Medicine, beginning April 1;

Dr. Mignon C. Chasen as Assistant in Psychiatry, beginning February 1;

Dr. Allan Goldblatt as Exchange Assistant Resident on the Children's Medical Service, for the period January 21 through March 2;

Dr. Eduardo Salazar as Clinical and Research Fellow in Medicine, for six months, beginning January 1;

Dr. T. David Seigne as Clinical Fellow in Anesthesia, beginning June 1;

Dr. Stewart Sell as Intern in Pathology for one year, beginning July 1;

Dr. Isadore Starr as Clinical Fellow in Medicine for one year, beginning April 15;

Dr. Rudolf Toch as Clinical Associate in Children's Medicine, beginning January 11;

Dr. Cecil J. Watson as Visiting Physician for one week, beginning March 6.

At their meetings on February 10, 17, and 24, and March 2 and 9, the General Executive Committee voted:

To accept the resignations of:

Dr. Willi Burgi from the position of Research Fellow in Medicine, effective as of January 31;

Karl Dus, Ph.D. from the position of Research Fellow in Medicine, effective as of December 31, 1959;

Dr. Pierre A. Maurice from the position of Clinical and Research Fellow in Medicine, effective as of February 15.

To rescind the appointment of:

Harish C. Srivastava, Ph.D. as Research Fellow in Medicine.

To extend the appointments of:

Dr. Bernard D. Grant as Clinical Fellow in Orthopedic Surgery, for one month, through March 31;

Dr. Alberto Salama as Clinical and Research Fellow in Neurology for one year, beginning March 1;

Dr. Alejandro H. Villegas as Clinical and Research Fellow in Surgery, for an additional month, beginning March 1;

Dr. Alfred D. Weiss as Clinical and Research Fellow in Neurology for one year, beginning July 1.

To reappoint:

Dr. Barry G. W. Arnason as Clinical and Research Fellow in Neurology for one year, beginning July 1;

Dr. George E. Battit as Assistant Resident in Anesthesia for one year, effective as of January 1;

Dr. George H. Collins as Clinical and Research Fellow in Neurology for one year, beginning July 1;

Dr. Robert S. Harper as Clinical Fellow and Acting Resident in Pathology for one year, beginning July 1, 1959;

Elton P. Katz, Ph.D. as Research Fellow in Orthopedic Surgery for one year, retroactive to April 28, 1959;

Dr. Walid A. Mnaymneh as Assistant Resident in Orthopedic Surgery for one year, beginning April 1;

Dr. Kenneth G. Potee as Clinical and Research Fellow in Medicine for one year, beginning March 1;

Annette M. C. Rapin, Ph.D. as Research Fellow in Medicine for one year, beginning February 1;

Dr. Margaret A. Single as Clinical and Research Fellow on the Children's Medical Service for six months, beginning January 1.

To appoint:

Dr. Glenn E. Behringer as Chief of the Surgical Out-Patient Clinic, to succeed Dr. Clement A. Hiebert, who has resigned that position;

Marvin W. Colter, M.A. as Research Fellow in Psychology, in the Department of Psychiatry, for one year, beginning September 1, 1959;

Dr. Bruce W. Konigsmark as Clinical Fellow in Neuropathology for one year, beginning July 1;

Dr. George Küry as Research Fellow in Neuropathology for one year, beginning July 1;

Dr. Jean P. Lamour as Graduate Student Assistant in Orthopedic Surgery, for the period February 8 through April 3;

Dr. Alexander M. McPhedran as Clinical Fellow in Neuropathology for one year, beginning July 1;

Gerald L. Mechanic, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning March 1;

Albert F. Parlow, Ph.D. as Research Fellow in Biology, in the Department of Surgery, for one year, beginning March 1.

150th ANNIVERSARY PROGRAM

Mr. Philip H. Theopold, co-chairman with Mr. Francis W. Hatch of our 150th Anniversary Program, has announced a gift to the Hospital of $250,000 from the Abbot and Dorothy H. Stevens Foundation, in memory of the late Abbot Stevens of Andover. This gift will be used for the construction of the Heart Clinic in the new Clinics Building, and brings the total amount of the contributions toward our $20,000,000 goal to $5,149,972 as of February 29.

Mr. Abbot Stevens was a member of the Massachusetts General Hospital Corporation for eight years prior to his death on May 12, 1958. His interest in the M.G.H. was only one of his countless activities in community affairs. The results of his sense of civic responsibility will long serve as enduring memorials, as will the Heart Clinic in the new Clinics Building serve as a reminder of hope to all those patients afflicted with heart disease.

Through the MGH Clinics, the Hospital most directly extends its medical care into the community, for annually some 200,000 visits are made by patients to our 44 clinics. For these patients, the Hospital must provide the best possible care in an attractive setting that will contribute to their total comfort and well-being.

The facility is to be designed primarily for the care of patients who cannot afford to pay the full cost of their medical care, and for the teaching of medical students, house staff, and clinical fellows. At the same time, it is to be designed so that it can be adapted easily to any future changes in the general pattern of medical care.

The new Clinics Building will do more than re-house present activities. It will include complete diagnostic and special therapeutic facilities, such as X-ray, Electrocardiography, Psychometric Testing, Transient Operating Rooms, Pharmacy, and Social Service, to mention but a few These facilities will be readily accessible to all ambulatory patients who are to be cared for in the building, so that they may obtain the best in modern medical care with a maximum of convenience at a minimal cost. It will also provide for needed expansion of services in such areas as rehabilitation, preventive and community health services, industrial medical services, family health, headquarters for various home care activities, and other similar efforts on behalf of the community's health.

UNITED CEREBRAL PALSY ASSOCIATION

As a highlight of its 10th anniversary, the United Cerebral Palsy Association, through its Research and Educational Foundation, announced on March 2 a grant of $27,346 to the Massachusetts General Hospital.

Drs. Ellsworth T. Neumann, Frank R. Ervin, and Vernon H. Mark accepted the generous check from Mrs. Solomon M. Feldman of Lynn, President of the United Cerebral Palsy Association of the North Shore, and Mr. Richard E. Daly of Salem, Executive Vice-President.

The research project, "Investigation and treatment of movement disorders by stereotactic methods", which will continue through December 1960, is under the direction of Dr. Ervin, Associate Psychiatrist at Massachusetts General Hospital and Instructor in Psychiatry at Harvard Medical School, and Dr. Mark, Assistant in Neurosurgery at M.G.H. and Instructor in Surgery at Harvard Medical School.

Through the joint efforts of medical investigators at Massachusetts General, the treatment of movement disorders, such as those present in cerebral palsy, are being studied. In the hope of clarifying the physiological disturbances which underlie these poorly understood conditions, the technique of making precisely located lesions in the depths of the brain is being used. This type of procedure has proved useful in several medical centers throughout the world.

This investigative work, supported by grants from the United Cerebral Palsy Association and the United States Public Health Service, has significance from both a therapeutic and research point of view.

Since its founding in 1949, the United Cerebral Palsy Association has consistently supported the research of hundreds of nationally-known scientists in an effort to find the causes of brain damage, ways to prevent this tragic disability, and better methods of treatment for the more than 600,000 Americans with cerebral palsy. In addition, the organization's 344 affiliates provide medical treatment, education and rehabilitation services to thousands of children and adults.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material*, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Cardiology

Morse, R. L., Brownell, G. L., and Currens, J. H.
The blood pressure of newborn infants: Indirect determination by an automatic blood pressure recorder in 20 infants.
Pediat. 25:50.

Endoscopy

Benedict, E. B.
Comments: A gastroscopic biopsy study of 50 postoperative stomachs.
Gastroenterclogy 38:267.
Benedict, E. B.
Gastritis.
In Current therapy, 1960, Philadelphia, W. B. Saunders Company, p. 244.
Benedict, E. B., and Nardi, G. L.
Dysphagia and esophageal obstruction.
In Current therapy, 1960, Philadelphia, W. B. Saunders Company, p. 230.

Neurology

Schwab, R. S
Dequalinium in myasthenia gravis.
Brit. M. J. *i*:57.
Schwab, R. S., and Murphy, J. T.
Recent experiences with parenteral Dilantin.
Epilepsia 1 (1959/60):227.

Ophthalmology

Leahey, B. D.
Beta radiation in Ophthalmology.
Am. J. Ophth. 49:7.

Plastic & Reconstructive Surgery

Murray, J. E., and Cannon, B.
Basal-cell cancer in children and young adults.
New England J. Med. 262:440.

* * *

THE YEAR ABROAD

In recent years a number of house staff members have interrupted their residency training to spend periods of a year or more studying in Europe. Although some few have taken clinical appointments in hospitals abroad, the bulk of people from the M.G.H. have gone to laboratories, and most of these to research positions in England. Drawn to Britain by the language, which the English reluctantly share with us, they have quickly come to appreciate Whitehead's observation that the English language has been a major barrier to Anglo-American understanding, since this common tongue has encouraged the erroneous belief that the two cultures are fundamentally similar—a misconception promptly dispelled by attending a cricket match, visiting a pub, or chatting with a London bobby.

Even apart from the considerable general appeal of a year in Europe, the attractions of interrupting one's residency to study there are legion. Basic science in England speaks for itself, but the value of working in an English laboratory is not restricted to sitting at the feet of an illustrious mentor. The year abroad is a

No. 89 in a series of Staff photographs
Dr. John H. Knowles, Assistant in Medicine—Chief of the Pulmonary Disease Unit

time for taking stock, an opportunity to step aside from the demanding pressures of clinical responsibility to follow hunches, to indulge one's curiosity, and to examine one's fitness for investigation. It is a chance to resurrect tangential interests that were quietly interred at the onset of one's internship. There is time to read, to think, to relax, and to mature.

England is particularly suited for such a venture. The self-confidently reserved English laboratory atmosphere lends itself well to introspection. Although the Industrial Revolution came early to Britain, the assembly line is a contribution of the New World which has been slow to infiltrate English life. One may be an individual without being eccentric, although he may be an eccentric if he prefers. In the lab, he is likely to be treated as a research worker with a special field of interest rather than as an anonymous contributor to a giant project. He is not victimized by the pressure to produce. His time is generally his own. He is surrounded by a tradition of close reasoning and critical review that stems from the public (private) schools. A high standard of performance is expected.

There is also an appreciation that all work makes Jack very dull indeed, and the beauty and cultural heritage of England and the nearness of continental Europe provide an appealing complement to the laboratory.

Dr. Churchill has predicted wisely: "In twenty years, the portion of this period in your life you will recall most vividly will be the year you spent abroad."

Edwin W. Salzman, M.D.,
Assistant Resident in Surgery

VOLUNTEER GROUPS

MGH Staff Wives Association

March 1, 1960, from 3 to 5 P.M. at Bartlett Hall, was the occasion of the tea given by the Staff Wives Association for the 150 personnel and their wives who are visiting M.G.H. from foreign countries. Mrs. Jackson M. Thomas of Wellesley was chairman of the tea, assisted by Mrs. Bartlett H. Stone of Wellesley. This annual affair is our formal entertainment, as an association, for our visitors from many countries. Invitations are also extended to all members of the Staff and their wives, to the Trustees of the Hospital, to secretaries of the Chiefs of Staff, and to heads of Departments.

The pourers were Mrs. Oliver Cope, Mrs. Sylvester B. Kelley, Mrs. Walter Bauer, Mrs. Charles B. Burbank, Mrs. John M. Head, Mrs. Howard Ulfelder, and Mrs. Soma Weiss.

The hostesses were the Community Chairmen.

The annual meeting of the Staff Wives Association will be held on Tuesday, May 10, at 10 A.M., in Bartlett Hall.

Distaff Club

"Contemporary architecture" was the subject of Mr. Tom Payette's very interesting talk, given on March 16 in the Penthouse. What to look for in buying or building a house was also emphasized.

At the same meeting, Mrs. George M. Williams discussed the progress of the Volunteer Project, which has been most successful and is greatly appreciated by the Hospital. We hope to continue this project indefinitely.

The Book Club's selection for March was *The fall* by Camus, which stimulated a lively discussion at the home of Mrs. Edwin L. Carter.

We are looking forward to hearing Dr. Paul Tillich at our meeting on April 13.

New addresses:

Dr. Fernando A. Cardenal (a.r.s. *Or.* 1959), Columela 4, Madrid, Spain
Dr. Harry B. Ditmore, Jr. (*S.* 1954), Ireland Army Hospital, Fort Knox, Ky.
Dr. Edward A. Gall (r.p. *Path.* 1937), University of Cincinnati College of Medicine, Cincinnati 29, Ohio
Dr. Walter E. Garrey (*E.S.* 1933), 585 Main St., Malden 48, Mass.
Dr. Luke Gillespie (past a. obst.), Boston Lying-in Hospital, 221 Longwood Ave., Boston 15, Mass. P.H
Dr. Philip H. Leiderman (r.p. *Psychiat.* 1957), Massachusetts Mental Health Center, 74 Fenwood Rd., Boston, Mass.
Dr. Edwin H. Mulford, II (a.r.s. *N.S.* 1947), 748 Post Rd., Darien, Conn.
Dr. Pauline Owyang (*C.M.* 1943), 35 Binney St., Boston 15, Mass.
Dr. Eugene E. Record (*N.S.* 1937 and *Or.* 1941), Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.
Dr. William A. Rogers (*Or.* 1924), Peacham, Vt.
Dr. Agnes Burt Russfield (*Path.* 1950), Bio-Research Institute, Inc., 9 Commercial St., Cambridge, Mass.
Dr. Edward L. Sleeper (clin. assoc. *Dn.*), 29 Lincoln St., Framingham, Mass.
Dr. Avery D. Weisman (r.p. *Psychiat.* 1945), 80 Woodbine Rd., Belmont 78, Mass.

THE NEWS

No. 195 Boston, Mass. May 1960

ACTIVITIES OF THE ENDOCRINE UNIT

An invitation from the MGH News to outline the structure and function of one of the specialty areas in the Hospital gives one pause. What are the boundaries of the area to be described?—or is the search for such boundaries archaic now? Is our Hospital in fact a tight federation of specialty units?—or is there a perceptible common market in the day-by-day activities of medical care, teaching, and particularly in the approach to medical research? The writer feels that the answer should be clear to those who have been reading these columns over the past several years. This brief summary should offer further evidence of the marked similarity of approach to these problems by many individuals involved in what is called academic medicine in the M.G.H. as a teaching hospital.

The question as to what constitutes Endocrinology is particularly intriguing. Vexed by this task, Dr. Fuller Albright retreated into a definition of what Endocrinology was not. He protested that when major advances are made in an area of Endocrinology—such as in diabetes—forthwith the subject is rechristened "Metabolism" and carefully extracted from the amorphous residue. At the M.G.H., for many years, the study of diabetes and thyroid diseases has been carried out in separate clinics and research facilities, and with eminent success. This fragmentation has in practice promoted more intensive programs in all these areas of medicine. The Endocrine Unit is quite content with its legacy of the "amorphous residue" of endocrine and metabolic disorders. There are compensations in being amorphous. It allows one to thrust out pseudopods in many interesting directions.

The primary function of the Massachusetts General Hospital is the care of the sick. The Endocrine Unit has organized a general Endocrine Clinic which meets weekly on Monday afternoons for consultative recommendations or for the long-term care of ambulatory patients. Endocrine diseases are, almost by definition, diseases of "too much" or "too little", and the latter in particular require close medical supervision in the administration of replacement therapy over extended periods of time. Many of the patients in this clinic have been followed for periods of twenty to thirty years, allowing valuable studies of the natural histories of their disorders to be made. Individual members of the Endocrine Unit serve on a rotational basis as consultants to the ward services on the wide variety of medical problems which fall within our area of major interest. In this work, Drs. Irving P. Ackerman and Daniel D. Federman have been particularly active. Dr. Walter T. St. Goar has maintained his long-term interest in Endocrinology, particularly in diseases of the parathyroid gland, and has contributed in many ways to the clinical and teaching program of the Unit.

The internal teaching program of the Endocrine Unit is designed for continual review of problems ranging from clinical decisions of immediate concern in the Ambulatory Clinic to basic scientific theory underlying endocrine and metabolic research. The former need is met by an informal conference, following the weekly Endocrine Clinic, under the capable direction of Dr. Federman. Here specific problems presented by patients seen that day are reviewed by all the members of the clinic. Somewhat similarly, the physician acting as the consultant for the month leads a walking Rounds once weekly, so that all members can benefit from the experience offered by patients who have been seen in consultation. The weekly Endocrine Grand Rounds allows a more formal review of one or two patients in the Ether Dome. This exercise is now a combined Endocrine Rounds, under the rotational sponsorship of the Diabetes, the Thyroid, and the Endocrine Units. Finally, a series of weekly evening seminars on basic science are sponsored, with topics of widely varying scope, such as: current concepts of protein biosynthesis, porphyrin metabolism, studies on the mechanism of action of estrogens, etc. The above teaching program was termed "internal" in contradistinction to the participation by members of the Unit in many other teaching functions, such as the HMS IV elective course in endocrinology, the graduate course in internal medicine, and many other programs of the Harvard Medical School.

It is within the field of research that the Endrocrine Unit has changed most definitively within the past two years. There has been no sharp rupture with the past, but certainly a change in emphasis. Hormones are secreted, circulate accessibly in the blood, and catalytically monitor virtually every cell in the body. The rate of secretion seems always to be controlled by a feedback mechanism, comparable to a thermostat—a "chemostat", if you will. It is this accessibility of hormones in transit (or in their spillage into the urine) which should allow eventually for great precision in the diagnosis of "too much" or "too little". Of course, considerable progress has already been made in this regard in the measurement of the adrenal steroids and thyroid hormones—substances of sufficient chemical individuality to allow direct quantitative analyses. Most of the remaining hormones do not offer such convenient handles and their concentrations can only be approximated by immunochemical or bioassay procedures. The study of how a hormone functions, intriguing in itself, may carry an ultimate additional bonus in a medical setting in spawning a more sensitive and specific assay procedure. The field of metabolic diseases stretches out endlessly—for which disease is not "metabolic" in its final analysis? The inborn errors of metabolism (Garrod's "chemical analogues of structural malformations") are much more distinctly circumscribed. They have been called "molecular diseases"—diseases caused by the genetic ablation or alteration of an enzyme. These diseases cut across all the medical specialties, but a number of them have traditionally fallen within the scope of the Endocrine Unit. Here, again, the opportunity exists for a precise definition of the disease mechanism through the application of biochemical techniques.

Following the pioneering work of Drs. Joseph C. Aub, Fuller Albright, and Walter Bauer, the M.G.H. has continuously maintained a deep interest in metabolic bone disease. In the Endocrine Unit, Dr. Stephen M. Krane is now most directly engaged in the study of bone physiology and disease. He has begun a long-term program of biochemical investigations relating to bone formation and destruction. It has long been known that bone is particularly rich in citrate, and that parathyroid hormone results in an elevation of citrate in venous blood from bone. It has been speculated that citrate accumulates in bone because of a relative enzymatic deficiency of isocitric dehydrogenase, and that perhaps parathyroid hormone may affect calcium indirectly through an action on citrate metabolism—a potent chelating agent. Dr. Krane has recently shown conclusively that bone contains normal amounts of the Krebs cycle enzymes and cofactors necessary for citrate utilization. His studies suggest that the calcium ion competes with the enzyme aconitase for citrate, effectively removing citrate from the metabolic pool. Thus, citrate accumulation seems to be secondary to the calcium concentration, and no primary defect in citrate metabolism exists in bone. These precise quantitative studies have contributed significantly to current concepts of bone metabolism. As is often the case with such fundamental work, there have been many interesting scientific by-products, such as the development of new techniques for measuring Krebs cycle activity and the levels of reduced and oxidized pyridine nucleotides. Rather far removed from osseous tissue while summering at Woods Hole, Dr. Krane turned to the metabolism of marine eggs (*Arbacia punctulata*) and demonstrated striking changes in the pattern of pyridine nucleotides and glucose metabolism following fertilization. In conjunction with Dr. Melvin J. Glimcher of the Orthopedic Research Laboratory, interesting studies have been undertaken concerning the early phases of ossification. It has been found that purified collagen, the major protein of osteoid, takes up radioactive phosphate *in vitro* during incubation. Collagen was found also to split phosphate from adenosine triphosphate (ATP). The nature of this chemical bond and the conditions necessary for its formation are under investigation. It is apparent that this phenomenon may be of great importance in the deposition of bone salts in osteoid. Working with Dr. Krane, Dr. Dwight R. Robinson has made ingenious modifications of a technique to measure the phosphaturic effect of parathyroid hormone in parathyroidectomized rats. Although now in its early stages, this gives promise of being a more sensitive assay procedure for this hormone than any previously devised. It is hoped that this technique may eventually allow for a clinically useful assay procedure for parathyroid hormone in the occasional patient where this information would be of great diagnostic or research interest.

Dr. Anne P. Forbes has been carrying out clinical investigations on a variety of endocrine disorders. Major attention has been directed toward physiological studies to elucidate the mechanism of the impaired water excretion in patients with panhypopituitarism. In this work she has been assisted by Dr. Jorgen G. Jacobsen, from Copenhagen. She has also been concerned with a number of studies relating to growth hormone. With Dr. Richard A. Field, changes in the level of non-esterified fatty acids (NEFA) as an index of growth hormone activity are being measured. Attempts are being made to find more objective evidence for a proposed estrogen inhibition of growth hormone release by measurement of the "sulfation factor" of Daughaday before and after estrogen therapy of acromegaly. Dr. Patricia H. Benedict has continued her follow-up studies of cases of fibrous dysplasia seen at the M.G.H. and of the adrenal and ovarian morphology found in women with hirsutism.

The writer has been interested in studies of nucleic acid metabolism in man, particularly in developing quantitative assay procedures for individual steps in pyrimidine biosynthesis. Assay techniques have now been devised for six sequential steps leading to uridylic acid, using preparations from circulating leukocytes and erythrocytes. So far, the main applications of these techniques have been to hematological disorders, with grossly abnormal patterns demonstrable in leukemic cells and in pernicious anemia. Several members of a new class of antimetabolites have been synthesized and found to be effective inhibitors of pyrimidine synthesis *in vitro*. These compounds are currently being tested for *in vivo* activity as anti-neoplastic agents. Knowledge of the mechanism of action of fluoropyrimidines has been extended with the demonstration that these compounds serve as feed-back inhibitors of earlier stages of pyrimidine biosynthesis. In other words, they not only metabolically compete with their normal analogues, but also shut down the rate at which they are being synthesized.

Quite recently we have been interested in orotic aciduria—or, rather, the disease which *was* orotic aciduria, since the single known patient with this disorder died several years ago. This child, with refractory megaloblastic anemia, was discovered at Emory University in Atlanta to be excreting large amounts of orotic acid (a pyrimidine precursor) in the urine. With the cooperation of Dr. Charles Huguley, in Atlanta, blood was collected from the deceased child's parents and three siblings. It has been possible to demonstrate the heterozygous enzymatic defect in the erythrocytes of the parents and two of the three siblings, the other child being normal. Preliminary evidence suggests that the enzymatic defect can also be demonstrated in saliva and that the trait of orotic aciduria may not be so rare as was previously thought. Thus, the investigation of a rare metabolic defect found only once in a family from south Georgia may have significance considerably greater than that initially anticipated.

It is planned in the near future to extend these studies to certain other metabolic diseases, particularly gout, and to study the effect of growth hormone and gonadotropins on nucleic acid synthesis. Certain studies on amino acid transport by kidney cortex slices have also been started in an attempt to elucidate more fully the tubular disorder of cystinuria.

The Endocrine Unit has been most fortunate in the close collaboration of Drs. Janet W. McArthur and Maurice M. Pechet. Through their independent laboratory facilities and research projects they have greatly broadened the over-all investigative program of the Unit. Dr. McArthur is internationally known for her work on gynecologic endocrinology and particularly for significant contributions on the biological characterization and assay of human gonadotropin hormones. During the year she devoted a great deal of time to the organization and function of an international "workshop conference" on human pituitary gonadotropin, in an effort to standardize nomenclature and assay procedures. In her laboratory a number of advances have recently been made in assay techniques for gonadotropic activities. Of particular interest is the demonstration that gonadotropic hormones (notably "LH") cause an acute depletion of ovarian ascorbic acid, which, in the hands of Dr. Albert F. Parlow, has allowed convenient quantitative measurements to be made. Dr. Pechet's thorough grounding in organic chemistry is reflected in his long-term interest in the relationship of structure to function of steroid derivatives of the glucocorticoid series. In this work he effectively utilizes the balance study facilities of the Mallinckrodt Research Ward. Recently he has begun studies of individual, chemically pure components of vitamin D mixtures, showing different qualitative effects on calcium and phosphorus absorption and excretion. Purified parathyroid hormone prepared by Dr. Howard Rasmussen (*M.* 1953), who is now at the Rockefeller Institute for Medical Research, is being used in studies of pseudohypoparathyroidism.

Within this brief review it is not feasible or even desirable to attempt to outline all the current activities of the Endocrine Unit except in the broadest of terms. The legacy of the Unit is a brilliant one in patient care and in the imaginative study of disease, carried out by Dr. Albright and his collaborators over many years. The attempt to maintain such a tradition is a continuing challenge to all current members of the Endocrine Unit.

Lloyd H. Smith, Jr., M.D.,
Assistant Physician
and *Chief, Endocrine Unit*

* * *

The American College of Physicians has announced that Dr. Chester M. Jones has been named its president-elect for 1960-1961.

Dr. Robert F. Loeb (*W.M.* 1920) has been awarded the 1959 Kober Medal by the Association of American Physicians for his contributions to the medical sciences.

The American Cancer Society has reported that Dr. Paul S. Russell (*S.* 1949), Assistant in Surgery on our Staff, has successfully transplanted organs and tissues from one strain of mouse to an unrelated strain. This achievement is of basic theoretical importance in cancer research.

Dr. John D. Stewart (*E.S.* 1930) has been elected President of the American Surgical Association.

The Law-Science Academy of America has conferred the Gold Medal and a citation of the organization on Dr. James C. White, for distinguished contributions in bringing Neurological Surgery into closer relationship and cooperation with Law in the administration of justice. The Medal is regarded as the highest honor attainable in this country for integrative work between the learned professions.

In presenting the award, Dr. Hubert W. Smith, Director of the Institute, said, in part:

> Today 80% of all cases tried in civil courts involve personal injury actions. Questions of causal connection, immediate and delayed effects of injuries, disability, and prognosis may pose very complex issues which nevertheless must be resolved in this area. The Law-Science

Academy has endeavored to develop criteria of Proof, resting on the judgment of outstanding medical specialists, in order to more safely guide judges and juries in their conclusions.

In honoring Dr. White, the Committee of Fellows of the Academy took into account his distinguished contributions to literature of Neurological Surgery, particularly in areas such as pain, which are of much importance in the administration of justice. They also made the award in recognition of Dr. White's active work, during recent years, in lecturing systematically at various Short Courses conducted by the Law-Science Academy in metropolitan cities of the United States.

Dr. W. Stewart Whittemore (*S.S.* 1910) was recently honored by the City of Cambridge and the Middlesex South District Medical Society Auxiliary "for selfless devotion to all, regardless of station, and for bringing happiness, productivity, and dignity to our community and citizens." He was presented with a gift as a token of the group's esteem and its appreciation of his more than 50 years' service as a practising physician in the community.

It is interesting to note that Dr. Whittemore should enjoy the distinction of having delivered, at Mount Auburn Hospital, in December of 1927, the only King ever born in this country — King Phumiphon of Thailand.

The Board of Trustees, at their meetings on March 18 and April 1, voted:

To accept the resignation of Mr. Frederick D. Foster from the position of Assistant Director.

To appoint:

Dr. David W. Allen as Clinical and Research Fellow in Medicine, beginning July 1;

Dr. J. Claude Bennett as Clinical and Research Fellow in Medicine, beginning July 1;

Dr. Irving D. Bornstein as Assistant Resident in Dermatology for one year, beginning July 1;

Dr. Caesar Briefer, Jr. as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Mervyn F. Burke, Jr. as Second Assistant Resident in Surgery, beginning September 1;

Dr. Monroe Cole as Clinical Fellow in Neuropathology for one year, beginning July 1;

Dr. Lois R. Davidson as Clinical Fellow in Anesthesia for one year, beginning November 1;

Dr. Roman W. DeSanctis as Clinical Fellow in Medicine, assigned to Cardiology, beginning July 1;

Dr. Leon M. Edelstein as Assistant Resident in Dermatology for one year, beginning July 1;

Dr. Peter A. Freeman as Clinical Fellow in Orthopedic Surgery for one year, beginning March 12;

Dr. Robert S. Ganelin as Exchange Assistant Resident on the Children's Medical Service, for the period May 22 through June 30;

Dr. Mehran Goulian as Research Fellow in Medicine, for the period July 1 through December 31, 1960, and as Resident in Medicine, beginning January 1, 1961;

Dr. Richard T. Johnson as Clinical Fellow in Neuropathology for one year, beginning July 1;

Dr. Richard A. Katz as Exchange Assistant Resident on the Children's Medical Service, for the period April 12 through May 21;

Dr. David Korn as Clinical and Research Fellow and Acting Assistant Resident in Pathology, for the period September 1, 1960 through June 30, 1961;

Dr. Burnham E. Lamkins as Assistant Resident in Dermatology for one year, beginning July 1;

Dr. Donald R. Lintner as Clinical Fellow in Radiology for one year, beginning May 9;

Dr. Myron Lotz as Clinical and Research Fellow in Medicine, beginning July 1;

Dr. Thomas E. Macnamara as Assistant in Anesthesia, effective as of March 10;

Dr. James Q. Miller as Clinical Fellow in Neuropathology for one year, beginning July 1;

Dr. Alexander Polak as Assistant Resident in Pathology, assigned to Neuropathology, for one year, beginning July 1;

Dr. Mitchell T. Rabkin as Clinical and Research Fellow in Medicine, beginning July 1;

Dr. Edward J. Riseborough as Clinical Fellow in Orthopedic Surgery for one year, beginning May 9;

Dr. Ellis L. Rolett as Clinical Fellow in Medicine, assigned to Cardiology, beginning July 1;

Dr. Allan I. Sandler as Clinical and Research Fellow in Medicine, beginning July 1;

Dr. William L. Strickler as Assistant Resident in Urology, beginning July 1;

Dr. Se Mo Suh as Exchange Assistant Resident on the Children's Medical Service, for the term March 3 through April 11;

Dr. James D. Sullivan as Clinical Fellow in Physical Medicine, beginning July 1;

Dr. Marvin S. Weinfeld as Assistant Resident in Orthopedic Surgery for one year, beginning April 1.

The Trustees also voted to appoint the following Interns for the period of one year, beginning July 1:

Medicine

Dr. David H. Alpers
Dr. Stanley H. Appel
Dr. Peter V. Barrett
Dr. Lloyd A. Ferguson
Dr. Stephen E. Goldfinger
Dr. James R. Hughes
Dr. Rex L. Jamison
Dr. Raphael F. Smith
Dr. William B. Stason
Dr. Samuel O. Thier
Dr. Richard J. Wurtman
Dr. William J. Yount

Surgery

Dr. Joseph R. Barrie
Dr. Sheldon C. Binder
Dr. John D. Burrington
Dr. George P. Canellos
Dr. Ruben F. Gittes
Dr. Donald B. Halverstadt
Dr. Ashby C. Moncure
Dr. Gerald S. Moss
Dr. Leslie W. Ottinger
Dr. John M. Reed

Children's Medicine

Dr. John M. Davis
Dr. Leonard I. Kleinman
Dr. Brigid P. Nesburn
Dr. John T. Truman

At their meetings on March 16 and 30, the General Executive Committee voted:

To promote:

Dr. Harold Simon to the position of Resident in Radiology, beginning April 1.

To extend the appointment of:

Dr. David Korn as Intern in Pathology through August 31.

To reappoint:

Dr. Károly Balogh as Clinical and Research Fellow in Pathology, retroactive from May 1, 1959, and also for one year, beginning May 1, 1960;

William H. Ellett, B.Sc. as Assistant Physicist (Medicine) for one year, beginning September 24, 1959;

Dr. Jorgen G. Jacobsen as Clinical and Research Fellow in Medicine for one year, beginning April 1;

Borge Larsen, Ph.D. as Research Fellow in Medicine, for the period April 15 through September 30;

Dr. John D. Turner as Clinical and Research Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1.

* * *

VOLUNTEER GROUPS

The MGH Spring Formal, sponsored by the Staff Wives and the Distaff Club, will have many innovations this year. To be held on a Saturday, May 7, rather than a Friday evening, it will be a dinner-dance and will take place for the first time at the beautiful M.I.T. Faculty Club, overlooking the Charles River. (There are free Club parking facilities in the rear.) Cocktails may be ordered at the Club between 7 and 8 (and through the evening), and dinner will be served promptly at 8. The Club has the reputation for excellent cuisine, and the menu for the evening will feature their specialty! Sammy Eisen, who earned many favorable comments last year, will again provide music for dancing.

The invitations, including an explanation of how reservations may be made, were mailed in April. A reminder: reservations should be sent to Mrs. Charles E. Huggins, Monument Street, Concord, with a check for $12.00 per couple. She will arrange the seating plan, so that couples and groups who indicate on their reservations that they wish to sit together may do so. A table number will be assigned as couples with reservations arrive at the door. No tickets are being mailed. The number of reservations is limited, so the Dance Committee suggests that you act promptly.

Co-chairmen for the dance are Mrs. George L. Nardi and Mrs. Harold C. Urschel, Jr. The committee members are: Mrs. Homer L. Ash, Mrs. Francis G. Barnum, Jr., Mrs. Arthur E. Baue, Mrs. Glenn E. Behringer, Mrs. Roman W. DeSanctis, Mrs. Charles E. Huggins, Mrs. John H. Knowles, Mrs. Anthony S. Patton, Mrs. Stuart E. Price, Jr., Mrs. William G. Stewart, Jr., and Mrs. William R. Waddell.

The Formal is a highlight of the MGH year for both Staff and Distaff couples. This year a dinner-dance in a new setting will be a particularly exciting event.

1811

Massachusetts General Hospital has chosen May 10 for the observance of National Hospital Week. There will be four showings of the MGH 150th Anniversary film, "A watch in the night", in the Lower OPD Amphitheatre at 9:45 and 11:15 A.M., and 2:45 and 4:15 P.M. In addition, two performances of "A day at the M.G.H. — Many hands, many skills" — a parade of the people who serve our patients — will be presented in the Moseley Rotunda at 10:15 A.M. and 3:15 P.M. Everybody is cordially invited to attend.

Dr. Madelaine R. Brown, attending a neurological conference in the Ether Dome

A COURAGEOUS STAFF MEMBER

Dr. Madelaine R. Brown was a member of our Neurology Staff from 1936 until her retirement on June 30, 1959. Although she still maintains a private practice, Dr. Brown has curtailed her office hours and now sees only a few of her regular patients in her office in the Warren Building. She continues to attend the neurological conferences here at the Hospital, however.

The March issue of *The Johns Hopkins Magazine* carried an illustrated article about Dr. Brown. Having received the kind permission of the Editor of the Hopkins journal to reprint the article and a selected picture, and also Dr. Brown's rather hesitating and modest sanction (typical of her where any publicity concerning her is involved), we give you the story of Dr. Brown as it appeared in *The Johns Hopkins Magazine*:

DETERMINATION

THOUGH ALMOST TOTALLY CRIPPLED, DR. BROWN STILL DOES HER BEST

Shortly before she received her M.D. from Johns Hopkins in 1927, Madelaine Ray Brown saw a bulletin board card announcing an internship in neurology at Bellevue Hospital. She applied, was accepted, and after serving a rotating internship at the University of Michigan Hospital, began her career at Bellevue Hospital as a neurologist.

At the end of her year at Michigan, however, Dr. Brown suddenly lost the sight of her right eye. After six weeks, before the malady had been diagnosed, she regained her sight. She was relieved, but puzzled. She had no way of knowing that this had been her first contact with an insidious and crippling disease (later to be called multiple sclerosis) of the central nervous system.

Since Dr. Brown's first attack thirty-three years ago, medical scientists have learned much about multiple sclerosis, but its cause and cure remain mysteries. They know that it causes deterioration of the fatty sheath (myelin) which covers and protects the nerve fibers in the brain and spinal column. This disintegration obstructs nerve impulses, causing paralysis or impaired use of the parts of the body innervated by these nerves. Curiously, multiple sclerosis strikes two-thirds of its victims during their young adulthood (between twenty and forty years of age), and one out of every four hundred young adults suffers from the disease.

As Dr. Brown discovered, multiple sclerosis is characterized by periods, sometimes lasting for years, in which the disease does not progress and even seems cured. Following her first attack, Dr. Brown experienced several more, often a year or more apart, which impaired the use of her limbs, then passed, leaving her normal. Between attacks, she kept active in her profession and worked vigorously to keep herself physically fit. She learned to ski and made canoe trips to Minnesota and Ontario. She continued research in neurological diseases like her own. She studied in London, became a resident in neurology at Bellevue Hospital in New York City, was the first woman intern at Boston City Hospital. She was a neurologist at New England Hospital and later at Massachusetts General Hospital. By 1940, when she became an instructor in the Harvard Medical School, her left leg was permanently weakened. Nevertheless, she took on more duties during the war.

Gradually, Dr. Brown lost ground against her disease. In 1953, she bought her first wheel chair. And four years later, she was so severely handicapped that she purchased a hydraulic lift to move her from her wheel chair. Today, Dr. Brown is almost totally handicapped and must rely on other people and a host of mechanical gadgets to perform even the simplest tasks of turning pages, eating, and smoking. Yet, as the photos on these pages indicate, she continues her work.

AN UNCOMMON COURAGE

Dr. Brown's own attitude toward her handicap is rather matter-of-fact, and she has said, "There are two ways of meeting this thing. One way is to go to bed and not move out for the rest of your life. The other way is just to do your best." Her choice is obvious: Since her confinement to a wheel chair, she has received the Elizabeth Blackwell Citation and has been named Medical Woman of the Year by the New England Medical Women's Association.

But Dr. Brown is aware that she has been more fortunate than some others. No amount of courage and determination can keep some of these victims active. The rapid and devastating onslaught of multiple sclerosis can reduce a person to a hopeless and helpless cripple to whom advice about staying active and eating properly is nonsense.

The victims who do have a choice between going to bed and staying active may find in Dr. Brown's experience a measure of hope. Since 1927, she has lived with a disease that would eventually overcome her. Yet, after each attack, she intensified her effort to make the best use of what was left to her. Even today, when the disease is in its most advanced stages, and when she knows the ultimate outcome, she does her best. And this takes uncommon courage.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Anesthesia

Beecher, H. K.
Research and common sense in a clinical specialty — Anesthesia.
J.A.M.A. 172:449.

Bacteriology

Sharp, J. T.
The cell wall of bacterial L forms and pleuropneumonialike organisms.
Ann. New York Acad. Sciences 79:344.

Endoscopy

Benedict, E. B., Taylor, G. W., Rogers, W. P., Jr., and Burbank, C. B.
Carcinoma of the tongue, and paralytic dysphagia.
Gastroenterology 38:456.

General Medicine

Pittman, H. S.
Gamma globulin concentrations in ambulatory patients with bronchiectasis.
Am. Rev. Respir. Dis. 81:251.

General Surgery

Burke, J. F.
Lymphatic localization of malignant and bacterial cells.
Surg. Forum 10:39.

Churchill, E. D.
The scientific endeavors of a surgeon.
In Papers dedicated to Professor Carl Semb on the occasion of his sixty-fifth birthday, February 19, 1960, pp. 9-14. Also published as a supplementum 253 to Acta Chirurgica Scandinavica, Oslo, Nationaltrykkeriet.

General Therapy

Butler, A. M.
The use of glucose, electrolyte, albumin, and amino-acid solutions and whole blood in parenteral fluid therapy.
Quart. Rev. Pediat. 15:34.

Otolaryngology

Kelemen, G.
Basic anatomy and neurophysiology of speech and language.
Cerebral Palsy Rev. 21:8.

Psychiatry

Nemiah, J. C.
The lecture: A reconsideration.
J. Med. Ed. 35:183.

Miscellaneous

Clifford, M. H.
The effect of neoplasms on longevity. Should we change our underwriting practices?
In American Life Convention, 1959, Chicago, Ill., p. 142.

Dohan, F. C.
Convalescence — when does it end?
In American Life Convention, 1959, Chicago, Ill., p. 27.

Garland, J.
Editor resartus.
Canad. M.A.J. 82:239.

This very interesting letter has come from Dr. Anthony A. Arzimanoglu (a.r.s. *Or.* 1952), 1 Neofytoy Vamva St. (K), Athens, Greece:

I do not know whether you call me a "singleton" in Athens or in Psychico. [Both. — *Editor*] Psychico is only three-quarters of a mile from Athens proper and is where I live and where most of the Americans stationed in Athens also live. It is a residential town.

In Psychico, only a few yards from my house, is the campus of the American Athens College, of which I am an alumnus. The college has a board of trustees in New York and another in Athens. It is the best college we have in Greece. When I was using its desks there were only 250 students, while now there are over 1200. It is expanding fast in the number of both pupils and buildings.

We have three children — a boy nearly five years old and a pair of non-identical twins of two and a half years. My private office is located in Athens, opposite the building of the American Embassy.

Mountain Pendeli is about ten miles from Athens. All the white marble from which the Parthenon was erected, as well as the white marble for the ancient statues, monuments, and modern buildings, came from Pendeli.

Two years ago a new 250-bed hospital for pediatric orthopedics (surgical cases) was opened in Pendeli. It has two orthopedic services and I am the surgeon-in-chief of one of them. Another 400-bed affiliated hospital for physiotherapy and rehabilitation is by the seashore, about ten miles from Athens, in the opposite direction from Pendeli. We transfer all children after surgery to this hospital for post-surgical physiotherapy. The children return to Pendeli for regular follow-up, even after their discharge. Thus we have been able to build up long follow-ups and publish papers on congenital hips, polio sequelae, spastics, etc.

I work also as an orthopedic consultant and surgeon in the USAF Hospital in Athens, where most of the American citizens stationed in Athens — civilians and members of the armed forces — are treated.

So far, I have seen the following members of the MGH family here in Athens: Dr. and Mrs. Joseph S. Barr, Dr. and Mrs. Peter E. Sifneos, and Dr. and Mrs. John F. Burke. I hope to see more and more of you coming to visit Athens — a sister city of Boston, since you call Boston the Athens of the States.

Dr. Arzimanoglu enclosed a picture of the very attractive Children's Orthopedic Hospital in Pendeli, which you may see on the bulletin board near the foot of Treadwell stairs.

New addresses:

Dr. Mignon C. Chasen (a. *Psychiat.*), 111 Cedar St., Newton Centre, Mass.
Dr. John C. Coolidge (*C.M.* 1945), 141 Coolidge Hill, Cambridge, Mass.
Dr. Thomas G. Gabuzda (*M.* 1956), 94 Baekkeskov Vej, Bronshoj, Denmark
Dr. Harriet L. Hardy (assoc. p.), Medical Dept., Massachusetts Institute of Technology, Cambridge, Mass.
Dr. Timothy S. Harrison (a.r.s. 1959), Penny Farms, Fla.
Dr. Guy J. Isaac (clin. and res. fel. *M.* 1959), Hôpital Saint Pierre, Louvain, Belgium
Dr. Robert E. Key (sr. r.s. *Or.* 1958), 800 5th Ave., Fort Worth, Tex.
Dr. Jesse T. Nicholson (r.s. *Or.* 1933), Children's Hospital, 1740 Bainbridge St., Philadelphia 46, Pa.
Dr. John T. Potts (*M.* 1958), National Institutes of Health, Bethesda, Md.
Dr. Harvey D. Rothberg, Jr. (*M.* 1954), Seton Hall College of Medicine, Jersey City, N. J.
Nathan Sharon, Ph.D. (res. fel. *M.* 1958), Weizmann Institute of Science, P.O. Box 26, Rehovoth, Israel
Dr. Robert L. Thomas (*N.S.* 1933 and *E.S.* 1936), 2844 Summit St., Oakland 9, Calif.
Dr. Theodore van Ravenswaay (a.r.p. *Path.* 1957), 2009 Parkade Blvd., Columbia, Mo.
Dr. Walter P. Zmyslowski (a.r.p. *An.* 1959), 28 Marion Ave., Worcester, Mass.

Brief bits:

Dr. Joseph S. Barr spoke on "Modern concepts of backache" at the Annual Spring Clinic of the Norfolk County Medical Society, in Norfolk, Virginia, on March 12. From March 14 through 18, Dr. Barr served as Visiting Professor in the Department of Orthopedic Surgery at the University of Pittsburgh and Children's Hospital, Pittsburgh, Pennsylvania.

Dr. Edward B. Benedict attended the meetings of the American Gastroenterological Association and American Gastroscopic Society in New Orleans. On March 30, he presented a paper at the latter meeting, on "The treatment of benign stenoses of the esophagus". One of the social events of the meeting was an evening boat ride on the Mississippi, with buffet supper and dancing included.

Miss Edna S. Lepper, R.N., Associate Director of Nursing Service, and Miss Mary Ruth Wolf, Director of the Volunteer Department, were guest speakers at the Maine Medical Center Auxiliary meeting, held in Portland on May 4.

On March 30, Dr. Francis C. Lowell was elected President of the New England Society of Allergy, to succeed Dr. Walter S. Burrage.

Miss Mary Ruth Wolf participated in a workshop on Hospital Volunteer Services, at the spring meeting of the Connecticut Association of Hospital Auxiliaries, in Cheshire, on April 19.

ELECTRORETINOGRAPHY

> People forget that it is the eye which makes the horizon and the rounding mind's eye which makes this or that man a type or representative of humanity, with the name of hero or saint. — *Emerson*

During the last few months a laboratory for electroretinography has been established at the Massachusetts Eye and Ear Infirmary. We would like to express our deepest gratitude to our Chief of Ophthalmology, Dr. Edwin B. Dunphy, for without his help there would be no such laboratory. Dr. Charles L. Schepens assisted in obtaining part of the basic equipment for the laboratory.

Electroretinography (ERG) is a term which has more than one meaning. Literally, it means the recording of the bioelectrical potentials from the retina. The broader meaning of ERG we will explain later in this paper.

As life itself is a sequence of natural developments, with discoveries and inventions evolving from the intelligent human mind, so the scientist in his dedicated work makes progress in enlarging the knowledge of the physiology of man. Naturally, each new theory must have not only a firm basis in the already known facts, but it must also be in harmony with our knowledge of anatomy and physiology.

The earliest and most primitive eye that can be called an eye is that of the *Euglena viridis.* This creature appears just on the borderline between the microscopic and the macroscopic worlds. It is of green color and has a specialized mouth, just below which is a tiny rose-colored spot with pigment — the *Euglena's* eye. This minute eye is both a thermometer and a photometer; it measures the intensity of both the heat and the light in its surroundings. However, this eye — or better, pigment-eye — never has a picture of the outer world.

It is a long step from this rudimentary eye to the recording of the bioelectrical potentials from the vertebrate retina. To help bridge this step rapidly we will give some data on the development of the knowledge of the retina.

It was the Swiss writer, Platter, in the 16th century, who first described the definite light-sensitive function of the retina. Prior to Platter, it was thought that the lens was the receptor of light. It was Kepler, in 1604, who explained the path of light rays in the eye and the optical function of the crystalline lens. Because of his pioneering work as a microscopist, it is not surprising to learn that it was Leeuwenhoek, in 1674, who made the first microscopic examination of the retina. The macula was discovered by Buzzi in 1782, and Sömmering described the fovea in 1795. Sömmering interpreted the fovea as the blind spot on the retina. It was Mariotte, in 1666, who proved that it is the blind spot of the optic papilla which is the blind spot on the retina. It was not until 1835 that Trevianus discovered the visual cells. The technique of fixation with chromic acid, to prepare retina sections for microscopic examination, was made by Hannover in 1840.

The complicated structure of the retina was further described by Bowman in 1846, when he distinguished six retinal layers, and by Corti when he traced the nerve fibers from the visual cells to the optic nerve in 1850. It was Müller, in 1853, who proved the photosensitive function of the retinal cells; and Schultze, in 1866, described the different forms of the receptor cells — the rods and cones.

The retina, being a complicated neural structure, is not only a layer of sensory cells, but it is also a part of the central nervous system. The impulses originate in the sensory cells and pass from them through three neurons: the rods and cones, the bipolar cells, and the ganglion cells, whose axon is one of the fibers of the optic nerve. Several collateral elements — the amacrines and the transverse or horizontal cells — are also involved in the transmission of the impulse.

The center of the human retina — the fovea — is made up exclusively of cones, while the remainder of the retina is composed of both rods and cones, with the rods being more predominant toward the periphery of the retina.

This knowledge of the sensory cells (rods and cones) led to the development of the so-called duplicity theory, first suggested by Schultze in 1866. In essence, this theory states that there are two kinds of visual functions: the one mediated by the rods and the other mediated by the cones. The cone vision, if one may call it this, is responsible for the high degree of visual acuity and for color perception and intensity. Rod vision mediates low intensities and is achromatic.

The Purkinje phenomenon or shift, described first in 1825, can be shown in the ERG. This phenomenon illustrates the basic fundamental duplicity theory of the retina — the rods and cones. If a recording of the ERG is made in the light-adapted eye and in the dark-adapted eye with the same equal-energy spectrum as a stimulus, there will be a definite difference in size and shape of the b-waves of the ERG. It has been shown on the frog retina that in dark adaptation and with weak stimuli, the maximum amplitude of the b-wave was at a wave length of 510 mμ, while in light adaptation this maximum shifted to 560 mμ.

Experiments have established that the visual function is of two types: photopic or light-adapted vision or cone vision, and scotopic or dark-adapted vision or rod vision. This is to say that the retina does not necessarily function best at high intensities or less well at low illuminations. It is in the rod and cone layers that the visual image is formed. The ultimate messages from the retina are transmitted by the optic nerve chiasma.

It is interesting to note the exceptional vision of birds. The eyes of birds are the finest and most remarkable of all eyes on earth. They are often both telescopic and microscopic. The focusing mechanism is chiefly the cornea, not the lens as in the human eye. Their visual acuity is incredible. In some instances it is one hundred times greater than that of human eyes. A bit of grain, a tiny insect, which we can barely see at a distance of one yard, birds can readily see at the same distance. We have all witnessed small birds in the twilight make a dash for an insect on a leaf or twig more than a city block away and see them pick it off accurately while still flying.

The eyes of many birds are on the sides of their heads, and because of this they cannot have binocular vision. In spite of this fact, many of them do have stereoscopic vision. They accomplish this because they have two maculae in each eye. Thus, they have two pictures from two different angles.

Birds' retinas do not have any vessels and this absence probably sharpens the sight of the bird. We recall that normally our maculae do not have any blood vessels either. Birds cannot see blues and violets. This helps in their distance vision because the haze which hangs about distant objects and which, for our eyes renders them invisible, simply does not exist for birds. Birds, on the other hand, see infrared radiations which for us affect only the temperature sense of the skin and not the retina.

It is also interesting to note the characteristics of some fishes' eyes. There are fishes with thermometer eyes, and fishes with incandescent eyes which illuminate the sea so that other types of fish may have vision. The choroid coat of some fishes' eyes is a reflector, which shines in the dark. Some fishes have two pupils in each eye, one for seeing in the water and the second for seeing in the air. Also, in some young fishes, the eyes lie in the usual way — one on each side of the head — when the fish are first hatched, but as they grow older they begin to swim along only on the bottom of their habitat, scraping constantly on the gravel and sand with one side of the head. As a result, the skull twists until the two eyes lie together on the upper side of the head.

The usually accepted division of the human retina into layers is that proposed in 1852 by Müller: (1) pigment epithelium consisting of a layer of cells filled with an absorbing pigment which prevents the diffusion of stray light; (2) layer of rods and cones consisting of the photosensitive ends of the receptor cells (rods and cones); (3) external limiting membrane — thin membrane separating (2) from (4); (4) outer nuclear layer — the nuclei of the visual cells, those of the cones being generally in contact with the external limiting membrane while those of the rods are disposed below them; (5) outer fiber layer consisting of the axons of the rods and cones, ending in feet or spherules, which are sometimes regarded as forming a separate layer; (6) inner nuclear layer, containing the nuclei of the bipolar cells and of the cells of association (horizontal and amacrine cells); (7) inner fiber layer, made up of the axons of the bipolars; (8) layer of ganglion cells or, at least, of nuclei of those cells; (9) layer of optic nerve fiber, i.e., the axons of the ganglion cells; (10) internal limiting membranes — a thin membrane adjacent to the hyloid membrane of the vitreous body.

Although the retina is nervous tissue and is a part of the central nervous system, it is interesting to note that the central cortex shows an optimum respiration at a pH of 9.0 to 9.5, while the optimum respiration of the retina is at a pH of 7.4 to 8.0.

Retinal metabolic changes due to the influence of light have been reported. The energy spectrum, 400 to 800 mμ, can stimulate the retina and give rise to visual sensation. Before this spectrum is able to stimulate the retina, the light must be absorbed by a part of the retina, otherwise the light would pass through without imparting some of its energy to the photoreceptors. Only that portion of light which is absorbed effects a photochemical reaction.

Substances of the retina which have the property of absorbing parts of the visible spectrum are called pigments. One of these pigments is termed rhodopsin, or visual purple. As a result of exposing the rhodopsin to light, a bleaching takes place in the pigments which is comparable to photographic processes. If a bleached retina is put back into the dark, it is found that the rhodopsin is re-formed. This process can be repeated. In the human eye, only the rods contain rhodopsin. Rhodopsin is the chemical basis of rod vision, and is also the basis of vision in dim light. The dark-adapted eye (scotopic) is most sensitive to light of wave length 500 mμ.

Vitamin A must be supplied continually for good vision. In the process of sight, the retina constantly withdraws the active isomer of vitamin A from the circulating blood and returns the inactive isomer.

The regeneration of visual purple is most important for vision. Should it not be regenerated constantly, while being bleached at the same time by light, vision would consist of only short periods of visual sensation.

In man, no visible photosensitive pigments have been isolated from the fovea. It was Wald who first extracted a photosensitive pigment from the cone retina of the chicken. This was bleached to form a yellow photo-product and was called iodopsin. Its absorption spectrum is at a peak of 560 mμ in yellow-green. In human eyes, the maximum sensitivity of foveal cones is at 555 mμ.

For the functioning of the retina it is necessary that there be pigments which absorb light and are bleached down to products which in their turn stimulate the photoreceptors. These then discharge an impulse to the optic nerve fibers. Continuous breakdown of these pigments in the light and their continuous re-formation in the dark, establishes a steady state, which depends to a large degree on the state of illumination. The breakdown of rhodopsin and iodopsin changes the retinal potential and, as a result of this action, the ERG is possible.

As stated previously, electroretinography — the recording of the bioelectrical potentials from the retina — is a member of the electrodiagnostic family of electrocardiography and electroencephalography. Acting in its capacity in both research and clinical use, electroretinography is a fortunate tool for objective examination. Radiant energy, or light stimulus (blue-white xenon light), is applied on the retina through the pupil in order to evoke the existing resting potentials. The variations or imbalance, caused by the light stimulation, produces the so-called action potential, which is the electroretinogram.

It is then easy to understand that the electroretinogram of the normal eye depends on the quality (wave-length) of the light which stimulates the retina, the size of the pupil (amount of light stimulating the retina), and the state of adaptation (dark or light).

In the pathological eye, the electroretinogram depends naturally on more variables. The ERG is affected according to the given pathology of the eye. Of course, sometimes in the evaluation of the pathology, there might be no difference between the recording of a degenerated retina and a detached retina, for example. In both cases, no ERG would be obtained if the degree of impairment were severe.

Electroretinography is still a limited science. This condition exists in spite of the tremendous amount of work done in the field and the great number of papers published. There is still a limitation and a lack of definitiveness in its use in the clinic. However, the ERG is being used more and more as a tool for the diagnosis of a number of ophthalmic diseases.

Perhaps the reason for ERG's limitations rests in the fact that relatively few ophthalmologists are really interested in the subject and that few ophthalmological centers have equipped themselves to do ERG work. In a way this is fortunate, for ERG has thus not become the exclusive experimental tool of only one group of workers — ophthalmologists, but has been taken up and utilized by physiologists, biologists, neurophysiologists, chemists, photochemists, and psychologists. These independent associations or approaches have provided the foundation for basic investigative work that is daily adding depth and clarity to the subject of electroretinography.

It was in the 1840's that electrical methods were first applied to the study of physiology and ultimately to the study of the physiology of vision. So, the ERG is not new. It is exactly 111 years since DuBois Reymond discovered that a potential of about 6 millivolts appeared between an electrode placed behind the eye and a similar electrode placed on the surface of the cornea. Holmgren, in 1870, was the first to succeed in recording an electrical response from a human eye. In 1908, Einthoven and Jolly investigated and named the various waves. They called the small negative wave "A-wave", the large rapid positive wave "B-wave", and the slowly-rising positive response "C-wave". These three waves represent the on-effect. The small sharp positive, or off-effect, was called the "D-wave". In 1933, Cooper and Creed were the first to amplify electronically the human ERG. About the same time, Granit analyzed the ERG into separate components, of which P III was negative (or "A-wave"), and P II and P I were positive (or "B-wave" and "C-wave"). He also found that the so-called I-retina, or inhibitory type, is dominated by cones, and that the E-retina, or excitatory type, is dominated by rods.

Kahn and Loevenstein, in 1924, were the first to appreciate the clinical importance of ERG. However, technical difficulties caused them to give up the idea of recording on human subjects.

It was Riggs of Brown University who, in 1941, invented the scleral type contact lens electrode. This electrode permits the recording of the ERG in human subjects for many hours with no discomfort.

The present-day technique of recording the ERG is as follows: The subject's pupils have been dilated to the maximum with a 10% solution of neo-synephrine. An electrode — the reference electrode — is placed on the temporal area of the face adjacent to the eye and close to the outer canthus. A second electrode — the ground electrode — is then placed on the forehead. The patient then assumes a supine position in order to reduce muscle activity which may interfere with the recording. After this, several drops of an anesthesia are put into the fornix of the eye and the contact lens electrode is placed on the eye which is to be examined, while the fellow eye is covered. The contact lens is then filled with saline solution and a silver rod is inserted into it. The electrical contact is thus made by the saline solution and the silver rod. This rod is hooked to the amplification system and finally to the recording device. A photostimulator supplies the light for the stimulation of the retina. During this stimulation, the subject is fixating on a rod-fixating point.

To better understand the recorded results of ERG, it is necessary to speak of the various components of the response.

The principal characteristics of the different components are as follows: In the vertebrates, with the exception of some birds, the component I disappears almost completely if the eye is light-adapted. This suggests some connection with the activity of the rods. This component is absent in cone retinas. The physiological function of this component is still uncertain. It may be that component II is sensitized in such a manner that it may develop a useful function at the transition time from night- to day-adaptation.

As far as the component II is concerned, the characteristics are unstable. In low illuminations, the B-wave is indefinite and often shows several successive fluctuations. At high illuminations, one can obtain double initial undulations, and this not only in rod-free retinas but also in white-blue xenon light. Physiologically, this component is important because of its way of developing, which corresponds to the electrical activity of the optic nerve.

As for component III, it is regarded as having an inhibitory function. It is the first component to appear in the ERG. P III begins before the discharge in the optic nerve and is the component which is most resistant to effective chemical agencies and to pressure.

It is well to emphasize that the ERG depends upon the light intensity and its quality, the transparency of the ocular media, the size of the pupil, and the state of adaptation. The most important component for the evaluation of the ERG in clinical use is the height of the B-wave.

In the studies of ERG, flicker (or repeated flashes) is used. Flicker, a phenomenon described by Brucke in 1864, arises as a result of frequent repetitions of brief flashes. The chief characteristic of the qualitative sensation is the sequence of its modulatory nature. In the senses of touch and pressure it is called vibration, and in vision it is called flicker. Repeated light flashes, when the rate is slow, produces the sensory effect known as flicker, while the rate which produces an impression of steady illumination is called fusion, or critical flicker frequency (CFF).

Flicker is used as a cone activity test (macula test). The so-called X-wave, which is a positive response, similar to the scotopic B-wave but smaller in size, is obtained with brief flashes of high intensity. It has been shown that in protanopic human eyes this X-wave is absent while the eyes are stimulated with red light. Yet, by stimulation with red light, one gets on the ERG both the photopic X-wave and the scotopic B-wave.

As to the origin of the bioelectrical retinal response (ERG), many controversial papers have been published. The following locations have been given as to the seat of its origin: the receptors, bipolar cells, external plexiform layer, and inner margin of the outer nuclear layer, while Bruch's membrane and the pigment epithelium have been named as the seat of A- and C-waves.

More confusion exists as to the relative role of the rods and cones. In 1952, Ottoson and Svaetichin, using microelectrodes directly from the receptors, suggested that all positive responses are from the rods and all negative from the cones. This conclusion can be questioned when it is pointed out that an A-wave can be obtained from the pure rod eye of the gecko, a species of lizard, and also that the eyes of turtles, which have only cones, produce C-waves as well as A-waves.

Although it is somewhat removed from our subject, I would like to mention the work of Stone at Yale. He has found that salamanders are capable of regenerating a new retina if the old one is destroyed. He transplanted eyes from one species of salamander to another species and he found that vision eventually followed. In these transplanted eyes, when circulation was blocked, the retina degenerated in a few weeks and the optic nerve also degenerated. The surviving pigment epithelium cells then underwent rapid mitosis and migrated to form a new retina which eventually became differentiated and functional. The optic nerve would grow back from the neural layers of the retina to the brain, and vision would return after several months. In these transplanted eyes, the response of the C-wave is the same, although somewhat smaller, than in the normal salamander eye.

Typical ERG's have been obtained from isolated retinas. This shows that the response *is* from the retina itself. I have made recordings from an enucleated human eye and have found that 3 minutes after enucleation there was still a response. In another experiment, I recorded the ERG on a rabbit which died during the experiment, and an ERG recording was still possible 35 minutes after death. Could this phenomenon mean that death does not really come until after this time? . . . From all this evidence, we can say that the ERG is a mass response, with its origin in several layers of the retina.

We are now ready for the important question: Of what value is the ERG in the Ophthalmic Clinic?

Before answering this question, it is well to restate that, in general, successful ERG recordings depend on light intensity, transparency of ocular media, the size of the pupil, and the state of adaptation. Any disease process which affects any or all of these factors will also affect the quality of the ERG accordingly.

On the list of clinical entities that can be studied with the ERG is retinitis pigmentosa and its variations. This is a hereditary and familiar disease. It can be dominant, recessive, and recessive sex-linked (males) in form. It affects, as a rule, both eyes, but it can also be unilateral and can also affect a single sector of the retina. The characteristic findings are the pigmented bone corpuscles (mostly in the periphery of the retina), an optic disc with a waxy color, narrow blood vessels, and narrow visual fields. It may be associated with nerve deafness, obesity, hypogenitalism, polydactylia, and other defects. In true and advanced retinitis pigmentosa, and also in the diffused tapeto-retinal degenerations, there is practically no response. In symptomatic pseudo-retinitis pigmentosa, such as that of syphilis, measles, and other secondary pigmentations of the retina, a fairly good response can be obtained. Both retinitis pigmentosa *sine* pigmento and amaurosis from the tapeto-retinal degenerations of Leber type do not produce any — or, at best, have very poor — ERG's. The differential diagnosis between the retinitis punctata albescens and the abortive forms of fundus albipunctatus with congenital hemeralopia of Lauber is possible only with the help of the objective ERG test, since ophthalmoscopically the two fundi appear the same.

In retinitis punctata albescens the ERG is absent, while in retinitis albipunctatus, the response is positive. Naturally, in this case it is very helpful and important to be able to give the patient an objective reassurance that, although his vision is not very good, his prognosis is good. It is possible to separate the typical macula degeneration of Stargardt from the tapeto-retinal degeneration only by help of the ERG. Stargardt has greying deposits in the perimacular area, is an abiotrophy, and belongs to the group of macular heredo-degeneration. It is being observed in patients younger than 40 years of age. Since it is the macular region which is mostly involved, the recording of the ERG shows a good response.

In choroideremia the ERG is extinguished, while in the atrophia gyrata of the retina there is still a response. Choroideremia is a congenital disease where choroid and pigment epithelium are absent, with the exception of small parts in the macular area region. Ophthalmoscopically, one sees a white fundus, since the sclera is exposed. This disease affects both eyes and is often associated with myopia. The vision is reduced and so are the visual fields.

Often surprising findings will come one's way in the course of the routine clinical use of the ERG. One such instance is that of a child diagnosed as having Tay-Sachs disease. This child was followed in the eye clinic of Geneva, Switzerland, and the case was systematically recorded by ERG every 6 months from the time the child was 6 months old until its death at the age of 4 years. Throughout this period, the ERG was found to be normal in all respects. This one experience can be taken to mean that in Tay-Sachs disease the visual cells are usable, at least until the age of 4.

Incidentally, it is possible to take ERG recordings even from premature infants. No one is too young or too old for the ERG. It is not necessary for the patient to be able to communicate with the examiner. The machine does it for him.

The principal use of the ERG in infants is in the study of suspected tumors, congenital anomalies of the inner eye, and in all cases when one cannot look into the eye with the ophthalmoscope.

Foreign bodies in the eye, particularly if they are non-magnetic, will affect the ERG considerably.

In cases of detachment of the retina, the ERG response is related to the degree of the detachment. However, much work must still be done on this subject.

In hemorrhages of the vitreous body and of the retina in retinal impairments and in circulatory disturbances, one finds a reduced and even a flat ERG.

And, finally, there is notable use of electroretinography in the Ophthalmic Clinic. From time to time there are cases of cataracts (and they may be of any origin) in which there is such a poor light projection that there is doubt in the ophthalmic surgeon's mind as to the integrity of the retina behind the cataract. Should the patient be subjected to surgery? Will he have a retina capable of normal visual tasks after surgery? A good ERG recording will help the surgeon to reach a decision for or against surgery. This would also be true for all impairments where the ocular media are not transparent, and one cannot see what is going on in the retina. For example: In cases of corneal opacities, when the transplantation of a cornea is suggested, and in hemorrhages of the vitreous body when the fundus cannot be seen, it would be useful to the surgeon to know what condition the retina is in. So, it is obvious that the ERG is of definite value in the Ophthalmic Clinic.

As stated earlier, we know that the ERG is a summation response from the entire retina because of the scatter of light by the crystalline lens. It is impossible with present-day equipment to direct a single pin point of light to a specific area of the retina and receive a response from only that area. This is proved when light, directed to the blind spot, produces an effect on the ERG, in spite of the fact that this area has no receptors. Also, Dr. Ernst G. Wolf, Research Associate and Biophysicist, has shown that dark-adaptation curves can be obtained by projecting a 1° test field into the blind spot and that when this is done the recording shows a rod and cone segment. Such curves can be due only to the action of scattered light on the surrounding retinal elements. As long as the difficulties of scatter exist, ERG's from localized and specific areas of the retina will be impossible to obtain. It can easily be seen what contributions a well-localized retinal response would make to our clinical work.

Earlier I made mention of the limitations of the ERG. I would now like to discuss some of the work we here at the Infirmary's laboratory for ERG are doing to remove at least some of these limitations.

One problem that has been a constant one concerns the contact type lens electrode. This contact lens does not exactly follow the globe when the eye moves. This means that the electrical contact with the cornea may be partially broken off, with a lessening of the ERG response. In our laboratory we have developed and tested a new contact type film electronic electrode, which may be called a "physiological electrode". This physiological electrode is a strip of film 1 mm. wide, 7 mm. long, and is only .00065″ thick. It is very flexible and is electroconductive. This little strip of conductive film, as a result of the force of the suction action of the cornea, takes the exact shape of the cornea, and thus the cornea and the physiological electrode behave as a unit. The tears of the eye make the electrical contact. Naturally, being so light and thin, this physiological electrode even follows the microscopic movements of the eye, while steady potentials are being recorded. With this physiological electrode, it is no longer necessary to use the saline solution, which often produced artifacts because of air bubbles. We wish to express our appreciation to Mr. Frederick Koury, from the Research Laboratories, Sylvania Electric Lighting Division, a subsidiary of General Telephone, Inc., for his help at this point in our work.

We are, in addition, currently developing a new illumination source for the stimulation of the retina during ERG. At present the light stimulation used is 33″ from the eye. The slightest movement of the head or of the eye prevents the light from falling directly into the pupil, and, therefore, the retina is deprived of the full amount of light and the response is then altered. As a consequence, the interpretation of the ERG cannot be correct. The same situation also prevents us from really knowing how much light was actually used to obtain the response. We are now in possession of a minute bulb, ½ mm. wide and 1 mm. long. It is proposed to place this bulb directly on the cornea itself so that in case the eye moves while being stimulated, the light bulb will move with the eye. For the study of color vision, it is possible to make the bottom of this bulb from colored filters.

Another most important factor is the standardization of the ERG. Up to now it has not been really possible to compare results obtained from one ERG laboratory with those of another, since each laboratory has different equipment. One can easily understand the advantages in having all ERG laboratories standardized. To accomplish this, we do not think that each laboratory should entirely change its present equipment, as some have suggested. Instead, we are now working on a system which would for the first time allow exact measurements of the light stimulation used in ERG. This system will employ a photocell, installed on the cornea exactly opposite the pupil. Since the photocell will give the exact reading of the used light, we feel that by this very simple and inexpensive device we could accomplish the purpose of standardization of the ERG.

At the same time, we are engaged in clinical studies of two very serious diseases which affect the human eye: glaucoma and diabetic retinopathy. In reference to glaucoma, we are making a comparative study. The idea for this came from an experimental study on normal young students' eyes, which I made a few years ago. This consisted of applying pressure to the normal eye. At 60-70 mm. Hg. there was no longer any response on the ERG. At the same time, vision was lost and the pain which usually accompanies glaucoma was present. While I slowly released the pressure to 15-10 Hg., the subjects began to see again and the ERG came back to normal. These findings are of extreme importance for comparison with those of acute glaucoma, with high tension. In diabetic retinopathy, it is believed that the disease has its beginnings in the retinal vessels themselves. Since vaso-constriction affects the ERG in the same manner as does a blackout of the retina from lack of oxygen supply, we feel that the ERG might prove its usefulness as an early diagnostic tool before any ophthalmoscopical changes are visible.

Along with our regular research projects, we are also doing routine recordings on all retinas where the diagnosis is questionable. There are many more projects that could be undertaken, but we are limited physically and economically.

We do feel that this Electroretinography Laboratory of the Massachusetts Eye and Ear Infirmary has, for the future, many fruitful years of work. This endeavor can produce many benefits for ophthalmic clinicians, as well as for those engaged in research on the basic sciences of the eye.

Benjamin Ziv, M.D.,
Fellow in Ophthalmology,
Massachusetts Eye and Ear Infirmary,
in charge of the
Electroretinography Laboratory

These announcements have been received from the Massachusetts Eye and Ear Infirmary since our last report on the Eye and Ear staff appeared in The News:

The following appointments were made at the meeting of the Executive Committee of the Board of Managers of the Massachusetts Eye and Ear Infirmary, held on January 18:

Dr. John M. Carroll — Fellow in Ophthalmology, assigned to the Howe Laboratory for six months, beginning April 1;
Dr. Kamil Ergin — Fellow in Anesthesia for one year, beginning February 20;
Dr. Jack E. Goldstein — Fellow in Ophthalmology, assigned to the Howe Laboratory for six months, beginning January 1;
Dr. John W. Irwin — Coordinator of Otolaryngological Research;
Dr. David B. Karlin — Fellow in Ophthalmology, assigned to the Retina Service for one year, beginning July 1;
Dr. J. Wallace McMeel — Fellow in Ophthalmology, assigned to the Retina Service for one year, beginning July 1.

It was voted to accept with regret the resignation of Dr. Peggy J. Clark-Roberts as Fellow in Anesthesiology at the Infirmary.

The Executive Committee of the Board of Managers made the following appointments at their meeting held on February 15:

Dr. Byron S. Lingeman—Assistant in Ophthalmology, beginning February 1;
Dr. Stephen S. Pappas—Fellow in Ophthalmology, assigned to the Retina Service, for one year, beginning July 1;
Dr. Raniero Di Piero—reappointed as Fellow in Anesthesiology, from February 23, 1960 through March 31, 1961;
Dr. Sydney Shore—Assistant in Otolaryngology;
Dr. Edward C. Sweebe—Assistant in Ophthalmology, beginning February 1;
Dr. Michael Wiedman—Assistant in Ophthalmology, beginning March 1;
Dr. Albert H. Williams—Assistant in Otolaryngology.

It was also voted to accept with regret the resignation of Dr. Mendell Robinson as Assistant in Otolaryngology.

The following appointments were made at the meeting of the Executive Committee of the Board of Managers of the Massachusetts Eye and Ear Infirmary, held on April 18:

Dr. Paulo R. L. Barros — Fellow in Ophthalmology, assigned to the Retina Service, as of July 1;
Dr. Yale J. Berry — Resident in Otolaryngology, as of July 1, 1961;
Dr. Oscar De La Cruz — Resident in Otolaryngology, as of July 1, 1961;
Dr. Dennis Harris — Fellow in Ophthalmology, assigned to the Retina Service, as of July 1;
Dr. Roy A. Johnson — Resident in Otolaryngology, as of July 1, 1961;
Dr. Roger S. Kaufman — Resident in Otolaryngology, as of July 1, 1962;
Dr. Anne S. Morgan — Fellow in Ophthalmology, assigned to Pathology, as of April 18;
Dr. Denis B. Sweeney — Fellow in Ophthalmology, assigned to the Retina Service, as of July 1.

At this meeting the following resignations were accepted with regret:

Dr. Robert E. Klotz — as Assistant to the Chief of Otolaryngology;
Dr. George F. Reed — as Assistant to the Chief of Otolaryngology.

Both Dr. Klotz and Dr. Reed will remain on the staff of the Infirmary.

The following appointments were made at the meeting of the Board of Managers, held on April 20:

Dr. Alexander S. Macmillan, Jr. — Roentgenologist, as of July 1;
Dr. Alexander S. Macmillan, Sr. — Senior Consulting Roentgenologist, as of July 1;
Dr. William W. Montgomery — Associate Surgeon in Otolaryngology, as of April 20.

Dr. Bronson Crothers (*W.M.* 1911) was posthumously granted the John Howland Award at the Annual Meeting of the American Pediatric Society, held in Swampscott in May. Dr. Crothers died on July 17, 1959.

The Board of Trustees, at their meetings on April 15 and 29, voted:

That the appointment of Dr. Hubert J. Wolfe be changed from Third Assistant Resident in Pathology, beginning July 1, to Clinical and Research Fellow in Pathology and Acting Assistant Resident for one year, beginning July 1.

To reappoint:

Robert W. Jeanloz, D.Sc. as Associate Biochemist (Medicine) for the three-year period, ending December 31, 1962.

To appoint:

Dr. William J. Adelson as Assistant to the Children's Medical Service, beginning July 1;
Dr. Noel H. Aldridge as Clinical Fellow in Radiology, beginning July 1, with the understanding that when he obtains a permanent Massachusetts license he will become Assistant Radiologist;
Dr. Howard P. Baden as Clinical and Research Fellow in Dermatology, beginning July 1;
Dr. Irwin M. Freedberg as Clinical and Research Fellow in Dermatology, beginning July 1;
Dr. Lee Jackson as Clinical Assistant in Psychiatry at McLean Hospital, beginning July 1;
Dr. Peter G. Kimball as Intern on the Dental Service for one year, beginning July 1;
Dr. Jacques Y. Lambrechts as Clinical Fellow in Anesthesia, for a period of six months, beginning July 1;
Dr. A. David McGugan as Resident in Dermatology for one year, beginning July 1;
Dr. Roger H. Morris as Assistant Resident in Anesthesia, beginning July 8, 1961;
Dr. Barbara Gurd Mueller as Clinical Assistant in Psychiatry at McLean Hospital, beginning July 1;
Dr. Egbert H. J. Mueller as Clinical Fellow in Psychiatry at McLean Hospital, beginning July 1;
Dr. José A. Pángaro as Clinical Fellow in Medicine, for the period April 1, 1960 through June 30, 1961;
Dr. Jalna A. Perry as Clinical Assistant in Psychiatry at McLean Hospital, beginning July 1;
Dr. Leonard B. Shulman as Intern on the Dental Service for one year, beginning July 1.

At their meetings during April, the General Executive Committee voted:

To promote:

Dr. Donavin A. Baumgartner, Jr. from the position of Second Assistant Resident to that of First Assistant Resident in Surgery, beginning July 1;
Dr. Mortimer J. Buckley, Jr. from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;
Dr. Willard M. Daggett, Jr. from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;
Dr. Arthur L. Herbst from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;
Dr. Dale G. Johnson from the position of Second Assistant Resident to that of First Assistant Resident in Surgery, beginning July 1;
Dr. Nelson R. Lampert from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;
Dr. Lucian L. Leape from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;
Dr. Raphael H. Levey from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;
Dr. John W. Madden from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;
Dr. Ronald A. Malt from the position of Second Assistant Resident to that of First Assistant Resident in Surgery, beginning July 1;
Dr. Eldred D. Mundth from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;
Dr. Anthony S. Patton from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;
Dr. John T. Porvaznik, Jr. from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;
Dr. David B. Skinner from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;
Dr. James H. Stempien from the position of Intern to that of Resident on the Dental Service for one year, beginning July 1;
Dr. William G. Stewart, Jr. from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;
Dr. John Urquhart, III, from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;
Dr. Richard H. Wohl from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1.

To reappoint:

Dr. Fernando A. Cardenal as Clinical Fellow in Orthopedic Surgery, with the privilege of assisting Dr. Otto E. Aufranc in the care of his private patients, for the period April 1 through May 31;
Dr. Abdollah Gashgai as Second Assistant Resident in Surgery, beginning July 1;
Dr. Donald J. Glotzer as First Assistant Resident in Surgery, retroactive to April 1;
Dr. John B. Herrmann as Second Assistant Resident in Surgery, beginning July 1;
Elton P. Katz, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning April 28;
Dr. Eugene R. Nobles, Jr. as First Assistant Resident in Surgery, beginning July 1;
Anne M. Stoffyn, Ph.D. as Research Fellow in Medicine for one year, beginning May 13;
Dr. Harold C. Urschel, Jr. as Second Assistant Resident in Surgery, beginning July 1;
Dr. C. Gene Wheeler as Second Assistant Resident in Surgery, beginning July 1.

To appoint:

Neil Baggett, Ph.D. as Research Fellow in Biochemistry (Medicine) for one year, beginning September 1;
Dr. Joseph H. Dimon, III, as Clinical Assistant in Orthopedic Surgery, with the privilege of assisting Dr. Otto E. Aufranc in the care of his private patients, for the period April 1 through May 31;
Dr. Goro Irie as Research Fellow in Radiology for one year, beginning July 1;
J. Veronica King, Ph.D. as Research Fellow in Medicine for one year, beginning September 12;
Leslie Parker, B.Sc. as Research Fellow in Medicine (Physics) for one year, beginning September 1;
Dr. Shizuko Takahashi as Research Fellow in Medicine for one year, beginning July 1.

The General Executive Committee also voted:

To change the starting date of the appointment of Dr. James P. Bell as Clinical Assistant in Orthopedic Surgery from November 1, 1959 to November 23, 1959;
To extend the appointment of Dr. Alejandro H. Villegas as Clinical and Research Fellow in Surgery for an additional two months, ending May 31.

On April 20, McLean Hospital announced the following:

That the appointment of Dr. William Kornfeld had been changed from Clinical Assistant in Psychiatry to Assistant Attending Psychiatrist, effective April 1;
That Dr. Emmett Wilson, Jr. had been appointed Resident in Psychiatry for one year, beginning July 1.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter, and not under the hospital department with which you are affiliated.

The following new titles have been received:

Anesthesia

Smith, G. M., and Beecher, H. K.
Amphetamine, secobarbital, and athletic performance: II. Subjective evaluations of performances, mood states, and physical states.
J.A.M.A. 172:1502.

Endoscopy

Benedict, E. B., and Nardi, G. L.
Esophageal varices.
G.P. 21:111.

General Medicine

Calkins, E., and Cohen, A. S.
Diagnosis of amyloidosis.
Bull. Rheumatic Dis. 10:215.

General Surgery

Cope, O.
Hyperparathyroidism: Diagnosis and management.
Am. J. Surg. 99:394.

Neurosurgery

White, J. C., Schwab, R. S., and Sahinalp, I.
Parasagittal meningiomas of the longitudinal sinus and falx.
J. Neurosurg. 17:197.
White, J. C., Sweet, W. H., and Hackett, T. P.
Radiofrequency leukotomy for relief of pain: Coagulation of medial frontal white fibers in stages by means of inlying electrodes.
A.M.A. Arch. Neurol. 2:317.

Physiology

Blank, I. H.
Percutaneous absorption: Methods of study and factors which influence absorption.
J. Occupational Med. 2:6.

Radiology

Bartlett, M. K., and Dreyfuss, J. R.
Residual common duct stones.
Surgery 47:202.
Petersen, J. A.
Recognition of infrapulmonary pleural effusion.
Radiology 74:34.
Phillips, R. I.
Radiological monitoring for technicians.
Cincinnati, Ohio, The American Society of X-ray Technicians.
Potsaid, M. S., and Maruyama, Y.
Effect of AET and MEG on rat thyroid I^{131} uptake.
Radiology 74:74.
Robbins, L. L.
The future of Radiology. President's Address, Radiological Society of North America
Radiology 74:485.
Robbins, L. L.
Radiologic features of myasthenia gravis.
In Thymectomy for myasthenia gravis, Henry R. Viets and Robert S. Schwab, with chapters by Drs. Benjamin Castleman, Laurence L. Robbins, Richard H. Sweet, and James L. Vanderveen, Springfield, Ill., Charles C. Thomas, chap. V.
Schulz, M. D.
On the choice of modality in the treatment of cancer. President's Address, American Radium Society.
Am. J. Roentgenol. 83:1.

Miscellaneous

Cole, G.
Career in special libraries.
Science News, vol. 6, no. 3:2.

Books

Webster, E. W.
A basic radio-isotopes course.
Boston, New England Roentgen Ray Society.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

VOLUNTEER GROUPS

MGH Staff Wives Association

The annual meeting of the Staff Wives Association of Massachusetts General Hospital was held on May 10. Since this date coincided with the observance of National Hospital Week, the first part of the meeting was devoted to a viewing of "A watch in the night" — the new MGH 150th Anniversary motion picture film.

This was followed by a coffee in Bartlett Hall. The speaker for the occasion was Mr. David C. Crockett, Associate Director for Resources and Development, who reported on the MGH 150th Anniversary Program — its progress to date and its plans for the future.

Mr. Crockett's speech was followed by the business meeting, which included the report of the outgoing president, Mrs. Alfred Kranes, under whose leadership for the past two years the activities of the Staff Wives have continued to expand in many areas.

In her report, Mrs. Kranes emphasized that the Staff Wives Association is open to *all* interested women, not only to the wives of staff members. She then spoke of the Reception Center at M.G.H., where more than 200 visitors from more than 50 countries have been received and welcomed during the past year. Massachusetts General has the largest number of foreign visitors of any hospital in the Boston area. Numerous inquiries about this center have been received from hospitals across the country.

Activities in the Reception Center this past year have included the finding of living quarters for 100 visitors and their families, the furniture exchange (which has loaned more than 300 items to our visitors from other lands), the distribution of 250 tickets to concerts and theatre performances (donated by friends of

M.G.H.), and the entertaining of all visitors in private homes, especially during the winter holidays.

The Staff Wives Association also arranges for the Chapel Concerts, given twice a month by professional musicians from October to May, for the enjoyment of the patients in our Hospital. A large and active committee, under the direction of Mrs. Milford D. Schulz, has been responsible for this much appreciated activity.

The following officers were elected for the coming year:

President — Mrs. Vincent P. Perlo
Vice-President — Mrs. H. Dunster Howe
Treasurer — Mrs. Avery D. Weisman
Corresponding Secretary — Mrs. Alexander Leaf
Recording Secretary — Mrs. Philip R. Dodge

BIOGLETS

Dr. J. Richard Baringer, Intern in Medicine — born in Columbus, Ohio, January 19, 1935; B.Sc., Ohio State University, 1955; M.D., Western Reserve University School of Medicine, Cleveland, Ohio, 1959; married.

Dr. William E. Wilson, Assistant Resident in Orthopedic Surgery — born in Montreal, Canada, November 7, 1927; military service: Canadian Army, 1942-46; premedical education: senior matriculation, Glebe Collegiate, Ottawa, 1945, and B.Sc., McGill University, Montreal, 1949; M.D.C.M., McGill University Medical School, 1953; intern, rotating, Montreal General Hospital, 1953-54; Junior Assistant Resident in General Surgery, Montreal General Hospital, 1954-55; Assistant Resident in Surgery, Hospital for Sick Children, Toronto, 1955-56; Research Assistant in Experimental Surgery and Demonstrator in Anatomy, McGill University Medical School, 1956-57; M.Sc., McGill University, 1957; Assistant Resident in General Surgery, Queen Mary Veterans Hospital, 1957; Assistant Resident in General Surgery, Royal Victoria Hospital, Montreal, 1958; Fellow of the Royal College of Surgeons (Canada) in General Surgery, 1958; Assistant Resident in Orthopedic Surgery, Children's Medical Center, Boston, Massachusetts, 1958-59; married.

The following notes are taken from a recent *McLean Newsletter*:

Dr. Anne Parsons, Assistant Social Anthropologist at McLean, has returned from a stay of 18 months in Naples, where she studied cultural aspects of schizophrenia, on her grant from the National Institutes of Health. Dr. Parsons gives this report of her work in Italy:

> Since I have been lucky enough to travel on my job, I have been looking at McLean through a slightly different lens, comparing it with the psychiatric hospitals in Naples, where I was for a year and a half. In the short time I have been back, I have had a few thoughts which I would like to pass on to the rest of the staff. One is that, seen comparatively, the amount of effort and moral concern that McLean staff members put into their jobs is very impressive. From this I would not want to conclude that all Neapolitans spend all of their time in the sun, but certainly the average hospital work load is much lighter, for the simple reason that a number of things we take for granted have not occurred to them as essential; for example, keeping daily nursing notes or making the case history such an extensive document. This is because the ideal of patient care with them is a far more limited one; their goal is to keep patients from being a disturbance to society, not to help them become happier integrated individuals.
>
> But I also think our very high level of expectations brings new problems of a sort which one does not find in Naples. For one thing, because we are much more aware of and know more about the social and psycho-dynamics of human behavior, we sometimes become self-conscious in actual relationships in ways I doubt that a Neapolitan could. Besides, our culture is very sadly deficient in non-verbal means of communication and sometimes I think we have a compulsion to translate emotions into words. Another consequence of our high level of knowledge and standards is that when anything goes wrong it is apt to be considered as personal failure. Thus it has the potentiality of setting in motion a vicious circle of guilt, anxiety, and withdrawal; or else an atmosphere in which everyone assumes that "if only we could change something" we could avoid any problems in the future. Perhaps the lack of long-drawn-out periods of tensions in Neapolitan hospitals relates to an attitude which assumes that there are no perfect solutions to human problems.
>
> Anthropologists enjoy fantasying about the ideal culture which is made up of only the best aspects of those which they know. My private fantasy for the moment is of a hospital which would combine the high capacity for participation in immediate interpersonal relationships and for dealing with tension (which I found in Naples) with the high level of optimism, responsibility, and respect for the individual that is so conspicuous here. It's only a fantasy, but one worth thinking about.

GRADUATION OF DIETETIC INTERNS

Graduation exercises for our Postgraduate Dietetic Interns were held in the Bigelow Amphitheatre on March 25. The two interns who had completed the course were Miss Alice Kapsner and Miss Louise Cudd — both graduates of the University of Minnesota.

Miss Louise Hatch, Director of the Dietary Department and School of Dietetics, extended greetings from the dietary staff and interns to the guests, who included directors of dietary departments from other hospitals in the area and representatives of the American Dietetic Association, among whom were Mrs. Quindara Dodge, a past president of the American Association.

Miss Hatch then introduced Dr. Doris Johnson, Director of the Dietary Department of the Grace-New Haven Hospital and the 42nd president of the American Dietetic Association — the guest speaker of the afternoon. Dr. Johnson gave an inspiring talk, in which she emphasized the privileges and responsibilities of the internship. She explained that this training serves to introduce the intern to all the different phases of the dietitian's profession, namely, (1) diet therapy, (2) administration, (3) teaching, and (4) community nutrition. She stressed the point that the internship teaches professional ethics, which include responsibility to the profession, to the Association, to related organizations, to the community, to employers, and also helps to mold the intern's own personal ethics. She also reminded her listeners that the standards in dietary performance depend upon the personal conduct of each member of the profession. In addition, high standards are of direct benefit to the intern, she said, for it is through her profession that she will make her livelihood and, at the same time, be of service to her fellow men.

Miss Hatch next introduced the candidates to Dr. Clark, who presented them with certificates in recognition of the satisfactory completion of their course. In his remarks, Dr. Clark spoke of the many educational programs offered at the Hospital and concluded with an expression of the pride which the Hospital feels in these graduates who go out into their various fields as representatives not only of their profession but of the Hospital.

New addresses:

Dr. David W. Allen (*M.* 1955), Massachusetts General Hospital, Boston 14, Mass.
Dr. Bob Bullwinkel (*S.* 1957), 131 Bellevue Ave., Summit, N. J.
Mr. Frederick D. Foster (past a. dir.), Wells Television, 52 Vanderbilt Ave., New York, N. Y.
Dr. Charles S. Kubik (*Bd. of Cons.*), Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.
Dr. K. Jack Momose (clin. fel. *R.* 1956), Dept. of Radiology, Ottawa General Hospital, Ottawa 2, Ont., Canada
Dr. William A. Tisdale (*M.* 1952), Massachusetts General Hospital, Boston 14, Mass.
Dr. George W. Van Gorder (hon. s.), 36 Regent St., West Newton 65, Mass.
Dr. Edward L. Voke (j.r.p. *R.* 1931), Ohio Bldg., Akron 8, Ohio
Capt. G. Melville Williams, MC, USAR (*S.* 1958), Fort Sam Houston, Tex. (home address: c/o Mr. M. O. Williams, 45 Jewett Ave., Tenafly, N. J.

Brief bits:

Dr. Benjamin Castleman was named President-elect of the International Academy of Pathology, at their 49th Annual Meeting, held in Memphis, Tennessee, in April. He plans to attend the coming meeting of the Academy, to be held at the Royal College of Surgeons in London, England, this June. Dr. Castleman was elected Fellow of the American Academy of Arts and Sciences, at the meeting of the Academy held on May 11.

Dr. Edwin F. Cave delivered the Fourth Alan DeForest Smith Lecture, sponsored by the New York Orthopaedic Hospital Alumni Association, at the College of Physicians and Surgeons at Columbia University, New York City, on April 22. His subject was "The chronically disabling knee joint".

Miss Genevieve Cole, Librarian of Treadwell Library, spoke on "Communication and motivation", during a panel discussion of "The supervisor and the supervised", at a meeting of the Hospital Libraries Group of the Medical Library Association, held in Kansas City, Missouri, on May 17.

Dr. Thomas B. Fitzpatrick delivered two lectures at the Divisional Meeting of the American Cancer Society last January, was Visiting Physician at Yale Medical School during April, and will act as Chairman of the Symposium on Cancer of the Skin, which will be part of the Fourth National Cancer Conference, to be held in Minneapolis in Sep-

Dr. Benjamin Ziv, Fellow in Ophthalmology, Massachusetts Eye and Ear Infirmary — in charge of the Electroretinography Laboratory

tember.

Dr. John Gergely presided at the Inter-Society Session on Muscle, at the meeting of the Federation of American Societies for Experimental Biology, held in Chicago on April 11. He also gave, by invitation, a paper on "Biological aspects of organic semi-conductors" at a recent conference on Electronic Conduction in Organic Materials, held at Duke University, Durham, North Carolina. On May 9 he participated in a Symposium of the Radiation Research Society on Energy Transfer in Photobiological Processes and gave a paper entitled "Energy and electron transport in macromolecular systems" in San Francisco.

Dr. Sven M. Gundersen (*E.M.* 1931) has been elected Chairman of the Board of Directors of the Hitchcock Clinic, Hanover, New Hampshire. Dr. Gundersen is also President of the New Hampshire chapter of the American College of Physicians.

Mr. John W. Webb, Director of our Pharmacy, was installed as President of the Massachusetts Society of Hospital Pharmacists on April 27.

Dr. James C. White gave the William Snow Miller Lecture at the University of Wisconsin, in Madison, on April 11. His subject was "Problems in interrupting the pathways of pain in post-traumatic neuralgia, and visceral and malignant disease".

We were very glad to receive this note from Dr. Charles W. Peabody (*E.S.* 1917 and *Or.* 1920), our "singleton" in Barrington, R. I.:

I retired from private practice in Detroit just two years ago, and established a home (and a sail-cruising yacht) at this site. Professionally, I am inactive, save for weekly consulting work at the U.S. Veterans Administration Hospital in Providence.

This nice letter has come from Dr. Donald B. Steenburg (*E.S.* 1915):

Here is a condensation of the life of a "singleton" in the Far West.

Following a brief tour of duty at Dannes-Camiers, France, in World War I with the 2nd Harvard Unit (Massachusetts General Hospital), I joined my father here in Aurora, Nebraska, in the conduct of a general surgical practice. My brother, Dr. Edmund K. Steenburg (*E.S.* 1919) joined us in 1920, remaining until October 1958 when he removed to Washington, D.C., bringing on my "singleton status".

Presently my two sons, Dr. E. A. and Dr. Houtz G. Steenburg, are working with me in a general practice based in our 30-bed private hospital which we plan to replace soon with a Foundation-financed hospital with Hill-Burton aid. At this time a new clinic building is contemplated.

Dairy farming has been my avocation during the 44 years of my residence here and still is an interesting and demanding activity. My sons are doing their share of it also.

Blue Shield executive board work has been an interesting and useful activity for me since its inception in Nebraska.

We have a fairly active chapter of the American College of Surgeons in Nebraska, and this has required time and effort through the years to attain its present stature.

Following my year as president of the Nebraska State Medical Association, I became chairman of the Medical Education Committee, to which has been added the duty of collecting for A.M.E.F. as its chairman in Nebraska, and also the duty of attending the Executive Faculty meetings of the University of Nebraska School of Medicine, in Omaha, as a liaison member from the Nebraska State Medical Association.

My daughter, Mrs. George Engler, resides with her family in Chicago. Mrs. Steenburg is hale and hearty and busies herself with our 14 grandchildren, when the opportunity affords.

The economic conditions here in the middle of the great plains are reflected, I think, by the increasing number of young farmers who are selling out to enter industrial pursuits on the coasts. These fine people have been caught in the price squeeze between falling prices of hogs, cattle, and grains, and the increased (highly unionized) prices for the machinery they must have to operate their farms and ranches. Quite an effort is being made to bring industry into this area, especially for the utilization of surplus products of the farm.

Snowfall has been very heavy this winter and will recharge our ground storage, which is very important to this highly irrigated, intensively farmed area.

We are always happy to return to Boston and the M.G.H.

We were very glad to receive this letter from Dr. Désiré J. A. Rebello (a.r.p. *D.* 1954):

I left the U.S.A. in July of 1959 and came over to England en route to India. Since September of last year I have been working at this hospital — the full name and address of which is the Manchester and Salford Hospital for Skin Diseases, Quay Street, Manchester 3, England. I shall be here till the end of September.

I shall be grateful if you could mail my copies of The News to this hospital until the beginning of September. I am afraid that by the time I reach India I will have missed out on a lot of things that are happening at that "Mecca" of medical learning and research — I mean the Massachusetts General Hospital.

Britain is very prosperous at this time. The standards of medical care, medical teaching, and research are very advanced. However, the British still use old-fashioned equipment, e.g., X-ray machines in some of their medical institutions, and the buildings themselves are very old.

Kind regards to my friends at M.G.H.

* * *

IMPORTANT NOTICE

Will every member of the House Staff who will be leaving M.G.H. at the end of June (or at any other time, for that matter) please see that your future address reaches Cora F. Holbrook, Archivist and Editor of The News, and that any subsequent address — particularly your future office address — is sent to her.

The Directory section of our *Annual Report* is prepared each year in the Archives Department, and this information is essential in keeping the Directory up to date. Each new address also appears in The News as soon as it is received.

Your cooperation in this matter will be much appreciated.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 197 Boston, Mass. October 1960

SOME THOUGHTS ON THE COLOR PROBLEM AND INTEGRATION OF DERMATOLOGY AND MEDICINE

Presidential Address, The Society for Investigative Dermatology, Miami, Florida, June 13, 1960

Presidential addresses are often avoided at meetings and seldom read after publication, even when given by men with much grayer hair than mine! I was elected President of this distinguished Society while I was in England on a fellowship last year, and I could not therefore at the time protest my youth and my ineptitude for such responsibility.

My topic might be called integration and the color problem. I refer to the integration of Dermatology and Medicine. And the color problem of which I shall speak is better stated as the problem of color. What I mean to convey is that my interest in the problem of color aided appreciably in integrating the Department of Dermatology in a large general hospital [Massachusetts General] and medical school [Harvard Medical] to which I have recently moved. Let me explain further. Shortly after I went to my new position last fall, I was invited by the Medical Service to speak on melanin (a clinical discussion of various melanin pigmentations), by the Metabolic Unit on the tyrosine-melanin metabolic pathway, by the Department of Ophthalmology on melanin pigment in the eye, et cetera. Having spent the past fourteen years on the problem of melanin, I was able to present the results of some original investigation and a panoramic view of a subject of interest to physicians in diverse specialties and to biologists and biochemists. These meetings resulted in new interdepartmental projects and a *rapprochement* of the Department of Dermatology and the Hospital and Medical School.

This rather egotistical introduction brings me to what should have been my topic sentence: The barriers of the various specialties are collapsing, and although special clinical interests and problems still exist, we are all engaged in a vast common enterprise, namely, the study of biology. To solve the problems of biology in so far as they concern Man, workers in the various segregated areas are beginning to be interested in the same basic concepts and to use the same or very similar research methods. Some of the papers recently given at the Federation Meetings in Chicago or the meeting of the American Society for Clinical Investigation could have been given here with the same impact, or vice versa.

The future of Dermatology in a medical school is intimately linked with the quality of research. In a decade, the question of integration of Dermatology will not be discussed if we continue to expand the scope and increase the quality of basic research. I must hasten to add that the Dermatology Department must, however, not only match the standard of the other specialties in research, but must also provide the same excellence in patient care and the teaching of the specialty. To achieve a balance of the triad of patient care, teaching, and research, we need to develop individuals with imaginative leadership and critical judgment; we need to provide them with opportunity for training and experience in Clinical Dermatology, and a two-year service "at the bench" in a basic science laboratory. In other words, the future of Dermatology depends on individuals. As Emerson so aptly put it, "An institution is the lengthened shadow of one man." Competition for space and for research funds is becoming increasingly fierce, but the simple truth is that space and funds follow a good man like a shadow. Let me give you an illustration. If you ask a medical student, an intern, or a professor of biochemistry from the University of Chicago Medical School for his view of the specialty of Dermatology, he will describe the superb and stimulating teaching, and the high caliber of research. To them, the specialty of Dermatology is represented by men with critical judgment, teachers who integrate basic science and clinical problems, individuals who are making an honest effort to understand normal and diseased skin with the most recent research and clinical tools. Compare this with the opinion of interns from certain of our other excellent medical schools. They will state that to them Dermatology represents an esoteric field in which instruction was given by residents whose presentation aroused little interest and in which research seemed to consist in the evaluation of "salves" or in the nuances of rarely encountered cutaneous disorders such as acrodermatitis atrophicans chronica. For these unfortunates, Dermatology has been segregated from the rest of medicine as a waif, undeserving of serious scientific recognition.

Turning to the more scientific aspects of the color problem, I would like to point out the integrative possibilities inherent in biochemical genetics. This subject is of interest to dermatologists and also to investigators in various other fields of Medicine. This is an approach to disease which relates the clinical and laboratory findings to altered metabolism. Thus we speak of "biochemical lesions". This concept of disease places it at the molecular level and the biochemical lesion may then be the consequence of a gene defect, or possibly the alteration of the gene by environmental factors (radiation, infections, stress, immune and autoimmune responses). These gene mutations then bring about the formation of altered protein molecules, including altered enzymes. When the gene is altered a new protein is made which may or may not be functionally defective, with different physical properties or decreased or absent enzymatic activities. These abnormal enzyme proteins lead to blocks in the normal metabolic pathway.

Today I would like to consider briefly the genetic condition known as albinism as a prototype. Some of you may consider that this is a rather unimaginative subject to discuss on this occasion, but atopic dermatitis and psoriasis, two hereditary dermatoses, will in my opinion ultimately prove to be gene defects with resulting abnormal biochemical consequences.

Albinism is an example of one type of metabolic block in which the enzymatic defect leads to a deficiency of the product, melanin. I will also mention later a disease with a different type of metabolic block, phenylketonuria. In phenylketonuria, decrease in melanin occurs, not from a defect of the melanin-forming enzyme, tyrosinase, but from the reversible inhibition of this enzyme by the enormously increased amounts of phenylalanine in the serum and extracellular fluids.

I have for some time been especially interested in albinism as evidence of a relationship between the genes and biochemical lesions. Let me define albinism, for present purposes, as an hereditary and congenital deficiency of melanin caused by a characteristic defect of metabolism in the melanocyte.

You are probably all aware that albinism occurs throughout the animal kingdom. It may be seen in vertebrates ranging from brook trout to whales and man. The incidence in man is reported to be one in twenty-five thousand. Noah—the Noah who embarked in the Ark—was an albino, and so also was W. A. Spooner—that famous Warden of New College, Oxford, for whom are named Spoonerisms—those accidental transpositions of the initial letters of words. Were he here today he might tell you that many of my experimental data have been obtained from the tissues of pickens and chigs. It was in 1660, after seeing negroes with white skin on the African coast, that Balthazar Tellez, a Portuguese, using the

Latin adjective, *albus,* coined the Portuguese term, *albino.* The condition has been the subject of speculation for centuries. For many years, albinos were considered to stand between apes and man in the evolutionary scale. Linnaeus, the Swedish naturalist, grouped them with the cave dwellers known as troglodytes, and certain Central American Indians even today consider that albinos are set apart from normal man as being more intelligent, freer from sin, and altogether nearer to God.

Types of albinism

The metabolic defect of the melanocyte in albinism may be present throughout the entire melanocyte system or be limited to the melanocytes of one region of the body. In the past, clinical nomenclature has not been such that one could easily specify with clarity either the extent or the site of involvement. For my own use, therefore, I have come to employ a more functional system of terminology which seems to me to have many advantages over the traditional system. I present it here for what it may be worth. The term "oculo-cutaneous albinism" indicates succinctly the simultaneous existence of the two major visible manifestations of albinotic abnormality of the melanocyte system and gives proper emphasis to ocular involvement which is an inherent part of the syndrome. The term "ocular albinism", as I use it and as it has been used in the past, adequately describes the condition to which it is applied. "Localized cutaneous albinism" is the term I have come to employ when the pigmentary deficiency appears only in localized areas of the skin.

Ocular changes (hypopigmented fundus oculi, translucent irides, and nystagmus) are the most reliable criteria for the diagnosis of oculo-cutaneous albinism because the color of the hair, eyes, and skin of patients with this disorder may be indistinguishable from that of normal blond Caucasians. Localized cutaneous albinism (LCA) may closely resemble segmental vitiligo, especially when it appears on one side of the face. The two diseases may be differentiated, however, by five distinguishing features:

1. The depigmentation of LCA is present at birth.
2. Physical trauma of the normal skin usually evokes depigmentation of the traumatized area in vitiliginous subjects, but does not do so in patients with localized cutaneous albinism.
3. LCA is present in the family history of more than fifty percent of these patients. The family names Whitlock (Whitelock), Horlock (from hoar), Silverlock, Blaylock, and Bianconini (literally, Whitelock) were given to the original holders of the name because of the presence of a white forelock. The Italian family—the Bianconinis—bear a white forelock to the present day.
4. The depigmented lesions of LCA are usually on the abdomen and ventral thorax, whereas those of vitiligo are characteristically found around the eyes, in the axillae, over bony prominences, and at sites of repeated trauma.
5. A tuft of depigmented hair (the white forelock) is present in the midfrontal area of the majority of patients with LCA. The similar depigmentation of hair which may be associated with vitiligo is almost invariably accompanied by depigmentation of parts of the skin on the face and other regions of the body.

Nature of the biochemical lesion of albinism

In a monumental study of albinism, Karl Pearson, the English geneticist, concluded that the deficiency of melanin, characteristic of albinism, results from a structural defect or an absence of melanocytes. His findings were published in 1911, only a few years after Sir Archibald Garrod, in his Croonian Lectures, had listed albinism among "inborn errors of metabolism". The conflict between these two points of view could not be resolved until modern cytological, histochemical, and biochemical techniques made it possible to determine whether melanocytes are present in the skin, hair, and eyes of albinos, and whether there is evidence of a biochemical lesion in albinism.

That melanocytes are present in the skin of albinos was suspected when it became known that pigmented melanocytic nevi and non-pigmented melanomas occur in albinotic skin. Only after the advent of the electron microscope, however, could the presence of melanocytes in such skin be unequivocally demonstrated. These cells can be identified by their dendritic processes and by the presence of numerous ovoid or rod-shaped bodies which are presumed to be amelanic melanin granules. No evidence has been found to support Pearson's interpretation of oculo-cutaneous albinism as the consequence of a structural defect of melanocytes.

Data obtained in biochemical and histochemical studies of skin from chicken, guinea pig, and man have proved that albinism is due to a defect of metabolism. In amelanic granules isolated from the feather papillae of the albino chick, tyrosinase activity has not been detectable, but in melanic granules isolated from the feather papillae of the black Leghorn chick, it has been found to be abundant. Following injection of radioactively labelled tyrosine into the yolk sacs of black Leghorn and albino chicks, significant amounts of radioactivity have been found in the feathers of the black species, and virtually none in the albino mutants.

Manometric measurement has revealed that tyrosinase activity is almost completely absent from the skin of the albino guinea pig fetus and that hydroxylation of tyrosine to dopa does not take place. It has not been possible with manometric techniques to demonstrate that tyrosinase activity is absent in the skin and hair bulbs of human albinos. However, with histochemical, radioautographic techniques, utilizing tyrosine-2-C^{14} as a substrate, tyrosinase activity has not been found in the melanocytes of the hair bulb of the human albino.

Failure of melanin to form in albino melanocytes from melanogenic substrates (tyrosine and dopa) could be the result of a lack in the melanocyte of genes for 1) tyrosinase synthesis, 2) synthesis of the protein matrix (melanosome), or 3) polymerization of the monomer, indole-5, 6-quinone, to the melanin polymer. Viewed under the electron microscope, the melanic melanosomes (melanin granules) of the human albino hair bulb appear to be exactly like the melanic melanosomes present in the normal pigmented hair bulb. It would seem, therefore, that the defect in albinism must be either a failure of tyrosinase synthesis or of melanin polymerization. The latter possibility is unlikely, since there is no hydroxylation by homogenates of the fetal skin of albino guinea pigs. If the defect in albinism were a failure of melanin polymerization, then hydroxylation of tyrosine would be required to provide the precursor, dopa, which ultimately leads to the formation of indole-5, 6-quinone, the monomer that polymerizes to melanin. All available evidence indicates, therefore, that the biochemical lesion of albinism results from absence in the melanocyte of the gene which is required for the synthesis of tyrosinase.

Effect on tyrosine metabolism of a "block" in the tyrosine-melanin pathway

One might expect that the marked decrease or absence of tyrosinase in the melanocytes of albinos would act as a metabolic "block" behind which tyrosine would accumulate as do phenylalanine and related metabolites in the extracellular fluids of patients with phenylketonuria when L-phenylalanine oxidase is absent from the liver or present only in reduced amounts. We have not been able to obtain biochemical evidence that there is such an accumulation of tyrosine in albinism. No decrease in the urinary excretion of adrenalin and nor-adrenalin was observed in six albino patients, and study of serum protein-bound iodine and I^{131} uptake in human albinos suggests that the other major pathway of tyrosine, to thyroxin, is unchanged in these subjects. It would appear, therefore, that the albino can metabolize tyrosine which may accumulate as the result of a block in the tyrosine-melanin pathway. In phenylketonuria, by way of contrast, the characteristic decrease in melanin results not from a defect of the melanin-forming enzyme, tyrosinase, but from the reversible inhibition of this enzyme, by large amounts of phenylalanine which accumulate in the serum and extracellular fluids. Phenylalanine and its degradation products act as competitive inhibitors not only of tyrosinase, with resulting decrease in melanin formation, but also of adrenalin formation, as evidenced by decreased excretion of adrenalin and nor-adrenalin in the urine.

It has been stated previously that two types of evidence are required for conclusive proof of the existence of a specific enzymatic deficiency in any given metabolic disorder: 1) *in vitro* demonstration of a decrease or absence of the enzyme which is known not to result from the effect of inhibitors; and 2) *in vivo* demonstration of biochemical changes in body fluids or tissues and of changes in metabolism, under experimental conditions, which can be attributed to the diminution or absence of a reaction which is normally catalyzed by the enzyme in question. The biochemical and histochemical studies I have just outlined appear to satisfy the first requirement: i.e., tyrosinase is lacking in the melanocyte of the albino. Existing data do not, however, entirely satisfy the second requirement, although absence of melanin in albinotic skin is proof that the block of the tyrosine-melanin pathway is attributable to the absence of tyrosinase.

I have attempted to sketch with the broadest strokes the genetic condition known as albinism and to emphasize its significance as a prototype of a disorder in which the clinical findings can be related to a biochemical lesion. Similar information is needed on some of the more important and disabling cutaneous disorders, such as atopic dermatitis and psoriasis.

We are living in an era in which the expansion of scientific knowledge has already assumed astronomical proportions. Each successive discovery seems to lead the way to still further discoveries and to draw increasing numbers of investigators into the field of research. Techniques of investigation are now available which surpass in accuracy and ingenuity anything previously conceived of. Like all other sub-specialties of medicine, Dermatology has been caught up in this movement. Dermatologists are being challenged to think in terms of the most advanced scientific knowledge. To meet this challenge, we must be able to integrate basic science with clinical skill and to train students to do likewise. Nosology is no longer sufficient. In much of our past research effort, there has been too much fervor and too little measure. This does not mean that we should retreat to the laboratory and substitute the bench for the bed. It means, rather, that we must maintain an even balance of the triad of patient care, teaching, and research. We cannot meet the challenge without insisting upon the highest possible standards of work and developing a tradition of excellence.

Thomas B. Fitzpatrick, M.D.,
Chief of Dermatology Service

Mary A. B. Brazier, D.Sc. has been awarded the degree of Doctor of Science by the University of London. The University awards this degree on the basis of published work.

On his departure from Beirut in May, Dr. Edward D. Churchill received the decoration of "Officier de l'Ordre du Cèdre" from the President of the Lebanese Republic. While on leave of absence from Harvard Medical School and Massachusetts General Hospital, Dr. Churchill served as Visiting Professor of Surgery at the American University of Beirut and Acting Director of the Department of Surgery in the American University Hospital.

A new $500,000 Chair in Psychiatry "and the sciences basic to it", honoring Dr. Stanley Cobb, a member of the Harvard 50-year Class, was announced by Harvard's President Nathan M. Pusey last June.

At their meeting on May 27, the Trustees voted to grant a Dalton Scholarship to Dr. Robert S. Lees for a period of four months, beginning July 1.

Dr. James Howard Means has been elected an Honorary Fellow of the Royal Society of Medicine in London, England.

At their meeting on June 10, the Trustees voted to grant a Dalton Scholarship to Dr. Robert H. Schapiro, at the rate of $1,000 per year.

Bishop Henry Knox Sherrill, who resigned as President of our Board of Trustees in 1946 to become Presiding Bishop of the Protestant Episcopal Church in the United States of America, was decorated with the National Order of the Legion of Honor last May, for "distinguished service to the cause of Franco-American friendship". The honor was conferred by Baron Charles de Pampelonne, Consul General of France to the United States.

The 1960 award of the Massachusetts Division of the American Cancer Society has been awarded to Dr. Grantley W. Taylor "in recognition of his outstanding contribution to the control of cancer".

* * *

The Board of Trustees, at their meetings held during May, June, July, and August, voted:

To accept with regret the resignation of Dr. John P. Bunker from the position of Anesthetist, effective as of August 31;

To accept with regret the resignation of Dr. Mahlon B. Hoagland from the position of Associate Biochemist (Medicine), effective as of June 30;

To accept with regret the resignation of Dr. Paul S. Russell from the position of Assistant in Surgery, effective as of June 30;

To accept the resignation of Leonard B. Spector, Ph.D. from the position of Assistant Biochemist (Medicine), effective as of August 31.

To grant leave of absence to:

Dr. Ramond D. Adams, through September 30;
Dr. Walter Bauer, for a period of from four to six weeks;
Mudlagiri K. Gaitonde, Ph.D., Assistant Biochemist at McLean Hospital, from March 27, 1960 until July 1, 1962;
Dr. Morton N. Swartz, for a period of one year, beginning July 1.

To promote:

Dr. Lloyd M. Caplan from Resident in Psychiatry to Clinical Fellow in Psychiatry at McLean Hospital, beginning October 8;
Dr. Jacob Christ from Assistant Psychiatrist to Assistant Attending Psychiatrist at McLean Hospital, beginning July 1;
Dr. Henry U. Grunebaum from Resident in Psychiatry to Clinical Assistant in Psychiatry at McLean Hospital, beginning September 1;
George P. Hauser, Ph.D. from Assistant Biochemist to Associate Biochemist at McLean Hospital, beginning July 1;
Dr. Robert L. Kelley to the position of Clinical Assistant in Psychiatry, beginning July 1;
Dr. Harry S. Olin from Resident in Psychiatry to Clinical Fellow in Psychiatry at McLean Hospital, beginning July 1;
Dr. Maurice M. Pechet from the position of Clinical and Research Fellow in Medicine to Assistant in Medicine, beginning August 1;
Dr. Phelps M. Robinson from Resident in Psychiatry to Assistant Psychiatrist at McLean Hospital, beginning July 1.

To reappoint:

Dr. Mahmoud Sadrieh, with a change of title from Consultant in Surgery pro tempore to Clinical and Research Fellow in Surgery, for one year, beginning July 1;
Dr. Makoto Seiji as Clinical and Research Fellow in Dermatology for one year, beginning August 1.

To extend the appointment of:

Dr. Richard J. Stenger as Assistant in Pathology from July 1 through August 31.

To change the appointments of:

Dr. Elroy E. Anderson from O.P.D. Resident in Children's Medicine to that of Clinical Assistant in Children's Medicine, effective as of July 13;
Dr. Norris B. Finlayson from First Assistant Resident in Pathology to Clinical Fellow and Acting First Assistant Resident in Pathology for one year, beginning July 1;
Dr. Juan F. Sotos from Assistant to the Children's Medical Service to Clinical Fellow on the Children's Medical Service, as of February 19.

To appoint:

Dr. Khalil Abi-Torbey as Assistant Resident in Urology for one year, beginning July 1;
Dr. Joseph Albert as Clinical Associate in Dermatology, beginning July 1;
Dr. Karl-Eric Aström as Research Neuropathologist in the Department of Neurosurgery, for a period of two months, beginning approximately October 15;
Dr. Dudley M. Baker as Assistant Resident in Orthopedic Surgery for one year, beginning July 1;
Dr. Jane M. Berman as Clinical Fellow in Psychiatry at McLean Hospital, beginning July 1;
Dr. Peter H. Berman as Clinical Fellow in Neurology for one year, beginning July 1;
Dr. William A. Binstock as Assistant Attending Psychiatrist at McLean Hospital, beginning July 1;
Dr. Robert L. Bragg as Assistant in Psychiatry, beginning July 1;
Dr. Rosalie A. Burns (Mrs. Herbert I. Goldberg) as Clinical and Research Fellow in Neurology for one year, beginning July 1;
Dr. Ronald Cable as Clinical Fellow in Radiology, acting as Assistant in Radiology, beginning September 1;
Dr. Lloyd M. Caplan as Clinical and Research Fellow in Psychiatry for one year, beginning October 1;
Dr. James J. A. Cavanaugh as Assistant Physician to the Children's Medical Service, beginning July 1;
Dr. Peter T. Choras as Assistant Resident in Psychiatry for one year, beginning July 1;
Donald G. Comb, Ph.D. as Assistant Biochemist (Medicine) for one year, beginning September 1;

Dr. Sheldon Cooperman as First Assistant Resident in Pathology for one year, beginning July 1;
Dr. Wellington B. Cu as Assistant Resident in Psychiatry for one year, beginning July 1;
Dr. David C. Dean as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;
Dr. Edward C. Defoe, Jr. as Clinical and Research Fellow on the Children's Medical Service, for the period September 1, 1960 through June 30, 1961;
Dr. Jacob de Graeff as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Luis L. de Mola as Clinical Fellow in Pathology, for the period July 1 through December 31;
Dr. Patrick J. Donegan as Clinical Fellow in Anesthesia for one year, beginning February 1, 1961;
Dr. John Q. Durfey as Clinical Fellow in Anesthesia, beginning August 15, with the understanding that when he obtains a permanent Massachusetts license he will become Assistant in Anesthesia;
Dr. Richard G. Eaton as Assistant Resident in Orthopedic Surgery for one year, beginning July 1;
Dr. Daniel S. Ellis as a Member-at-Large on the General Executive Committee for one year, beginning July 1;
Dr. Eric Engel as Clinical and Research Fellow in Neurology for one year, beginning October 1;
Dr. Donald J. Fern as Assistant Resident in Psychiatry for one year, beginning July 1;
Dr. Arnold D. Fiascone as Assistant to the Children's Medical Service, beginning July 1;
Dr. Robert E. Flynn as Assistant in Neurology, beginning July 1;
Dr. Howard S. Frazier as Assistant in Medicine, beginning May 1;
Dr. Hans Hacker as Clinical and Research Fellow in Neurosurgery for one year, beginning August 1;
Dr. Peter M. Hacking as Clinical Fellow in Radiology for one year, beginning June 1, 1961;
Dr. Reginald Hall as Clinical and Research Fellow in Medicine for one year, beginning September 1;
Dr. Earle I. Hammer as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. William H. Harris as Assistant in Orthopedic Surgery, beginning July 1;
Dr. Robert W. Jackson as Clinical and Research Fellow in Orthopedic Surgery for one year, beginning July 1;
Dr. A. Myron Johnson as Exchange Assistant Resident on the Children's Medical Service, for the period August 11 through September 20;
Dr. James W. Lance as Clinical and Research Fellow in Neurology for one year, beginning October 1;
Dr. Myron B. Laver as Clinical Fellow in Anesthesia, beginning July 1, with the understanding that when he obtains a permanent Massachusetts license he will become Assistant in Anesthesia;
Dr. Robert S. Lees as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Edward Lewin as Research Fellow in Neuropathology at McLean Hospital, beginning September 15;
Dr. Austra Likais as Clinical Fellow in Medicine, assigned to Allergy, for one year, beginning June 1;
Dr. S. Bert Litwin as Clinical and Research Fellow in Surgery, beginning July 1;
Dr. Tecla O. Lovina as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Donald McCaughan as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Ramon L. Marquez as Assistant Resident on the Children's Medical Service, for the period July 5 through December 31;
Makoto Matsumoto, Ph.D. as Research Fellow in Biochemistry at McLean Hospital, beginning September 15;
Dr. Edward Messner as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. Abbott R. Miller as Second Assistant Resident in Radiology for one year, beginning July 1, 1961;
Dr. John A. Mills as Clinical and Research Fellow in Medicine, beginning June 24;
Lewis C. Mokrasch, Ph.D. as Assistant Biochemist at McLean Hospital, beginning September 1;
Dr. David R. Moloney as Clinical and Research Fellow in Dermatology for one year, beginning July 1;
Dr. Robert A. Nebesar as Second Assistant Resident in Radiology, beginning January 1, 1961;
Dr. Joe R. Norman as Clinical and Research Fellow in Medicine, beginning July 1;
Joseph C. Oakley, D.M.D. as Assistant Dental Surgeon, beginning May 13;
Dr. Harry S. Olin as Clinical and Research Fellow in Psychiatry and Acting Assistant Resident for one year, beginning July 1;
Dr. George W. Rever as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. Jack O. Rice as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. J. David Robertson as Associate Biophysicist at McLean Hospital, beginning June 1;
Earle H. Rosenberg, D.M.D. as Dental Surgeon, beginning July 1;
Dr. Ammon Rosenthal as Exchange Assistant Resident on the Children's Medical Service, for the period July 1 through August 10;
Dr. John J. Ross as Clinical Fellow in Neurology for one year, beginning July 1;
Dr. Jordan S. Ruboy as Assistant to the Children's Medical Service, beginning July 1;
Dr. Justus S. Saurbrey as Clinical and Research Fellow in Surgery for one year, beginning October 1;
Dr. Krishna M. Saxena as Clinical and Research Fellow on the Children's Medical Service, for the period September 1, 1960 through June 30, 1961;
Dr. Robert H. Schapiro as Clinical and Research Fellow in Medicine, beginning July 1;
Dr. Ronald A. Seltzer as Second Assistant Resident in Radiology for one year, beginning July 1, 1961;
Dr. Boris Senior as Clinical and Research Fellow on the Children's Medical Service, beginning November 1;
Dr. Louis Solomon as Clinical Fellow in Orthopedic Surgery for one year, beginning August 10;
Homer J. Squires, D.S.C. as Assistant Podiatrist on the Orthopedic Service, beginning May 1;
Dr. Richard H. Sweet as a Member-at-Large on the General Executive Committee for one year, beginning July 1;
Dr. Martin Terplan as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Captane P. Thomson as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
William H. Tingey, Jr., D.M.D. as Assistant Dental Surgeon, beginning May 13;
Dr. Rudolf Toch as Clinical Associate in Children's Medicine for one year, beginning July 1;
Dr. Louis Wener as Assistant in Radiology, beginning January 1, 1961;
Dr. Walther T. Weylman as Assistant in Radiology, beginning January 1, 1961;
Dr. Harold W. Williams, Jr. as Assistant Resident in Psychiatry for one year, beginning July 1;
Dr. Nicholas T. Zervas as Clinical and Research Fellow in Neurosurgery, for a period of eight months, beginning September 1.

The Trustees also voted to approve having Dr. Kiyoshi Inokuchi give a Richardson Lecture at the Hospital.

At their meetings during May, June, July, and August, the General Executive Committee voted:

To change the appointment of Dr. John E. Adams as Second Assistant Resident in Pathology from July 1 to September 15;
To rescind the promotion of Dr. Alan M. Bornstein from Third to Second Assistant Resident in Pathology, as of July 1;
To accept the resignation of Dr. James J. A. Cavanaugh from the position of Clinical and Research Fellow in Medicine, effective June 30;
To accept the resignation of Dr. Adolfo C. Coussirat from the position of Clinical Fellow in Anesthesia, effective as of June 24.

To promote:

Dr. George E. Battit to the position of Chief Resident in Anesthesia, beginning July 1;
Dr. Murray L. Janower to the position of First Assistant Resident in Radiology, beginning July 1;
Dr. William T. McCoy to the position of Resident in Radiology for one year, beginning July 1;
Dr. Robert G. Ojemann to the position of Resident in Neurosurgery, for the period September 1, 1960 through April 30, 1961;
Dr. Stuart E. Price, Jr. to the position of Resident in Urology for one year, beginning July 1;
Dr. Oscar E. Starobin from the position of Clinical Fellow in Medicine to that of Clinical Assistant in Medicine, beginning July 1;
Dr. Karl H. Wegner to the position of Second Assistant Resident rather than Third Assistant Resident in Pathology for one year, beginning July 1.

To reappoint:

Dr. Harry S. Abram as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. Maurice J. Boivin as Assistant Resident in Anesthesia for one year, beginning July 6;
Dr. John A. Bolzan as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Bob Bullwinkel as Third Assistant Resident in Surgery, beginning August 1;
Dr. Sidney R. Cooperband as Research Fellow in Medicine for one year, beginning July 1;
Dr. Jean R. Crabbe as Clinical and Research Fellow in Medicine, for the period July 1 through December 31;
Dr. Gianfranco Dal Santo as Clinical Fellow in Anesthesia, beginning June 23;
Dr. Frederick J. Duhl as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. Michael H. M. Dykes as Clinical Fellow in Anesthesia for one year, beginning January 1, 1961;
Dr. Alvin Essig as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Martin H. Flax as Clinical and Research Fellow and Acting Assistant Resident in Pathology for one year, beginning July 1;
Dr. Robert G. Frost as Assistant Resident in Anesthesia for one year, beginning September 1;
Dr. Lamont W. Gaston as Clinical and Research Fellow in Medicine, for the period July 1 through October 31;
Dr. Jack J. Greenberg as Second Assistant Resident in Surgery, beginning August 1;
Dr. William A. Hall as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Manuel Hernandez as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. Peter R. Holt as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Robert E. Kahn as Clinical and Research Fellow in Medicine, assigned to Allergy, for one year, beginning November 1;
Shelby Kashket, Ph.D. as Research Fellow in Medicine for one year, beginning July 1;
Dr. Leo T. Kelly as Assistant Resident in

Anesthesia for one year, beginning July 1;
Marvin R. Lamborg, Ph.D. as Research Fellow in Medicine for one year, beginning July 1;
Dr. Melvin Lederman as Clinical and Research Fellow in Surgery for one year, beginning July 1;
Dr. William F. McCourt as Clinical and Research Fellow in Psychiatry for one year, beginning July 1, provided he passes the special examination of the Educational Council for Foreign Medical Graduates;
Dr. Charles F. McKhann, III, as Second Assistant Resident in Surgery, beginning August 1;
Dr. John A. Mannick as First Assistant Resident in Surgery, beginning September 1;
Dr. Perry F. Mullinax, Jr. as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Bagepalli S. Narasinga Rao, Ph.D. as Research Fellow in Physics (Medicine) for one year, beginning November 1;
Emery Nyilas, Ch.E. as Assistant Physicist (Medicine) for one year, beginning August 5;
Dr. George M. Perrin as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. Alphonse M. Prus as Assistant Resident in Anesthesia for one year, beginning July 1;
Dr. Hugues Ryser as Clinical and Research Fellow in Medicine for one year, beginning September 15;
Dr. John R. Senior as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Nathan T. Sidley as Clinical and Research Fellow in Psychiatry for one year, beginning September 1;
Dr. Eliot M. Slater as Assistant Resident in Anesthesia, for six months, beginning June 1;
Mary J. Spiro, Ph.D. as Research Fellow in Medicine for one year, beginning July 1;
Dr. Robert G. Spiro as Research Fellow in Medicine for one year, beginning July 1;
Mary L. Stephenson, Ph.D. as Assistant Biochemist (Medicine) for one year, beginning July 1;
Dr. Quentin R. Stiles as Second Assistant Resident in Surgery, beginning August 1;
Dr. Philip R. Sullivan as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. Herbert C. Wimberger as Clinical and Research Fellow in Psychiatry for one year, beginning July 1.

To extend the appointments of:

Dr. James P. Bell as Clinical Assistant in Orthopedic Surgery, through May 15;
Dr. Fernando A. Cardenal as Clinical Fellow in Orthopedic Surgery, from June 16 through October 31;
Dr. Sophus H. Johansen as Clinical Fellow in Anesthesia, from August 9 through September 30;
Dr. George F. Kwass as Clinical Fellow and Acting Assistant Resident in Pathology, from July 1 through September 30;
Dr. Richard C. Packert as Clinical Fellow in Radiology, from July 1 through December 31;
Dr. Gilberto Rebouças as Clinical and Research Fellow in Medicine, from June 1 through September 15;
Dr. C. Norman Shealy as Assistant Resident in Neurosurgery but assigned to private service, from September 1, 1960 through April 30, 1961;
Dr. Dorothy A. Westcott as Clinical Fellow in Anesthesia, through July 14, 1961;
Dr. R. Lewis Wright as Assistant Resident in Neurosurgery, assigned to Neuroradiology, from September 1, 1960 through April 30, 1961;
Dr. Irving Zieper as Clinical and Research Fellow in Neuropathology for the months of July and August.

To change the titles of:

Dr. Padmakar P. Lele from that of Consultant in Neurophysiology to Assistant Neurophysiologist in the Department of Neurosurgery for one year, beginning May 4;
Dr. Harilaos T. Sakellarides from that of Clinical Fellow to Clinical and Research Fellow in Orthopedic Surgery for one year, beginning July 1.

To appoint:

Dr. Leroy D. Aaronson as Clinical Assistant in Dermatology, beginning July 1;
Dr. Donnell W. Boardman as Clinical Assistant in Medicine, assigned to Allergy, for one year, beginning May 1;
Dr. William T. Butler as Clinical Fellow in Medicine for one year, beginning July 1;
Dr. Edwin L. Carter as Clinical Assistant in Surgery, with the privilege of assisting Drs. Bartlett and Hamlin in the care of their patients in the Baker Memorial and Phillips House, beginning July 1;
Dr. M. Robert Coles as Clinical Assistant in Psychiatry, to work primarily in the Alcoholism program with Dr. Chafetz, beginning July 1;
Dr. Witold Drabikowski as Research Fellow in Medicine, beginning October 1;
Samuel R. Kamhi, Ph.D. as Research Fellow on the Orthopedic Service for one year, beginning October 1;
Roger J. B. King, Ph.D. as Research Fellow in Medicine for one year, beginning October 1;
Dr. Rodolfo R. Llinás as Research Fellow in Neurophysiology in the Department of Neurosurgery for one year, beginning September 1;
Dr. Alice Lowell as Clinical Assistant in Medicine, assigned to Allergy, beginning May 1;
Dr. James E. McKittrick as Clinical Assistant in Surgery, with the privilege of caring for the patients of Dr. Leland S. McKittrick in the Baker Memorial and Phillips House, beginning July 1;
Dr. Peter J. Mozden as Clinical Assistant in Surgery, with the privilege of assisting Dr. Langdon Parsons in the care of his patients in the Baker Memorial and Phillips House, beginning July 1;
Dr. Edward A. Nalebuff as Clinical Assistant in Orthopedic Surgery for one year, beginning October 1;
Haruhiko Noda, D.Sc. as Research Fellow in Medicine, for a period of six months, beginning July 15;
Dr. Nobuhiko Okabe as Research Fellow in Pathology for one year, beginning September 1;
Dr. Rafael J. Romay as Graduate Student Assistant on the Orthopedic Service for one year, beginning August 1;
Dr. Perla B. Salama as Research Fellow in Neurology, assigned to the Electroencephalography Laboratory, for a period of three months, beginning September 1;
Dr. Nobuaki Sasano as Research Fellow in Pathology for one year, beginning September 1, 1961;
George Szabó, Ph.D. as Assistant Biologist (Dermatology), beginning August 1, 1959;
Dorothy F. Travis, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning October 1;
Dr. Weiert M. Velle as Research Fellow in Medicine for one year, beginning October 1.

MYASTHENIA GRAVIS AND QUININE TONIC

Since a large number of patients with myasthenia gravis come to the Massachusetts General Hospital Out-Patient Clinic, through private physicians, and are admitted to the wards, Baker Memorial, or Phillips House, and have thymectomy here under various members of the staff, Dr. Henry R. Viets and I thought it might be worth while to inform all staff members about the possible risks if such patients were given a popular beverage known as quinine tonic.

It has long been known that quinine salts have a curare-like effect and this makes the symptoms of myasthenia gravis worse. Indeed, the use of a 5 gr. tablet (300 mg.) of quinine sulfate, used to diagnose certain forms of the disease, is one of the diagnostic procedures. This amount of quinine would make a mild or moderate myasthenic a bit worse and would have no effect on a non-myasthenic or otherwise normal person.

Since this is so, we have recently investigated, through the American Medical Association Council on Foods and Nutrition, the problem of quinine content in the beverages available in this country. A letter of warning about this matter to all physicians appeared on page 932 in the June 25 issue of the *Journal of the American Medical Association*. Five distributors of this quinine beverage, including one overseas company, were extraordinarily cooperative in getting this information to us and in sending one of their chemists and a supervisor to Boston to clear up some puzzling difficulties in the measurement of quinine salts in the presence of an alkaline carbonated drink containing some flavoring and essential oils.

All of the five beverages tested had quinine salts under 3 mg. per 32 cc. (one ounce). This would mean that it would take 10 bottles of beverage to equal a 5 gr. or 300 mg. test tablet. However, since the severe forms of myasthenia may be sensitive to this salt—10 to 20 times that of a normal person—even one bottle of this beverage might produce a dangerous exacerbation in a severely ill patient. These products are becoming increasingly popular throughout the United States and it seems wise to ask all members of the staff of this Hospital to tell their myasthenic patients to avoid quinine water, even if their cases are mild, or, if they like the beverage, to take as small an amount as possible—not more than one-half a bottle. In hot weather, with carbonated drinks available in the Hospital, it is conceivable that this type of beverage might be offered to patients as an alternative to ginger ale or some other similar drink. This warning should prevent any nurse, Gray Lady, physician, or relative from giving a myasthenia gravis patient a drink of quinine water.

Incidentally, the calorie content of the various available quinine waters varies between 90 and 100 calories per bottle, therefore the ordinary form of this beverage has to be considered for such patients as diabetics, who are on measured or low calorie intake. Several of the firms do make, on special request, tonic water sweetened with non-calorie materials, such as Sucaryl.

Robert S. Schwab, M.D.,
Neurologist,
in charge of Myasthenia Gravis Research

MEDICAL ILLUSTRATION DEPARTMENT

Mr. Thomas Stebbins has recently been appointed Director of the Massachusetts General Hospital School of Medical Illustration and the Medical Art Department to succeed Mrs. Muriel McLatchie Miller, who retired on June 30.

Mr. Stebbins, who was Director of the Medical Art Department at the Henry Ford Hospital in Detroit, was the final unanimous choice of our Staff Committee on Medical Art and Photography. Mr. Stebbins is a graduate of Deerfield Academy, Amherst College, and the Department of Medical Illustration of the Johns Hopkins University Medical School. He attended the Pennsylvania Academy of Fine Arts, and has been Consultant to the University of Maryland Medical School and Research Assistant at Johns Hopkins Hospital. He is a past Vice-President of the Association of Medical Illustrators and is currently chairman of the Association's Finance Committee and a member of its Board of Governors.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter, and not under the hospital department with which you are affiliated.

The following new titles have been received:

Anesthesia

Beecher, H. K., and Ford, C.
Nathan P. Rice's *Trials of a Public Benefactor*: A commentary.
J. Hist. Med. & Allied Sc. 15:170.
Smith, G. M., and Beecher, H. K.
Amphetamine, secobarbital, and athletic performance. III. Quantitative effects on judgment.
J.A.M.A. 172:1623.

Arthritis and Rheumatism

Calkins, E., Black, R. L., Clark, G. M., Hollander, J. L., Mainland, D., Mikkelsen, W. M., Ragan, C., and Short, C. L.
Therapeutic evaluation in rheumatoid arthritis.
Arthritis & Rheumatism 3:101.

Biochemistry Research

Gergely, J., Gouvea, M. A., and Martonosi, A
Studies on actin. II. Partially polymerized actin solutions.
J. Biol. Chem. 235:1704.
Martonosi, A., Gouvea, M. A., and Gergely, J.
Studies on actin. III. G-F transformation of actin and muscular contraction (Experiments *in vivo*).
J. Biol. Chem. 235:1707.
Martonosi, A., Gouvea, M. A., and Gergely, J.
Studies on actin. I. The interaction of C^{14}-labeled adenine nucleotides with actin.
J. Biol. Chem. 235:1700.

Cardiology

Bland, E. F.
Declining severity of rheumatic fever: A comparative study of the past four decades.
New England J. Med. 262:597.
Currens, J. H.
Cor pulmonale & atrial fibrillation.
Newton-Wellesley Med. Bull. 12:12.
Littmann, D., Starobin, O. E., Hall, J. H., Matthews, R. J., and Williams, J. A.
A new method of left ventricular catheterization.
Circulation 21:1150.
Rowe, J. C., Bland, E. F., Sprague, H. B., and White, P. D.
The course of mitral stenosis without surgery: Ten- and twenty-year perspectives.
Ann. Int. Med. 52:741.

General Medicine

Harwood, R.
Insulin-binding antibodies and "spontaneous" hypoglycemia.
New England J. Med. 262:978.

General Surgery

Churchill, E. D.
Surgery, the amanuensis of science.
In Disease and the advancement of basic science, Henry K. Beecher, Editor, Cambridge, Mass., Harvard University Press, p. 364.
McDermott, W. V., Jr.
The ammonium tolerance test in the diagnosis of disease of the liver and portal hypertension.
Surg. Forum 10:282.
McDermott, W. V., Jr.
The double portacaval shunt in the treatment of cirrhotic ascites.
Surg., Gynec. & Obst. 110:457.
Nardi, G. L.
Technique of sphincteroplasty in recurrent pancreatitis.
Surg., Gynec. & Obst. 110:639.
Raker, J. W., and Friedsam, H. J.
Disaster-scale medical care problems: A study of medical management of casualties resulting from a tornado in Dallas, Texas.
J.A.M.A. 173:1239.
Waddell, W. R., Zuidema, G. D., and Smith, G. M.
Catechol amine excretion by duodenal ulcer patients.
J. Clin. Investigation 39:834.

Laboratory Science

Leskowitz, S., and Waksman, B. H.
Studies in immunization. I. The effect of route of injection of bovine serum albumin in freund adjuvant on production of circulating antibody and delayed hypersensitivity.
J. Immunol. 84:58.

Medical History

Churchill, E. D.
Foreword.
In Thoracic surgery before the 20th century, Lew A. Hochberg, M.D., New York, Washington, Hollywood, Vantage Press.

Neurology

Brown, M. R.
The inheritance of progressive muscular atrophy as a dominant trait in two New England families.
New England J. Med. 262:1280.
Majno, G., Waksman, B. H., and Karnovsky, M. L.
Experimental study of diphtheritic polyneuritis in the rabbit and guinea pig. II. The effect of diphtheria toxin on lipide biosynthesis by guinea pig nerve.
J. Neuropath. & Exper. Neurol. 19:7.

Neurophysiology

Brazier, M. A. B.
Some uses of computers in experimental neurology.
Exper. Neurol. 2:123.
Dunlop, C. W., Adey, W. R., Killam, K. F., and Brazier, M. A. B.
Mechanism of action of thiosemicarbazide and Metrazol on cerebellar and cerebral activity in the cat.
Am. J. Physiol. 198:399.

Neurosurgery

Bakay, L.
Studies in sodium exchange: Experiments with plasma, cerebrospinal fluid, and normal, injured, and embryonic brain tissue.
Neurol. 10:564.

Otolaryngology

Lewis, D. K.
Some unsolved problems of stapes mobilization.
Ann. Otol., Rhin. & Laryng. 69:222.

Psychiatry

Benda, C. E.
The existential approach in psychiatry.
J. Existential Psychiatry 1:24.
Benda, C. E.
Language, consciousness, and problems of existential analysis (Daseinsanalyse).
Am. J. Psychotherapy 14:259.
Sifneos, P. E.
A concept of "emotional crisis".
Ment. Hyg. 44:169.

Rhino-Neurosurgery

Hirsch, O.
Operation of a hypophyseal duct tumor by transsphenoidal method in a 3½ year old child with spongy sphenoid. (In German)
Acta-oto-laryng. 51:561.

Miscellaneous

Churchill, E. D.
The standards of military medicine in the Army.
Med. Bull. of the U.S. Army, Europe, 17:127.
Farnsworth, D. L.
Emotional obstacles to health programs.
J. School Health 30:49.
Farnsworth, D. L.

CONSULTING STAFF

A member of our group of Consultants has expressed the conviction that several members of our Consulting Staff are doing especially valuable work and would be glad to send reports of such work to THE NEWS if they were invited to do so. THE NEWS is always glad to receive at any time material suitable for publication in its pages; but, because of the above suggestion, the Editor of THE NEWS herewith extends a special invitation to all members of the Consulting Staff to contribute reports of any of their activities which they feel would be of interest to our readers.

* * *

PODIATRY SERVICE

For a good many years Dr. John F. Kelly, Podiatrist attached to our Orthopedic Service, has held a weekly clinic in the Out-Patient Department for referred podiatry patients and has answered consultation requests on the wards and private services of the Hospital.

The volume of this work has increased to the point where we now have four podiatrists—Dr. John F. Kelly, Podiatrist, and three Assistant Podiatrists: Drs. John D. McLean, Hugh J. O'Rourke, and Homer J. Squires—on the staff of the Hospital. Any of these men may be called for consultation in the Baker Memorial and Phillips House. Billing for professional fees will be on the same basis as for other professional services.

* * *

Over three hundred friends of Mr. William J. MacNair attended an informal reception last July, honoring him on the occasion of his retirement from the Hospital after many years of service as Head of Orderlies and more recently as Director of the Building Service Department.

The Administration presented Mr. MacNair with a very attractively framed Novak colored block print of the Bulfinch and White Buildings, as seen from the Lawn, and a handsome check. Quite as much appreciated by Mr. MacNair was the gift of a guest book, in which were the signatures of scores and scores of his past and present associates and friends at M.G.H.

* * *

Mr. Maurice H. Richardson (Jr.) is working on a biography of his well-known father, who became a member of our Visiting Staff in 1882 and rose to the position of Surgeon-in-Chief in 1911, which position he held at the time of his death in 1912. Mr. Richardson would greatly appreciate receiving any items of interest which concern his father's life and work. Such items will be acknowledged and returned, and due credit given to the contributors if the material is published. Mr. Richardson's address is 1623 Centre Street, Roslindale 31, Massachusetts. His telephone number is FA 5-2423.

VOLUNTEER GROUPS
MGH STAFF WIVES ASSOCIATION

The sun shone brightly on June 11, when Dr. and Mrs. Bradford Cannon, gave their annual family picnic for our MGH visitors from other lands, as well as for the Staff Wives and their families. Two hundred people—nearly half of them children— arrived by bus and private transportation at the Cannon home on Weston Road in Lincoln. Friends and strangers grouped and regrouped to have picnic lunch on the lawn, while ice cream and soft drinks were dispensed with pleasant informality in front of the Cannon house. After this, the picnickers played tennis, badminton, or baseball, walked in the woods or went swimming. There was much coming and going, much conversation, and much varied activity, from eleven in the morning until four in the afternoon.

An added feature of this year's picnic was a side trip by bus to the nearby de Cordova Museum (also in Lincoln) which was holding its annual festival—the theme being the Arabian Nights. Everyone, therefore, had the opportunity of exploring the museum, seeing its permanent exhibits, and could also wander about the grounds near the lake and view the colorful festival.

For many days after the picnic, our visitors from other countries stopped by at the Staff Wives' desk in the Hospital to express thanks and pleasure. Many of the visitors from Norway, Pakistan, Japan, Poland, or elsewhere, had had, on June 11, their first introduction to Boston's lovely country surroundings and to informal American hospitality. They had enjoyed the day, were grateful for the good will expressed, and were most gracious in their thanks.

The following letter from Dr. Edgardo G. Carrasco (clin. and res. fel. *M.* 1960) and Mrs. Carrasco, whose present address is Los Diamelos 2948, Santiago, Chile, was addressed to the Staff Wives' Desk, and reads:

> Dr. and Mrs. Edgardo Carrasco, for one and a half years in Boston, want deeply to thank all members of that Desk for the many attentions we received while we lived in your city. It is difficult, when you are not a native of the United States, to express how grateful we are, but if the words look short, we want to let you know that always we will keep in our hearts, as an example of kindness, the beautiful job you are doing at the Hospital for the foreign visitors.
>
> Please receive again our thanks and best wishes for the future.

New addresses:

Dr. Joseph Albert (r.p. *D.* 1960), 95 Lincoln St., Framingham, Mass.

Brief bits:

At the Pan-American Medical Congress, held in Mexico City last May, a day was devoted to a program on Clinical Electroencephalography. Dr. Mary A. B. Brazier was the North American Chairman.

Dr. John P. Bunker has been appointed Professor of Anesthesia at Stanford University School of Medicine, effective in September.

Dr. Benjamin Castleman presented a paper, including the showing of a film, on the "Dynamics of aortic valve disease" before the International Congress of Clinical Pathology in Madrid and the International Academy of Pathology in London during the latter part of June. During a two-week stay in Israel. he conducted a Slide Seminar on "Lesions of the mediastinum and lung" before the Israeli Pathology Society (about 40 pathologists) in Jerusalem, a lecture on "Hyperparathyroidism" and a C.P.C. at the Hebrew University-Hadassah Medical School, and a C.P.C. at the Tel Hashomer Hospital in Tel Aviv.

Dr. Dean A. Clark has been elected an Alumni-Trustee-at-Large of Princeton University. Dr. Clark will serve a four-year term.

Dr. Perry J. Culver has succeeded Dr. Kendall Emerson (*E.S.* 1902) as Assistant Dean for Admissions and Chairman of the Committee of Faculty Admissions at Harvard Medical School.

Dr. Louis K. Diamond is travelling in many countries in his study of a nutritional disease among children, called kwashiorkor. He will visit hospitals and clinics in the Middle East, Central Africa, South America, Central America, and Mexico — areas in which the disease is prevalent.

Dr. Allan L. Friedlich has been re-elected Vice-President of the Massachusetts Heart Association's Greater Boston Chapter.

Dr. Frederick T. Hatch has been appointed Chief of the Arteriosclerosis Study Unit at the Hospital.

Capt. Stephen E. Hedberg, on leave of absence from his Residency in Surgery for active service in the U.S. Army, is assigned to Walter Reed Army Institute of Research. He was recently sent on temporary duty to Chile, to carry on observations on clostridial infections in earthquake victims.

Dr. Oscar Hirsch has been awarded a grant by the American Cancer Society (Massachusetts Division) for the continuation of his study of malignancy in pituitary tumors.

Dr. William V. McDermott, Jr. returned in May from a six-week European trip which included brief visits to Manchester, Birmingham, and Paris; a visit to the University of Louvain with Professor Morelle and Dr. Charles G. DeMuylder; participation in a panel on "Hepatic coma" at the International Congress of Gastroenterology, Leyden, Holland; and a talk on "The surgical treatment of cirrhotic ascites" at the first meeting of the International Association for the Study of Diseases of the Liver. The last two weeks in England were spent at the King's College

No. 91 in a series of Staff photographs

Dr. Thomas B. Fitzpatrick—Chief of Dermatology Service

Hospital and Medical School, where Dr. McDermott served as Associate Director of Surgery pro tempore, at the invitation of Mr. Harold Edwards. On the return trip via New York, Dr. McDermott spoke on "Portal hypertension" in a panel at the spring meeting of the New York Academy of Medicine.

Dr. Alex F. Müller (a.r.p. 1953) has been made a full Professor of Medicine at the University of Geneva, Switzerland.

Dr. George L. Nardi spoke on "Hyperparathyroidism and multiple endocrine tumors" at the Holyoke Hospital on May 15, at the invitation of Dr. Edward L. Ferguson (*S.* 1954). On May 17, he addressed the staff of the Centro Medico in Guatemala City, Central America, and showed a motion picture on "The surgical management of chronic pancreatitis" as a guest of Dr. Rodolfo E. Herrera (*E.S.* 1943). From May 23 through May 25, he participated in a symposium on the pancreas, sponsored by the Mallinckrodt Foundation, at Endicott House in Dedham.

Dr. Oglesby Paul (*W.M.* 1943), President-elect of the American Heart Association, was the principal speaker at the dinner which followed the 11th annual meeting of the Massachusetts Heart Association, held in Boston last May.

Dr. Carter R. Rowe and Dr. J. Drennan Lowell read a paper on "Prognosis of fractures of the acetabulum" at the American Orthopaedic Association meeting, held at Hot Springs, Virginia, on June 1.

Dr. Paul S. Russell, who resigned as Assistant in Surgery at M.G.H. on June 30, assumed his new duties as Associate Professor of Surgery at Columbia University College of Physicians and Surgeons, and Associate Attending Surgeon at the Presbyterian Hospital, New York City, on July 1.

Dr. Joseph Stokes, III, presented a paper on "Genetic factors in the pathogenesis of coronary atherosclerosis" at the 2nd Asian-Pacific Congress of Cardiology, held in Melbourne, Australia, last June.

Dr. David W. Wallwork (*E.S.* 1932) was named President-elect of the Massachusetts Medical Society at the Annual Meeting of the Society, held in Boston last May.

The prize for the best paper presented at the 36th Annual Meeting of the American Association of Neuropathologists was awarded to Drs. Henry deF. Webster, David Spiro, Byron H. Waksman, and Raymond D. Adams for their paper on "Phase and electron microscope study of experimental diphtheritic neuritis in guinea pig sciatic nerves".

Dr. Edwin O. Wheeler has been elected Secretary of the Massachusetts Heart Association's Greater Boston Chapter.

At the annual meeting of the Greater Boston Council, Directors of Hospital Volunteers, Miss Mary Ruth Wolf, Director of our Volunteer Unit, was elected Chairman for 1960-1962.

MASSACHUSETTS EYE & EAR INFIRMARY

The following appointments were made at the meetings of the Executive Committee of the Board of Managers of the Massachusetts Eye and Ear Infirmary, held during May, June, July, and August:

Dr. Mary Ampil — Fellow in Anesthesiology for one year, beginning July 1;

Dr. Joel Contreras — reappointed as Fellow in Ophthalmology, attached to the Retina Service, for one year;

Dr. Geza Jako — reappointed as Fellow in Otolaryngology for one year, beginning July 1;

Dr. David L. Knox — Fellow in Ophthalmology, assigned to the Howe Laboratory, for one year, beginning July 1, 1961;

Dr. Dominic Lim — Fellow in Anesthesiology for one year, beginning September 1;

Dr. Eeva-Liisa M. Martola — Fellow in Ophthalmology, assigned to the Glaucoma Consultation Service, for one year, beginning July 1;

Dr. Calbert I. Phillips — Fellow in Ophthalmology, assigned to the Glaucoma Consultation Service, for one year, beginning October 1;

Dr. Ronald Pinkerton — Fellow in Ophthalmology, assigned to the Howe Laboratory, for four months, beginning September 1;

Dr. Mendell Robinson — Assistant in Otolaryngology;

Dr. Uthai Rutnin — reappointed as Fellow in Ophthalmology, attached to the Retina Service, for one year;

Dr. Felix Sabates — reappointed as Fellow in Ophthalmology, attached to the Retina Service, for one year;

Dr. Silvio von Pirquet — reappointed as Fellow in Ophthalmology, assigned to the Retina Service, through December 31;

Dr. Takeshi Watanabe — Fellow in Otolaryngology, attached to the Eaton-Peabody Laboratory, for one year, beginning September 1;

Ernst G. Wolf, Ph.D. — Fellow in Ophthalmology, assigned to Retina Physiology, for one year, beginning July 1.

At the meeting of the Board of Managers, held on July 20, Dr. Garrett L. Sullivan's title was changed to that of Surgeon in Ophthalmology, and the following were made Associate Surgeons in Ophthalmology:

Dr. Henry F. Allen
Dr. W. Morton Grant
Dr. Sumner D. Liebman
Dr. Abraham Pollen
Dr. Charles L. Schepens

150th ANNIVERSARY PROGRAM

Massachusetts General has received a gift of 50,000 pounds sterling ($140,000) from the Wellcome Trust Fund in London. The money will be used to establish the Henry S. Wellcome Fund for Research in Medical Science at the Hospital.

The Wellcome Trust was created by the will of the late Wisconsin-born Sir Henry S. Wellcome, co-founder and later sole owner of Burroughs Wellcome and Company, a world-wide pharmaceutical enterprise. Under the terms of the will, all the distributed profits of the business are used to promote research in human and animal medicine, or in the history of medicine anywhere in the world.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL
1811

No. 198 Boston, Mass. November 1960

THE ALLERGY UNIT

The Allergy Unit currently consists of a group of Research Laboratories on the fourth floor of the Bulfinch Building and an Allergy Clinic on the third floor of the Out-Patient Department.

Since the illnesses with which the Unit is concerned are not ordinarily of a nature to require admission to the Hospital, the great preponderance of patients are seen in the Allergy Clinic. We hope ultimately to bridge the existing gap between basic research in the laboratory on the one hand and allergic disease as it presents itself in the patient with an "allergy" on the other. The gap exists today, as it has in the past, because the techniques which have been so productive in the fields of immunology and the prevention of infectious disease are either inapplicable or only indirectly applicable to the elucidation of questions regarding allergic disease in man, even though some type of immunological response is assumed to be responsible. We see as our immediate task, therefore, the fusing of these two relatively independent activities, of which the Allergy Clinic has, from the standpoint of investigation, always been much the weaker. This is not said in criticism of the patient care provided in the Clinic, because this is quite a different problem and one which, of course, must always come first. But the remark that patient care of the future depends on the quality of clinical investigation today is no less true for being a platitude; and among the diseases of immediate concern to us, investigation can hardly begin elsewhere than in the Clinic. We hope, therefore, to modify the Clinic so as to provide the kind of information needed to make it possible to reach this objective — an effort which has led to a number of changes and innovations. We foresee, therefore, an increasingly close association between those who work in the Clinic and those who are doing laboratory research exclusively.

The major investigative effort in the Allergy Clinic at the present time is an attempt, now in its second year, to assess the value of injections or "shots" in hay fever, with careful experimental control. It may come as a surprise that this has never been done in a manner to confirm or deny the prevailing opinion among allergists that injections are indeed effective. We feel that adoption of the much-touted repository ("one shot") method will be premature until it has been clearly established whether or not the conventional procedure is effective, and if effective, to what degree.

The subspecialty of allergy has suffered from a misunderstanding, both within and without, as to what constitutes its concern — mainly, I think, because the word "allergy" is used to denote two very different things. Clinically, it is a subspecialty within the specialty of internal medicine, preoccupied almost exclusively with hay fever (allergic rhinitis and sinusitis) and bronchial asthma (allergic obstructive bronchitis) and a few other closely related conditions. This constitutes a narrow spectrum of disease — a fact which has unfortunately also tended to narrow the medical horizon of clinical allergists. Used in its other sense, a "physiological" one, allergy is an integral aspect of the means by which higher organisms become adjusted to life on earth, and apparently is the basis on which their capacity to withstand the onslaughts of bacteria, viruses, and parasites largely rests. It has been generally assumed that, like immunity, allergic reactions are mediated by antibody, which may be described as a globulin (usually a gamma globulin) produced as a response to invasion of the "internal milieu" of one or more substances harmful or perhaps only foreign to the organism, and capable of acting in a manner either to render a subsequent encounter with these substances harmless (immunity), or seemingly to stir up an "alert" of such intensity as to be damaging or, at times, even fatal (allergy). In this sense the terms "immunology" and "allergy" embrace a wide variety of tissue reactions as seen in infections and infestations, induced resistance to disease and a host of clinical states including serum disease, many forms of reactions to drugs, certain hematologic disorders, and some or all of the so-called "collagen" diseases. An allergic mechanism may perhaps underlie such familiar chronic processes as rheumatic fever and rheumatoid arthritis. The available means of studying these conditions as allergic reactions are so meager and so poorly suited to advance our understanding that what little progress has been made has come very slowly. Perhaps the recent intense interest in experimentally induced delayed type allergy will alter this unfortunate state of affairs. In any case, this difficult field, which is too far-flung for any single Unit to encompass, offers numerous opportunities to those who wish to engage in research.

The history of the Allergy Unit has been closely tied to the history of the Allergy Clinic in the Out-Patient Department. The Clinic was started in 1919 by Dr. Francis M. Rackemann, under whose enthusiastic and expert guidance it thrived and grew. At that time, Dr. Rackemann had laboratory space on the fourth floor of Bulfinch, where work on various aspects of allergy was carried on until 1942, when the laboratory was moved to the basement of the Bulfinch. Upon Dr. Rackemann's retirement in 1948, Dr. Walter S. Burrage became Chief — a position he held until 1956. The great preponderance of investigation into the diseases treated in allergy clinics had been carried on here and elsewhere at the clinical level. The need for research into the mechanisms underlying these disease processes — a need which had been clearly recognized by Dr. Rackemann when the Allergy Clinic was first established in 1919 — had become increasingly apparent. Dr. Burrage, with Dr. John W. Irwin, who began his association with the Allergy Clinic in 1950, established a new research laboratory on the fifth floor of the Domestic Building, and carried out studies in anaphylaxis which were to develop in the direction of a much broader study of the behavior of small blood vessels — studies which led ultimately to the creation of the Microcirculatory Laboratory in the Eye and Ear Infirmary, under Dr. Irwin's direction. They also followed a group of asthmatic patients under treatment with the adrenocorticosteroid drugs, and were active in other phases of clinical investigation as well.

In 1956, Dr. Robert L. Berg was appointed Chief, and at the same time the Unit was assigned excellent laboratory space on the fourth floor of Bulfinch. Thus, research activities in allergy returned to a point very close to the home they had occupied before 1942 under Dr. Rackemann. Dr. Sidney Leskowitz joined the Unit in 1956, having been associated during the previous two years with the research laboratories in the Vincent Memorial. In 1958, Dr. Berg was offered the position of Professor of Preventive Medicine at the University of Rochester, which he accepted. It was the empty post that Dr. Berg left behind him that the present incumbent filled in the same year, leaving an Allergy Unit at the Massachusetts Memorial Hospitals which was very similar in organization to the one described herein. Dr. E. Mildred Follensby and Dr. William Franklin were members of that Unit and, with Dr. Robert E. Kahn, a Research Fellow in the Unit, made the short trip across town, encumbered with the files, books, and bottles that somehow come to be an extension of the very "self" of all of us. We were joined on arrival by Dr. Edgardo G. Carrasco, from Santiago, Chile, who had been appointed to the Allergy Unit at the Massachusetts Memorial Hospitals as a Research Fellow.

Those interested in pursuing this history further will find articles in past issues of The News: one by Dr. Rackemann in October 1947; two by Dr. Burrage in February and December 1952; and one by Dr. Irwin in November 1956.

Dr. Follensby had a long association with Dr. Sanford B. Hooker at Boston University School of Medicine before joining the Allergy Unit at the Massachusetts Memorial Hospitals. Her primary interest at present is the identification and characterization of allergenic substances in pollen extracts and the development of *in vitro* methods for detecting antibody to them. To date, no entirely *in vitro* method exists which will detect with certainty antibody responsible for the allergic peculiarities of patients with hay fever and asthma. A close approach to such a procedure was achieved four years ago when Dr. Follensby showed that a precipitate formed by reacting rabbit antibody for human gamma globulin with serum from a patient who had been treated with injections of pollen extract for pollenosis, would specifically remove the allergenic activity of solutions prepared from ragweed pollen extract. This procedure is applicable in some antigen-antibody systems where conventional immunologic procedures fail. An outgrowth of this procedure has been a study by Dr. Kahn of the behavior of unreacted antibody contained within a precipitate toward antigens of varying molecular size. He has also been studying other means of precipitating "non-precipitating" antigen-antibody complexes.

Dr. Leskowitz has been primarily interested in the nature of the immune response and some aspects of delayed type hypersensitivity. In the course of injecting rabbits with immune precipitates, he uncovered differences in some animals in the immunologic specificity of gamma globulins. Working with Dr. James J. A. Cavanaugh, then a Research Fellow in the Unit, it was shown that, when a second antigen is injected into a rabbit which is already responding maximally to a first, no decrease in the intensity of the response to the second is observed. This finding indicates that "competition" of antigens does not occur under these circumstances. Dr. Leskowitz, in collaboration with Dr. Mary Amdur in the School of Public Health, is also studying the role of hypersensitivity in the production of respiratory airway obstruction ("asthma") in the guinea pig. As mentioned earlier in this article, the Unit is undertaking a "double-blind" study to assess the efficacy of conventional injections or "shots" for the treatment of hay fever and seasonal asthma. This study, which has proved to be a major undertaking, is the chief concern of Dr. Franklin. He is assisted in this by two Clinical Fellows — Dr. Louis F. Scribner and Dr. Charles H. Banov — who joined the Unit in July 1960. An attempt to carry out such a study was made in 1957 and, though unsuccessful, the experience gained was very valuable. The current study began in March 1959. Although final analysis of the data obtained to date will require considerable time and effort, it is already clear that the means of assessing the progress of patients is such as to delineate the ragweed season with striking clarity.

Francis C. Lowell, M D.,
Physician
and *Chief of the Allergy Unit*

* * *

Dr. Madelaine R. Brown (past neurologist at Massachusetts General) received a citation at the 75th anniversary convocation of Bryn Mawr College last June. This is the first time that Bryn Mawr has ever given citations.

Dr. Dean A. Clark was one of five new Council chairmen to be appointed by Frank S. Groner, President of the American Hospital Association, at the meeting of the AHA Board of Trustees held in San Francisco last August. As chairman of the Council on Research and Education, Dr. Clark will also serve as a member of AHA's Coordinating Council.

Dr. Daniel H. Hiebert of Provincetown has been named General Practitioner of the Year by the Massachusetts Medical Society. Although Dr. Hiebert is not an alumnus of M.G.H., he attended courses in cardiology here at the Hospital in years past and is well known to many physicians in this area and otherwhere for his 41 years of outstanding work in medicine. He is much beloved by scores of friends and patients on the Cape.

Dr. Robert F. Loeb (*W.M.* 1920) was elected an Honorary Fellow of the Royal Society of Medicine in London, England, last summer.

After Dr. James Howard Means had been elected an Honorary Fellow of the Royal Society of Medicine and had participated in the International Goitre Conference, in London, England, last summer, this poem appeared in the August 6 issue of *The Lancet:*

IV INTERNATIONAL GOITRE CONFERENCE
July 1960

(With apologies to Kipling)

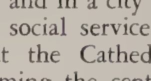
The tumult and the talking die:
The Profs and Lecturers depart:
To Moss go back tail coat, white tie,
The robes of medicine, science, or art.
We will remember some we met,
But what they said we'll soon forget.

Of chromatography we heard,
And lots of iodotyrosines.
We didn't understand a word,
But pinned our faith to Dr. Means.
And thus with our accustomed ease
We'll go on curing Graves' disease.

While we all bemoan the departure of Rev. William B. Spofford, Jr., our Supervisory Chaplain for the past four years, we cannot but wish him a happy and rewarding experience in his new post. He has been elected Dean of St. Michael's Cathedral, Boise, Idaho, and will assume his new duties on November 1.

Located directly across from the Idaho State Capitol and in a city featuring many medical and social service agencies, it is planned that the Cathedral will work toward becoming the central educational unit in the diocese of Idaho, under the direction of Mr. Spofford, and toward relating to the on-going training of seminarians and clergy of the Protestant Episcopal Church, as well as carrying on the normal functions of a cathedral-parish.

Mr. Spofford's new address will be 2003 North 23rd Street, Boise, Idaho.



The Board of Trustees, at their meetings held on September 9 and 23, voted:

To approve an invitation to Professor Philip R. Allison of Radcliffe Infirmary, Oxford, England, to give a Richardson Lecture at the Hospital;

To set the retirement date for Dr. Joseph S. Barr as June 30th following his sixty-sixth birthday;

That Dr. Winfield S. Morgan, who has been on leave of absence for two years, be reinstated as Assistant Pathologist, as of September 12;

To accept the resignation of Dr. John T. Sharp from the position of Assistant in Medicine, effective August 31;

To accept with regret the resignation of Reverend William B. Spofford as Protestant Chaplain at the Hospital, effective October 15.

To appoint:

Dr. Luciano Basauri as Clinical and Research Fellow in Neurosurgery for one year, retroactive to July 1;

Dr. Allan M. Butler to the Board of Consultation, effective as of July 1;

Dr. William P. Castelli as Clinical Fellow in Medicine for one year, beginning October 1;

Dr. John P. Connelly as Chief Resident on the Children's Medical Service for one year, beginning July 1, 1961;

Dr. Prafulchandra M. Dalal as Clinical and Research Fellow in Neurology for one year, beginning September 1;

Dr. Peter A. Del Giudice as Assistant Resident in Anesthesia for one year, beginning August 1, 1961;

Dr. Derrick Felix-Davies as Clinical and Research Fellow in Medicine for one year, beginning October 15;

Dr. Gerald Kenner as Assistant Resident in Orthopedic Surgery for one year, beginning October 1;

Professor Alan C. Lendrum of Scotland as Visiting Pathologist pro tempore for one week, beginning October 17;

Dr. J. Philip Lythgoe as Clinical and Research Fellow in ~~Neurology~~ for one year, beginning October 15; Surgery (mistake li

Dr. David C. Mitchell as Assistant Resident in Orthopedic Surgery for one year, beginning October 1;

Dr. Paul F. J. New as Associate Radiologist, beginning September 23;

Dr. Nathan B. Talbot as Acting Chief of the Children's Medical Service until a permanent Chief is selected and has assumed office;

Dr. Marvin L. Tanzer as Clinical and Research Fellow in Medicine for one year, beginning July 1, 1961;

Dr. Howard A. Trachtenberg as Assistant Resident in Anesthesia, beginning July 1, 1961.

At their meetings on September 7, 14, and 21, the General Executive Committee voted:

To accept the resignation of:

Dr. Herbert Schunk from the position of Clinical Fellow in Radiology, effective September 21.

To promote:

Dr. Robert E. Dinsmore to the position of First Assistant Resident in Radiology, beginning October 1:

Dr. Elwin W. Donnelly to the position of Resident in Radiology, beginning October 1;

Dr. Leonard I. Kleinman to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1961;

Dr. Brigid P. Nesburn to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1961;

Dr. Murray K. Rosenthal to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1961;

Dr. John T. Truman to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1961.

To extend the appointment of:

Dr. José L. Barzelatto as Clinical and Research Fellow in Medicine, through October 31.

To ~~reappoint~~:

James E. Anliker, Ph.D. as Research Fellow in Anesthesia for one year, beginning July 15;

Dr. John A. Baldwin as Clinical and Research Fellow in Psychiatry for one year, beginning October 1;

Dr. William H. Batchelor as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. Albert Damon as Clinical Fellow in Medicine for one year, beginning September 1;

William H. Ellett, B.Sc. as Assistant Physicist (Medicine) for one year, beginning September 24;

Dr. Sigetosi Kamiyama as Research Fellow in Medicine for one year, beginning September 1;

Koscak Maruyama, D.Sc. as Research Fellow in Medicine for one year, beginning September 1;

Dr. Serge Orloff as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Mr. James L. Pinter as Research Fellow in Physics (Medicine) for one year, beginning September 1;

Gene M. Smith, Ph.D. as Research Fellow in Anesthesia for one year, beginning September 1;

Pierre J. J. Stoffyn, Ph.D. as Research Fellow in Medicine for one year, beginning September 1;

Dr. Hirsh W. Sulkowitch as Research Fellow in Chemistry, assigned to Urology, retroactive to April 1 when his previous appointment expired.

To appoint:

Dr. Robert G. Ojemann as Clinical Assistant in Neurosurgery, with the privilege of caring for patients in the Neurosurgery Group, for a period of eight months, beginning September 1. This appointment is to run concurrently with his appointment as Resident on the Neurosurgical Service.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter, and not under the hospital department with which you are affiliated.

The following new titles have been received:

Anesthesia

Beecher, H. K.
Control of suffering in severe trauma: Usefulness of a quantitative approach.
J.A.M.A. 173 : 534.

Beecher, H. K.
Increased stress and effectiveness of placebos and "active" drugs.
Science 132 : 91.

General Surgery

McDermott, W. V., Jr.
Portal hypertension secondary to pancreatic disease.
Ann. Surg. 152 : 147

Neurology

Schwab, R. S.
Progression and prognosis in Parkinson's disease.
J. Nerv. & Ment. Dis. 130:556.

Neurophysiology

Brazier, M. A. B.
The EEG in epilepsy: A historical note.
Epilepsia 1 : 328.

Brazier, M. A. B.
Investigations of the action of thiosemicarbazide on the cerebellar cortex of the cat. (With Adey, Dunlop, and Killam)
In Inhibition in the nervous system and gamma amino-butyric acid, E. Roberts, Editor, New York, Pergamon Press, pp. 317-323.

Brazier, M. A. B.
Long-persisting electrical traces in the brain of man and their possible relationship to higher nervous activity.
EEG & Clin. Neurophysiol., suppl. 13, 347.

Brazier, M. A. B.
Some actions of anesthetics on the nervous system.
Federation Proc. 19 : 626.

Neurosurgery

Bakay, L.
The blood-brain barrier with special regard to the use of radioactive isotopes. (Japanese edition)
Tokyo, Ishiyaku Publishers, Inc.

Nursing

Sleeper, R.
Hospital School of Nursing? Nurse educator: Its survival depends on new methods and new facilities.
Hospitals 34 : 37.

Books

Brazier, M. A. B.
The electrical activity of the nervous system, ed. 2.
London, Pitman Medical Publishing Co., Ltd., and New York, Pitman Publishing Corporation.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

American men of science, ed. 10, vol. 2.
Tempe, Arizona, The Jaques Cattell Press, Inc., 1960.

⁂

WILLIAM OXNARD MOSELEY, Jr., M.D.

Last summer Dr. J. Monroe Thorington of Philadelphia sent Dr. Churchill a reprint of an illustrated article, written by Dr. Thorington, which had recently appeared in the *American Alpine Journal*. The article, entitled "The first American accident on the Matterhorn", gives a graphic and detailed account of how Dr. William O. Moseley, Jr. met his death during his descent from the mountain in 1879. After reading the article, Dr. Churchill was prompted to ask a few of our house staff if they knew for whom the Moseley Building was named, and why. Discovering that they knew nothing about the tragic story, Dr. Churchill procured permission from Dr. Thorington for us to use his Moseley material in any way we might wish.

Dr. Thorington is an Ophthalmologist (Princeton, 1915; University of Pennsylvania, 1919), a former President of the American Alpine Club, and an honorary member of the Alpine Club (London) and of the Appalachian Mountain Club.

Dr. Moseley was born in Boston in 1848, entered the Public Latin School in 1859, matriculated at Harvard College in 1865, and received his A.B. in 1869. From here on, we quote directly from Dr. Thorington's article in the *American Alpine Journal:*

". . . Soon after graduation he [Moseley] went abroad for a short time, and, after coming back to this country, again sailed and remained for a period of five years, making extensive journeys in Europe and the East. Several summers from the beginning of June to the end of September were spent in the mountains. Probably he was in the Alps in 1870 and heard of the new catastrophe on Mont Blanc, which for the first time involved Americans, when Dr. Bean and Mr.

Randall, their companion, three guides and five porters were lost in a raging blizzard. Certainly he knew the history of the Matterhorn."

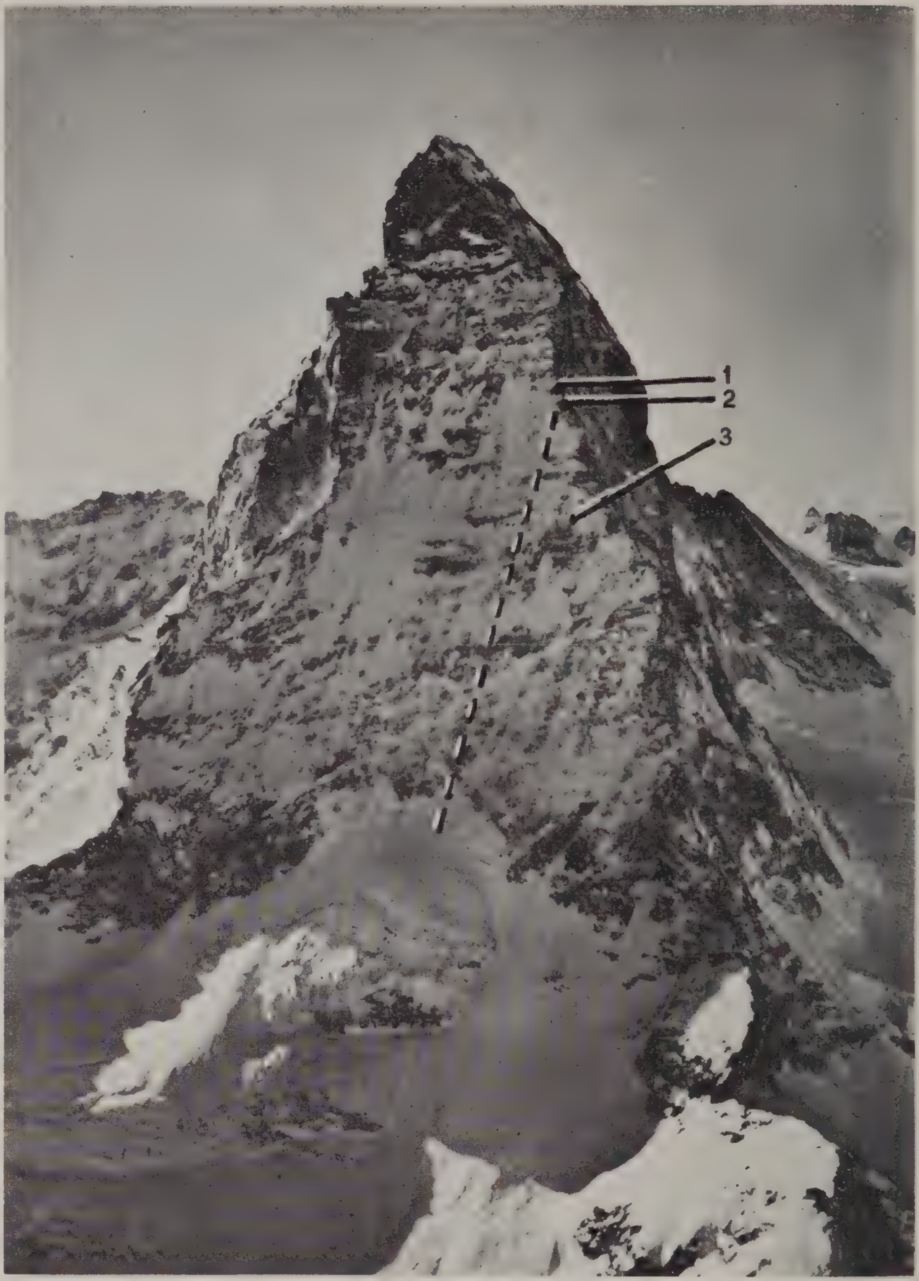
[In 1874 and 1876 Moseley was again in the Alps, and conquered such heights as Mont Blanc, Hintere Schwärze, Kleinleitenjoch, Hochwilde, and the Untergabelhorn.]

"Moseley became House Officer in the Massachusetts General Hospital in August, 1877, and was unable to visit the Alps that summer, this being partially compensated for by his election to the Alpine Club (London).

"He acquired his M.D. from Harvard in 1878 and immediately left for Europe. His companion in the Oberland was Emil Burckhardt, a member of the Basel Section of the Swiss Alpine Club, with whom he climbed the Blumlisalphorn and the Bietschorn. His list for this season also includes Zermatt climbs: Monte Rosa from Lysjoch, Triftjoch and Col Durand. Moseley spent the winter in Vienna, with additional medical study.

"1879 was a year of greater ambition and also a fateful one. In the last three days of July Moseley added to his record Eigerjoch, Jungfraujoch and the Jungfrau from Wengenalp. Then, with Craven [A. E. (A.C.), an English friend with whom he had climbed several of the aforementioned mountains] he made the first traverse from the Gross to the Klein Doldenhorn, and the second passage (north to south) of the Viescherjoch. Continuing to Zermatt, they took with them two of the ablest Oberland guides, Peter Rubi and Christian Inäbnit, both of Grindelwald. It was a strong party of four that left Zermatt on the evening of August 13, intending to ascend the Matterhorn and return in one day, thereby avoiding a night in the dilapidated hut on the northeast ridge. They arrived at the summit at nine o'clock on the morning of the 14th and began the descent after 20 minutes. Moseley had complained more than once that the rope was more of a hindrance than an advantage. Crossing the shoulder, they descended the difficult rocks where an iron chain was stretched, which Moseley scorned. The party then reached a point about 45 minutes above the hut.

"As the major difficulties were now behind them, Moseley asked that the rope be taken off, but Rubi and Craven urged him to keep it on until the hut was reached. In a few minutes, however, Moseley untied from the rope, saying that he could do better without it. Rubi yielded, the others unroped as well and all proceeded rapidly downward. Twenty minutes from the hut they had to cross a projecting rock with a smooth surface. Rubi went over first, planting his axe to give Moseley, who followed, a firm foothold. Moseley declined this aid and, placing one hand on the rock, attempted to vault over it. His foot slipped, his axe flew out of his hand and he fell from the rock onto snow, down which he slid on his back. He nearly succeeded in stopping himself with his elbows, but the snow was solidly frozen and he fell to the rocks beneath. Twisting with great effort, he tried to grasp these, but his velocity was too great and he hurtled from rock to rock until he disappeared from view. Three days later his broken body was found immediately above the bergschrund of the Furggen glacier, 2000 feet below the point of the accident. He was brought down to Zermatt by three guides and several British climbers, Craven among them. Moseley's remains were interred below the south wall of the English church, but subsequently his body was brought back to this country and buried at Mount Auburn, Cambridge, Massachusetts.



THE MATTERHORN. AIR VIEW SHOWING LINE OF MOSELEY'S FALL
1. SOLVAY HUT; 2. MOSELEY-PLATTE; 3. SITE OF OLD HUT

"Mr. C. E. Mathews, then president of the Alpine Club, who was at Zermatt, presented the foregoing information in a letter to *The Times,* and added: 'I was shocked to find, on examining the remains, that Mr. Moseley had hardly any nails in one of his boots, and all rock-climbers know how impossible it is to ensure steadiness under such conditions, and it is quite clear that if the rope had not unhappily been removed, I would not have had to trouble you with this letter.'

"The site of the accident is still known as the 'Moseley-platte.' [*See* THE NEWS for December 1956 for a short piece by Dr. Walter F. Lever, which describes the Moseley Platten.] In the Zermatt museum is a photo-portrait of Moseley, as well as one of his boots and the punctured metal canteen he was carrying at the time. [A picture of the boot and canteen, from the *American Alpine Journal* article, is on the bulletin board near the foot of Treadwell stairs.] His name is perpetuated in the Moseley Professorship of Surgery, Harvard Medical School, and in the Moseley Memorial Building (1916), Massachusetts General Hospital. . . .

"Although Moseley was an experienced climber, his death must be attributed to over-confidence, premature unroping, and footgear that was inadequate even by the standard of the time. He had not sufficiently heeded Whymper's warning: 'Climb if you will, but remember that courage and strength are naught without prudence, and that a momentary negligence may destroy the happiness of a lifetime. Do nothing in haste; look well to each step; and from the beginning think what may be the end.' "

A picture of Dr. Moseley and a bronze plaque hang on the south wall, just inside the entrance to the Moseley Building.

* * *

VOLUNTEER GROUPS

Distaff Club

The Distaff Club started the year off on July 14 with a tea, to welcome the new house staff and their wives. The tea was given in the lobby of the Warren Building.

The first meeting of the year was held on September 21 in the Penthouse. The speakers were Miss Mary Ruth Wolf, Director of our Volunteer Unit, and Mr. Francis W. Hatch, Co-Chairman of the MGH 150th Anniversary Committee. They spoke on "The role of the Massachusetts General Hospital — past, present, and future."

At our October 19 meeting, Dr. Paul Tillich of the Harvard Divinity School, spoke to both husbands and wives on "Science and religion".

On October 28, our annual barn dance was held in Mr. Vincent Hoagland's barn, on Sunset Road in Weston.

We are looking forward to hearing Dr. Churchill comment on his trip to Lebanon at our November 15 meeting. Husbands, also, are invited to this meeting.

Distaff Club officers this year are:

President — Mrs. Harold C. Urschel, Jr.
Vice-President — Mrs. Willard M. Daggett, Jr.
Corresponding Secretary — Mrs. Anthony S. Patton
Directory Secretary — Mrs. John T. Porvaznik, Jr.
Treasurer — Mrs. Roman W. DeSanctis
Publicity Chairman — Mrs. Raphael F. Smith
Projects Chairman — Mrs. William G. Stewart, Jr.
Housing Chairman — Mrs. Dwight R. Robinson
Newsletter Editor — Mrs. John W. Madden
Area Coordinator — Mrs. Richard H. Wohl

MASSACHUSETTS EYE & EAR INFIRMARY

At their meeting on September 19, the Executive Committee of the Board of Managers of the Massachusetts Eye and Ear Infirmary voted:

To change the title of Dr. George Kelemen to Research Consultant in Otolaryngology;
To accept with regret the resignation of Dr. Maurice R. Ruben from the position of Assistant Surgeon in Otolaryngology.

To appoint:

Dr. Richard R. Gacek — Resident in Otolaryngology, beginning July 1, 1961;
Dr. John B. Roberts—Resident in Otolaryngology, beginning July 1, 1961.

To reappoint:

Dr. Sotiria S. Mourkidou — Fellow in Anesthesiology for another year, beginning October 1.

New addresses:

Dr. H. Clarke Anderson (*Path.* 1959), Memorial Hospital, 444 E. 68th St., New York, N.Y.
Dr. Robert E. Ball (r.p. *Psychiat.* (*McL.*) 1960), Toronto Psychiatric Hospital, 2 Surrey Place, Toronto 5, Ontario, Canada
Dr. Norman K. Brown (*M.* 1957), Dept. of Medicine, King County Hospital, Seattle 4, Wash.
Dr. Allan M. Butler (*Bd. of Cons.*), Director, Metropolitan Hospital, 1800 Tuxedo Ave., Detroit, Mich.
Dr. Lloyd M. Caplan (r.p. *Psychiat.* (*McL.*) 1960), Massachusetts General Hospital, Boston 14, Mass.
Dr. James J. A. Cavanaugh (a.p. *C.M.*), 12 W. Central St., Natick, Mass.
Dr. Zanvil A. Cohn (*M.* 1954), Rockefeller Institute, 66th St. and York Ave., New York 21, N.Y.
Dr. Garth R. Drewry (*M.* 1953), 1 Davis Blvd., Tampa 6, Fla.
Dr. Stanford B. Friedman (*C.M.* 1958), Room 3 N-212 Clinical Center, National Institutes of Health, Bethesda, Md.
Dr. Murray L. Janower (a.r.p. *R.*), Div. of Radiological Health, c/o Bureau of State Services, Dept. of Health, Education, and Welfare, Washington 25, D.C.
Dr. Robert J. Kinney (a.r.p. 1943), Box 669, Fort Bayard, N.M.
Dr. Kenneth E. Liffmann (*Dn.* 1956), 811th Medical Group, Loring AFB, Maine
Dr. Bernard F. Mach (*M.* 1959), Rockefeller Institute for Medical Research, 66th St. and York Ave., New York 21, N.Y.
Dr. Eugene J. Morrissey (a.r.s. *Or.*), U.S. Naval Academy, Annapolis, Md.
Dr. Herbert A. Newman (a.r.p. *C.M.* 1960), U.S.A.F. Hospital MATS, Box 451, Travis AFB, Calif.
Dr. Herman A. Osgood (h.p. *R.* 1919), 139 Bellevue Ave., Melrose 76, Mass.
Dr. Savitri Ramcharan (*C.M.* 1954), Metabolic Research Unit, Dept. of Medicine, Stanford University School of Medicine, Palo Alto, Calif.
Dr. Edward H. Risley (*E.S.* 1908), P.O. Box 143, Prides Crossing, Mass.
Dr. Richard L. Sallade (a.r.s. *U.* 1959), 838 Stuart Ave., Boardman, Ohio
Dr. John T. Sharp (a.*M.* 1960), Henry Ford Hospital, 2799 W. Grand Blvd., Detroit, Mich.
Dr. Robert T. Spalding (clin. & res. fel. *Psychiat.* (*McL.*) 1960), Chattanooga Guidance Clinic, 1020 E. 9th St., Chattanooga, Tenn.
Lt. William E. Strole, Jr., MC, USNR (*M.* 1959), 3rd Battalion, 5th Marines, 3rd MAR Div., FMF, PAC, c/o FPO, San Francisco, Calif.

Brief bits:

Dr. Edwin F. Cave has deposited in the Archives Room, for safe keeping while he is away, a kangaroo foot trophy which was presented to the American Orthopedic Association by the Australian Orthopedic Association at the last joint meeting in 1958. It is to be kept by Dr. Cave during this year of his Presidency of the A.O.A. and will be passed on by him to the next President in May 1961. It would be worth your while to come to the Archives Room to see the trophy with its attached inscribed silver torch.

Dr. Roger W. Jeanloz spent the summer abroad. The purpose of his trip was to study methods of isolation and structure determination of complex glycolipids and lipo-glycoproteins from animal tissues and from bacteria. He gave many lectures in Germany, France, Switzerland, Poland, Sweden, and Israel, and was presented with the Medal of the Société de Chimie Biologique de France.

Dr. Lewis W. Kane has been elected President of the Boston Tuberculosis Association. Dr. Kane served as Vice-President of the Association for three years and as Chairman of the Education and Case-Finding Committee for two years. He is also a member of the Board of Directors of the Massachusetts Tuberculosis and Health League.

Here are some excerpts from an interesting article which appeared in the *Cleveland Plain Dealer* of August 24. They concern Dr. Fiorindo A. Simeone (*W.S.* 1936).

The first two open-heart operations performed in the Middle East were directed by a Clevelander — Dr. Fiorindo A. Simeone, Chief of Surgery at Cleveland Metropolitan General Hospital.

The operating surgeon was a former student of his, Dr. Ibrahim Dagher, former resident in thoracic surgery at the hospital here.

Dr. Simeone is back at his Cleveland post after spending three months in Lebanon where he served as professor of surgery and head of the department at the American University of Beirut. He left Cleveland late in April to attend the annual Middle East medical meeting in Lebanon, May 6-8.

"Both operations were successful and they had a terrific impact upon the public," he said in an interview. "The Lebanese government was pleased."

The patients were a boy of 6 and a woman in her early 30s. Dr. Simeone said most of the equipment used in the operations was homemade, but it "functioned very well."

The American University is a private institution chartered in New York. According to Dr. Simeone, about half of its graduates come to America for their graduate training, a considerable number go to England.

Just before his departure [for home] Dr. Simeone was called upon to treat Pierre Gemayl, Lebanese minister of health and education, who had been seriously injured by a runaway truck. Dr. Simeone was whisked away to the hospital at the French medical center, where the patient had been taken with multiple fractures of ribs on both sides.

"The shock was brought under control and eventually the patient came through in good shape," recalled the surgeon. "Had the outcome been different, it might have had unpleasant political repercussions in Lebanon. Gemayl is an important person. He is leader of the Christian block and looked upon as the one man who has been able to keep it together."

According to Mrs. Simeone, Dr. Henri LeBrigand (Research Fellow in Surgery, Harvard Medical School and Massachusetts General Hospital, 1946-47) who worked with Dr. Simeone during his sojourn in Boston, arrived in Beirut at the request of the Lebanese to see Mr. Gemayl in consultation, Dr. LeBrigand being a prominent thoracic surgeon in Paris at the present time. Mrs. Simeone added that the Lebanese were quite impressed by this international reunion and friendly cooperation.

This letter has come from Dr. Paulo F. Albuquerque (r.s. *U.* 1944), our "singleton" in Rio de Janeiro, Brasil:

I am afraid I am redundant by answering your note of February 8, as during my frequent visits at the General I have kept most of my colleagues well informed as to my wanderings around.

Although I am the only former resident located in Rio, there are several men in town who have benefited from the Hospital teaching programs as fellows or other forms of apprenticeships.

Urological surgery in its various aspects takes all of my professional time. Besides the practise of it, there is a residency here patterned after the one at the General, which not only is the first serious attempt at such a program among us but is also unquestionably the best

No. 92 in a series of Staff photographs
Dr. Francis C. Lowell, Physician — Chief of the Allergy Unit

one available south of the border.

My special interests have always been multiple. Among the ones that can be confessed to, I believe that sports take most of my spare time, as I try to keep fit with some tennis, horse riding, motor boating, and skin diving — all undertaken in a rather leisurely manner.

Thank you for the thoughtfulness of your inquiry.

This letter has come from Dr. Harvey E. Billig, Jr. (*Or.* 1935), Medical Director of the Billig Clinic in Los Angeles:

Congratulations to Dr. Lloyd H. Smith, Jr. and The News for the very erudite summary of "Activities of the Endocrine Unit" in your May issue.

I was at Massachusetts General Hospital in earlier days of the pioneering work of Doctors Aub, Albright, and Bauer, and I feel that I was infected with the endocrine modulated enzymatic chemical outlook on control of metabolism in all the tissues of all the people. I have tried to convey this thinking into my rehabilitation practice and have encountered the necessity, on numerous occasions, for explaining at length a number of the points of understanding, as to what "Metabolism" amounts to, and the importance of the continuity of its maintenance in balance for the sake of ALL the tissues of the body.

To illustrate: One of our findings directly resulting from this approach, which I was "sold on" during my stay at Massachusetts General Hospital, is reported in the two enclosed reprints entitled "Hyperinsulinism of menses" and "The role of premenstrual tension in industry". Nearly all of the patients mentioned in these articles had been to a dermatologist for their bruises, a gynocologist for their menstrual symptoms, an internist for their obesity, and an orthopedist for their backache, which I think illustrates the necessity for the type of work you are doing, in order that each individual in the various specialties can be aware of the associated ramifications of a metabolic disorder.

Sincere congratulations.

Dr. Schwab received a short letter from Dr. Paul E. Spangler (*W.S.* 1925), which has been passed on to us. Dr. Spangler is Senior Medical Officer on the S.S. *Hope.* The letter says, in part:

Since Djakarta is pretty well equipped from a medical training point of view, our appearance there will be very short, so I don't know how much we will be able to accomplish. Much of our time there is to be taken up with pomp and ceremony, which seems to loom large with the powers that be.

I must confess that I am pretty ignorant about the latest trends in the management of Parkinson's disease. I wonder if you might send me some literature to brighten me up.

Your letterhead struck a note of nostalgia.

The 85th Commencement Exercises of the Massachusetts General Hospital School of Nursing were held in John Hancock Hall on September 8. One hundred seventeen nurses joined the ranks of more than 5,000 alumnae of the MGH School of Nursing.

150th ANNIVERSARY NOTES

Mr. Ralph W. Burger, President of the John A. Hartford Foundation, Inc. of New York City, has announced the award of a new grant for $190,204 to the Massachusetts General Hospital from the Foundation, for investigative work on "The study of the mechanisms of fluid and electrolyte transport by living cells and tissues". This research is to be carried on under the direction of Dr. Alexander Leaf. The Foundation has supported Dr. Leaf in earlier studies, and since 1956 has awarded more than $660,000 to M.G.H. for research.

The Albert A. List Research Fellowship has been created by a gift of $200,000 from the Albert A. List Foundation in New York City. The recipient of this Fellowship will be named jointly with the Harvard Medical School or the Massachusetts Institute of Technology, in accordance with the usual practice followed in appointing basic scientists or clinical scientists at M.G.H.

A new $350,000 facility in which scientists will probe the basic workings of the human mind is being readied here at the Hospital. The new unit will be called the Stanley Cobb Laboratory for Research in Psychiatry.

A one-half-million-dollar laboratory for orthopedic research was dedicated on September 11, here at the Hospital. A team of scientists and doctors from M.G.H., Harvard Medical School, and the Massachusetts Institute of Technology will carry on basic studies of the skeleton and the way it is built, in order to gain new knowledge of a wide range of bone disorders. This is one of the first projects to be completed as part of the Hospital's observance of its 150th Anniversary in 1961.

* * *

Contributions to The News in the amount of $650, over and above the subscription fees, were received during the fiscal year 1959-1960.

A note of appreciation is always sent to each contributor, but The News takes this opportunity to express publicly its thanks for such generosity from so many of its readers.

THE NEWS

No. 199 Boston, Mass. December 1960

CARDIORENAL UNIT OF THE CARDIOVASCULAR RESEARCH LABORATORIES

The last report from the Cardiovascular Research Laboratories appeared in THE NEWS of April 1953. This was two years after these Laboratories were created with the opening of the Research Building. Shortly after this first report, the then Chief Cardiovascular Investigator, Dr. Ivan D. Frantz, Jr., became the Research Professor of Medicine at the University of Minnesota School of Medicine, and the Cardiovascular Research Laboratories were temporarily closed down. For two years the space housed the Dermatology Laboratories, until their present quarters became available.

In 1956 the Laboratories were reopened to house the Research Laboratories of the Cardiorenal Unit of the Medical Services; and in July 1960 the newly created Arteriosclerosis Study Unit, under Dr. Frederick T. Hatch, also took up occupancy on Research 1. Because Dr. Hatch will undoubtedly report separately at some later date on the independent investigations of his Unit, this report will concern itself solely with the research activities of the Cardiorenal Unit.

First, let me explain why the study of kidney, electrolyte, and fluid problems should be included in a cardiovascular research unit. As is well known, the heart is the pump which circulates the extracellular fluids of the body, supplying oxygen and nutrients to the tissues and carrying away the waste products. It is not surprising, therefore, that heart disease in many instances manifests itself by disturbances in the body fluids. The occurrence of edema (or dropsy) is perhaps the most dramatic instance of this relationship. It is also now well appreciated that the major function of the kidneys is to adjust the volume and composition of the fluids which the heart circulates. Thus, it is fitting that the heart and kidneys, so closely related functionally, together with the fluid bridge which joins them, should be studied in the same unit. In fact, it was the enigmatic problem of how body fluid volumes and compositions were disturbed in heart failure that initially stimulated our interests in salt, water, and kidneys.

After studying these relations in patients for several years (before the Cardiorenal Unit was incorporated into the Cardiovascular Research Laboratories), it became apparent that until certain basic information was obtained regarding how water and salts are transported across cell membranes, our understanding of cardiorenal relations and disease would be incomplete. It is toward solving this central problem in renal physiology that our major laboratory effort is focused.

We know that the kidneys receive messages regarding the body's needs for water and salt from secretions of the neurohypophysis and adrenal cortex glands, respectively. Hence, our studies must eventually explain how vasopressin and aldosterone modify the renal handling of salt and water. Finally, the problem attains even more general interest in that all cells of the body are engaged in transporting water, salts, and nutrients across their cell membranes, and an elucidation of these mechanisms in any tissue may be expected to help our understanding of function and disease in other tissues as well as in the kidneys.

Not infrequently one's progress in studying a complicated problem in biology can be greatly aided by the good fortune of obtaining a simple system for study. The demonstration by Professor Hans H. Ussing of the University of Copenhagen that certain amphibian membranes can be utilized *in vitro* for the study of membrane phenomena has been of considerable help to us in our work. In fact, it was while working in his laboratory that we happened upon the urinary bladder of the toad as a useful preparation to study. This unique membrane, consisting essentially of a single layer of cells supported on a thin layer of connective tissue, performs many of the important activities of the mammalian renal tubules. It reabsorbs water and sodium selectively from the urine, and its permeability characteristics are specifically altered by the two mammalian hormones, vasopressin and aldosterone, which are so important in regulating kidney activity in man. The toad bladder can readily be studied *in vitro,* for example, as a sheet of cells separating two halves of a lucite chamber, thus allowing ready access to the two opposite surfaces for permeability studies.

The processes of reabsorption in the toad bladder — and also, as it is becoming apparent, in the mammalian renal tubule — center about the movement of the sodium ion. This ion is actively transported at the expense of energy provided from the metabolism of the single layer of cells. The movement of positively charged sodium ions from the mucosal to serosal sides renders the latter electrically positive to the former. Anions, such as chloride, are reabsorbed passively and secondarily to the electrical potential created by the primary active transport of sodium ions. Water is reabsorbed passively in response to the concentration gradients produced by the reabsorption of salts. Vasopressin, the mammalian antidiuretic hormone, markedly stimulates this reabsorption of water; aldosterone, the mammalian salt-retaining hormone, increases the active sodium reabsorption.

Much of our time has been spent obtaining quantitative measurements of these transport processes. The energy for the active sodium transport comes from the combustion of the glycogen stored in the mucosal cells. The energy requirements for transport have been determined. The site of action of vasopressin has been localized to one surface of the mucosal layer of cells, and the changes induced by the hormone in the cell membrane have been studied. The relationship of sodium transport to that of other ions has been examined.

Such information is basic to our understanding of reabsorptive processes in the toad bladder, the renal tubule, or elsewhere. In the past year, however, we have also sought explanations in this well-defined system for a few situations which arise clinically. The isolated toad bladder has given us reasonable replies regarding the mechanism of the polyuria seen in patients with potassium depletion, the resistance to the antidiuretic actions of vasopressin which develops upon its prolonged use in the overhydrated patient, and the mechanism of action of mercurial diuretics — to name a few. Of course, results obtained in such an isolated system as we use must await confirmation eventually in man. So far, however, the parallels which have been established give us encouragement. Thus, antidiuretic hormone in the bladder preparation affects specifically and markedly the reabsorption of water and urea and the active transport of sodium. In the mammal, until recently, only its effect on water reabsorption was known. Following the description of the striking effects of antidiuretic hormone on permeability to urea in the bladder, a similar effect in the mammalian renal tubule has been recently described. Likewise, an effect of this hormone on sodium reabsorption in the mammalian renal tubule has followed on the heels of its ready recognition in the bladder.

Progress in this Laboratory has depended upon the collaboration of several enthusiastic, gifted, and dedicated clinical and research fellows in Medicine: John Anderson (currently at King's College Medical School, London); LeRoy H. Maffly (now at the Cardiovascular Research Unit of the University of California); Richard M. Hays (Department of Medicine, Albert Einstein Medical College); Lot B. Page, now a member of our Visiting Staff, and Ezra Lamdin. Howard S. Frazier, Jean R. Crabbé, Alvin Essig, Earle I. Hammer, and Jacob de Graeff comprise the present team. Dr. Crabbé, who has found the action of aldosterone on sodium reabsorption in the bladder, soon will be returning to his native Belgium. Rex L. Jamison (an Intern in Medicine here at M.G.H.) examined the actions of mercurial diuretics on sodium transport while a medical student; and Albert Keller, who ably studied the histology and electron microscopic structure of the membrane, is now in his first year at Harvard Medical School.

In conclusion, it seems certain to us that improvement in our understanding of these basic membrane phenomena will aid our understanding of certain disease processes. From a better understanding of function has invariably followed better care for the sick patient. How successful such an approach as ours will prove to be remains to be seen. So far, only two things seem certain: 1) my associates and I feel that study of membrane phenomena has increased our perception into physiological factors operating in clinical problems, and 2) that the pursuit of these exciting matters leaves us never a dull moment.

Alexander Leaf, M.D.,
Associate Physician
and *Chief Cardiovascular Investigator*

IDA M. CANNON

Ida Cannon died on July 7, 1960, at the age of 83. Her service to the Massachusetts General Hospital, where she was Chief of the Social Service Department from 1914 to her retirement in 1945, was recognized by the Trustees when they adopted the following resolution, which reads, in part: ". . . For nearly four decades she has given devoted service to the Hospital in the hitherto neglected field of human relations; [with Dr. Richard C. Cabot] a large part of the credit for the development of medical social service here and in other hospitals is due to her. She was a true pioneer. As author, lecturer, consultant and trainer of social workers she made such an impress in the field of social work that she is looked upon as an acknowledged leader throughout the nation. Endowed by nature with a sympathetic and kindly disposition, Miss Cannon brought to her problems a deep human understanding and sound judgment. . . ."

Miss Cannon was born in Milwaukee on June 29, 1877, and had embarked on a successful career in nursing before she came to Boston. She graduated from the Minnesota City and County Training School for Nurses in 1896. Her first position after graduation was that of organizing and supervising a hospital at the Minnesota School for Feeble-minded at Faribault, Minnesota. She later served as visiting nurse for the St. Paul Associated Charities. She became increasingly interested in the social aspects of nursing, and in 1906 she came to Boston to attend the Boston School of Social Work (later, Simmons College School of Social Work) and made her home with the family of her brother, Dr. Walter B. Cannon, the eminent physiologist at Harvard.

During this period she met Dr. Richard C. Cabot, who had assembled in 1905 a staff of paid and volunteer social workers in the Out-Patient Clinics of the Massachusetts General Hospital, and until she completed her course at Simmons in 1907 she worked for him as a volunteer in her spare time. She joined his staff as a paid worker in 1907. The importance of social factors in medical care was increasingly recognized in other hospitals, and at about this time visiting nurses were added to the staffs of several hospitals. Miss Cannon's training in both nursing and social work enabled her to recognize that the kind of service needed for the practice of social work in a medical institution required the diagnostic and treatment skills of social casework rather than those of nursing. It was this differentiation which influenced the development of the Social Service Department at the Massachusetts General Hospital. Dr. Cabot's idealism and enthusiasm were well supplemented by Miss Cannon's ability to organize and interpret; and this Department, in spite of some administrative difficulties at first, became the forerunner and model of this work in the United States and abroad. In 1919 the Department became an official part of the MGH family.

Dr. Cabot, in 1930, in reviewing the early days of the Department, paid this tribute to Miss Cannon: "Two words seem to me to convey most of what Ida Cannon has done for us and for this movement: she has been a wonderful interpreter and a brave challenger. I have never seen anyone who so thoroughly understood both the ideals of the physician and the ideals of the social worker so that she could interpret each to each. She has defended the doctors to the social workers; she has defended the social workers to the doctors; and in both cases she has carried conviction. She is an ideal listener. She is a hearty laugher. She can be fair to many conflicting strands and interests at the same time. She is never content and never condemnatory. She has been the educator of her supposed bosses."

Miss Cannon held many important positions in the field of medical social work. In 1920 and 1921 she was elected President of the American Association of Hospital Social Workers, which association she had been active in establishing. She was a delegate to the White House Conference on Child Health and Protection in 1931; to the International Conference of Social Work in Frankfort in 1932 and the 1936 Conference in London.

Among her many activities, she was a lecturer on the faculties of Simmons College, Boston College, Boston University, and the New York School of Social Work. She served as a Trustee of the Cambridge City Hospital and of the Tewksbury State Hospital and Infirmary, and was a member of the Cambridge Board of Public Welfare. She was also a member of the Advisory Committee on the Medical Care Program of the Massachusetts Department of Public Welfare.

Countless articles and speeches by Miss Cannon throughout the years illustrate her activity in promoting the field of medical social work. She was the author of two books: *Social work in hospitals,* published by the Russell Sage Foundation in 1913 and revised in 1923, and *On the social frontier of Medicine,* published by the Harvard University Press in 1952.

Recognition of Miss Cannon's service in establishing and developing the field of medical social work is indicated by the fact that she was granted honorary degrees by the University of New Hampshire (1937), and Boston University (1950); that she was given the 1959 Lemuel Shattuck Award by the Massachusetts Public Health Association, "for distinguished service in public health"; and that in 1959 she was given honorary membership in the Institute of Almoners in England.

The tributes that meant the most to her, however, were from those who had been closely associated with her at the Massachusetts General Hospital. Dr. J. Howard Means, in his "Foreword" to *On the social frontier of Medicine,* describes Miss Cannon's part in the development of social work at the Hospital in these words:

"This department was the pioneer of all medical social service departments. It was a prototype from which a new professional activity spread throughout the world. Miss Cannon served in it longer, and carried more of its responsibilities, than any other person. . . .

"The early days of the department were tough going. It was a problem of 'selling' social service to the doctors — members of the most socially conservative of professions — and great was the sales resistance. . . .

"The evolution of attitude on the part of the medical staff toward the Social Service Department at the Massachusetts General Hospital, as Miss Cannon traces it, went through these phases — resistance, tolerance, partial recognition, and finally full acceptance and establishment as an official and necessary department of the Hospital, a responsibility of the Hospital Trustees to support."

No finer tribute to Miss Cannon could be written than that expressed so beautifully by Dr. Means in the opening paragraph of the "Foreword": "It is given to but few men or women to participate, vitally, in the birth and growth of a new profession. It is also rare to have the opportunity and the skill, in the rich autumn of life, after nearly five decades of selfless service, to write powerfully the saga of an adventure that has resulted in bringing comfort to millions of suffering people."

M. K. T. [Mar

* * *

Wheaton College, at its One Hundred and Twenty-fifth Anniversary Convocation on October 15, conferred the honorary degree of Doctor of Science upon

Miss Ruth Sleeper, Director of our School of Nursing and Nursing Service.

Dr. Henry K. Beecher has been commissioned as a Kentucky Colonel by the Governor of Kentucky "in recognition of his work in medical education in that State".

The Board of Trustees, at their meetings on October 7 and 21, voted:

That the appointment of Dr. Peter H. Berman as Clinical Fellow in Neurology, to have begun July 1, be rescinded;

That Dr. J. Evarts Greene be reinstated as Clinical Associate in Medicine, retroactive to February 21, 1958;

That the appointment of Dr. John J. Ross as Clinical Fellow in Neurology, to have begun July 1, be rescinded.

To appoint:

Dr. Mark Abramowicz as Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1961;

Wesley Allinsmith, Ph.D. as Associate Psychologist, effective as of August 1;

Dr. Frank K. Austen as Chief Resident in Medicine for one year, beginning January 1, 1961;

Dr. Edward F. Balius as Assistant Resident in Anesthesia, beginning July 1, 1961;

Dr. Gerald S. Brickman as Clinical Associate in Orthopedic Surgery, effective as of October 1;

Dr. Stephen P. Clement, Jr. as Exchange Assistant Resident on the Children's Medical Service, for the term September 21 through October 31;

Dr. John D. Constable as Assistant in Surgery, effective as of October 1;

Dr. Leonard Garren as Assistant Resident in Medicine for one year, beginning July 1, 1961;

Dr. Edgar Haber as Resident in Medicine for one year, beginning July 1, 1961;

Dr. John B. Joseph as Assistant Resident on the Children's Medical Service for one year beginning July 1, 1961;

Dr. Mehmet N. Kalayci as Clinical and Research Fellow on the Children's Medical Service for one year, beginning January 1, 1961;

Dr. Myron B. Laver as Assistant in Anesthesia effective as of September 20;

Dr. Robert S. Lees as Assistant Resident in Medicine for one year, beginning July 1, 1961;

Dr. Gordon K. MacLeod as Assistant Resident in Medicine for one year, beginning July 1, 1961;

Dr. Felix S. Palubinskas as Clinical Fellow in Radiology, beginning July 1, 1961;

Dr. Stephen L. Reynolds as Junior Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1961;

Dr. John W. Singleton as Resident in Medicine for one year, beginning July 1, 1961;

Dr. Arnold N. Weinberg as Resident in Medicine for one year, beginning October 1, 1961

At their meetings on September 28, and October 7 and 19, the General Executive Committee voted:

To accept the resignation of Dr. Rosalie A. Burns from the position of Clinical and Research Fellow in Neurology, effective as of August 31;

That the appointment of Dr. Mustafa L. Sipahi as Clinical Fellow in Radiology become effective as of November 7 rather than December 1.

To promote:

Dr. David H. Alpers to the position of Assistant Resident in Medicine for one year, beginning July 1, 1961;

Dr. Peter V. D. Barrett to the position of Assistant Resident in Medicine for one year, beginning July 1, 1961;

Dr. Oscar S. DePriest, III, to the position of First Assistant Resident in Surgery for one year, beginning October 1;

Dr. Stephen E. Goldfinger to the position of Assistant Resident in Medicine for one year, beginning July 1, 1961;

Dr. Rex L. Jamison to the position of Assistant Resident in Medicine for one year, beginning July 1, 1961;

Dr. Robert K. Osborne to the position of Resident in Medicine for one year, beginning July 1, 1961;

Dr. Raphael F. Smith to the position of Assistant Resident in Medicine for one year, beginning July 1, 1961;

Dr. William B. Stason to the position of Assistant Resident in Medicine for one year, beginning July 1, 1961;

Dr. Samuel O. Thier to the position of Assistant Resident in Medicine for one year, beginning July 1, 1961;

Dr. Richard J. Wurtman to the position of Assistant Resident in Medicine for one year, beginning July 1, 1961;

Dr. William J. Yount to the position of Assistant Resident in Medicine for one year, beginning July 1, 1961.

To extend the appointments of:

Dr. Ingrid Gamstorp as Clinical and Research Fellow in Neurology and Pediatrics, from October 1 through December 31;

Dr. Jan Trabka as Research Fellow in Neurology, assigned to Neurophysiology, from July 9 through October 30.

To reappoint:

Dr. Ann B. Barnet as Clinical Fellow on the Children's Medical Service for one year, beginning September 26;

Dr. Arthur E. Baue as First Assistant Resident in Surgery for one year, beginning November 1;

Dr. David L. Collins, Jr. as First Assistant Resident in Surgery for one year, beginning November 1;

Dr. Franco R. Dinale as Clinical Fellow in Anesthesia for one year, beginning October 1;

Dr. Ulf A. Friberg as Research Fellow in Orthopedic Surgery for one year, beginning November 1;

Dr. Gilbert Hermann as First Assistant Resident in Surgery for one year, beginning November 1;

Dr. Walter E. Klingensmith as First Assistant Resident in Surgery for one year, beginning November 1;

Irving Weliky, Ph.D. as Research Fellow in Medicine for one year, beginning October 1.

To appoint:

Dr. Jacqueline Gauthier as Research Fellow in Psychiatry, effective as of September 28;

Dr. Anne F. Godley as Clinical Assistant in Medicine, effective as of October 1;

Dr. Rodrigo R. Santos as Graduate Student Assistant in Surgery, for the period September 1, 1960 through May 31, 1961.

At the meeting of the General Executive Committee, held on October 26, the following were appointed as Graduate Student Assistants in Medicine, assigned to Cardiology, for one year, beginning October 1:

Dr. Carl E. Agliozzo	Newark, N. J.
Dr. H. Michael Berger	Quito, Ecuador
Dr. Chi-wei Chen	Singapore, Malaya
Dr. Bertrand G. Dumais	Drummondville, Quebec
Dr. Alexander C. Houston	Sarnia, Ontario
Dr. Henri Larocque	Montreal, Quebec
Dr. Stanislaw Pasyk	Krakow, Poland
Dr. Rajeshwar Prasad	Jamshedpur, India
Dr. Duk S. Rhoe	Seoul, Korea
Dr. Sergio O. Rustia	Manila, Philippines
Dr. Arturo M. Singer	San Angel, Mexico
Dr. Nicos E. Tsanatos	Salonica, Greece
Dr. Ömer F. Turnaoglu	Istanbul, Turkey

ERRATUM

Due to a mistake in a report sent to the office of THE NEWS, Dr. J. Philip Lythgoe's title as it appeared last month among the Trustees' appointments was incorrect. Dr. Lythgoe has been appointed Clinical and Research Fellow in Surgery for one year, beginning October 15.

* * *

THE STANLEY COBB LABORATORIES FOR RESEARCH IN PSYCHIATRY

The dedication of the Stanley Cobb Laboratories for Research in Psychiatry and the observance of the Twenty-fifth Anniversary of the establishment of the Psychiatry Service at Massachusetts General Hospital took place on October 14 and 15.

Speakers at the Dedicatory Luncheon on Friday, at the Hospital, were: Mr. Phillips Ketchum, President of the Massachusetts General Hospital Corporation, who presided; Reverend William B. Spofford, until recently our Supervisory Chaplain; Dr. Seymour S. Kety, Research Director at the National Institute of Mental Health, Bethesda, Maryland, and a member of our Scientific Advisory Committee; Dr. George P. Berry, Dean of Harvard Medical School; Dr. Erich Lindemann, Chief of our Psychiatry Service; and Dr. Dean A. Clark, our General Director.

Dr. Alfred H. Stanton, Psychiatrist-in-Chief at McLean Hospital, presided at the Social and Community Psychiatry Luncheon on Friday, at the Boston Club. Dr. Stephen Fleck, Associate Professor of Psychiatry and Public Health, Yale University Medical School, was the speaker.

Dr. Carl A. L. Binger, Honorary Physician on our Staff, presided at the Anniversary Dinner on Friday night, at the Harvard Club. The speakers were: Dr. Robert B. Livingston, Director of Basic Research, National Institute of Mental Health, Bethesda, Maryland; Dr. Wilder Graves Penfield, Director of the Montreal Neurological Institute; and Dr. Erich Lindemann.

Scientific sessions for the dedication were held all day Friday at the Morse Auditorium of the Boston Museum of Science and on Saturday morning at the Hospital.

More than 300 alumni and guests attended these events, many traveling considerable distances to be present at the dedication.

Although we would like to include here transcriptions of all the speeches that were given at this dedication observance, space limitations make it impossible to carry out that desire. However, we give you two of the talks — those by Dr. Cobb and Dr. Kety. Here is Dr. Cobb's address:

At a time like this, one looks back over the years with some feelings of doubt. But, if I had my life to live over, I think I would make the same major decisions.

The question that colleagues most often ask me about my professional life is why I changed from neurology to psychiatry in 1934. Why did I leave research in cerebral circulation, EEG, and epilepsy to go into psychosomatic medicine? Why did I make the shift?

In the first place, I found it a great stimulus to change my work and environment in mid-life. It keeps one young.

Secondly, in order to lead a full life one must take part in the genius of his time. In those years of the early '30's, many lines of new knowledge in physiology, psychology, and medicine were converging to recreate an old point of view and give it substance. We were beginning to conceive of both health and disease as the reaction of the human organism to a complex environment, internal and external. At long last ecological thinking was entering Medicine, accepting as basic the proposition that causes of human reactions are complex, so the etiology of a disease must be multiple.

Finally, the change was not difficult. My interest has always been *to study how the brain works and why it often does not work.* To me, mind and brain are one: if you study the violin you must also study the music it makes.

At that time, the teaching and investigation of psychiatry in a general hospital gave me a unique opportunity. Psychosomatic medicine was an exciting and expanding field. My twenty years as chief of the Psychiatry Service at the M.G.H. were, for me, a great adventure. They were happy years because of the wonderful people who made up the Service—and that includes all of you here who worked with me as residents, fellows, and staff members; on the wards, in the out-patient, and in the laboratories; from John Abbott and Murray Burns, my first residents, to Norman Bernstein and Frederick Whiskin, my last. These great years have been made possible by the cordial and helpful cooperation of all the other services—medical, surgical, and special; we all owe much to Dr. J. Howard Means for originating the idea of a psychiatry ward in his medical division.

And now the service is taking on new expansion under Dr. Lindemann, who sees psychiatry with a broad and fresh vision. Problems I was never able to meet are being taken up. There is a remarkable new service for the alcoholic patient; important relationships with the community are being made; and, last but not least, there is this new laboratory for research in psychiatry, which is already an active and productive institute under the direction of Gardner Quarton. Here I am, fortunate in being generously given a warm nook in the sun for my old age.

Dr. William T. Councilman, my teacher in pathology, told me in 1923, "When you retire, the fun is to choose a small field and cultivate it intensely." That is what I am doing in studying the comparative neurology of birds. It is not, however, so narrow a field as one might think. It can become global in its scope, as this story will show you. The tale is entitled "Instead of the cross, the albatross around his neck was hung."

In April, at the end of a talk in Washington on comparative anatomy, I took the occasion to ask my cosmopolitan audience if they could help me fill out my collection of avian brains. I enumerated several desiderata, among them an albatross. A doctor connected with the Navy told me that at the Midway Islands albatrosses were so abundant that they were a hazard for the aeroplanes landing and taking off, and that there was a biologist there, working on the problem, who could easily get me a brain. So I wrote the biologist, asking him to preserve for me two albatross heads by fixing them in formalin solution; when hardened, he could wrap them in cellophane and send them to me by mail.

I heard nothing until Saturday, August 6. I was, as they say, "relaxing on Cape Cod" when the telephone rang at about noon, and the operator read me the following telegram:

> "NAVY OVERSEAS AIR CARGO TERMINAL, 010401Z YOUR ACTION, INFO: / BUREAU AERONAUTICS, WASH. D.C. / OFFICE NAVAL RESEARCH, WASH. D.C. / FISH AND WILD LIFE SERVICE, DEPT. INTERIOR WASH. D.C. / CITE SE-3 M.G.S. 231958Z x/ TWO CRATES LIVE ALBATROSS DEPT. SANFRANCISCO VIA AIRBORN FREIGHT THIS DAY / BY GOVERNMENT BILL LADING N-33007299 AIRBORN AIRBILL SFO 873981".

After a couple of repetitions of this cryptogram, it was borne in upon me that I was the possessor of two live albatrosses in "Wash. D.C." Action seemed imperative, for I feared these great birds did not travel well in crates. Moreover, the relaxed state of the people of the eastern seaboard on an August Saturday afternoon did not help communications; but I bravely started warming the telephone wires. An ornithological friend at Woods Hole (called in from the beach) told me to get in touch with the head of the Washington Zoo—that he loved albatrosses. Contact was fortunately made with him shortly after lunch, and he was eager to go right over to the Air Cargo Terminal and get the birds. He said they probably would not survive long in crates, so I urged him to take them to his Zoological Park and keep them.

Success seemed to have crowned my efforts. I heaved a sigh and took a short nap. An hour later, however, he called back from the airport, saying he could not find the crates and "Please repeat those numbers." Ten minutes later, I was summoned again to the telephone by a call from Boston. A voice with a rich Irish brogue said, "Say, Doc, this is the Air Freight Terminal at Logan. There's two crates of queer fowl just arrived here in your name. It's three-thirty and we close at four-thirty. What'll I do with 'em?" After some discussion, I said, "Load them in a taxi and send them to the Boston Zoo. I'll telephone the Director." Answer: "No taxi would hold one of 'em. There's two monstrous birds in each crate. I'll have to get a truck." More haggling. Finally, "All right, I'll pay the bill, but you get them there!" Then a search for the Director of the Zoo. When at last located, he agreed to wait and accept the gift. But the express did not deliver the goods until Sunday morning.

Monday I drove to Boston. The albatrosses seemed altogether too tame and a bit droopy. The Director was worried. He had had no experience with albatrosses, and although he had telephoned Washington for instructions and had given them salt water to drink, they looked sick. We decided to send them back to Washington, because the Director of the Zoo there wanted them and thought he could save them. . Off they went by air. Alas, if the poor birds had only been allowed to use their own wings they would have fared better!

Then I went down to my office in the M.G.H., and found a letter which was the payoff! It was from Washington, and read in part: "Since the personnel on the Island have neither the training nor equipment for preparing the specimens you requested, live albatrosses will be sent you. . . . You will be expected to bear the cost of shipment from the West Coast to Massachusetts."

Epilogue: Two of the birds died and I finally got their brains. As far as the bill is concerned, I am still two jumps ahead of the shore patrol.

And now the address by Dr. Seymour S. Kety:

We have gathered today, from many parts of the country, to help dedicate the new laboratories for research in psychiatry at the Massachusetts General Hospital—laboratories which honor a man and continue a concept which he developed. The laboratories are bright and new and well equipped. Much more important, they house creative minds and support their research. Dr. Cobb, the man whose name they honor, has a place in the history of American psychiatry and in the admiration and affection of those who know him, which I cannot embellish.

The concept which these laboratories fulfill was developed by him in the nutrient atmosphere and upon the precedents which have always characterized this hospital, its staff, and its trustees. As long ago as 1890, there were established at the McLean Asylum (the psychiatric branch of the Massachusetts General Hospital), three laboratories for psychiatric research—physiological, biochemical, and psychological. It is interesting and perhaps more than accidental that the first disciplines to become established in the Stanley Cobb Laboratories are physiology, biochemistry, and psychology. The concept of which I should like to speak, however, was that of establishing a department of psychiatry in the midst of an active general hospital and doing so at a time when "mind" and "body" were forcibly separated in medical thinking as were "organic" and "functional", and by this very act fulfilling a determination to weave them together in study as they were integrated in nature.

There was another aspect to this concept—the recognition that research was possible and necessary in a field which has too often been forced to depend upon clinical impressions, the development of insightful and plausible theories and their doctrinaire espousal, rather than their critical evaluation. In the first edition of his *Preface to nervous disease,* written nearly 25 years ago, Dr. Cobb discussed the gap which lies between the clinical phenomena of psychiatry and the fundamental mechanisms upon which they are based: "It is here that research must be carried on for many years in order that block after block of facts may be built up to explain the observations and to support satisfactorily the theories now promulgated in psychiatry and in psychology. Many of these theories are probably correct. Indeed, correct explanations are often discovered years before proof is available. Charcot, Freud, Janet, and Prince seem to have hit on truths, but at present their theories have little support in scientifically controlled observations. They can present little data that would be accepted by a physicist, or even by a physiologist, as sufficiently controlled; but at present the data of physics are so unlike those of psychiatry that similarity of method is not to be expected. This is no reason for saying, however, that accurate, controllable methods never can be applied to the observations of human behavior; it is because the science of psychiatry is young that it seems too complex for quantitative analysis. All sciences pass through an infancy in which qualitative analysis alone is possible."

There is yet another face of that concept which has characterized his work and the philosophy of his department—a true eclecticism which stems from the open-mindedness, the freedom from dogma and prejudice, and, above all, the humility, which appreciation of the complexity of the field and the inadequacy of present knowledge engenders.

Today, two decades later, one cannot overemphasize eclecticism. Psychiatry, in common with other disciplines which couple vast areas of ignorance with a profound and pressing need for knowledge, suffers from a tendency toward oversimplification. The principle that there is no division between psychiatry and the other branches of medicine carries with it the danger that the unique organizational complexity of the nervous system may be forgotten. The recognition that the brain is merely a physico-chemical system can lead to the attractive but erroneous conclusion that therefore physics and chemistry are the *real* sciences of behavior, while psychology and sociology are merely empirical, descriptive, and derivative, to be tolerated as a sort of first-aid manual—"What to do until the biochemist arrives".

I should like to illustrate the danger of such an attitude with a parable which I have told before but which seems a fitting way to close a postprandial peroration. It is entitled "The true nature of a book".

Somewhere in the South Pacific there is an island inhabited by a people of high intelligence and well-developed civilization, except that they had never seen a book—having developed other means for the transmission of knowledge. One day a ship laden with nearly a million books is wrecked near by and thousands of cases of these exotic objects are washed up on their shores. This arouses so much curiosity and consternation that the people decide to set up a scientific institute to study them. They set up this institute by scientific disciplines and establish a policy that each scientist may examine these objects only with the tools and techniques and concepts which are characteristic of his discipline. The first laboratory to be organized is the laboratory of anatomy. They study these strange objects for a while and their conclusion reads like this: "The specimen is a roughly rectangular block of material covered ventrally and dorsally with two coarse, fibrous, encapsulated laminae approximately 3 millimeters thick. Between these lie several hundred thin, white lamellae, a fraction of a millimeter thick, all fixed at one end and mobile at the other. On closer inspection of a few of these, they are found to contain a large number of black surface markings arranged in linear groupings in a highly complex manner."

By that time the chemists have appeared on the scene. The first chemist to get hold of a specimen burns it and satisfies himself that it obeys the law of the conservation of matter and is therefore in his province. Next comes the analytical chemist, who breaks it down into a number of pure compounds—he also reports traces of elementary carbon which he feels are probably impurities. Then come the biochemists, who slice the book and mince it and, best of all, homogenize it (because on the slices and the mince they can still see those black contaminants and the homogenate can be centrifuged to remove them, permitting them to work with a pure system). But all of these chemists have an uncomfortable feeling that though what they are doing is important, the real answers will come from the fellow down the hall who has just arrived and is still polishing his bright and expensive equipment—the molecular biologist.

With the self-confidence which comes from the adulation of the less fundamental sciences, he is anxious to begin work on the copy he has selected because someone has told him that it is biased and distorted. Having hung a sign over his door which reads "No twisted book without a twisted molecule", he proceeds to search for it. By repeated extraction, centrifugation and, sometimes, ultracentrifugation, electrophoresis, hydrolysis, and repolymerization, he finally isolates a pure substance, free of the carbon particles, and what is even better, a macromolecule, and a twisted one at that. His version of the fundamental nature of the book is a molecular model of cellulose.

Simultaneously, the physiologists have been attacking the subject. They have read the report from the anatomists and proceed to study and speculate upon why and how the pages are attached on one side. They study the movement of the pages as the book is riffled, and derive complex equations to describe it. Then a biophysicist discovers that in an appropriate electrostatic field, the graphite deposits produce discontinuities in potential. Fine microelectrodes are developed to pick these up, and amplifiers and oscilloscopes to display them. They discover by sticking these electrodes into the book in various places that those which do not break off will pick up signals, some of which are reproducible. They develop thousands of tracings of these signals and call in the cyberneticist to help them uncode them. The signals are recorded on miles of magnetic tape and fed into huge computers. Excitement mounts when in a particular region extending over a few millimeters in a certain book, one of them discovers on a particular day that, for a few minutes before he damaged the source of the signals, a tremendously complex pattern appeared which was reproducible but incomprehensible. But this is fed into the data reducers and the computers, which can generate and test thousands of hypotheses per minute. Finally, the electric typewriter begins to print —a meaning has been found in that complex pattern. It reads "THE".

By this time the behavioral scientists have been admitted to the institute and begin to study the problem. They are a strange lot. Some of them have read the reports of the anatomists, the chemists, and the physiologists, but many of them don't seem to care. Most will admit, if pressed, that the book is material in nature, obeys material laws, that it and its contents are nothing more than a highly specialized arrangement of chemical substances. But they don't slice the book, and they don't purify the chemical substances—in fact, they seem to feel that it is improper to do so. Instead, they ask questions peculiar to their discipline and look in the book for the answers. The first one likes to count, so he counts the number of letters in hundreds of samples of words and derives a frequency distribution of the words by their length. He finds a preponderance of 4-letter words and forms a hypothesis that the book is a modern novel, and ventures a prediction that it will be a best seller and also banned by the Postmaster General. Then he looks for particular words and counts them and confirms the hypothesis. His colleagues join him, asking other general questions and finding their answers in the content of the book. They learn a great deal about classes of books, how they differ from one another and of their effects on the community. Although he has learned much about the nature of books—more in certain areas than the physical scientist, his techniques falter in the area of the individual book, its characteristics, and his ability to make entirely reliable predictions about it. If it is important to learn something about the individual book, then there is need for a technique which can read it completely. Such a technique has not yet appeared, but some progress has been made in its development. The book is brought in desperation to the psychoanalyst in the hope that he will be able to read it. Well, actually he doesn't, but he asks the author to select portions and read them while he listens. Of course, the author is biased and he reads what he wants to read, or, if there is "good transference", those passages which he thinks the analyst would like to hear. And the analyst himself doesn't always hear with equal acuity, but, depending on his school or on his preconceived notions, is deaf to greater or lesser portions of the data. Nonetheless, this anecdotal, biased, and unverified patchwork may be the closest approximation which we have to the rich and almost inexhaustible fund of information which reposes in the individual human brain and, to a significant extent, determines individual behavior. Like all scientific methodologies, this one was not born perfect and complete, and much remains to be done to perfect its usefulness in research and to validate and improve its therapeutic efficacy.

If it be felt that I have attached increasing values to the disciplines as I have enumerated them, I have done so only to counteract a hierarchical tendency in the opposite direction which I fear exists today. There are no better or worse, no higher or lower disciplines, except with respect to their relevance to particular problems. If a book fulfills its functions poorly by virtue of being badly bound, or because of inferior paper, ink, or glue, the anatomist or the chemist may eventually discover it and quite possibly make it right. In the case of the brain, the biological disciplines have made and will continue to make remarkable progress toward understanding its structure, its metabolism, its functional interrelationships and the mechanisms which underlie behavior, and have solved or will make possible the understanding of those mental disorders in which these functions are significantly defective. But in the area of information, content, and experience, stored as it is in the complex interrelationships of 13 billion neurons, biology is most pretentious if it thinks it can unravel most of the answers by means of its tools alone. There will undoubtedly some day be a biochemistry or a biophysics of memory—but hardly of memories.

It is that concept of psychiatry—monistic, heuristic, and eclectic—which has enabled Dr. Cobb to pursue productively the study of neuropathology, of cerebral circulation, psychosomatic disorders, the rhinencephalon, emotional states, and social psychiatry. It is that concept which guides Dr. Lindemann and his present department, with its broad range of interest and research and its versatile members who move comfortably between psychodynamic theory and the precise and objective areas of neurochemistry and neurophysiology. One has seen those principles become the guiding force in the establishment of other departments of psychiatry and institutes of psychiatric research; and in these days, Dr. Cobb can see that concept becoming the cornerstone of American psychiatry.

The factors which produce mental disorder were never taught to belong to a single discipline nor conform to a single school; the future of psychiatry lies in the integration of many disciplines and various approaches, each with its own values, its unique concepts and techniques, and its special limitations.

"But if our study of neurocirculatory asthenia has taught me anything, it is that one must take a pluralistic point of view toward etiology and realize that many factors combine to bring about the concatenation of events which precipitates a clinical syndrome." [From a paper read by Dr. Cobb at the dedication of the Laboratory for Biochemical Research at McLean Hospital, May 17, 1946.]

* * *

MULTIPLE SCLEROSIS RESEARCH

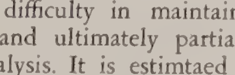
An MS Hope Chest check for $5,680 has been presented to Dr. Dean A. Clark on behalf of the National Multiple Sclerosis Society by Mr. Arnold Cutler, Chairman of its Boston Chapter, for support of the research being carried on at M.G.H. by Dr. Byron H. Waksman, Associate Bacteriologist in the Department of Neurology here at the Hospital. This is the first payment on a multiple sclerosis grant totalling $11,361 for the year.

Dr. Waksman will carry on his investigations in association with Dr. Raymond D. Adams, Chief of our Neurology Service. In the course of this project, Dr. Waksman will investigate certain naturally occurring and experimental animal diseases which resemble multiple sclerosis and related conditions. In particular, he will study the character of diseases produced by allergic reactions to various viruses growing in the brain. Such allergic reactions are known to be capable of producing demyelination, which is a characteristic feature of multiple sclerosis.

Multiple sclerosis is considered one of the major diseases in which demyelination occurs. Demyelination is the destruction of, or damage to, patches of myelin — a fatty substance which appears to insulate the nerve fibers of the central nervous system somewhat like the insulation on an electric cord. It is hoped that Dr. Waksman's research at the Hospital will lead to a better understanding of the mechanism whereby myelin is broken down.

Multiple sclerosis is a progressive, crippling disease. It hits young adults mainly — those in the 20 to 40 age group. Its symptoms are many and varied. Some of the more common ones are defective vision, speech difficulties, extreme fatigue, tremors, difficulty in maintaining body balance, and ultimately partial or complete paralysis. It is estimtaed that more than 500,000 Americans are victims of MS and related diseases.

In presenting the check, Mr. Cutler said the money represented voluntary contributions to the MS Hope Chest by thousands of Americans in all parts of the country. The Chest finances vital research, such as Dr. Waksman's, all over the nation. It also helps to pay for MS clinics and services for MS patients and their families, Mr. Cutler said.



STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material*, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Endoscopy

Benedict, E. B.
Benign inflammatory postoperative esophageal stenosis.
Gastroenterology 39:285.

General Surgery

Barnes, B. A., Cope, O., and Gordon, E. B.
Magnesium requirements and deficits: An evaluation in two surgical patients.
Ann. Surg. 152:518.

Leadbetter, G. W., Jr., Duxbury, J. H., and Dreyfuss, J. R.
Absence of vesicoureteral reflux in normal adult males.
J. Urol. 84:69.

McDermott, W. V., Jr.
Postoperative liver failure.
In Complications in surgery and their management, Artz, C. P., and Hardy, J. D., Editors, Philadelphia, W. B. Saunders Co., chapter 14.

Waddell, W. R., and Field, R. A.
Carbohydrate metabolism in atherosclerosis.
Metabolism 9:800.

Laboratory Science

Morgan, W. S., von der Decken, A., and Hultin, T.
Amino acid incorporation into interior protein sites by purified rat liver systems.
Exp. Cell Res. 20:655.

Medical Science

Smith, L. H., Jr., and Sullivan, M.
Feedback inhibition by fluorinated pyrimidines.
Biochim. biophys. acta 39:554.

Smith, L. H., Jr., Sullivan, M., Baker, F. A., and Frederick, E.
Inhibition of dihydroorotase in pyrimidine biosynthesis.
Cancer Res. 20:1059.

Orthopedic Surgery

Cave, E. F.
Surgery of the chronically disabling knee.
Bull. New York Orthopaed. Hosp. 4: no. 2, p. 2.

Plastic & Reconstructive Surgery

Cannon, B., and Peacock, E. E., Jr.
Medical progress—Plastic Surgery: The hand
N. Eng. J. M. 263:184, 238.

Books

Benda, C. E.
The child with mongolism.
New York, Grune & Stratton, Inc.

Thoma, K. H., and Goldman, H. M.
Oral Pathology, ed. 5.
St. Louis, C. V. Mosby Company.

Thoma, K. H., and Robinson, H. B. G.
Oral and dental diagnosis, ed. 5, Philadelphia, W. B. Saunders Company.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

Ballantine, R. I. W.
General anaesthesia for neurosurgery.
Boston, Little, Brown and Company, 1960.

Bronchologie; technique endoscopique et pathologie tracheo bronchique, vol. 1.
Paris, Masson et Cie, 1956.
(7P)

The 114th anniversary of Ether Day was observed on October 17. There was the customary awarding of service pins for 5, 10, 20, and 30 years of continuous service at the Hospital, with Dr. Clark presiding and helping with the distribution of the pins. Nearly 200 were given out, including 5 to our doctors who have served the Hospital continuously for 25 years. The 30-year group was unusually large this year, numbering 14.

Mr. Ralph Lowell, a member of our Board of Trustees, brought greetings from the Board; Dr. Clark gave a brief history of the Hospital; Miss Carrol S. Cox, R.N., a mezzo-soprano, gave us a sample of her lovely voice with two songs by Rodgers and Hammerstein, Mr. Harvey Davies accompanying her at the piano; and with a showing of the MGH film, "A watch in the night", and refreshments, the program came to a close.

We have left till the last to mention what many may feel was the most outstanding feature in this year's observance of Ether Day. A sizeable group of women who graduated from our School of Nursing 50 years ago were asked by Dr. Clark to rise. The applause they received was lengthy and hearty.

VOLUNTEER GROUPS

MGH Staff Wives Association

About one hundred seventy-five people came to Walcott House to attend the Staff Wives Association Tea, given on November 1 for our visitors from other lands. The guests included doctors and wives, technicians, secretaries, nurses, and fellowship holders from Australia, Austria, Belgium, Canada, Denmark, Egypt, England, Germany, Hungary, India, Israel, Japan, Korea, Norway, Scotland, and South Africa.

Perhaps because of the cold and inclement weather outside, the party seemed to take on a particular warmth of friendliness. The Walcott House living room provided a very pleasant setting, with flowers, silver, and an occasional bright sari adding to the gracious but informal atmosphere of welcome. People came and went from four o'clock until well after six, and both newcomers and old friends enjoyed the conversation and the refreshments.

Staff Wives who poured at the Tea were: Mrs. Charles B. Burbank, Mrs. Alfred Kranes, Mrs. Jackson M. Thomas, Mrs. Earle M. Chapman, Mrs. Joseph C. Aub, Mrs. Kurt J. Isselbacher, Mrs. Thomas B. Fitzpatrick, and Mrs. Leland S. McKittrick.

The Music Committee of the Staff Wives Association presented Mrs. Francis Friedman of Cambridge in a harp recital on the afternoon of November 2. It was the Committee's second concert this fall. Forty-three patients came to enjoy the unusual and delightful half-hour of harp music — twenty-three in wheel chairs and twenty who were ambulatory. With the addition of Hospital personnel and volunteers, an audience of at least seventy-five crowded the MGH Chapel.

The Staff Wives concerts are becoming increasingly popular, and this presents something of a problem, since the patients are brought from all over the Hospital — many in wheel chairs. There are faithful members of the Association who come to help with the transportation of patients, but additional volunteers would be more than welcome. If you can help in this regard, please inquire at the Staff Wives Reception Desk about dates for future concerts when you may be able to give assistance. The patients are most appreciative of this consideration of them.

Distaff Club

December 1 is the date for our annual gift-wrapping meeting. The gifts are for the MGH's Christmas Party for the employees' children.

On December 9 we will have our annual Christmas Party in the Penthouse. We are going to feature an "International" theme this year. The party is given for husbands and their wives, as well as for the bachelor members of the House Staff and their dates.

BIOGLETS

Dr. Khalil Abi-Torbey, Assistant Resident in Urology—born in Beirut, Lebanon, Dec. 3, 1929; on a competitory basis, appointed extern in the American University of Beirut Hospital, 1952; also on a competitory basis, appointed Intern (rotating), American University Hospital, 1953; Intern in Surgery, American University Hospital, 1954; Chief of the Surgical Clinic, American University Hospital, 1955; Resident in Surgery, New England Hospital, Boston, Massachusetts, 1956; Resident in Urology, Cleveland Clinic, Cleveland, Ohio, 1957; Clinical and Research Fellow in Urology, Massachusetts General Hospital, 1958-60.

Dr. David H. Alpers, Intern in Medicine—born in Philadelphia, Pennsylvania, May 9, 1935; A.B., Harvard College, 1956; M.D., Harvard Medical School, 1960.

Dr. Arturo L. Aranas, Resident in Psychiatry, McLean Hospital, Belmont, Massachusetts—born in Lipa City, Philippine Islands, May 31, 1929; M.D., University of Santo Tomás, Manila, 1956; Intern (rotating), Memorial Hospital, Worcester, Massachusetts, 1956-57; Resident in Internal Medicine, Memorial Hospital, Worcester, 1957-58; Resident in Psychiatry, Charles V. Chapin Hospital, Providence, Rhode Island, 1958-60; Teaching Fellow in Psychiatry for one year, beginning July 1, 1960, Harvard College.

Dr. Peter V. D. Barrett, Intern in Medicine—born in Los Angeles, California, October 22, 1934; A.B., University of California at Los Angeles, 1956; M.D., Harvard Medical School, 1960; married.

Dr. Joseph R. Barrie, Intern in Surgery—born in Brooklyn, N. Y., August 22, 1935; B.S., Yale University, 1956; M.D., Harvard Medical School, 1960.

Dr. Irving D. Bornstein, Assistant Resident in Dermatology—born in Honesdale, Pennsylvania, June 8, 1931; B.A., University of Virginia, Charlottesville, Virginia, 1953; M.D., University of Virginia, 1956; Intern (rotating), Gorgas Hospital, Canal Zone, 1956-57; military service: Lieutenant, Medical Corps, USNR, Naval School of Aviation Medicine, USNA Station, Pensacola, Florida, 1957-58, and Flight Surgeon with Fleet Aircraft Service Squadron 105, at U.S. Naval Station, Roosevelt Roads, Puerto Rico, 1958-60; Staff Physician, Memorial Medical Center, South Williamson, Kentucky, March to June 1960.

New addresses:

Dr. Norman W. Andrew (r.p. *An.* 1956), Boston City Hospital, Boston, Mass.
Dr. Henry H. Brewster (*W.M.* 1940), University of Colorado Medical Center, Denver 20, Colo.
Dr. Henry N. Claman (r.p. 1958), 420 Rogers Ave., Glen Burnie, Md.
Dr. James H. Eldredge (a.r.s. *Or.* 1960), Children's Medical Center, 300 Longwood Ave., Boston, Mass.
Dr. Jacqueline Gauthier (r.p. *Psychiat.* (*McL.*) 1959), Massachusetts General Hospital, Boston 14, Mass.
Dr. Anne F. Godley (*M.* 1949), 43 Hedge Rd., Brookline, Mass.
Dr. Volta R. Hall (r.p. *Psychiat.* 1938), 412 Beacon St., Boston, Mass.
Dr. James A. Halsted (*W.M.* 1932), University of Kentucky Medical Center, Lexington, Ky.
Dr. Timothy S. Harrison (a.r.s. 1959), Grace-New Haven Community Hospital, New Haven, Conn.
Dr. John A. Mannick (*S.* 1954), Hospital Division, Medical College of Virginia, Richmond, Va.
Dr. Samuel S. Mathews (*Or.* 1928), 8820 Wilshire Blvd., Beverly Hills, Calif.
Dr. Milton L. Miller (*E.M.* 1932), University of North Carolina School of Medicine, Chapel Hill, N. C.
Dr. Paul L. Norton (*Or.* 1933), Concord Medical Center, Concord, Mass.
Dr. George F. Reed (assoc. s. *Otolar.*), Salada Bldg., 330 Stuart St., Boston 16, Mass.

Brief bits:

Dr. Patricia H. Benedict attended the First International Congress of Endocrinology, in Copenhagen last July, and, with Dr. H. Robert Dudley, Jr. of our Department of Pathology and Dr. George Szabó of the Department of Dermatology, presented an exhibit entitled "Albright's syndrome (fibrous dysplasia)—endocrine features and pigmentation".

Dr. Bradford Cannon presented a paper on "Repair of cranial defects with bone" at the Pan-Pacific Surgical Association meeting, in Honolulu last September. In October he attended the meeting in Los Angeles of the American Society of Plastic and Reconstructive Surgery, of which he is Vice-President, and then went on to San Francisco, where he spoke at a panel on "Facial injuries" for the American College of Surgeons.

Dr. Gordon L. Brownell has assisted in the Isotope Committee Lecture Series here at the Hospital. He directed the AEC-NSF Summer Institute in Radioisotope Techniques at M.I.T., and assisted in organizing the American Cancer Society meeting on Research in Radiotherapy at Madison, Wisconsin.

Dr. Oliver Cope gave two lectures at the Symposium on Surgery of Endocrine Organs, at the New York University Medical Center in November. His subjects were: "The metabolism of calcium, phosphorus, and magnesium: Tests of parathyroid function", and "Surgery of the parathyroids".

Dr. James H. Currens participated in a program sponsored by the Illinois Heart Association, at Mattoon, Illinois, on October 6. and spoke on "The treatment of myocardial failure".

Dr. Ralph Hawkins (r.s. *N.S.* 1948) of Palo Alto, California, treated us to a nice visit here at M.G.H. last October.

Dr. Oscar Hirsch was invited by the Hitchcock Clinic Medical School at Hanover, New Hampshire, to give a lecture last October 18 on "Pituitary tumors".

Dr. Lloyd H. Smith, Jr. attended the First International Congress of Endocrinology, in Copenhagen, last July.

Dr. Jack E. Tetirick (*S.* 1952) of Columbus, Ohio, flew to Indonesia late in October to participate in Project HOPE. Dr. Tetirick will live aboard the S.S. *Hope* for two months. When his team returns home, another will replace it. We wonder if the names of other MGH-ers, besides those of Dr. Spangler and Dr. Tetirick, will appear on the roster of Project HOPE.

Five recent graduates of the MGH School of Medical Illustration attended the annual meeting of the Association of Medical Illustrators, held in Chicago last October. After a 3-day program of seminars and workshops, an MGH reunion was arranged.

Dr. Robbins received this interesting letter, a few weeks ago, from Dr. K. Jack Momose (clin. fel. *R.* 1956). It is headed Department of Radiology, Ottawa General Hospital, Ottawa 2, Ontario, Canada, and reads in part:

> As much as I wanted to stay in Europe a month longer, I finally had to return to Canada, since I had promised to work with Conway Don (clin. fel. *R.* 1957) for a year in Ottawa.
>
> I started out on this trip to Europe with the idea of seeing the many centres of radiology during a period of about six months. As you see, it turned out to be almost a year. By taking this position in Ottawa, I was able to stay in Europe several months longer.
>
> As for the trip — I think that I saw and learned a considerable amount. Since I went as a postgraduate student, I was able to get in at the "back door" of many of the centres. On the other hand, as I had already worked in radiology in all its phases for over six years in some of the best institutions, I felt that I was able to evaluate and incorporate the different approaches and methods which I encountered. I think my four objectives were to learn more neuroradiology, see more special techniques in general radiology (especially catheter work), see different views of radiotherapy, and to assess the various training methods for student radiologists. (Of course, I also went as a tourist to see and learn about the different countries.) I believe I was able to fulfill most of these objectives.
>
> I spent most of my time in London, in order to learn as much as I could about neuroradiology at Queen Square. I spent over seven months there. In comparison with the method taught at the Montreal Neurological Institute, where I had spent about three months last year, I found the methods there in London quite different. I think the Swedish technique which is followed over there has an edge over the Montreal technique. However, I think some of the technique which is employed in Montreal can well be incorporated into the Swedish method. I think the main strength of Queen Square in neuroradiology is due largely to the rich collection of material they have stored away there. I felt that I learned more by going through literally thousands of cases of certain conditions than from just watching the routine work. Another power in that place, which calls for good work in neuroradiology, is the clinical staff with its many stimulating minds. They tend to ask for, and spur on, research in neuroradiology. I found the director, Dr. Hugh Davies, to be the most underrated neuroradiologist in England and in the neuroradiological world. Although he makes suggestions and helps out a great deal whenever someone is writing a paper, he seldom places his name on the paper. He is a most kind and helpful person.
>
> I was able to spend one or two days each week, over a period of six months, with Dr. Steiner at the Hammersmith postgraduate school hospital. He kindly made me an honorary clinical fellow so that I could watch and do some things there. In addition, I was able to visit most of the teaching hospitals in London, such as the Middlesex, University College Hospital, St. Bartholomew's, St. Thomas's, St. Mary's, etc., and all the specialty institutions, such as the Brompton Hospital for Chest, National Heart Hospital, Orthopaedic Institute, Dental Institute, Ear, Nose, and Throat Institute, etc. I also visited the diagnostic and therapeutic centres in Bristol, Manchester, Edinburgh, Newcastle upon Tyne, Oxford, Cambridge, Birmingham, etc. I took the visitors' course in radiotherapy at the Royal Marsden (Professor Smithers) and the special course of Professor Paterson at Manchester. I must say that it was all very stimulating and interesting, although on the diagnostic side I thought they were moderately behind in several branches.
>
> I then spent about seven weeks in the Scandinavian countries. Radiology in Sweden and Norway was an eye opener. Radiology in Sweden, I was always told, is about five to ten years ahead of any other country. In many ways, it certainly is — especially in diagnostic radiology. I wish that I could have stayed much longer there. I did see more neuro-

No. 93 in a series of Staff photographs

Dr. Alexander Leaf, M.D., Associate Physician — Chief Cardiovascular Investigator

radiology and the many catheter techniques which they had developed there. The radiology department seems to be one of the most important departments in a Swedish hospital. They tended to give an exact diagnosis whenever possible, thus making the clinicians' work much easier. The diligence of the Swedish people amazed me. While the consultants in England came to work at about nine to ten o'clock, the Swedish staff came to work between six-thirty and seven-thirty. It also seemed to me that they often went home at about six o'clock during the week and as late as three o'clock on Saturdays.

In England, the lack of money seems to be holding the hospitals back from expanding and from using more modern equipment. However, they were beginning to remedy this and some renovations were being started. What the English did in diagnostic radiology was good, but they seldom incorporated any outside ideas except some of the Swedish methods in neuroradiology and catheter techniques.

When I first went to England I had no intention of taking any examinations, as I wanted to see everything and would have no time to study. However, the people in England are so proud of their hard-earned degrees, which they get after several attempts on the average, that they tend to scoff at any degrees earned in other countries. People used to ask me at what level of training I was. I told them that I had my American Boards in Radiology and my Canadian certificate in both diagnosis and therapy. They then would automatically place me at about their D.M.R.D. level or lower. I encountered this feeling several times during my visits to different places. I therefore asked one of the senior registrars at Queen Square what my chances were to write the F.F.R. He looked surprised and asked if I had written my D.M.R.D. of London. I told him I already had my D.M.R. from Toronto University, but better yet my American and Canadian specialty boards. He gently suggested that I had better try the D.M.R.D., since the F.F.R. was beyond my reach — or at least he inferred it. (He had already tried and didn't make it.) This annoyed me all the more. When I then applied at the Faculty of Radiology, they were very nice but more or less took the same attitude, stated that the D.A.B.R. was about their D.M.R.D. level, but, as I had done about five years of diagnostic radiology, they would ask their warden about this at the next meeting and would let me know. They finally granted me permission to write the examination, but somehow all this annoyed me, since I thought our training was superior to their D.M.R.D. level. At any rate, I got hold of some of their old examination papers to see what the gist of their questions was. The exam consisted of six hours of writing on diagnostic radiology and three hours each in surgery, medicine, and pathology, all of which took about four days. After a gap of two weeks, during which they corrected the papers, I had orals in each subject, which lasted about a week. Two people fire questions at you at each oral. One is a specialist in his field (pathologist, internist, and surgeon), and the other a radiologist in either diagnosis or therapy. Finally, two radiologists from different parts of England showed me about a dozen X-ray films, covering the various branches of radiology, and asked many questions. Fortunately, I passed, and I considered myself lucky, as they let through only five candidates out of about 28.

I guess I could go on and on, but I had better stop now. I think that radiology has a great future and can contribute tremendously to, and even lead in, the field of medicine and attain the high level that the main centres in Sweden have been able to reach. As Professor Hodge once said at A.F.I.P. when I was a fellow there, after he had returned from a trip to Sweden, "If I were only twenty-five years younger. . . . What a future radiology has. . . . A vast new investigative field seems to be opening in X-ray and it would be so good to be in it!" I must say that I agree with him wholeheartedly. After seeing the X-ray departments in Sweden, one can imagine all kinds of things one can do. Not only that, but after seeing some of their work, one feels proud to be a radiologist.

Please give my regards to the people I know at M.G.H.

A brief letter from Dr. Paul E. Spangler (*W.S.* 1925), Senior Medical Officer on the S.S. *Hope,* appeared in the November issue of The News. Soon afterward we were delighted to receive this interesting and detailed report of Dr. Spangler's activities from Mrs. Spangler:

Dr. Spangler sailed as Senior Medical Officer with the S.S. *Hope* on September 22 and was due to arrive at Djakarta, Indonesia, on October 19. I enclose two clippings that tell briefly of the ship's return to San Francisco, late in August, after overhaul in Seattle, and of the first operation performed on the ship after it sailed, and before it had even reached Honolulu.

Dr. Spangler entered the United States Navy as a captain in the Medical Corps in July 1947. He had been on active duty with the Reserve for four years. He was stationed at the old Pearl Harbor Hospital on December 7, 1941; and it was he who performed the first operation of World War II, on one of the casualties wounded by flying shrapnel. After being stationed in the Hawaiian Islands for three and a half years, he went to the hospital ship *Repose*—a sister ship of the *Consolation*—now the S.S. *Hope.* He returned to private practice in Portland, Oregon, for a year, and then applied for a commission in the regular Navy.

His first duty station was at NAS, Corpus Christi, as Chief of Surgery and then Executive Officer from 1947 to 1949. Then he was sent to the Postgraduate School at the University of Pennsylvania Medical School for a course in surgery which qualified him for the American Board of Surgery. He then served as Chief of Surgery at the Naval Hospital, Portsmouth, Virginia, for three years. In July 1953 he was sent to the U.S.N. Postgraduate School at Monterey, California, as Senior Medical Officer. He held this post for four and a half years. Then he was transferred to the Naval Hospital at Oakland, California, as Senior Medical Member of the Physical Evaluation Board, which post he held until he retired from the Navy on July 1, 1959. However, he had already become interested in Project HOPE, and was signed on in September of 1959. An office was opened in April 1960 at the Stanford Medical Center, Palo Alto, California, but this was closed before the ship sailed.

A dedication ceremony and flag raising was held on September 13, with Vice-President Nixon as speaker. The ship was then moved from its berth at Hunters Point to Pier 50, from which it sailed on September 22. The project is to last a year, with six months in Indonesia and then four months in South Viet-nam. It is hoped that a fleet of hospital ships will follow the example set by the S.S. *Hope.*

Further information on the project may be obtained from the Washington Headquarters, Project HOPE, 1818 M Street, N.W., Washington, D.C.

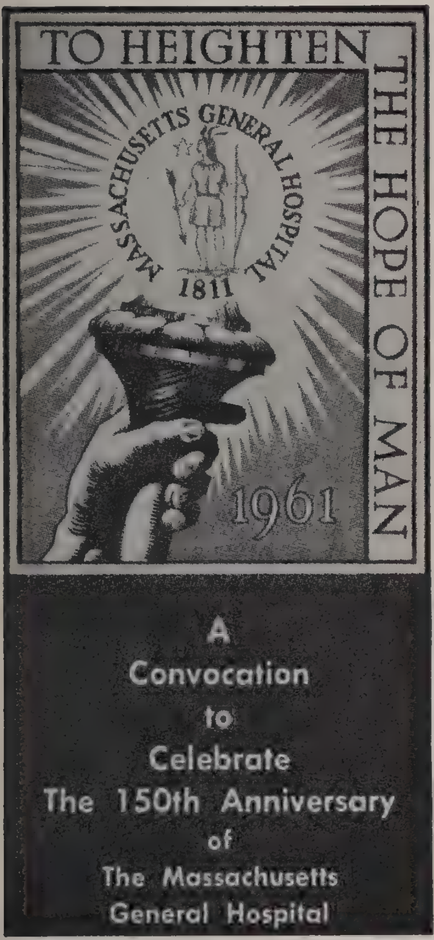
No. 200 Boston, Mass. January 1961



TO HEIGHTEN THE HOPE OF MAN
MASSACHUSETTS GENERAL HOSPITAL
1811
1961
A Convocation to Celebrate The 150th Anniversary of The Massachusetts General Hospital

"The Massachusetts General Hospital will observe its 150th birthday in 1961." When the first public announcement of this great milestone in the history of the third oldest voluntary nonprofit hospital in the United States was made nearly two years ago, it conveyed different connotations to different people. To many it was an announcement of an interesting, historical event yet to come; in others, it aroused a curiosity about the origin and history of the Hospital; and in still others it intensified an awareness of the responsibilities that such a heritage imposes upon those entrusted with the future development of this great and venerable institution.

Preparations for the Anniversary have been going on for many months, with nearly 500 people working on the program. And now—suddenly—it is 1961, and on January 31, and February 1 and 2, a three-day Convocation will inaugurate the 150th Anniversary Year of the Massachusetts General Hospital.

The M. G. H., which since its founding has been the main teaching hospital of the Harvard Medical School, received its charter of incorporation from the Massachusetts Legislature on February 25, 1811. The first patient was admitted to the historic Bulfinch Building, which is still in use, in 1821. The McLean Hospital, our psychiatry division, was opened in 1818—the fourth hospital for the mentally ill in America.

The Convocation has been organized round the theme

TO HEIGHTEN THE HOPE OF MAN

The first day, January 31, will be devoted to a series of symposia on areas of medical science in which the Hospital has been making notable contributions, and on nursing. A variety of panel discussions during the next two days, February 1 and 2, will cover such subjects of general interest as patient care, public health, medical economics, and medicine of the future.

Among the participants will be the Secretary of Health, Education and Welfare, Arthur S. Flemming; Dr. Leroy E. Burney, Surgeon General of the United States; Senator Lister Hill of Alabama; Dr. Leona Baumgartner, New York City Commissioner of Health; Dr. Isidor S. Ravdin, Vice President for Medical Affairs of the University of Pennsylvania; Dr. Paul Dudley White, Honorary Physician to the Massachusetts General Hospital; Dr. Ancel Keys, Professor at the University of Minnesota School of Public Health; Miss Daisy C. Bridges, General Secretary of the International Council of Nurses, London; James E. Stuart, President of the Blue Cross Association; Dr. Howard A. Rusk, Chairman of the Department of Physical Medicine, New York University Medical Center; The Rajkumari Amrit Kaur, former Minister of Health of India; Dr. Rene J. Dubos of the Rockefeller Institute, New York; Dr. John Roderick Heller, Jr., President of Memorial Sloan-Kettering Cancer Center in New York City; Dr. Nathan M. Pusey, President of Harvard University; Dr. Julius A. Stratton, President of the Massachusetts Institute of Technology; and Dr. George Packer Berry, Dean of Harvard Medical School.

The MGH House Pupils Association (former residents and interns of the Hospital) and the School of Nursing Alumnae Association have chosen, by secret ballot, their outstanding living members for recognition during the Convocation.

Several of the world's great hospitals and medical institutions will send representatives to receive 150th Anniversary citations and medals at the Anniversary Banquet on February 2 at the Sheraton-Plaza Hotel.

Nationally known individuals will be the main speakers at the banquet and at general luncheons on February 1 and 2. Their names will be announced at a later date.

MGH Trustee John E. Lawrence is Chairman of the Convocation. United States Attorney Elliot L. Richardson, and Edward A. Weeks, Editor of *The Atlantic Monthly,* are Vice Chairmen in charge of speakers and panels. H. D. Hodgkinson, Chairman of the Board of Filene's, heads the publicity committee, and Gerald W. Blakeley, Jr., Vice President of Cabot, Cabot and Forbes, is responsible for arrangements.

Dr. Paul Dudley White is Chairman of the doctors' committee, arranging the scientific symposia. The nursing panels were planned by a committee headed by Miss Ruth Sleeper, Director of our Nursing Service and the School of Nursing.

Other members of the Convocation Committee are the Rt. Rev. Henry K. Sherrill, retired Presiding Bishop of the Protestant Episcopal Church in the United States of America, Honorary Chairman, and MGH Trustee Francis W. Hatch, a Co-Chairman, of the 150th Anniversary Program; Dr. Dean A. Clark, General Director of the M. G. H.; Dr. Edward D. Churchill, Chief of the General Surgical Services; and David C. Crockett, Executive Director of the Program.

Seven scientific symposia will be conducted in the Hospital during the Convocation. The subjects are "Precision in surgery"; "Atherosclerosis"; "Genetic disorders of endocrine glands"; "Connective tissue and certain of its diseases"; "Frontiers in cancer research"; "The study of cell structure in nervous disease"; and "Rhythmic activity of tissues".

Subjects of the nursing symposia, to be held at the Museum of Science, are "The evolving role of the nurse"; and "Nursing education for the future".

The general panels will be on February 1 and 2 at the Sheraton-Plaza Hotel. The subjects will be "The hospital and the community"; "Financing medical care"; "International health"; and "Medicine of the future".

A clinical pathological conference, now a standard feature of medical education which was "invented" at the Massachusetts General Hospital fifty years ago, will be conducted at the Hospital on January 31.

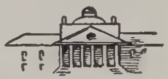
Many activities of a social and scientific nature will be taking place not only in conjunction with the Convocation, but throughout the Anniversary Year, as well; and special exhibits, prepared under the direction of the 150th Anniversary Hospital Participation Committee, will depict past achievements, present accomplishments, and future plans of the Massachusetts General Hospital.

* * *

Irvin H. Blank, Ph.D. has been recognized by The New York Academy of Sciences with the honor of Fellowship in the Academy. This honor is in recognition of the achievements of Dr. Blank's work in science. Fellowship in this Academy is awarded to a member who has attained outstanding recognition for scientific achievement or for the promotion of science, and is accordingly recognized as an honor in the world of science.

Dr. Frederic M. Blodgett (*C.M.* 1946), Assistant Professor of Pediatrics at Yale Medical School, received the Francis Gilman Blake Award for 1960. This award, sponsored by the Yale chapter of Nu Sigma Nu, is presented annually to the faculty member chosen by the graduating class as the most outstanding teacher in the medical sciences.

Dr. Richard J. Clark was recently presented with a meritorious award at the third annual national meeting of the President's Committee on Employment of the Physically Handicapped, for "leadership as director of the cardiac work classification unit of the Massachusetts Heart Association".



The Board of Trustees, at their meetings on November 4 and 18, 1960, voted:

To reappoint:

Dr. John Gergely as Associate Biochemist (Medicine), for the three-year period beginning June 1.

To appoint:

Dr. Felix A. Battat as Assistant Resident in Orthopedic Surgery for one year, beginning January 1;

Dr. William D. Bradford as Exchange Resident on the Children's Medical Service, for the period November 1, 1960 through December 12, 1960;

Dr. Donald L. Bornstein as Resident in Medicine for one year, beginning January 1, 1962;

Dr. Nelly Chiofalo (Basauri) as Clinical and Research Fellow in Neurology, assigned to Electroencephalography, for a period of eight months, beginning November 1, 1960;

Dr. Melvin E. Clouse as Second Assistant Resident in Radiology, beginning January 1, 1962;

Dr. John Q. Durfey as Assistant in Anesthesia, effective as of November 3, 1960;

Dr. James M. Gibson as Intern in Pathology for one year, beginning July 1;

Dr. Hensley S. Johnson as Clinical Fellow in Dermatology, effective as of October 3, 1960;

Barbara W. Kalckar, Ph.D. as Associate Biochemist (Medicine), for the three-year period beginning July 1;

Leonard M. Lansky, Ph.D. as Assistant Psychologist in the Department of Psychiatry, effective as of November 1, 1960;

Dr. Rita A. Manzi as Assistant Resident in Anesthesia, beginning August 1;

Dr. Gerald R. Plotkin as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. René Riquelme as Clinical and Research Fellow in Surgery, for the period September 16, 1960 through March 15, 1961;

Dr. Lawrence C. Sack as Second Assistant Resident in Radiology for one year, beginning January 1, 1962;

Dr. Clement B. Sledge as Assistant Resident in Orthopedic Surgery for one year, beginning January 1;

Dr. Lawrence Stark as Clinical and Research Fellow in Neurology, assigned to Electroencephalography, for one year, beginning November 1, 1960;

Dr. Martin J. Wohl as Resident in Medicine for one year, beginning January 1, 1962.

At their meetings during November 1960, the General Executive Committee voted:

To rescind the appointment of:

Dr. Perla Berta Salama as Research Fellow in Neurology, to have begun September 1, 1960.

To promote:

Dr. Frederick W. Ackroyd from Third Assistant Resident to Second Assistant Resident in Surgery, effective January 1;

Dr. Arthur E. Baue to the position of Resident on the East Surgical Service, effective January 1;

Dr. Bob Bullwinkel to the position of Second Assistant Resident in Surgery, effective February 1;

Dr. Richard E. Senghas to the position of Senior Resident in Orthopedic Surgery for one year, beginning January 1.

To extend the appointments of:

Dr. John Denovian as Clinical Fellow in Medicine, assigned to Cardiology, from December 1, 1960 through February 28, 1961;

Dr. Giovanni Giuliano as Clinical and Research Fellow in Medicine, from November 30, 1960 through December 31, 1960.

To reappoint:

Anthony L. Andrikides, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning November 1, 1960;

Dr. Harold B. Anstall as Clinical and Research Fellow in the Blood Bank for one year, beginning October 1, 1960;

Dr. Kathryn S. Beck as Second Year Resident in Psychiatry at McLean Hospital, beginning July 1;

Dr. Jane M. Berman as Clinical Fellow in Psychiatry at McLean Hospital, beginning July 1;

Laurence C. Bonar, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning January 1;

Dr. Virginia L. Clower as Assistant Attending Psychiatrist at McLean Hospital, beginning December 2, 1960;

Dr. Roy M. Coleman as Second Year Resident in Psychiatry at McLean Hospital, beginning July 1;

Eubert J. Daniel, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning December 29, 1960;

Dr. Stephen E. Hedberg as Second Assistant Resident in Surgery, beginning January 1;

Dr. Eda M. Kahana as Clinical Fellow in Psychiatry at McLean Hospital, beginning July 1;

Dr. Bernard Levey as Second Year Resident in Psychiatry at McLean Hospital, beginning July 1;

Dr. Anthony P. Monaco as Second Assistant Resident in Surgery, beginning January 1;

Leighton B. Richards, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning December 1, 1960;

Dr. William M. Thurlbeck as Clinical and Research Fellow in Pathology, for the period November 1, 1960 through May 31, 1961;

Chuan-Tao Yu, Ph.D. as Research Fellow in Medicine for one year, beginning November 2, 1960.

To appoint:

Dr. Peter T. Choras as Second Year Resident in Psychiatry at McLean Hospital, beginning July 1;

Annemarie Closse, Ph.D. as Research Fellow in Biochemistry (Medicine) for one year, beginning February 1;

Dr. Wellington B. Cu as Third Year Resident in Psychiatry at McLean Hospital, beginning July 1;

Dr. Jack Ellenberg as First Year Resident in Psychiatry at McLean Hospital, beginning July 1;

Dr. Robert W. Farkas as First Year Resident in Psychiatry at McLean Hospital, beginning July 1;

Dr. Donald J. Fern as Second Year Resident in Psychiatry at McLean Hospital, beginning July 1;

Dr. Bruce W. Fischberg as Second Year Resident in Psychiatry at McLean Hospital, beginning January 1;

Dr. William H. Goodson, Jr. as First Year Resident in Psychiatry at McLean Hospital, beginning July 1;

Murray V. King, Ph.D. as Research Fellow in Orthopedic Surgery, retroactive for one year, beginning January 1, 1960;

Dr. John B. Livingstone as First Year Resident in Psychiatry at McLean Hospital, beginning July 1;

Dr. Judith G. Ronat as First Year Resident in Psychiatry at McLean Hospital, beginning July 1;

Dr. Philip I. Salib as Graduate Student Assistant in Orthopedic Surgery, for the period October 28, 1960 through December 15, 1960;

Dr. Melvyn B. Schupack as First Year Resident in Psychiatry at McLean Hospital, beginning July 1;

Dr. John S. Strauss as First Year Resident in Psychiatry at McLean Hospital, beginning July 1;

Dr. Captane P. Thomson as Second Year Resident in Psychiatry at McLean Hospital, beginning July 1;

Dr. Harold W. Williams, Jr. as Second Year Resident in Psychiatry at McLean Hospital, beginning July 1.

* * *

"A SENTIMENTAL JOURNEY"

To any devoted thyroidologist a visit to Dublin cannot fail to be, in part at least, sentimental. And borrowing a title from Sterne is amply justified by the fact that he was born in Ireland of an Irish mother.

Our visit was prompted by a modest little invitation appended to the program of the Fourth International Goiter Conference, held in London July 5 through 8, 1960. It read, "Members of the Conference and their families are warmly invited to visit Dublin on Tuesday, July 12th", the purpose, of course, being to visit the haunts of the late Robert James Graves, M.D. Of all the 650 conferees, only the Merrill N. Footes of Brooklyn and the Meanses of Boston had the wisdom to accept this invitation. They were indeed well repaid.

Dublin is a gracious and stately city, with great architectural integrity. Although there has been a settlement on the banks of the Liffey for many centuries, the present aspect of Dublin dates chiefly from the eighteenth century. It is Georgian, and very lovely Georgian at that.

After ensconcing ourselves in the old-fashioned comfort of the Shelbourne Hotel, we strolled about the city — especially to Trinity College, Dublin's brightest gem, and beautiful Merrion Square, where Robert Graves once lived. In the evening we repaired to the Queen's Theatre, where we saw a fine performance, by the Abbey players, of John Murphy's "The Country Boy". This play portrays vividly some of the harrowing consequences of the migration of young Irish people to America.

Next day, bright and early, we were off to the spacious house of the Royal College of Physicians of Ireland, in Kildare Street, escorted thither by Mr. Arthur Lawson, to whom we had been kindly referred by Dr. Francis C. Kelly of the Chilean Iodine Bureau in London. We were cordially welcomed by Dr. Charles Dickson, Fellow and Registrar of the College, who took us in hand and became our guide for the entire morning.

Although the present building of the College is just short of a century old, the College itself was founded in 1654 — that is to say, during the dictatorship of Oliver Cromwell, whose name is still thoroughly hated in Ireland. In the beginning, the College of Physicians constituted the first Medical Faculty of Trinity College, but after some thirty years, dissensions arose between them, and they parted company. Under a new charter from William III, the College of Physicians, in 1692, embarked on its subsequent independent existence.

The present home of the College serves, among other things, as a hall of fame for the great physicians of Ireland's golden age of medicine in the first half of the nineteenth century, up to the terrible catastrophe of the potato blight of 1845-47 with its resulting famine and pestilence, from the effects of which Ireland has never completely recovered. This golden age was the period in which many American doctors went to Dublin for graduate training. In those days they had to go abroad somewhere to get really first-rate medical education, and Dublin, along with London, Edinburgh, and Leiden, was among their places of choice. In the assembly hall of the College stand heroic-sized statues in white Carrara marble of Graves, William Stokes, Sir Dominic Corrigan, and Sir Henry Marsh.

From the College of Physicians we proceeded to the Meath Hospital. This is where Graves and his distinguished contemporaries worked. Opened in 1771 upon the site of Dean Swift's garden, it is still in full use as a teaching hospital today. Graves served on its staff from 1821 to 1843. In its general features it is not unlike the original Bulfinch Building of the M. G. H. Open wards, with large chimneys and fireplaces in the middle as the only source of heat, are particularly reminiscent of the Bulfinch in its salad days.

Merrill Foote joined us as we arrived at the front door of Meath Hospital, and Dickson introduced us to several members of its staff gathered on its front steps. Among these was Mr. Henry Stokes, grandson of William Stokes of Cheyne-Stokes and Stokes-Adams fame, now 80 years old, but seemingly extremely fit. We wished we could have spent hours at the Meath Hospital, to make a thorough ward round, in fact, but this was not possible. Instead, we hurried off to visit the grave of Graves, and lay an imaginary wreath upon it. Amidst greenery, flowers, and peace, in Mount Jerome Cemetery, is a simple stone bearing the following inscription:

Here Repose
The Mortal Remains of
Robert James Graves M.D.

He was born 28 March 1797
and died 20 March 1853
Aged 56 years

He requested that his only epitaph
should be that he was the son of the
late Rev^{d} Dr Rich^{d} Graves
Professor of Divinity in the University
of Dublin and that after
a painful and
protracted illness he died
in the love
of God and in the Faith
of Jesus Christ

The name of Robert Graves is known to every English-speaking member of our profession, and to many others. The American Goiter Society has emblazoned his countenance upon its letterhead, but why? There can be no doubt that it is chiefly, if not entirely, for his classical and excellent description of exophthalmic goiter that he is now known. Graves, however, was not the first to recognize this syndrome. His first published report on it was in 1835, but Caleb Hillier Parry of Bath had preceded him by twenty years, and Giuseppe Flajani had reported cases of goiter and violent heart action as early as 1802. All these physicians, together with the German, von Basedow, who described the malady in 1840, together with one or two others, have served eponymic roles with respect to exophthalmic goiter. If one wanted to be utterly fairminded, eponymically, perhaps one should call it Flajani-Parry-Graves-Basedow disease. This isn't much worse than Hand-Schüller-Christian disease, or Charcot-Marie-Tooth type of progressive muscular atrophy. But why an eponym at all? Simply because the purpose of a term is to convey meaning, and in this case by long association the eponyms have come to convey, more concisely and clearly than any descriptive appellation can do, the concept of a disease entity. Long usage decrees, moreover, that in English it shall be "Graves's" and in continental languages, "Basedow's" disease, nor must we forget that before any of these worthies, artists had observed the prominent eyes and enlarged necks, for they have left records of them in paint!

The chief point to make now, however, is that Graves, had he never touched upon exophthalmic goiter, still would be one of medicine's famous figures. As a clinical teacher he was outstanding. His published volumes of lectures on clinical medicine constitute a medical text of first rank. Being lectures, they are somewhat chattier than modern textbooks of medicine, but they are systematic and comprehensive, nonetheless. Graves was evidently a physician of very wide clinical experience, but with a profound interest in the underlying sciences upon which he drew freely for explanations of clinical phenomena. Thus, in his studies on inflammation he had constantly in mind the physiological events taking place in the capillary and arteriolar vessels. He always made every effort to consider the true nature of morbid change in designing treatment to correct it, and he was not one to accept prevailing theories uncritically. Often he dissented, and gave logical reasons for doing so.

Graves obviously was deeply interested in fevers and their epidemiology — "geography of diseases", he called it, and his chapters on these subjects are especially distinguished. He had a great deal to say about typhus, which was both endemic and often epidemic in Ireland in his day. He recognized its contagious character and noted the evil effect of over-crowding, as in workhouses, almshouses, gaols, etc., in intensifying the severity of an epidemic. This concept seems to be in line with the historic use of such terms as ship fever and prison fever for typhus.

I can find no direct separation of typhoid from typhus fever in Graves's writings, although this had been made clinically by Louis in Paris as early as 1829, and anatomically by Gerhard in Philadelphia in 1836. It is inconceivable, however, that typhoid did not abound in Ireland in Graves's time. Doubtless the two diseases were lumped together under the term typhus in his thinking, as it was in that of many others. He does use the term "maculated typhus", and states that in the severe epidemics it is the prevailing form. But cases of continued fever, with predominantly abdominal symptoms — including tympanites and hemorrhage from the bowels, which he also mentions, were very likely typhoid.

Trousseau, who wrote a very laudatory preface to the French edition of Graves's lectures, acclaims him particularly for "completely reversing medical practice" in the matter of how to feed patients with prolonged fevers. "The Dublin physician," said Trousseau, "single-handed, assailed an opinion which appeared to be justified by the practice of all ages," namely, that a low diet was "an indispensable condition in the treatment of fevers." Graves, on the contrary, inculcated the necessity of giving adequate nourishment under these circumstances, thus anticipating by some fifty years those who again liberalized the diet in typhoid fever, round the turn of the present century. It is recorded that he requested that "He fed fevers" should be his epitaph. Judging by his gravestone, however, he later changed his mind about this.

To other febrile diseases Graves also gives considerable attention. He recognized the ague (malaria) — which was evidently widely disseminated along with typhus, and presumably typhoid, in Ireland in those days — as quite distinct from these diseases. He observed a diminution in its incidence when swampy areas were properly drained, and he had success in treating it with quinine.

René Dubos cites Graves as having observed a spontaneous fluctuation in the character of scarlet fever. "In the year 1801," wrote Graves, "scarlet fever committed great ravages in Dublin, and continued its destructive progress during the spring of 1802." It returned at intervals during the next few years, but in a form "either so mild as to require little care, or so purely inflammatory as to yield readily to the judicious employment of antiphlogistic treatment."

Two other epidemic diseases also aroused his interest — cholera and influenza. Of the former, he wrote, "What causes combined to convert a malady habitually confined to the Indian peninsula, into a disease which overshadowed the earth, sparing no nation nor language, it would be useless to inquire; the subject is buried in profound obscurity." It was in 1817 that the cholera "assumed a new and more powerful character; it then became endowed with properties that rendered its extension steadily progressive over the earth in spite of all obstacles interposed by diversity of soil or climate." Graves followed its spread with close attention. It went eastward into Asia and westward into Europe. In 1832 it reached Edinburgh and London. That same year it quickly spread to Ireland and finally to North America.

In 1826 Graves, in a lecture to his students at Meath Hospital, gave them a description of cholera based on accounts of "eastern authors" and prepared them for its arrival in Ireland. When it did arrive in 1832, he had plenty of patients suffering from it to show them. Studying his own cases, it is clear from his remarks — although he doesn't use just this language — that he understood quite well that what these people died of was dehydration, due to the terrific loss of water through the bowels. The indication was to stop the diarrhea and, to this end, he introduced the generous use of acetate of lead combined with opium. He later learned that another physician had used it, but not in effective dosage. "Be this as it may," he said, "acetate of lead was not known to the medical men of Dublin and to the practising apothecaries before I recommended it. It had been frequently employed in the form of injection by them; but no one had given it in large doses by the mouth, or introduced it to the notice of the profession. I believe I can fairly claim the merit, such as it is, of being the first to give it in large and effectual doses." He laid great stress on early diagnosis and early inauguration of treatment, and claimed good results under these circumstances.

With regard to influenza, he collected information on many epidemics. He was most interested in comparing the rate of its spread with that of cholera. The latter had "been twenty years in compassing the earth; while influenza . . . often traverses the same space in a few months."

He also has a chapter on yellow fever, which reached Ireland in 1826, and he compares his findings with those of Louis at Gibraltar in 1828. But Graves's work is by no means overweighted on infectious diseases. Practically all branches of general medicine are, at least, touched upon in his well-balanced work — diseases of metabolism, the central nervous system, those of various organs, heart, lungs, abdominal viscera, etc., including (rather lightly) even the goiter.

But to conclude this necessarily sketchy account of the work of Graves, I will revert to his opening chapters in which he sets forth what may be his most important contribution of all — namely, his methods of clinical teaching. He was indoctrinating his students in these matters. "You come here to convert theoretical into practical knowledge," and this, he implied, cannot be done by sitting on benches listening to lectures, but only at the bedside, and, what is more, in a responsible role at the bedside. So he invented the clinical clerkship, and put it to use in the Meath Hospital in the early 1820's. He did not actually claim to have invented it, and said he got the idea from Germany. Nevertheless, if this is so, he at least improved upon it. In any event, there was nothing of the sort elsewhere in the United Kingdom at that time, nor for many years after he had had it in successful operation in Dublin. Without such a system as the clinical clerkship, Graves maintained, a man becomes a practitioner of medicine without ever having learned to practise. He has had no "*experience*, because he has at no time been charged with the responsibility of investigating a case for himself and by himself, because at no time has he been called on to make a diagnosis unassisted by others, and above all, because he has never been obliged to act upon that diagnosis, and prescribed the method of treatment." Here is something to which modern medical educators can appropriately pay homage!

After leaving Dublin, we took an all-too-brief motor trip through the lovely coastal areas between Galway and Sligo, with a charming young student to drive us. He had a warm Irish heart and the gay spirit characteristic of his people. This part of our trip also had some sentimental value, because — think of how many Bostonians have come from these parts.

Back in the Shelbourne Hotel just prior to a take-off for London, we encountered Edward Scott O'Keefe of the MGH staff and my classmate twice over — Harvard College '07 and HMS '11. He and Mrs. O'Keefe and a bright young granddaughter were all taking summer courses in early Irish literature at Trinity College. "It's the best place," said Ned, "to get courses of this kind."

Indeed, Ireland *is* the best place to get a variety of good things — at least, so it seemed to us in our very brief visit.

James Howard Means, M.D.,
Honorary Physician

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Biophysical Research

Gross, J., Levene, C. I., and Orloff, S.
Fragility and extractable collagen in the lathyritic chick embryo. An assay for lathyrogenic agents.
Proc. Soc. Exper. Biol. & Med. 105:148.

Gross, J., and Piez, K. A.
The nature of collagen. I. Invertebrate collagens.
Proc. AAAS Sympos. on Calcification in Biol. Systems, 395.

Piez, K. A., and Gross, J.
The amino acid composition of some fish collagens: The relation between composition and structure.
J. Biol. Chem. 235:995.

Cardiology

Shanahan, R., Myers, G. S., Del Campo, E., Friedlich, A. L., and Scannell, G.
Right ventricular pressure curves in congenital and acquired heart disease.
Brit. Heart J. 22:457.

Dermatology

Baker, R. V., Birbeck, M. S. C., Blaschko, H., Fitzpatrick, T. B., and Seiji, M.
Melanin granules and mitochondria.
Nature, London 187:392.

Blank, I. H.
Percutaneous absorption: Methods of study and factors which influence absorption.
J. Occupational Med. 2:6.

Blank, I. H.
Percutaneous absorption: Statement of problem and critical review of past methods.
J. Soc. Cosmetic Chemists 11:59.

Blank, I. H., and Dawes, R. K.
Antibacterial activity of weak solutions of aluminum salts.
Arch. Dermat. 81:565. (*See also* 82:428)

Cohen, A. S., and Hashimoto, K.
Electron microscopic observations on the lesion of elastosis perforans serpiginosa.
J. Invest. Dermat. 35:15.

Fitzpatrick, T. B.
Albinism.
In The metabolic basis of inherited disease, Stanbury, J. B., Wyngaarden, J. B., and Frederickson, D. S., Editors, New York, McGraw-Hill Book Company, Inc., chap. 13.

Fitzpatrick, T. B.
Dermatologic lesions and diseases associated with diabetes.
In Diabetes, Williams, R. H., Editor, New York, Paul B. Hoeber, Inc., chap. 42.

Fitzpatrick, T. B.
Presidential address. Albinism: Some thoughts on the color problem and integration of dermatology and medicine.
J. Invest. Dermat. 35:209.

Freinkel, R. K.
Metabolism of glucose-C-14 by human skin *in vitro.*
J. Invest. Dermat. 34:37.

Freinkel, R. K., and Lurie, A. S.
Some observations on the effect of *l*-tri-iodothyronine on acne vulgaris.
J. Invest. Dermat. 34:277.

Greisemer, R. D.
Biological factors affecting percutaneous absorption.
J. Soc. Cosmetic Chemists 11:79.

Hashimoto, K., and Hill, W. R.
Elastosis perforans serpiginosa: A case report with histochemical and enzyme digestion studies.
J. Invest. Dermat. 35:7.

Imbrie, J. D., Bergeron, L. L., and Fitzpatrick, T. B.
Follow-up study of effect of oral methoxsalen (8-methoxypsoralen) on sunburn and suntan.
Arch. Dermat. 82:617.

Imbrie, J. D., Bergeron, L. L., and Fitzpatrick, T. B.
Further studies demonstrating an increased erythemal threshold following oral methoxsalen.
J. Invest. Dermat. 35:69.

Sinesi, S. J.
In vitro culture of malignant epithelial cells and of living human skin elements.
Plast. & Reconstruct. Surg. 26:141.

Szabó, G.
Studies on mammalian pigmentation. II. The displacement of hair melanocytes during experimental carcinogenesis.
Anat. Rec. 137:170.

Szabó, G., and Bourne, G. H.
The effect of vitamin A on adult skin in organ cultures.
In Congres International de Biologie Cellulaire, Paris, Sept. 4-9, 1960. Resumes des communications, 243.

General Surgery

Huggins, C. E.
Blood vessel thromboplastins and early thrombosis after vascular operations.
Surgery 48:724.

Phillips, A. W., and Cope, O.
Burn therapy: I. Concealed progress due to a shifting battlefront.
Ann. Surg. 152:767.

Orthopedic Surgery

Cave, E. F.
Fractures, dislocations and fracture-dislocations.
In traumatic medicine and surgery for the attorney, Washington, D. C., Butterworth Inc., vol. 2, p. 61.

Physical Medicine

Watkins, A. L.
Present status of physical medicine and rehabilitation in treatment of arthritis.
Rheumatism 16:62.

Psychiatry

Benda, C. E.
Childhood schizophrenia, autism and Heller's disease.
In Mental retardation. Proceedings of the First International Conference on Mental Retardation, Bowman, P. W., and Mautner, H. V., Editors, New York, Grune & Stratton, Inc., p. 469.

Benda, C. E.
Mongolism: Clinical manifestations, pathology and etiology.
In Mental retardation. Proceedings of the First International Conference on Mental Retardation, Bowman, P. W., and Mautner, H. V., Editors, New York, Grune & Stratton, Inc., p. 340.

Benda, C. E.
Rudolf Virchow's cellular pathology after one hundred years, and modern geneto-cytology.
In Jubilee volume, 100th anniversary, Rudolf Virchow Medical Society in the City of New York, New York and Basel, S. Karger, p. 49.

Hackett, T. P., and Weisman, A. D.
Psychiatric management of operative syndromes. I. The therapeutic consultation and the effect of noninterpretive intervention.
Psychosom. Med. 22:267.

Melchior, J. C., Benda, C. E., and Yakovlev, P. I.
Familial idiopathic cerebral calcifications in childhood.
Am. J. Dis. Child. 99:787.

Sternbach, R. A.
A comparative analysis of autonomic responses in startle.
Psychosom. Med. 22:204.

Radiology

Curran, P. F., Webster, E. W., and Hovsepian, J. A.
The effect of X-irradiation on sodium and water transport in rat ileum.
Radiation Res. 13:369.

Potsaid, M. S.
Experimental and clinical uses of cineradiography in heart disease.
Proc. New England Cardiovascular Soc. 18: 26, 1959-1960.

Schultz, M. D., and Hale, J.
Instructions for the use of radiotherapy charts.
Radiology 74:843.

Schunk, H., and Maruyama, Y.
Two vascular grooves of the external table of the skull which simulate fractures.
Acta radiol. 54:186.

Wang, C. C., and Reeves, J. D.
Mesenteric vascular disease.
Am. J. Roentg. 83:895.

Webster, E. W.
Physical considerations in the design of facilities for the uniform whole-body irradiation of man.
Radiology 75:19.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

Alexander, P., and Block, R. J. (Editors)
A laboratory manual of analytical methods in protein chemistry, vol. 1.
New York, Pergamon Press, 1959.
(5B)

Annual Symposium of the M. D. Anderson Hospital and Tumor Institute.
Genetics and cancer: A collection of papers presented at the 13th annual symposium.
Austin, Tex., University of Texas Press, 1959.

BIOGLETS

Dr. Charles E. Burden, Assistant Resident on the Children's Medical Service—born in Bath, Maine, August 25, 1933; B.S., Yale University, 1955; M.D., Harvard Medical School, 1959; Intern, Children's Medical Center, Boston, 1959-60; married; one child.

Dr. Mervyn F. Burke, Jr., Assistant Resident in Surgery—born in Berkeley, California, March 16, 1929; A.B., University of California, 1950; M.D., University of California School of Medicine, 1954; Intern, San Francisco Hospital, 1954-55; military service: Surgical Ward Officer, U.S. Army Hospital, Bad Kreuznach, Germany, 1955-57; Assistant Resident in Surgery, University of California Hospital, 1957-60; married.

Dr. George P. Canellos, Intern in Surgery—born in Boston, Massachusetts, November 1, 1934; A.B., Harvard College, 1956; M.D., Columbia University College of Physicians and Surgeons, 1960; married.

Dr. Sheldon Cooperman, Assistant Resident in Pathology—born in New York City, August 16, 1931; attended New York University; M.D., State University of New York College of Medicine at New York, 1955; Intern in Ward Medicine, Barnes Hospital, St. Louis, Missouri, 1955-56; military service: Medical Officer, Flight Surgeon, USAF in England, 1956-58; Resident in Pathology, Mary Hitchcock Memorial Hospital, Hanover, New Hampshire, 1958-59; Teaching Fellow in Pathology, Dartmouth Medical School, Hanover, New Hampshire, 1959-60; married; three children.

Dr. John M. Davis, Intern in Children's Medicine—born in Kansas City, Missouri, October 11, 1933; A.B., Princeton University, 1956; M.D., Yale Medical School, 1960; married.

Dr. Paul R. Dinsmore, Resident in Psychiatry, McLean Hospital, Belmont, Massachusetts—born in Bangor, Maine, January 1, 1933; pre-college school years spent round the country as an "Army brat", my father being with the Adjutant Generals Corps; military service: temporary active duty as an enlisted man, taking basic training and a course in Medical Technology, Brooke Army Medical Center, Fort Sam Houston, Texas, 1951; B.A., University of Maine, Orono, Maine, 1954; M.D., George Washington University School of Medicine, Washington, D.C., 1958; Intern, University of Chicago Clinics, 1958-59; currently, Teaching Fellow at McLean, rotating through Neurology at Boston Veterans Administration Hospital

Dr. Richard G. Eaton, Assistant Resident in Orthopedic Surgery—born in Forty Fort, Pennsylvania, Dec. 3, 1929; B.S., Franklin and Marshall College, Lancaster, Pennsylvania, 1951; M.D., University of Pennsylvania School of Medicine, 1955; Intern (rotating), Graduate Hospital, University of Pennsylvania, 1955-56; Assistant Resident in Surgery, Peter Bent Brigham Hospital, Boston, Massachusetts, 1956-57; military service: Captain, U.S. Army, Fort Hood General Surgical Service, 1957-59; Assistant Resident in Orthopedic Surgery, Children's Medical Center, 1959-60; married; two children.

Dr. Lloyd A. Ferguson, Intern in Medicine—born in St. Louis, Missouri, November 5, 1932; B.S., University of Illinois, Urbana, Illinois, 1951; M.S., University of Illinois, 1954; military service: U.S. Army, 1954-56; M.D., University of Chicago School of Medicine, 1960; married; two children.

Dr. T. Corwin Fleming, Assistant Resident in Neurology—born in Boston, Massachusetts, January 26, 1932; A.B., Harvard College, 1952; M.D., Harvard Medical School, 1956; Intern in Medicine, UCLA Medical Center, Los Angeles, California, 1956-57; military service: Research Associate in Neurophysiology, NIH, Bethesda, Maryland, 1957-59; Resident in Psychiatry, University of Pennsylvania, Philadelphia, 1959-60; married; two children.

Dr. F. Daniel Foley, Assistant Resident in Pathology—born in Jersey City, New Jersey, March 3, 1933; A.B., St. Peter's College, Jersey City, 1954; M.D., Creighton University, Omaha, Nebraska, 1959; Intern in Medicine, Bellevue Hospital (Columbia), New York, N. Y., 1959-60; married; two children.

Dr. Richard F. Gibbs, Assistant Resident in Anesthesia—born in Chelsea, Massachusetts, June 11, 1931; B.A., Brandeis University, Waltham, Massachusetts, 1953; M.A., University of Massachusetts, Amherst, 1955; Teaching and Research Fellowship, Graduate School, Department of Zoology-Physiology, University of Massachusetts, 1953-55; M.D., New York Medical College, Flower and 5th Avenue Hospitals and the Metropolitan Hospital Medical Center, New York City, 1959; Intern (rotating), Beverly Hospital, Beverly, Massachusetts, 1959-60.

Dr. Gordon G. Globus, Resident in Psychiatry, McLean Hospital, Belmont, Massachusetts—born in Norwich, Connecticut, January 6, 1934; A.B., Cornell University, Ithaca, N.Y., 1955; M.D., Tufts University, Medford, Massachusetts, 1959; Intern, Veterans Administration Hospital, Los Angeles, California, 1959-60.

Dr. Stephen E. Goldfinger, Intern in Medicine—born in Brooklyn, N. Y., March 8, 1935; A.B., Princeton University, Princeton, New Jersey, 1956; M.D., Columbia College of Physicians and Surgeons, New York City, 1960; married.

Dr. S. Sheila Hafter, Resident in Psychiatry, McLean Hospital, Belmont, Massachusetts—born in New York City, October 19, 1930; B.A., Brooklyn College, Brooklyn, N. Y., 1950; M.A., New School for Social Research, New York, N. Y., 1954; M.D., Harvard Medical School, 1958; Intern (rotating) in Medicine and Surgery, St. Elizabeths Hospital, Washington, D.C., 1958-59; Teaching Fellow in Psychiatry, Harvard Medical School, 1959 to date.

Dr. Donald B. Halverstadt, Intern in Surgery — born in Cleveland, Ohio, July 6, 1934; B. A., Princeton University, 1956; M.D., Harvard Medical School, 1960; married; one daughter, Donna Lee, born September 9, 1960 —the day when Hurricane Donna also attracted much attention.

Dr. Peter G. Kimball, Intern on the Dental Service—born in Marblehead, Massachusetts, March 4, 1934; A.B., Hamilton College, Clinton, N. Y., 1956; D.M.D., Harvard School of Dental Medicine, 1960; married.

Dr Leonard I. Kleinman, Intern in Children's Medicine—born in Brooklyn, N. Y., June 29, 1935; A.B., Columbia College, New York, N. Y., 1956; M.D., State University of N. Y., Downstate Medical Center, 1960.

Dr. Burnham E. Lamkins, Assistant Resident in Dermatology—born in Troy, N. Y., January 15, 1932; B.S., St. Bernadine of Siena College, Loudonville, N. Y., 1954; M.D., Albany Medical College, Albany, N. Y., 1959; Intern (rotating), Beverly Hospital, Beverly, Massachusetts, 1959-60; married; two children.

Dr. Bernard Levey, Resident in Psychiatry, McLean Hospital, Belmont, Massachusetts—born in Cleveland, Ohio, September 3, 1933; B.S., Adelbert College, Western Reserve University, Cleveland, Ohio, 1955; M.D., Western Reserve School of Medicine, 1959; Intern in Medicine, Beth Israel Hospital, Boston, Massachusetts, 1959-60.

Dr. Bucknam McPeek, Assistant Resident in Anesthesia—born in Enid, Oklahoma, March 22, 1933; lived in Washington, D.C. and Little Rock, Arkansas; A.B., Harvard College, 1955; M.D., Harvard Medical School, 1959; Harvard Surgical Service at Boston City Hospital, 1959-60.

Dr. Walid A. Mnaymneh, Assistant Resident in Orthopedic Surgery — born in Beirut, Lebanon, July 18, 1931; attended the elementary and secondary schools and college at the American University of Beirut, 1937-50; B.A. in Medicine, Medical School of the American University of Beirut, 1951; M.D., Medical School of the American University of Beirut, 1954; Intern, 1955, Junior Assistant Resident in Surgery, 1956, Senior Assistant Resident in Surgery, 1957, and Resident in Surgery, 1958, American University Hospital in Beirut; Assistant Resident in Orthopedic Surgery, Massachusetts General Hospital, 1958-59; Assistant Resident in Orthopedic Surgery, Children's Medical Center, Boston, 1959-60; rejoined the Orthopedic Department at Massachusetts General as Assistant Resident, April 1960.

Dr. Ashby C. Moncure, Intern in Surgery—born in Richmond, Virginia, December 27, 1934; attended the University of Virginia, Charlottesville, Virginia, 1953-56; M.D., University of Virginia School of Medicine, 1960; married.

Dr. Gerald S. Moss, Intern in Surgery—born in Cleveland, Ohio, March 4, 1935; graduate of Shaw High School, Cleveland, Ohio; undergraduate, Ohio State University, Columbus, Ohio; B.A., Western Reserve University, Cleveland, Ohio, 1956; M.D., Ohio State University Medical School, 1960; married; one son.

Dr. Hart deC. Peterson, Assistant Resident on the Children's Medical Service—born in Newton Centre, Massachusetts, February 4, 1933; A.B., Middlebury College, Middlebury, Vermont, 1954; M.D., Boston University School of Medicine, Boston Massachusetts, 1958; Intern and Resident in Pediatrics, Boston City Hospital, 1958-60; married.

Dr. William J. Yount, Intern in Medicine—born in Menominee, Michigan, August 24, 1936; B.S., University of Wisconsin, Madison, Wisconsin, 1957; M.D., University of Wisconsin, 1960.

VOLUNTEER GROUPS

MGH STAFF WIVES ASSOCIATION

The last of a series of autumn morning coffee hours was given on November 17, at the Beacon Hill home of Mrs. Louis Bakay. Her co-hostess in entertaining the doctors' wives from Boston and the North Shore was Mrs. Leonard W. Cronkhite, Jr. Mrs. Cronkhite is Chairman of the North Shore division of the MGH volunteer organization. The purpose of these meetings has been to discuss and plan for future activities of the organization.

Other community coffee hours had been held during October and November. Mrs. Vernon H. Mark was the Newton hostess; Mrs. J. Gordon Scannell, the Belmont hostess; Mrs. John D. Stoeckle, the Winchester hostess; and Mrs. Melvin J. Glimcher, the Brookline hostess. Mrs. Albert C. England, Jr. of Lincoln and Mrs. John W. Cass, Jr. of Wellesley sponsored a joint gathering for the Staff Wives of those two communities. It was held at the de Cordova and Dana Museum in Lincoln, so that the Staff Wives could also have the pleasure of viewing a new exhibition of contemporary paintings from the collection of Mr. and Mrs. Patrick B. McGinnis.

The Music Committee of the Staff Wives Association sponsored a piano and viola concert in the Chapel on November 16. Sheila Vincent Boyce was at the piano and Diana Stevenson Brengel was violist.

A piano concert, on November 30, was given by Minuetta Kessler.

A tea in honor of our Volunteers was given by the Trustees and General Director in Bartlett Hall on December 6.

Beautifully decorated tables of delicacies provided an attractive setting for the many invited guests, who enjoyed this opportunity for the exchange of pleasantries. Examples of work done by the Volunteers, in many departments of the Hospital, were on display.

* * *

The Executive Committee of the Board of Managers of the Massachusetts Eye and Ear Infirmary, at their meeting on October 17, 1960, voted to appoint:

Dr. Anne Khu as Fellow in Ophthalmology, assigned to the Ophthalmic Plastics Laboratory for one year, beginning October 1, 1960;
Dr. John M. Kurkjian as Resident in Otolaryngology, beginning July 1, 1962;
Dr. George F. Miller as Resident in Otolaryngology, beginning July 1, 1962;
Dr. Eugene N. Myers as Resident in Otolaryngology, beginning July 1, 1962;
Dr. John C. Sebestyen as Fellow in Ophthalmology, assigned to the Ophthalmic Plastics Laboratory for another year, beginning September 1, 1960;
Dr. Daniel Toussaint as Fellow in Ophthalmology, assigned to the Howe Laboratory for one year, beginning October 1, 1960;
Dr. Richard D. Zonis as Resident in Otolaryngology, beginning July 1, 1962.

New addresses:

Dr. Mark D. Altschule (dir. *Int. M.* and *Res. Clin. Physiol.* (*McL.*)), McLean Hospital, Belmont, Mass.
Dr. Richard S. Cosby (*E.M.* 1940), 111 Congress St., Pasadena Calif.
Dr. Daniel Deykin (*M.* 1958), National Heart Institute, National Institutes of Health, Bethesda 14, Md.
Dr. Joseph H. Dimon, III (sr. r.s. *Or.* 1960), 1938 Peachtree Rd., N. W., Atlanta, Ga.
Dr. Geoffrey Edsall (*E.M.* 1936), Massachusetts Institute of Public Health Laboratories, 375 South St., Forest Hills, Boston 30, Mass.
Dr. Norris B. Flanagan (a.r.p. *Psychiat.* 1940), 203 Grove St., Wellesley, Mass.
Dr. Thomas Frank (a.r.p. *C.M.* 1953), 134 A Brattle St., Cambridge 38, Mass.
Dr. Thomas G. Gabuzda (*M.* 1956), Lemuel Shattuck Hospital, 170 Morton St., Jamaica Plain, Mass.
Dr. H. Louis George, Jr. (*C.M.* 1929), 104 Paddock St., Watertown, N. Y.
Dr. Lester H. Grant (a.r.p. 1957), Grace-New Haven Community Hospital, New Haven, Conn.
Dr. Stephen E. Hedberg (*S.* 1956), Massachusetts General Hospital, Boston 14, Mass.
Dr. John W. Josse (*M.* 1957), Dept. of Biochemistry, Stanford University School of Medicine, Palo Alto, Calif.
Dr. Anthony P. Monaco (*S.* 1957), Massachusetts General Hospital, Boston 14, Mass.
Dr. David C. Poskanzer (r.p. *N.* 1959), Massachusetts General Hospital, Boston 14, Mass.

Brief bits:

Dr. Gordon L. Brownell attended the meeting of the Dosimetry Committee in New York on November 21, 1960.
Dr. Evan Calkins was invited to participate in the Third National Conference on Leprosy, held at Carville, Louisiana, November 7-10, 1960. He spoke on "Amyloidosis in leprosy".
Dr. Dean A. Clark is one of the three doctors named by Governor Foster Furcolo to represent hospitals of the Commonwealth of Massachusetts at the White House Conference on Aging, to be held January 9-12, in Washington D. C.
Dr. Philip E. Meltzer gave two lectures at the combined meeting of the North and South Carolina Otolaryngological and Rhinological Societies, held on September 12 through 14, 1960. He also delivered a speech at the International Symposium on Otosclerosis at the Henry Ford Hospital in Detroit in November. His subject was "General remarks on surgery for otosclerosis".

Here are a few excerpts from a letter from Dr. John A. Mannick (*S.* 1954), dated November 22:

My official appointment is Instructor in Surgery at the Medical College of Virginia. . . . I am an attending man on one of the ward surgical services — a position very similar to that of a Junior Visit at M. G. H. . . . I have an office with Dr. Hume in the Medical College Hospital and help him with his private practice. . . . I will also go into private practice in a small way myself on December 1. . . . In addition, I am the newly appointed assistant director of the research lab, and direct the transplantation research done there.

Dr. Bauer received this letter from Dr. Donald N. Wysham (*M.* 1954) and Mrs. Wysham a few weeks ago. The Wyshams are in India on an Ecumenical Mission for the United Presbyterian Church of America.

There has been quite a change of scene for us since we wrote you last Christmas. A few weeks ago we arrived in Landour for full-time language study. Landour is perched on the crest of one of the Himalayan foothills, some 7,000 feet straight up from the flat, hot plains of northern India. The view from our veranda includes buildings of the famous Woodstock School below us, where Doug has just entered first grade, and further down, the twisting mountain roads that descend toward Dehra Dun and the plains. A five-minute walk from our house to the ridge above provides a spectacular view of the snowy range of Himalayan Mountain peaks. The weather remains comfortably cool, but we expect the onset of the monsoon rains soon. We are both slowly gaining in our use of Hindustani. We find we can speak reasonably well with the wallas (tradesmen) who come each morning, and can shop in the bazaar without using English. We expect to be here until September, when Don must get back to work at the hospital in Ludhiana.

In our last letter we gave only a brief picture of the hospital and medical school at Ludhiana. Since then, we hope you've had a chance to read a fine article ("The medical challenge of India and Pakistan") in the April 15 issue of *Presbyterian Life*. It is not only a broad picture of the medical needs of this part of the world, but a brief glimpse at some of the ways this need is being met day by day. Some of you, however, may not know that Ludhiana is one of three medical schools in the world partially supported by the United Presbyterian Church in the U.S.A. The Christian Medical College in Ludhiana was begun many years ago as a school for training women doctors, but beginning in 1947 men as well have been accepted. At that time the school assumed growing responsibilities for a teaching program that hoped to win approval for the full Indian medical degree. Eighteen months ago the first class graduated with the M.B.B.S. degree. Ludhiana offers a five-year program, with fifty students in each class — half of them men and half women — and about half the total number are Christians. Our students come from all over India. Large numbers of Christians come from Kerala at the southern tip of the continent. There are many Sikhs from the Punjab. Their turbans and beards are a familiar sight in the classrooms. It is tempting to refer to our students as boys and girls, for in India the usual age for entrance into medical school is sixteen or seventeen years. It is fun for us to get to know them, both in the hospital and in our home, where we get together with a group of students every week for an evening of games, colored slides, or discussions about Christianity. Like any American college students, they enjoy the coffee and cake that go with it!

You would enjoy seeing our hospital, and would appreciate some of the ways in which it is peculiarly Indian. It rivals a first-class American hospital in some respects. We have about 600 beds at the moment, and see most of the diseases common in the United States, such as coronary heart disease and diabetes, but also many diseases rarely seen in the U.S.A. — leprosy, amebiasis, tetanus, some malaria, and many others. The hospital and medical college staff number about seventy to eighty doctors, about half of them non-Indians. These come from Canada, New Zealand, England, Scotland, and Germany, as well as the U.S.A. Being a major referral center, the hospital does fairly advanced work — heart surgery, for example — while Don is frequently called to read electrocardiograms. One of our hopes is to see the beginning of a research program in Ludhiana in the future.

Shortly after our arrival in Ludhiana, we were joined by another Presbyterian family — the Melvin Casbergs. As director of the institution, Dr. Casberg is already deeply at work in an effort to put it on a firmer financial footing. His leadership is attracting other well-trained American physicians who will join our staff soon, including a urologist and a radiologist. We are encouraged by both his hardheaded realism in facing the problems of the institution, and his vision. He hopes to staff Ludhiana well in all major medical and surgical specialties, as well as encourage a research program in medical areas where India needs help. . . .

Running a large household in India, combined with two hours of language study with a pundit each day, is a full-time job for Dorrie. With household help, she finds she can devote more time to the children, and next winter she will be teaching our Douglas his first grade lessons. Both John and Doug seem to love India. Inevitably, they have picked up some of the language, and Dorrie finds Doug helpfully explaining something in Hindustani occasionally. One has to learn the language to keep up with one's children! It is interesting to see our cultures becoming intermingled. Picture John, aged four, in cowboy regalia, sucking a stick of sugar cane or watching the servants cook their evening chappatis over a charcoal fire. . . .

Don has had to make occasional house calls in the city, and lack of transportation is a problem. We hope to be able soon to afford a used jeep for these purposes.

Our warmest greetings to you all.

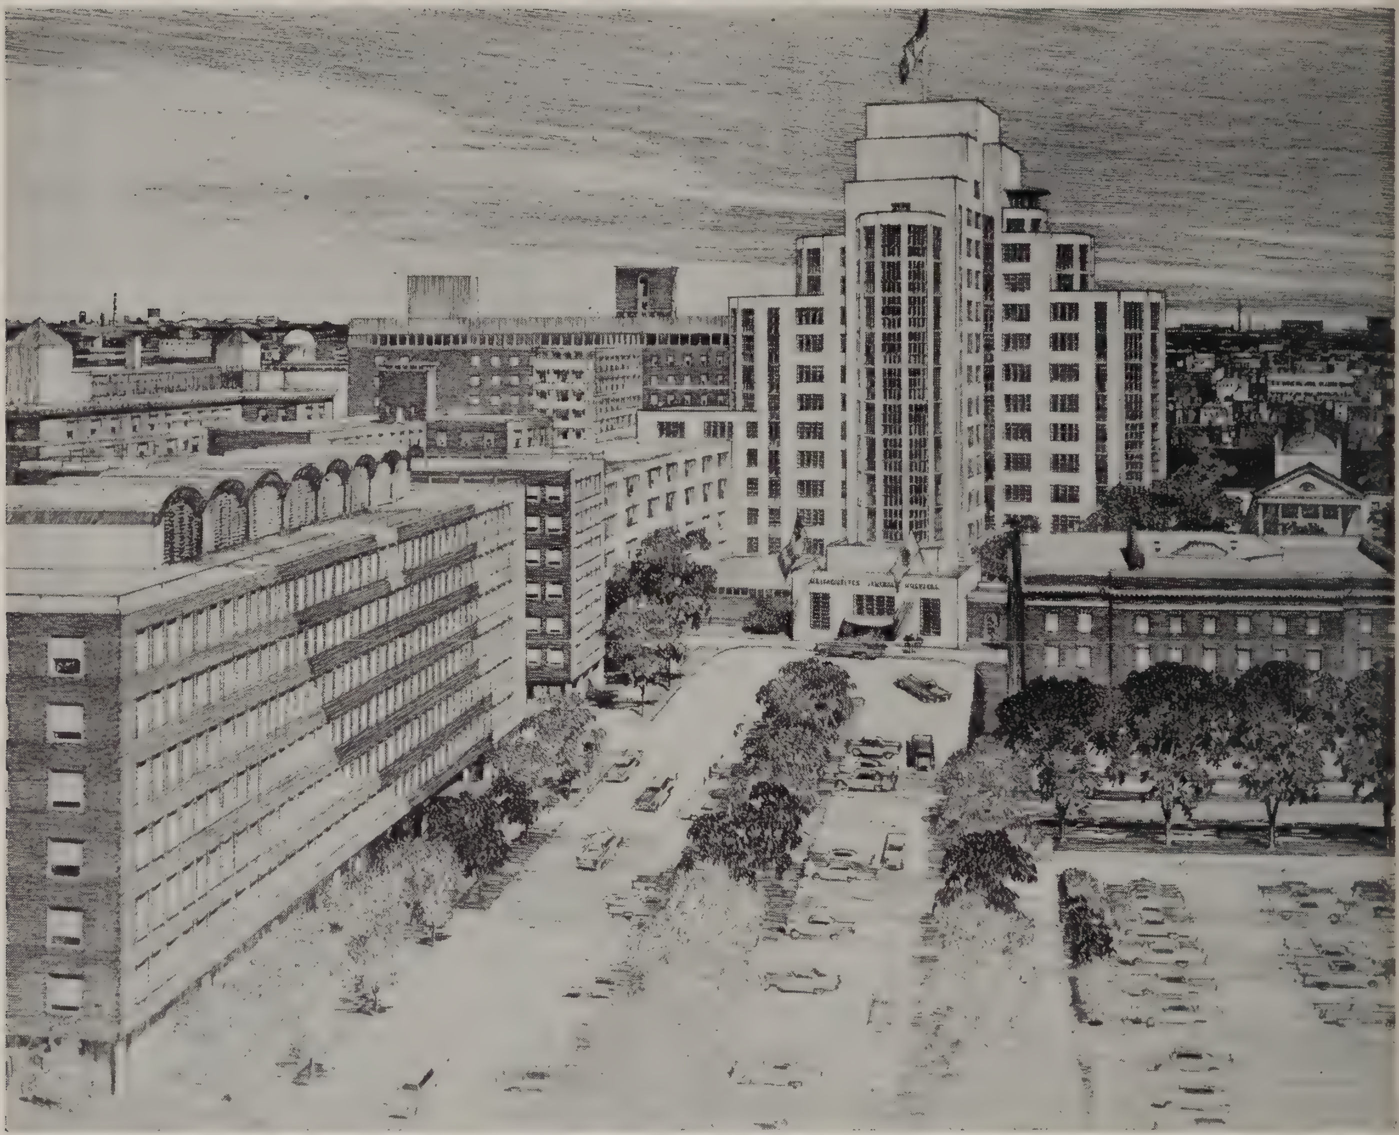
We were very glad to receive this letter from Dr. Désiré J. A. Rebello (a.r.p. *D.* 1954), written from the Liverpool Royal Infirmary, Pembroke Place, Liverpool 3, England:

I have changed my plans and am still in England. I have moved to Liverpool, which is about 30 miles from Manchester, and am now working for the United Liverpool Hospitals, in the Department of Dermatology of the Liverpool Royal Infirmary. The Royal Infirmary is the major teaching hospital for the University of Liverpool School of Medicine. There is a new modernistic building here for the medical school.

Liverpool suffered heavily from bombing during the war. One can still see shells of buildings that were gutted by bombs. However, the people of Liverpool are gradually rebuilding their city.

Liverpool is situated on the Mersey estuary. It is a busy port. Across the river is Birkenhead, which has several shipbuilding yards.

I wonder if you would be so kind as to mail my copies of THE NEWS to me here. Also, I wonder if the booklet "Research activities of the Massachusetts General Hospital" is still published. If so, I would like to receive it.



Architect's rendering of the new Clinics Building, to be erected on North Grove Street, between Cambridge and Fruit Streets

I used to get it when I was in America. [Both wishes have been granted. — Editor]

This most interesting letter has come from Dr. William P. Boger (a.r.p. 1942):

I enjoy the correspondence in The News so much that I make bold to offer an item for your consideration.

I spent the month of October making a lecture tour "around South America". Factually, it is quite easy, with the help of modern air travel, to accomplish the miles involved, but it is completely idle to think that one can encompass the geography, the culture, and the medical situation of even a fraction of this great continent in so short a space of time. However, it was a tremendous privilege for me to get a first-hand look at some of the medical problems totally foreign to our medical practices up here and to see the enormity of the problems with which the physicians in South America must cope, and with such inadequate machinery.

It was deeply interesting to me to discover to what extent that which one is able to accomplish medically depends upon social structure, governmental stability, and economics. In fact, I could not help feeling, very acutely, the frustration of many of the men who have spent one or even five years here in the United States at excellent centers, when they return to their own countries and find that it is one thing to know what to do, but almost an impossibility to actually do it.

My trip took me to Bogotá, Lima, Santiago, Buenos Aires, Montevideo, São Paulo, Port-of-Spain, and San Juan. During the trip I gave 22 lectures on the subject of the treatment of bacterial infections and the use of antibiotics, and on the staphylococcus problem. The trip was an arduous one and, although I was constantly stimulated by the grandeur of the scenery and the novelty of the many new things I saw every day, I arrived home pretty limp.

Quite unexpectedly, I was honored by being made a corresponding member of the Society of Internal Medicine of Buenos Aires, but even without that, I added considerably to the weight of my correspondence.

Everywhere I found evidence of the "long shadows" cast by Harvard and M. G. H. In fact, in consideration of the few names and addresses I found in the MGH "Directory", which I scanned prior to setting off on the trip, I encountered a considerable number of physicians who had either been at Harvard and M. G. H. or were desirous of going there. As always, it was inspiring to me to get this further stimulus to do better work than one might ordinarily do, just to live up to the great tradition that Harvard and M. G. H. stand for.

My trip was a wonderful privilege, and it has given me a lot of new insights into social and political problems, aside from the medical ones. If anyone is headed south any time soon, I will be happy to give him the benefit of a few helpful hints.

Incidentally, altitude sickness is not something just to be laughed off. It is a real thing, and anyone planning a trip ought to take into account the altitude of some of the stopping points and give thought to the extent to which this might limit activity or actually curtail it for a day or two. I got to La Paz unexpectedly, 13,380 feet high, and found out the hard way.

Dr. Cope has very kindly passed this letter on to us. It is from Dr. Jack E. Tetirick (*S.* 1952):

I am aboard the *S. S. Hope,* at Djakarta, Indonesia. I am the first surgeon aboard, along with John Ratcliffe (*W.S.* 1946). Ruth Currie (Dick's sister) is here, having resigned her post on White 10, so the M. G. H. is well represented.

We are shaking down the very difficult job of combining an ocean liner manned by the American President Lines, a floating hospital, and a floating medical school — all based in a foreign country of incredible chaos and poverty.

The people of Indonesia are afire with the idea of *Hope* — the fact that it is a teaching mission; that it is people to people, not government to government. Our surgery is televised to an adjacent classroom which is packed with Indonesian doctors each day. I have never felt so useful in my life and I rate this as an experience second to none. In a few days we move out to repeat the episode elsewhere in Java and Bali. There are many specialists aboard and a full complement of technicians — EKG, EEG, lab, dietician, physiotherapy, record room personnel, etc. — each doing a job, *plus* training Indonesians in their jobs — a fantastic array of talent and dedication.

We are lavishly entertained. The American ambassador states he has never seen the likes of it. All the other ambassadors have been aboard, including a scowling Russian.

Don't let the MGH people, in any category, miss this. The west coast people are better represented. The Chief is William B. Walsh, M. D., Washington, D. C.

The News

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 201 Boston, Mass. February 1961

THE HYPERTENSION CLINIC

It is always astonishing to realize how recently knowledge of many of the major diseases has been accumulated. Hypertension is only one example of this. Methods for measuring arterial blood pressure, with some semblance of accuracy, did not become available to clinicians until about the beginning of the present century. Some awareness of the importance of high blood pressure and its association with renal disease dates back to Richard Bright, who in 1827 noted that the arteries of the diseased kidney offered an increased resistance to injection. Nine years later, in 1836, Bright noted that hypertrophy of the heart was often present in patients dying of renal disease, even though no local cause for such hypertrophy could be found within the heart. He commented on these findings as follows: "This naturally leads us to look for some less local cause for the unusual efforts to which the heart has been impelled; and the two most ready solutions appear to be either that the altered quality of the blood affords irregular and unwonted stimulus to the organ immediately, or that it so affects the minute and capillary circulation as to render greater action necessary to force the blood through the distant subdivisions of the vascular system." Bright's second alternative contains a clear implication that the cardiac hypertrophy in these cases was the result of increased arterial pressure.

In the decades following Bright's great work, knowledge of the importance of blood pressure was furthered by the work of many investigators, notably Toynbee, Traube, Marey, Gull, and Mahomed; but throughout most of the nineteenth century no simple "bloodless" method was available for the bedside measurement of blood pressure. Consequently, clinicians of that era had to rely on palpation of the radial pulse for estimating arterial pressure. The art of palpating the pulse was cultivated with great solemnity, and its practitioners achieved a proficiency which has long since been lost. During the 1870's and '80's a number of ingenious machines were invented for the purpose of measuring blood pressure, but none were very accurate or very portable. The first major advance came with the development of the pneumatic cuff by Riva-Rocci in 1897. This was originally used to determine the systolic blood pressure—by noting the pressure in the cuff at which the radial pulse disappeared at the wrist. A few years later, in 1905, Korotkov, a Russian physician, suggested that the sounds heard on auscultation over the artery below the cuff could be used as criteria for both systolic and diastolic pressures. This method of measuring blood pressure is, of course, the one universally used today.

Following these developments, blood pressure measurement rapidly came into widespread clinical use. Whether or not these measurements were beneficial to the patients in the early years of the 20th century is certainly debatable. However, they were seized upon avidly by the insurance companies, which were quick to recognize the value of the measurements in predicting life expectancy. The larger companies rapidly began to accumulate statistical data for the purpose of determining insurance risk. These compilations of data have until recently been the chief source of normal values for blood pressure and it is only within recent years that large-scale studies of arterial pressure in normal subjects have been carried out under less prejudicial auspices.

At the Massachusetts General Hospital, hypertension began to receive special attention in 1928, when Dr. Robert S. Palmer, then finishing his cardiac residency, let it be known that he was interested in seeing patients with this problem in the Medical Clinic. Gradually, the number of patients referred to Dr. Palmer increased, and other physicians who shared his interest joined in. As the activities of the group expanded, it eventually became large enough to require a special day and a clinic secretary.

In the middle 1930's, the results of several lines of approach to hypertension began to show promising results. Goldblatt published his now famous experiments, showing that hypertension can be induced in certain animals by restricting the flow of blood to one or both kidneys. The rice diet, introduced by Kempner, was shown to be a highly effective mode of treatment for patients able to tolerate its strictures. And, at about this same time, early work on surgical sympathectomy was under way.

Each of these important developments was tested and applied by Dr. Palmer's growing group, in association with surgical and urological colleagues. Drs. Richard Chute and Neil L. Crone began an investigation of the effects of nephrectomy in patients with hypertension and unilateral renal disease. Dr. Reginald H. Smithwick undertook an investigation of the surgical approach to the relief of hypertension, leading to the development of the technique of dorsolumbar splanchnicectomy which bears his name. Dr. Palmer, Dr. Dera Kinsey, and other internists in the group, concerned themselves with the selection of patients for surgery, and also conducted clinic studies concerning the value of various diets and drugs, and of psychotherapy, in the treatment of hypertension.

During and following World War II, it became apparent in clinics throughout the country that the removal of unilaterally diseased kidneys was effective in only a small fraction of patients so treated, and enthusiasm for this procedure waned. At the same time, it appeared that the beneficial effects of surgical sympathectomy were often temporary, and smaller numbers of patients were being treated by this technique. Meanwhile, many new and more effective drugs were being developed for the medical management of hypertension.

The clinic at this time turned its attention more toward the evaluation of drug and dietary regimens, and to the psychiatric problems which are consistently evident in hypertensive patients. Beginning in about 1951, Dr. Palmer adopted a "class method" of treatment. Under this system, patients instructed and otherwise assisted each other in diet and discipline, and shared their common medical and emotional problems under the guidance of their physician. This system, a unique and highly effective form of group psychotherapy, was continued until Dr. Palmer resigned as Chief of the Hypertension Clinic in 1958. At that time, Dr. Charles H. DuToit was appointed as Dr. Palmer's successor.

Dr. DuToit, then Director of the Chemistry Laboratory, had long been interested in the chemistry of the catechol amines (epinephrine and norepinephrine) and had developed highly reliable methods for quantitatively measuring these compounds in urine and in other biological fluids. He hoped to study the role these compounds play in hypertension, and had already accumulated a considerable amount of clinical and chemical data on the clinic patients prior to his sudden death in March 1959.

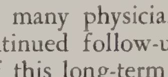
I had joined the clinic group, together with Dr. DuToit, in 1958, and was asked to take over as his successor. Members of the group now include Dr. James H. Currens and Dr. John Denovian, each with a long association with the clinic, Dr. Guy W. Leadbetter, Jr. of the Urology Department, Dr. Guillermo C. Sanchez and Dr. William F. McNeely of the Medical Staff, and Dr. Isadore Starr, who commutes from Laconia, New Hampshire, to join the clinic on alternate weeks.

We are endeavoring to maintain the standards of care, and attention to the individual problems of troubled patients, which characterized the activities of our predecessors in the clinic, and at the same time to bring new diagnostic and therapeutic techniques to bear on their underlying disease. In recent years, with the advent of vascular surgery and the development of new diagnostic techniques, it has become possible to find and correct constricting lesions on the renal blood vessels. In a heartening number of instances this type of surgery has resulted in cure or modification of high blood pressure. This study is being spearheaded by Dr. Leadbetter, aided by Dr. Alfred L. Weber of the Radiology Department. As a part of this program, we are able to make cross comparison between a number of different diagnostic techniques, and to study the functions of the kidney which has been partially deprived of its blood supply before and after surgical correction of vascular lesions.

A second major objective is to determine the role of the catechol amine compounds in hypertension, using the techniques perfected by Dr. DuToit and other methods which have been advanced only very recently. This study will be greatly facilitated by the completion of the new Hypertension Laboratory soon to be under construction on Domestic 3. The testing of new drugs, and especially the investigation of their mode of action, remain as important functions of the clinic.

We also have a unique opportunity to obtain a long perspective view of hypertensive disease, for Dr. Palmer has left as a legacy to our clinic a pedigreed group of hypertensive patients whose disease has been carefully documented for many years. These patients have remained steadfast through several eras of therapy, and have seen a good many physicians come and go. By continued follow-up and documentation of this long-term group, valuable information can be obtained about the natural history of hypertension and the value of our therapeutic methods, although sometimes they make us wonder, as Dr. Robert F. Loeb once remarked about a similar group of patients: "Are we following them, or are they following us?"

Lot B. Page, M.D.,
Assistant Physician
and *Chief of the Hypertension Clinic*



The Board of Trustees, at their meetings on December 2 and 16, 1960, voted:

That Dr. Paul M. G. St. Aubin be granted leave of absence for a period of six months, beginning January 1.

To appoint:

Dr. Lawrence D. Egbert as Clinical Fellow in Anesthesia, beginning approximately June 1;

Dr. Murray Feingold as Junior Assistant Resident on the Children's Medical Service, beginning July 1;

Dr. Alvaro Fernandez (Salas) as Clinical and Research Fellow in Neurology for one year, beginning December 1, 1960;

Dr. Christopher J. W. Huston as Clinical and Research Fellow in Surgery for one year, beginning November 1, 1960;

Dr. Peter R. Huttenlocher as Clinical Fellow in Neurology, to act as Assistant Resident, for one year, beginning July 1;

William Irvine, F.R.C.S. of the London Hospital, London, England, as Visiting Surgeon pro tempore, for a few weeks during the early part of 1961;

Dr. Marvin H. Lipton as Assistant Resident in Anesthesia, beginning August 1;

Dr. Manuel Nava (y Gutierrez de Velasco) as Clinical and Research Fellow in Medicine for one year, beginning December 1, 1960;

Dr. Peter P.-E. Schuntermann as Junior Assistant Resident on the Children's Medical Service, beginning July 1;

Dr. Eliot M. Slater as Assistant in Anesthesia, beginning December 5, 1960;

Dr. Harry J. Smith as Clinical Fellow in Pathology for one year, beginning July 1.

At their meetings on December 7, 14, and 28, 1960, the General Executive Committee voted:

To grant Dr. Giulio Carugo, Clinical Fellow in Anesthesia, leave of absence for a period of approximately six months, beginning January 1.

To continue the appointments of:

Dr. Edward Los as Assistant Resident in Anesthesia for a second year, beginning January 1;

Dr. Richard C. Packert as Clinical Fellow in Radiology, from December 31, 1960 through March 31, 1961.

To promote:

Dr. George B. Carter from the position of Second Assistant Resident to that of First Assistant Resident in Radiology, beginning January 1;

Dr. John B. Little from the position of First Assistant Resident to that of Resident in Radiology, beginning January 1;

Dr. Yosh Maruyama from the position of First Assistant Resident to that of Resident in Radiology, beginning January 1;

Dr. James W. Tanner from the position of Second Assistant Resident to that of First Assistant Resident in Radiology, beginning January 1.

To appoint:

Dr. Miguel Gonzalez-Acevedo as Graduate Student Assistant in Surgery, for the period October 17, 1960 through February 15, 1961;

Dr. Alexander Hubens as Graduate Student Assistant in Surgery, for the period October 17, 1960 through December 31, 1960;

Dr. D. Glyn Millard as Clinical Assistant in Radiology, beginning January 1;

Yutaka Nagai, Ph.D. as Research Fellow in Medicine for one year, beginning July 1;

Dr. Amado D. Ortiz as Graduate Student Assistant in Surgery for one year, beginning October 17, 1960;

Dr. John T. Pollard, Jr. as Clinical Assistant in Radiology, beginning January 1;

Dr. Clinton B. Seeley as Clinical Assistant in Radiology, beginning January 1.

A General Executive Committee vote of July 27, 1960, which failed to reach the office of THE NEWS until January, appointed Dr. Timo U. Kosunen as Research Fellow in Neurology for one year, beginning September 1, 1960.

* * *

THE ORTHOPEDIC RESEARCH LABORATORIES

[The dedication of our new Orthopedic Research Laboratories took place last September. We regret that the length of the report we had prepared on the event and the amount of space available in our pages since that time have been so incompatible that it has been necessary to withhold the article until now. Because THE NEWS attempts to report on all outstanding events which occur at the M.G.H. and because the material contained in the address delivered by Dr. Barr at the dedication ceremonies is of such value, historically, to all MGH-ers, we give you this transcript of Dr. Barr's speech even at this later date, feeling that the passage of these few weeks has not detracted in any way from its intrinsic value. — Editor]

The fall of the year is a pleasant time in New England. It must give all of us a kind of inner satisfaction—such as we knew as children of going to school again (for some of us, that's a good many years ago). We have attended an adult class today, with intellectual food served for our mental appetites. Professor Francis O. Schmitt has made us think about research of a fundamental character in a teaching hospital, and Dr. John D. McLean will add to the subject. Perhaps you will bear with me for a few minutes while I pretend that I am wise enough to continue with our discussion.

The history class is now in session. If I were to ask this class to name the men who have been on our orthopedic staff at Massachusetts General Hospital—men whose lives have helped shape the destiny of our service—I am sure I could see eager hands go up. Someone would name Joel Goldthwait, another, Robert B. Osgood, another, Armin Klein, and another, Marius N. Smith-Petersen. Other names would come to our minds, also; but our research laboratories are in being today chiefly because these men lived in Boston and worked on our service at the M.G.H. They helped to make Boston the cradle of our specialty—orthopedics. So young is our service that the professional lives of these men, covering the past fifty years, encompass the whole span of our specialty's history at the Massachusetts General. Through the efforts of Joel Goldthwait, Ward I was built. It was our first orthopedic and fracture ward, where, when Nat Allison was chief, I served thirty years ago as resident. Today that building houses the Bay State Rehabilitation Service, where the ambulatory handicapped are helped on their climb up the road to physical, social, and economic independence.

Robert B. Osgood—beloved by all who knew him, my chief when I was resident at the Children's—was at one time chief at the M.G.H. He was a man always interested in research and he pursued that research in his chosen field.

Armin Klein, for many years a member of the Orthopedic Visiting Staff here at the General, was on the faculty of Harvard and Tufts Medical Schools. He gladly taught me and scores of other residents the art of healing.

Marius N. Smith-Petersen was well known to all of us—a man with an original mind, whose brilliant contributions made him truly a mender of the maimed.

When you walk through the Orthopedic Research Laboratories remember that they stand today as a tribute to these and other orthopedic surgeons—clinicians who have led the way not only in patient care, but also in teaching and research.

The history class is now dismissed.

We have looked briefly at the past, and now the class in recent events will be in order. I take the teacher's prerogative of reminiscing, and this is the way I remember the events leading to the conception, foetal development, and birth of our laboratories.

Thirteen years ago I dropped in at the

office of the Chief of Surgery on White 4, and confided to him that a major aim of my life as Chief of the Orthopedic Service was to see research work of an enduring nature pursued on the service by our staff at the M.G.H. I was anxious to raise money, apply for a grant, and get going. Pete Churchill looked thoughtfully at me, smiled, and said, "The first thing to do is to find your man." He went on to explain that funds and facilities can always be found to support an able man who has original research vision. I was at first a little crestfallen, having believed, in a naive way, that if we had money we could buy the brains. On reflection I realized that Pete was right and that before one makes the stew one must first catch the rabbit. Although I did not fancy the role, I became a rabbit catcher.

My first bit of good luck came in the form of a tireless, resourceful, and dependable fellow, who, in addition to being an excellent clinician, has produced a sizeable output of first-class research work. I was lucky in another way in finding Thorny Brown, for he himself has proved to be an excellent rabbit catcher. Between the two of us, and with the able assistance of other hunters, we believe we have found the man who is productive in his own research activities, who can envision areas of worthwhile effort, and can assemble and direct the activities of the group which tackles the problem selected for study. Mel Glimcher has had graduate training in mathematics and physics, as well as in clinical orthopedics. He is especially—I might say uniquely—qualified to bring the new concepts of solid state physics at the molecular level to bear on our fundamental orthopedic problems. He has assembled his team, and they are now hard at work unraveling the mechanism of mineralization of tissue. They are starting by putting the building blocks together as a solution of collagen and calcium phosphate in pure water. By precise control of specified physical situations, they are studying the parameters of tissue mineralization. For the purpose of this study, a great deal of expensive equipment has been assembled. One might ask, why put the laboratory here rather than at the Harvard Medical School or at M.I.T.? Frankly, there are those who think that such research has no place in a hospital. However, the MGH trustees, administration, and our staff agree that it belongs here, and here it is—building completed, fully equipped, crowded with workers, each studying some phase of tissue mineralization, each producing verified bits of information which will fit into a larger concept of what encourages and what inhibits bone formation. Thus, in this laboratory, as in thousands of other research activities on our globe, new stocks of knowledge are being accumulated which will give us increasing power over the forces of nature, taking us step by step toward ever better mastery of our fate.

There are unexpected by-products of such research. Our clinical staff becomes familiar with—friends with—other research workers and with their thinking and their techniques. These techniques are not "ivory tower", but will, I am confident, become clinical tools in the near future. In a few years our orthopedic graduate students will become familiar with and use the electron microscope, X-ray diffraction, and the biologist's concept of the macromolecular structure of collagen. Through the clinical application of this new knowledge, the need for surgery may be lessened and we can become again what we once were—true orthopedists, students of the musculoskeletal system, and not just orthopedic surgeons.

So, in this laboratory we study special examples of fundamental biological phenomena. Other wiser physicians have done so before. For instance, Oliver Wendell Holmes studied mineralization. He chose one of the conchs—the nautilus. In our laboratory we have been looking into how pearls are formed, and it seems that an organic matrix is just as necessary for the formation of a pearl, or oyster shell, or clam shell as it is for mammalian bones. We hope that in our laboratories we will see nature as it is and that we will rediscover, as Holmes did, a kinship among all living things and hear once again the message which he heard from the chambered nautilus:

> Build thee more stately mansions, O my soul,
> As the swift seasons roll!
> Leave thy low-vaulted past!
> Let each new temple, nobler than the last,
> Shut thee from heaven with a dome more vast,
> Till thou at length art free,
> Leaving thine outgrown shell by life's
> unresting sea!

The individuals who made these laboratories possible have contributed, and those who will seek truth within its walls will contribute, to the welfare of the human race. For what better monument could they ask?

Joseph S. Barr, M.D.,
Chief of Orthopedic Surgery

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Anesthesia

Pontoppidan, H., and Beecher, H. K.
Progressive loss of protective reflexes in the airway with the advance of age.
J.A.M.A. 174:2209.

Arthritis and Rheumatism

Ropes, M. W., Muller, A. F., and Bauer, W.
The entrance of glucose and other sugars into joints.
Arthritis & Rheumatism 3:496.

Ward, J., Cohen, A. S., and Bauer, W.
The diagnosis and therapy of acute suppurative arthritis.
Arthritis & Rheumatism 3:522.

Biological Chemistry

Spiro, R. G.
Studies on fetuin, a glycoprotein of fetal serum. I. Isolation, chemical composition, and physicochemical properties.
J. Biol. Chem. 235:2860.

General Medicine

Freymann, J. G., Vander, J. B., Burrell, S. B., and Marler, E. A.
Corticosteroid therapy of chronic lymphocytic leukaemia: A study of erythrocyte survival and leukocyte dynamics.
Acta Unio internat. contra cancrum 51:849.

Freymann, J. G., Vander, J. B., Marler, E. A., and Meyer, D. G.
Prolonged corticosteroid therapy of chronic lymphocytic leukaemia and the closely allied malignant lymphomas.
Brit. J. Haemat. 6:303.

Graham, J. R.
Profiles in headache.
M. Science 8:647.

Graham, J. R.
Use of a new compound, UML-491 (1-methyl-D-lysergic acid butanolamide), in the prevention of various types of headache: A pilot study.
New England J. Med. 263:1273.

Graham, J. R., Malvea, B. P., and Gramm, H. F.
Aerosol ergotamine tartrate for migraine and Horton's syndrome.
New England J. Med. 263:802.

General Surgery

Carter, E. L., and Huggins, C. E.
A comparison of the effects of general hypothermia and arfonad-induced hypotension on survival of dogs after temporary acute occlusion of the portal vein.
Surgery 48:1028.

Neurosurgery

White, J. C.
Timing of nerve suture after a gunshot wound.
Surgery 48:946.

Orthopedic Surgery

Aitken, A. P., and Nalebuff, E. A.
Volar transnavicular perilunar dislocation of the carpus.
J. Bone & Joint Surg. 42-A:1051.

Otolaryngology

Kelemen, G.
Aural embryopathies.
In Mental retardation. Proceedings of the First International Conference on Mental Retardation, Bowman, T. W., and Mautner, H. V., Editors, New York, Grune & Stratton, Inc., p. 254.

Books

Marble, H. C.
The hand: A manual and atlas for the general surgeon.
Philadelphia, W. B. Saunders Company.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

Academy of Sciences, USSR.
Problems of evolution of physiological functions. A collection dedicated to the 75th birthday of L. A. Orbeli.
Moscow, Academy of Sciences, USSR, 1958.
(4C)

American Physiological Society.
Handbook of physiology, sec. I, vol. 3. Neurophysiology.
Baltimore, The Williams and Wilkins Company, 1960.
(19C)

Augenstine, L. G. (Editor)
Bioenergetics; consideration of processes of absorption, stabilization, transfer, and utilization.
New York, Academic Press, Inc., 1960.
(5A)

Bick, E. M. (Editor)
Trauma in the aged.
New York, McGraw-Hill Book Company, Inc., 1960.
(23T)

Bierring, W. L. (Editor)
Rypins' medical licensure examinations, ed. 9.
Philadelphia, J. B. Lippincott Company, 1960.
(1N)

Burton, M., Magee, J. L., and Kirby-Smith, J. S. (Editors)
Comparative effects of radiation.
New York, John Wiley & Sons, Inc., 1960.
(36Jn)

Castleman, B., and Dudley, H. R. (Editors)
Clinicopathological conferences of the Massachusetts General Hospital; selected medical cases.
Boston, Little, Brown and Company, 1960.
(7C)

Gorbman, A. (Editor)
Comparative endocrinology.
New York, John Wiley & Sons, Inc., 1959.
(14L)

Homburger, F. (Editor)
Progress in experimental tumor research, vol. 1.
Philadelphia, J. B. Lippincott Company, 1960.
(23K)

Jancsó, N.
Speicherung; Stoffanreicherung im Retikuloendothel und in der Niere.
Budapest, Akadémiai Kiadó, 1955.
(17E)

Lawrence, H. S. (Editor)
Cellular and humoral aspects of the hypersensitive states.
New York, Paul B. Hoeber, Inc., 1959.
(15D)

Mazer, C.
Mazer and Israel's diagnosis and treatment of menstrual disorders and sterility, ed. 4.
New York, Paul B. Hoeber, Inc., 1959.
(24E)

Mitchell, J. S. (Editor)
The cell nucleus.
New York, Academic Press, Inc., 1960.
(2Am)

Pincus, G., and Vollmer, E. (Editors)
Biological activity of steroids in relation to cancer.
New York, Academic Press, Inc., 1960.
(5T)

Rudnick, D. (Editor)
Cell, organism and milieu (17th Symposium of the Society for the Study of Development and Growth).
New York, The Ronald Press Company, 1959.
(2Am)

Rudnick, D. (Editor)
Developing cell systems and their control (18th Symposium of the Society for the Study of Development and Growth).
New York, The Ronald Press Company, 1960.

Ciba Foundation Study Group No. 5. Regeneration of the inorganic ion content of cells.
Boston, Little, Brown and Company, 1960.
(14J)

Wuhrmann, F., and Wunderly, C.
The human blood proteins.
New York, Grune & Stratton, 1960.
(14Am)

* * *

Dr. and Mrs. Claude E. Welch returned recently from Australia. They had been invited to Melbourne by St. Vincent's Hospital, where, during the entire month of October, the hospital was commemorating the fiftieth anniversary of the founding of its clinical school, and simultaneously was dedicating several large buildings, including many new wards, operating theatres, research laboratories, and a 500-bed nurses' home.

As a portion of this program, Dr. Welch had been appointed as the Visiting Professor of Surgery for the month. This included a fairly continuous program of lectures, ward rounds, and operative surgery.

St. Vincent's Hospital is one of the four hospitals in the city that have clinical schools associated with the University of Melbourne. A new medical school is opening there this year, and thenceforth all medical students in the University of Melbourne will be taught in either the Royal Melbourne Hospital or in St. Vincent's.

There are many close professional relationships between Melbourne and Boston. Many of our own staff landed there soon after the onset of World War II; the arrival of our armed forces came at a very dark hour in Australian history, and gratitude for our intercession has never dimmed since. One of our graduates, Mr. John B. Colquhoun (*Or.* 1927) is head of the Orthopedic Department in St. Vincent's. Many surgeons from Melbourne have visited in Boston during the past few years. Actually, there are four Australians studying in the Massachusetts General Hospital at this time, according to the receptionists' records.

Melbourne has a comparatively brief but important history as a medical center. The surgeon who has been known best in America was Sir Hugh Devine. He was associated with St. Vincent's for nearly all of his long and brilliant professional life. Sir MacFarlane Burnet, one of the foremost investigators of viruses, has a large research center attached to the University and the Royal Melbourne Hospital. He was awarded a Nobel Prize for his important work in virology during this same month of October when I was in Australia.

St. Vincent's Hospital was founded by the Sisters of Charity. These Sisters are completely devoted to the hospital, and, as a result, it has an *esprit de corps* that is unusually high. The hospital was immaculate; the operating rooms were large and completely equipped. The surgical staff is distinguished and well trained; most of its members have English as well as Australian degrees.

It has often been said that the Australians are a most generous and openhearted people. This is true to a greater extent than one could believe possible. They are charming, sympathetic, intensely practical—lovers of sports, tea, and travel. In addition, since the country is young and under-developed, they are individualists and pioneers.

Mrs. Welch spent a great deal of her time in the nursing school and in the college of nursing, since the education and training of nurses is under constant scrutiny and many American methods are being integrated into their programs. At the end of the month Mrs. Welch was made the first and only honorary member of the St. Vincent's Nursing School.

En route to Melbourne, the Welches spent a few days in Hong Kong, where they were the guests of Dr. C. A. Wang (*W.S.* 1944) and Mrs. Wang, in their beautiful home on the island. However, the unstable political climate and the hundreds of thousands of refugees make life there somewhat precarious. On rounds in Queen Mary's Hospital it was apparent that surgical methods had to be modified to cope with the great problem of malnutrition which is common to nearly all the refugees.

On their return trip, the Welches had a brief view of the huge institute that the Rockefeller Foundation is building in New Delhi for medical research, and then a long visit in Teheran with Capt. and Mrs. G. M. Williams. Here they saw many hospitals, and inspected some that were old, and some that were new, with the most modern facilities. The American Hospital there is small but perfectly equipped. There are now many men in the city of Teheran who have been trained in medical schools and hospitals in America. They are sparking a renaissance in Iranian medicine that should bear fruit in a few years.

When questioned about their trip on their arrival home, the travelers said: "In Teheran we also met the parents and the father- and mother-in-law of Farrokh Saidi (a.r.s. 1960), and they and their friends overwhelmed us with the traditional Iranian hospitality. Since our bags were already full, we left, weighed down by beautiful dishes, Persian rugs, and fur hats from the Caucasus. So encumbered, we returned and, after 79 days and 38,000 miles, were again in Boston. Our children did not recognize us, but our dog found us even more interesting than we were when we left."

* * *

VOLUNTEER GROUPS

MGH Staff Wives Association

A pleasing post-holiday concert was given in the Chapel on the afternoon of January 4. The performing artists were Carol Joplin, soprano, and Susan Stark, her piano accompanist.

Carol Joplin, a voice major at Skidmore College, is the daughter of Dr. and Mrs. Robert J. Joplin. Mrs. Joplin is active on the Music Committee of the Staff Wives Association. Miss Joplin offered a program of songs by composers as varied as Handel and Gian-Carlo Menotti.

Susan Stark, who is accompanist for the Skidmore College chorus, played a piece by Bach-Busoni and a prelude and fugue by Bach.

Both girls, seniors at Skidmore this year, were given permission to return to college a day late in order to give this MGH concert. Both have toured Europe with the College Glee Club. Their young talent, in an old setting, made the concert particularly charming.

A concert by Anton Winkler, flutist, was given on January 18 in the Chapel.

On February 1, Ann Talbot, mezzo-soprano, gave a concert, also in the Chapel.

BIOGLETS

Dr. Giuseppe G. Pietra, Assistant Resident in Pathology—born in Piacenza, Italy, December 30, 1930; Maturita Scientifica, Bologna, Italy, 1948; M.D., University of Milano, 1955; military service: Lieutenant in the Health Service, Italian Army, 1955-57; Research Fellow, Division of Oncology, Chicago Medical School, 1957-60; married.

Dr. Alexander Polak, Assistant Resident in Pathology, assigned to Neuropathology—born in Prague, Czechoslovakia, October 10, 1931; M.D., University of Western Ontario, London, Ontario, Canada, 1955; Intern (rotating), Toronto General Hospital, Toronto, Canada, 1955-56; Resident in Medicine, Toronto General Hospital, 1956-57; Resident in Surgery for 6 months, Shaughnessy Hospital, Vancouver. British Columbia, 1957; Resident in Neurosurgery for 6 months, University Hospital, Saskatoon, Saskatchewan, 1958; Fellow in Neurology, Toronto General Hospital, 1958-59; Clinical and Research Fellow, Massachusetts General Hospital, 1959-60.

Dr. Murray K. Rosenthal, Junior Assistant Resident on the Children's Medical Service—born in Malden, Massachusetts, December 14, 1932; A.B., Harvard College, 1954; A.M. (Biology), Boston University, Boston, Massachusetts, 1955; M.D., University of Vermont College of Medicine, Burlington, Vermont, 1959; Intern in Pediatrics (rotating), Rochester General Hospital, Rochester, N. Y., 1959-60; married; one daughter.

Brief bits:

Dr. Clemens E. Benda has been elected an Affiliate of the Royal Society of Medicine, London.

Miss Constance L. Braman, R.N. has been named as consultant to the registrar of Boston's Central Directory for Nurses.

Dr. J. Bradford Millet has announced his association with Dr. Richard A. Currie, for the practice of General, Thoracic, and Cardiovascular Surgery, at 216 Mayro Building. Utica, N.Y.

Dr. Kurt H. Thoma has returned from Buenos Aires, where he lectured before the Circulo Odontologico Del Oeste at the International Odontological Meeting held in celebration of the 150th anniversary of Argentina's independence. Dr. Thoma also gave a four-day refresher course to a group of South American oral surgeons on the subject "Surgical treatment of oral lesions and tumors".

Dr. Paul D. White has received an honorary membership from the National Association of Science Writers "in recognition of a major contribution to sponsoring the dissemination of accurate scientific knowledge by the press of the nation". Dr. White was one of only three to receive this newly-instituted top honor of the N.A.S.W.

New addresses:

Dr. Ralph H. Adams (*W.S.* 1935), Huggins Hospital, Wolfeboro, N.H.

Dr. Scott Adler (sr.r.s. *Or.* 1959), 200 Oak St., Albuquerque, N.M.

Dr. Joseph M. Alper (*E.M.* 1935), 1185 Park Ave., New York 28, N.Y.

Dr. D. Robert Alpert (a.s. *Oph.*), 1101 Beacon St., Brookline, Mass.

Dr. Edwin F. Alston (*Path.* 1944), 2305 Van Ness Ave., San Francisco, Calif.

Dr. Benjamin H. Alton (*W.S.* 1916), Gansett, Woods Hole, Mass.

Dr. Arthur F. Amick (*M.* 1957), 3415 Minnehaha Ave., Minneapolis 6, Minn.

Dr. W. Gerald Austen (*S.* 1956), National Heart Institute, Bethesda, Md.

Dr. William B. Ayers (*W.S.* 1943), 1554 Northern Blvd., Manhasset, Long Island, N.Y.

Dr. William B. Bacon (a.r.p. *Path.* 1951), South Hamilton, Mass.

Dr. Cecil F. Baxter (*W.S.* 1944), Medical Arts Bldg., Sarasota, Fla.

Dr. Carl B. Beeman (*Path.* 1934), 515 Lakeside Drive, Grand Rapids 6, Mich.

Dr. Glenn E. Behringer (*W.S.* 1946), 266 Beacon St., Boston, Mass.

Dr. George O. Bell (*W.M.* 1936), Lahey Clinic, 605 Commonwealth Ave., Boston. Mass.

Dr. Armand L. Bengle, Jr. (*E.S.* 1947), 2217 Webster St., San Francisco 15, Calif.

Dr. Donald W. Bickley (*W.M.* 1936), 2001 Kimball Ave., Waterloo, Iowa

Dr. Robinson LeR. Bidwell, II (*E.S.* 1943), 31 Bramhall St., Portland, Maine

Dr. James D. Bisgard (*W.S.* 1924), 422 Doctors Bldg., 44th and Farnam Sts., Omaha, Nebr.

Dr. John A. Boone (*C.M.* 1934), Medical College Hospital, 55 Doughty St., Charleston 16, S.C.

Dr. Lemuel Bowden (*E.S.* 1941), 177 E. 79th St., New York 21, N.Y.

Dr. Frederic B. Breed (a.s. *Oph.*), Danversport, Mass.

Dr. Robert J. Brockhurst (*M.* 1948), Retina Associates, 99 W. Cedar St., Boston, Mass.

Dr. Lloyd Brown (*N.S.* 1938), 316 State St., Bangor, Maine

Capt. Robert H. Brown, MC, USN (*E.S.* 1944), Orthopedic Service, U.S. Naval Hospital, Bethesda 14, Md.

Dr. C. Sidney Burwell (*W.M.* 1919), Harvard Medical School, 25 Shattuck St., Boston 15, Mass.

Dr. Roy L. Byrnes (a.r.p. *Path.* 1954), 34745 Camino Capistrano, Capistrano Beach, Calif.

Dr. Jack A. Cannon (*E.S.* 1944), Dept. of Surgery, UCLA Medical Center, Los Angeles 24, Calif.

Dr. J. Vernon Cantlon (*E.S.* 1935), 220 S. Virginia St., Reno, Nev.

Dr. Samuel C. Capps (*Path.* 1946), Butterworth Hospital, 100 Michigan Ave., Grand Rapids 3, Mich.

Dr. Sam L. Clark, Jr. (*M.* 1950), Washington University School of Medicine, St. Louis, Mo.

Dr. William D. Cochran (a.r.p. *C.M.* 1954). Boston Lying-in Hospital, 221 Longwood Ave., Boston, Mass.

Dr. Mary S. Coley (*C.M.* 1955), 63 Dauntless Lane, Hartford 5, Conn.

Dr. Henry B. Crawford (*Or.* 1931), 15 Prince St., Rochester. N.Y.

Dr. Thomas D. Cunningham (*W.M.* 1918 and *C.M.* 1920), 932 Republic Bldg., Denver 2, Colo.

Dr. Willard M. Daggett, Jr. (*S.* 1959), Children's Medical Center, 300 Longwood Ave., Boston, Mass.

Dr. Clyde W. Dawson (*Or.* 1936), Columbus Surgical Center, 1275 Olentangy River Rd., Columbus 12, Ohio

Dr. Arthur C. Guyton (*W.S.* 1943), University Medical Center, Jackson, Miss.

Dr. John S. Harter (*W.S.* 1935), Medical Arts Bldg., Louisville, Ky.

Dr. Clement A. Hiebert (*S.* 1952), 18 Bramhall St., Portland, Maine

Dr. L. Edgar Hummel (*Path.* 1932), Edward J. Meyer Memorial Hospital, 462 Grider St., Buffalo 15, N.Y.

Dr. Samuel P. Hunt (a.r.p. *Psychiat.* 1940). 520 Skiff St., North Haven, Conn.

Dr. Paul J. Kestens (clin. & res. fel. *S.* 1960), 42 rue de Tirlemont, Louvain, Belgium

Dr. Walter H. Lacey (*W.S.* 1917), West Hill, Keene, N.H.

Dr. John B. McGinty (a.r.s. *Or.* 1960), Children's Medical Center, 300 Longwood Ave., Boston, Mass.

Dr. Patricia A. McIntyre (*M.* 1953), Confederate Memorial Medical Center, Kings Highway at Linwood Ave., Shreveport, La.

Dr. Clare K. Marshall (r.p. *N.* 1954), 433 Main St., Burlington, Vt.

Dr. H. Peter Mueller (clin. assoc. *R.*), 39 Tyler Rd., Belmont 78, Mass.

Dr. George D. Parker (*Dn.* 1939), 4919 E. 38th Ave., Denver 7, Colo.

Dr. John T. Pollard, Jr. (r.p. *R.* 1959), 81 College Ave., Somerville, Mass.

Dr. Alexander L. Zaoussis (a.r.s. *Or.* 1954), 9 Merlin St., Athens, Greece

---

A long and very interesting letter has come from Dr. Hugh Grant Rowell (*W.S.* 1921), written from North Tarrytown, N. Y. The letter reads, in part:

> Being ever a nosey person and considering the world my oyster, I have had a multitude of careers, and though having retired, I am still up to my neck.
>
> Several years ago, upon my retirement, I, together with a long-time associate (both of us trained and interested in genealogy), set up what we call SPECIALIZED RESEARCH, through which we accept clients for genealogical and special research work. We are, as of now, official genealogists to the Pell Family Association, Inc., as well as having clients both in this country and in Europe.
>
> Genealogy is, of course, simply humanized history, and it is fascinating. I have prepared and published in the *New England Historical and Genealogical Register* a series of articles on the Rowell-Redington-Wheeler families.
>
> Like Hugh Williams and, I believe, Dr. Balch, I have been a clock collector for years and have a pretty fine collection of rare ones — mostly American and Dutch. I wrote a great deal on the subject, being a columnist and regular contributor to the now defunct *American Collector* and being Clock Editor as

NO. 94 IN A SERIES OF STAFF PHOTOGRAPHS
DR. LOT B. PAGE, ASSISTANT PHYSICIAN—CHIEF OF THE HYPERTENSION CLINIC

well as Circus Editor of *Hobbies*. I have clocks on my walls, mostly replacing paintings. I also have a clock room instead of the usual rumpus room in the cellar.

I have done a lot of research on circus history and have a very fine collection of very rare circusiana, including possibly the oldest circus poster in America. My model, based on Ringling-Barnum, was one of the earliest and was shown for Ringling-Barnum in New York City, also for a year with the Harry Peters lithographs at the Museum of the City of New York, at the New York Historical Society for several months, and at the Somers Museum of the Circus. Its last appearance was at the Roxy Theatre in New York City — now, alas, torn down.

I have had great pleasure in the genealogical-patriotic societies, of which I have been a state and national officer in many instances. Having followed down a large number of ancestral lines, I have been admitted to many Old World and American groups. As of now, I am President (national) of the Order of Americans of Armorial Ancestry, whose name appears on this letterhead.

I did some interesting work years ago on popular medical articles for *Colliers*, the *American Magazine*, and *MacLeans* (in Canada). I was teamed up with a top-level cartoonist, and we went to town. I also did a huge scientific tome which Saunders, back in the 1930's, sold for $7.50. I liked writing and still do.

One happy memory concerns the boat show I staged on the S.S. *Brazil*, on a South American cruise round 1938. I had a Broadway "band" just returning from Rio, and such stars as the Weire Brothers.

Professionally, I got into that field in which medicine and education are now combined, and in which I was a pioneer. I also did pioneer teacher training work in education of the gifted and the handicapped.

As to clippings, I have any number of fat press books which, I'll wager, my executor will incinerate pronto some day.

Although I retain my New York State medical license and am a life member of APHA, my activity in both those fields is mental, as of now.

I sometimes think that the best years of my life were spent at the Massachusetts General Hospital as striker and house pupil. I realize increasingly how good the opportunities and training were; and, of course, I met Mrs. Rowell there, as any nurse of that day will probably remember.

In a "Give my regards to Broadway" note — it has always been a matter of great pride to learn of the astounding accomplishments of the group who were with me at M.G.H. My real satisfaction has been to see how they have carried the message to Garcia.

In response to our appeal for something about his experiences while he was in Bahrain, Dr. Paul W. Harrison (*E.S.* 1909) has sent us this delightful but all-too-brief letter, written from the Memorial Home Community, Penney Farms, Florida. We hope we may have more from Dr. Harrison—and soon.

Thank you for your letter. It affords an irresistible temptation to haul out of the past an adventure differing from those of these tamer days.

"On a day of the days", as the Arab would say, our high-pressure dervish group held a séance in Kurram, eight miles from Muttreh where the Mission hospital was operating. Such a séance begins at about seven in the evening, and the name of God is repeated rapidly and loudly, with fierce emphasis, until at about midnight the participants begin to go to pieces, falling down, frothing at the mouth, etc.

Then the wonders begin. A baby, sick and with a headache, had its head removed and taken to a tub, full of dirty water, next to the local well. The head was washed carefully, brought back, and put into place. A sick eye was likewise removed and washed. The next morning both patients had recovered completely. The more active participants thrust long slender swords through their abdomens — they protruded from the back. All these things were reported to me the next day by some of my assistants who were onlookers. No matter how completely they were dissociated from each other, these reporters had all seen the same things — a very interesting type of group hypnosis.

One night, however, something more happened. One of the sharp-pointed swords did enter the body a little, leaving a tiny opening into the abdominal cavity. It cut the deep epigastric, which bled actively from both ends. This unexpected result terrified the swordsman. He lay down and evidently tried to stop the bleeding by pushing on his abdominal contents. Practically all of his small intestines were squeezed out and lay in the open air on his abdomen. This impressed the onlookers as being out of order, so they covered the mass of intestines with a five-gallon tin of mud brought over from the nearby well. This they bandaged in with a long bolt of cloth, but they decided it might be better to get this man over to the "Hakim" in Muttreh. It was a rough eight-mile trip for the stretcher-bearers, and they did not arrive until seven o'clock. Mobarrek, my chief assistant, reported the arrival of the patient with these words: "Sahib, a very bad case has come in."

I agreed with him. A little spinal anesthesia was the first step, and two ligatures of the deep epigastric the second. Then we spent forty-five minutes washing the mud off the intestines. Several changes of gloves were required. After widening the small opening a little, we spent the next forty-five minutes in putting the intestines back where they came from. The patient was carefully sewed up with silk, and put to bed.

He developed no peritonitis, and not even any distention. After two days he began to eat, and his extreme depression due to his failure to support his companions lessened. I dreamed of publishing that case until, on the ninth or tenth day, a bad pulmonary embolus carried him off. We felt very annoyed at him for letting us down.

I feel sure that most surgeons here in America have a very inadequate idea of what the peritoneum can do.

Lots of regards.

This very nice note has come from Dr. Murray L. Janower (a.r.p. *R.*):

I just want to drop you a note to let you know how much I have enjoyed reading THE NEWS since I have been gone. It almost makes me feel that I am back with you all at the M.G.H. rather than here.

I am in the Public Health Service, in the Division of Radiological Health in Washington, D.C. We are the agency of the government concerned with the health aspect of the population as affected by ionizing radiation. My work consists of proposing new areas of radiation research and supervising projects already under way. The many, many basic principles learned in Dr. Robbins's department are certainly coming in handy.

I'm also learning what the word "snow" means.

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 202 Boston, Mass. March 1961

THE ARTERIOSCLEROSIS UNIT OF THE CARDIOVASCULAR RESEARCH LABORATORIES

Arteriosclerosis will be the principal or a major contributing cause of death in about 40 percent of all people now living in most of the civilized parts of the world. This dire end will be effected by a process of hardening, thickening, and finally obstruction of the arteries that nourish vital organs of the body. The most common and lethal form in which the disease appears is the "coronary" or "heart attack". Obstruction of the blood supply to the brain leads to several types of "strokes". Involvement of the arteries which supply the kidneys sometimes results in hypertension or kidney failure. Gangrene of the limbs, and damage to the eyes and occasionally to other organs complete the broad spectrum of the serious consequences of arteriosclerosis.

The challenge of arteriosclerosis. Arteriosclerosis presents a major challenge for medical research in the immediate future. It is the greatest public health problem of the civilized parts of the world. It challenges us to develop a method for showing the presence of and measuring the arterial thickening in the living subject. Studies have shown that nearly all adult human beings in civilized regions have this condition to some degree. Yet we remain totally unable to estimate the extent or rate of development of the disease until obstruction of blood flow threatens to damage some vital organ.

Arteriosclerosis presents a prime intellectual challenge to the investigator. Clinical and laboratory research efforts have shown that a multitude of factors may participate in causing arteriosclerosis, e.g., heredity, diet, stress, disorders of lipid and carbohydrate metabolism, and disorders of blood coagulation. The integration of these diverse factors must be achieved for an understanding of the disease mechanism. The necessary thought processes keep the investigator on his toes—and sometimes give him a headache.

Attention to the challenge offered by arteriosclerosis is particularly timely right now. Knowledge in the biological sciences is advancing faster than ever before. This rate of development virtually assures us that the basic information necessary for understanding the mechanism of production of arteriosclerosis is now, or soon will be, available. One may feel confident that substantial progress is near at hand. Indeed, some preventive and therapeutic measures are now supported strongly enough by circumstantial evidence to justify their use in persons with a high risk of suffering from arteriosclerotic disease. The ultimate proof of the efficacy of these measures, or of new ones, will involve long and arduous study until we are able to measure the extent of the disease in the individual patient.

Survey of future research on arteriosclerosis. The Arteriosclerosis Unit is a new subdivision of the Cardiovascular Research Laboratory of the Medical Services. It has been formed to take up the challenge described above and to take advantage of the flood of new knowledge forthcoming from all the natural sciences. It seems appropriate in this first public communication from the new unit to provide the readers with a brief survey of several avenues of study of arteriosclerosis which are likely to be important in the next few years.

One of these significant avenues is the extension of a vast amount of earlier work on the gross and microscopic pathology of arteriosclerosis. Correlation of the pathological findings with the preexisting status of the patient is especially needed. These are some of the factors whose relation to arteriosclerosis needs further study: geography, diet, sex and endocrine status, blood pressure, nicotine and other toxins of civilization, and the presence of concurrent disease. Another requirement is further structural details on how the disease is initiated. There are now three schools of thought whose differences must be reconciled—one advocates intravascular thrombosis as the initial event, a second supports the infiltration of lipid or lipoprotein from the blood stream into the vessel wall, and the third school holds that sufficient lipid may be synthesized within the vessel wall to produce the lesions of arteriosclerosis. Advances which are occurring in the field of histochemistry and in techniques for studying the biochemistry of single cells should point the way to progress in this area.

The second avenue where progress is anticipated is further evaluation of the role of heredity in arteriosclerosis. It has been clear for a long time that the tendency to develop severe arteriosclerosis runs in families and in some racial groups. The belief is now held that the tendency to develop the disease is inheritable, although part of the incidence may be related to similarities of diet and environmental stresses within families. In these respects there seems to be a resemblance among arteriosclerosis, hypertension, and diabetes.

The importance of gaining an understanding of the role played by inheritance in the development of arteriosclerosis has recently been given a very practical turn. Advances in knowledge of genetic mechanisms have begun to show the nature of the molecules actually involved in the process of inheritance and the minutely specific consequences of abnormalities in the key molecules. Thus it has been found that the substitution of just one amino acid for another in the 280 amino acids of each half of the hemoglobin molecule results in sickle-cell anemia or other less common diseases due to hemoglobin abnormalities. A large number of diseases, known collectively as the "inborn errors of metabolism", have been shown to result from absence or improper synthesis of various enzymes. If our growing understanding of molecular genetics could be applied to the study of arteriosclerosis, we might learn what type of molecular abnormality to search for. Despite all the effort already put into arteriosclerosis investigation, we still do not know whether we are dealing with the deficiency of an enzyme of fat metabolism, with a faulty lipoprotein molecule, or with some defect in the blood vessel wall.

A third and major avenue for future investigation concerns the search for these molecular abnormalities which may lead to arteriosclerosis. It is well known that the lesions usually have a scattered distribution, with certain favored sites. Attention must be devoted to the factors in site selection. Why is it that a small amount of the disease in one individual can lead to an early fatal outcome, while extensive disease in another person may not shorten the natural life span? On this question the study of pressure-flow relationships in fluid systems and of the factors involved in the deposit of macromolecules from solution will press forward. Interesting model systems have recently been reported in which the circulation of an animal is led through a circuit of plastic or brass tubing outside the body. Deposits of platelets and lipids in the tubing which mimic the distribution patterns of lesions *in vivo* have been observed.

A widely prevalent thought in arteriosclerosis research has been that a significant abnormality could be found in the blood of affected patients or experimental animals. Unfortunately, too many such defects have been reported and the situation has become complex, indeed.

The proposal that thrombosis in the

blood stream might be the initiating event in arteriosclerosis prompted study of the clotting and clot-digesting (fibrinolytic) mechanisms. The findings have been indefinite but always suggestive. Increased plasma lipids, especially following fatty meals, have been found to promote blood clotting and to be frequently associated with arteriosclerosis. Impairment of fibrinolysis—the removal of existing clots—may also be associated with arteriosclerosis. These studies have been made difficult by an inadequate knowledge of the complex clotting and fibrinolytic systems, but such information is rapidly accumulating.

Let us now consider the area of greatest investigative effort—the study of the body fats or lipids. In the fourteen annual meetings of the American Society for the Study of Arteriosclerosis (now the Council on Arteriosclerosis of the American Heart Association), the papers presented have dealt with cholesterol more than 60% of the time, from clinical, pathological, and biochemical points of view. This strong bias toward cholesterol was based as much upon the availability of fairly accurate and specific methods for its measurement as upon evidence of its role in causing arteriosclerosis.

The enthusiasm for cholesterol did not shed sufficient light on the problem of arteriosclerosis. The bias may now be expected to give way to a thorough consideration of the other classes of lipids—the neutral fats or triglycerides, and the phospholipids.

A number of investigators have directed their attention to the macromolecules in which all the lipids are transported in the blood. The lipoproteins consist of protein, cholesterol and its esters, phospholipids, and triglycerides, in varying proportions. A great wave of enthusiasm for studying these substances was engendered about ten years ago by Gofman and his colleagues at the University of California. Their techniques for measuring the different types of lipoproteins with the ultracentrifuge did not lead to very much progress in terms of practical medicine. This failure was largely due to the impatience of those using the method to have a measure of the amount of arteriosclerosis and of the results of therapy in individual patients. Despite its lack of reliability as a measure of the disease, the method improved our understanding of the nature of lipoproteins. Present knowledge indicates that they represent the association of protein and lipids into complexes which are not molecules in the strict sense of the word. Covalent bonding between lipid and protein is believed to be absent, and only secondary valence forces are considered to be responsible for the binding. The composition of the complexes appears to be constant only on a statistical basis. The lipid moiety, and possibly the protein as well, can exchange in and out of the macromolecules. This much information is only the beginning of that which is needed to understand the relationships among the lipids, the lipoproteins, and arteriosclerosis. The task before us is a painstaking investigation of the ways in which the lipoproteins are formed and broken down. We must learn how the lipid becomes detached from the protein, forming an accumulation within the vessel wall.

The local environment for arteriosclerosis research. It is of interest to mention the important studies being carried out in the Boston area on lipid metabolism and arteriosclerosis. Professor Bloch, at Harvard University, has directed the most extensive contributions to our knowledge of cholesterol biosynthesis. At Harvard Medical School, Professor Kennedy, newly arrived Chairman of the Department of Biological Chemistry, has been largely responsible for current knowledge of the formation of the neutral fats and phospholipids; Professor Oncley has investigated the structure and physical chemistry of some of the lipoproteins; and Professor Janeway, Dr. Gitlin, and their collaborators have studied the turnover of serum lipoproteins. The nutritional aspects of arteriosclerosis have been studied extensively by Professor Stare and his colleagues at the Harvard School of Public Health.

Important contributions on the anatomy of the coronary blood vessels and on endocrine relationships in arteriosclerosis have come from Professor Blumgart and other staff members of the Beth Israel Hospital. Dr. Lever, formerly Associate Dermatologist at M.G.H. and now a member of our Board of Consultation, and his associates have studied patients with hyperlipemia and the mechanism of action of heparin and clearing factor on the transport of blood fat. Dr. Gorlin of the Peter Bent Brigham Hospital has been investigating the physiology of the heart's blood supply.

At the Massachusetts General there are an astonishing number of investigators who are carrying on research projects which have an intentional or an indirect relationship to arteriosclerosis. A mere list can hardly do justice to these efforts, yet it may have some value because this information has not before been assembled. The names of the investigators, their laboratories, and their research interests follow:

H. Anstall—Blood Bank—Clotting, heparin resistance
W. H. Batchelor—Arthritis Unit—Interaction of lipoproteins with tissue constituents
N. L. R. Bucher—Huntington Laboratory—Regulation of cholesterol biosynthesis
B. Castleman, I. Gore, and P. D. White—Pathology Department—Comparison of arteriosclerosis in Japan and the United States
D. G. Cogan and associates—Howe Laboratory, Massachusetts Eye and Ear Infirmary—Aberrant lipogenesis, retinal vascular patterns
J. Currens—Cardiac Unit — Clinical arteriosclerosis
R. A. Field and W. A. Hall—Diabetes Unit—Carbohydrate and lipid metabolism, nonesterified fatty acids
C. M. Fisher—Neurology Service — Arteriosclerosis and the nervous system
L. W. Gaston—Hematology Unit—Blood clotting
J. Gergely—Cardiac Biochemistry Laboratory—Muscle contraction
R. D. Griesemer—Dermatology Service—Sterol synthesis in skin
K. J. Isselbacher and associates—Gastrointestinal Unit—Intestinal absorption and synthesis of lipid, fatty liver
G. L. Nardi — Surgical Service — Coronary blood flow
L. Page—Hypertension Unit—Catecholamines, renal arteriosclerosis
R. S. Shaw—Vascular Laboratory—Occlusive vascular disease
J. Stokes, III—Family Health Service—U.S. P.H.S. Study at Framingham
W. R. Waddell — Surgical Service — Clinical lipid metabolism and arteriosclerosis
E. O. Wheeler—Cardiac Unit—Familial hypercholesteremia
P. D. White—Cardiac Unit—Clinical arteriosclerosis

The author regrets any omissions or errors he may have made in the above list.

The Arteriosclerosis Unit. In the extraordinarily fertile environment described above, this new unit has been established to concern itself directly with arteriosclerosis and with the correlation of knowledge relevant to the disease. Financial support has been provided by generous grants from the John A. Hartford Foundation and the American Heart Association. The members of the unit, in addition to the author, are Dr. Robert S. Lees as Clinical and Research Fellow and Miss Lillian Hagopian as Research Assistant.

The initial laboratory studies will seek to determine the mechanisms governing the association and dissociation of the lipoprotein complexes. It is important to learn to what extent these processes are under enzymic or hormonal control, even though there seems to be no making or breaking of covalent bonds between lipid and protein.

Clinical studies will be carried out for two purposes: to educate the investigators and to make practical application of the laboratory research. In the latter sense, it will be of particular interest to try to relate molecular genetics to the inheritance factors in arteriosclerosis. It is possible that studies of lipoprotein metabolism in patients with premature arteriosclerosis or with hereditary lipid disorders will reveal the presence of defective enzymes or defective proteins, as are found in the other "genetic" diseases. The cooperation of the Hospital staff is asked, that we may be permitted to study these patients whenever possible.

There is now in progress a cooperative study of twin brothers, aged 27 years. One of them recently suffered a heart attack, while the other is a robust young man. Comparison and long-term observation of these two subjects may provide valuable information on the metabolic and physiologic consequences of myocardial infarction. There is also the challenge to apply rational medical measures to treat the unfortunate twin and to preserve the health of his brother.

The direct contribution of the unit to patient care must, for the present time, be limited. The diagnosis of arteriosclerosis usually cannot be made, even with specialized techniques, until the dramatic late complications appear. And definitive medical therapy for the disease is not available. It would appear that the best approach is to carry out a strong research program dedicated to the improved care of future patients, for surely this is one of the functions of a university hospital.

Conclusion. This survey of some of the ways in which investigators are approaching the study of arteriosclerosis has shown the involvement of clinical medicine and epidemiology, pathology, classical and molecular genetics, and various aspects of biochemistry and biophysics. In other words, a general biological attack is under way and is gathering momentum. The challenge and the fascination of research in this field lies in the integration of the various streams of developing knowledge. It seems likely that many of "the straws in the wind", which everyone now finds confusing, are really secondary evidences of some fundamental and yet unrecognized cause of arteriosclerosis. The elucidation of this cause may come from thoughtful consideration of basic biological principles by well-prepared minds.

Frederick T. Hatch, M.D., Ph.D.,
Assistant Physician
and *Chief of the Arteriosclerosis Unit*

The Board of Trustees, at their meetings on December 30 and January 13, voted:

That the Children's Medical Service be allowed an additional Intern on July 1, with the understanding that this would not increase the total number of the House Staff on that Service.

To accept with regret the resignations of:

Dr. David Spiro from the position of Assistant Pathologist, effective as of December 31, 1960;

Dr. A. Dennis Surtees from the position of Assistant Anesthetist, effective as of January 23.

To appoint:

Dr. J. Richard Baringer as Assistant Resident in Neurology for one year, beginning July 1;

Dr. Philip R. Boyd as Clinical and Research Fellow in Psychiatry for one year, beginning January 9;

Dr. Martha A. Carpenter as Exchange Assistant Resident on the Children's Medical Service, for the period December 12, 1960 through January 20, 1961;

Dr. Larry J. Embree as Clinical Fellow in Neurology, to act as Assistant Resident, beginning July 1;

Dr. Milan Fiala as Clinical and Research Fellow in Medicine, beginning January 1;

Dr. Martin H. Flax as Assistant in Pathology, beginning January 1;

Dr. John L. Green as Exchange Assistant Resident on the Children's Medical Service, for the period January 21 through March 9;

Dr. Robert E. Hayes, III, as Clinical Fellow in Neurology, to act as Assistant Resident, beginning July 1;

Dr. Richard C. Hirschhorn as Assistant Resident in Urology for one year, beginning July 1;

Dr. Herman M. Kalckar as Biochemist, beginning July 1;

Dr. Carl M. Leventhal as Assistant Resident in Neurology for one year, beginning July 1;

Dr. John D. Murphy as Assistant Resident in Anesthesia, beginning July 1;

Dr. Eli R. Shuter as Assistant Resident in Neurology for one year, beginning July 1;

Dr. Lois M. Smedley as Assistant to the Children's Medical Service, effective as of November 1, 1960;

Dr. Narayana C. Surya as Visiting Psychiatrist pro tempore, for a period of three months, beginning January 15;

Murray Wittner, Ph.D., M.D. as Clinical and Research Fellow and Acting Intern in Pathology for one year, beginning July 1.

At their meetings on October 19, and January 4 and 18, the General Executive Committee voted:

To extend the appointment of:

Dr. Luis L. de Mola as Clinical Fellow in Pathology, through March 31.

To promote:

Dr. John E. Adams to the position of First Assistant Resident in Pathology for one year, beginning July 1;

Dr. John F. Barlow to the position of First Assistant Resident in Pathology for one year, beginning July 1;

Dr. F. Daniel Foley to the position of Second Assistant Resident in Pathology for one year, beginning July 1;

Dr. Lewis P. James, Jr. to the position of First Assistant Resident in Pathology for one year, beginning July 1;

Dr. Herbert I. Krickstein to the position of First Assistant Resident in Pathology for one year, beginning July 1;

Dr. Giuseppe G. Pietra to the position of Second Assistant Resident in Pathology for one year, beginning July 1.

To appoint:

J. Paul Burnett, Jr., Ph.D. as Research Fellow in Medicine for one year, beginning December 30, 1960;

Branislav D. Jankovic, M.D., Ph.D. as Research Fellow in Neurology for one year, beginning January 1;

Tapan K. Mukherjee, Ph.D. as Research Fellow in Biochemistry (Medicine) for one year, beginning February 1.

The 69th annual Vincent Show will be given in New England Mutual Hall by the Vincent Club, for the benefit of the Vincent Memorial Hospital, at 8:30 o'clock on Tuesday evening, April 4, through Saturday evening, April 8. There will be a matinee on Saturday afternoon at 2:30.

This year's show, "Winning Ways", in contrast with 1960's salute to the past, will be a gay and glamorous spoof on politics. The plot centers around the problem of getting one of our first female candidates for the Presidency into the White House. The co-authors are Mrs. Endicott Peabody and Mrs. Rose Parsons Lynch.

Tickets will go on public sale at the box office at New England Mutual Hall, 225 Clarendon Street, Boston, on Monday, March 20. It will be open Mondays through Fridays from 9:30 A.M. to 5:30 P.M. The box office telephone number is COpley 7-1379. Tickets for all six performances range in price from $1.25 to $6.00.

Since 1892, when its total gift was $494.50, to the 1960 gift of $45,000, the Vincent Club has contributed over $1,156,630 to the Vincent Memorial Hospital. Won't you all plan to come to New England Mutual Hall between April 4 and 8 and help the Vincent Club support its favorite candidate, your eighty years junior half-sister, the Vincent Memorial Hospital?

VOLUNTEER GROUPS

MGH Staff Wives Association

The Staff Wives Music Committee is particularly grateful to a recent soloist, Anne Talbot (wife of Dr. Nathan B. Talbot), whose distinguished musical background includes singing in oratorios, being soloist for the Chorus Pro Musica, and giving many concerts throughout New England. For nine years Anne Talbot has sung at the M.G.H. for patients, personnel, and visitors. The Hospital thanks her for nine generous gifts of fine music, and looks forward to her next concert.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Biochemistry Research

Gergely, J., and Maruyama, K.
The binding of inorganic phosphate to myosin in the presence of adenosine triphosphate.
J. Biol. Chem. 235:3174, 1960.

Martonosi, A., Gouvea, M. A., and Gergely, J.
Studies on actin. IV. Actin as a component of myosin-B.
J. Biol. Chem. 235:3169, 1960.

Parker, C. J., Jr., and Gergely, J.
Soluble relaxing factor from muscle.
J. Biol. Chem. 235:3449, 1960.

Endoscopy

Benedict, E. B., Hawes, L. E., Stewart, C. R.,

Spellman, J. W., and Walsh, W. F.
Corsage pin in stomach.
J.A.M.A. 175:48, 1961.

Radiology

Dreyfuss, J. R., and Willocx, R. G.
The elevator esophagus: A fluoroscopic clue to possible organic disease.
Radiology 75:914, 1960.

Books

Garland, J. E.
Every man our neighbor: A brief history of the Massachusetts General Hospital, 1811-1961.
Boston, Little, Brown and Company, 1961.

This is the last issue of THE NEWS in which 1960 titles will appear.

THE METABOLIC BASIS OF INHERITED DISEASE

JOHN B. STANBURY, M.D., JAMES B. WYNGAARDEN, M.D., DONALD S. FREDRICKSON, M.D., Editors

During most of the recorded history of man's existence disease has been predominantly "exogenous" in origin. Life was brief in a hostile environment of famine and pestilence. Pandemics decimated the population of continents with an efficiency which still evokes respect in this area of nuclear deterrents. Within the past few years, and perhaps within the restricted locale of the Western World, environment has been largely negated as the major arbiter of health or disease. This event is a legacy of both science and sociology—adequacy of nutrition and housing, sanitation, immunization, the discovery of chemotherapeutic agents, and many other similar advances. Some will point out that over-nutrition carries its own subtle dangers and that the continued inclemency of the environment is readily apparent at 5:00 P.M. on Memorial Drive.

It may be said that disease is now predominantly "endogenous". Health or disease of an individual is increasingly a function of his genetic endowment as the major determinant of his survival potential. Diseases may be inherited in man in the same inexorable geometry as shown by Mendel's peas, or, more subtly, the susceptibility toward a disease may be transmitted in ways quite obscure at this time. Within the past two or three years a new type of genetic disorder in man has been demonstrated, characterized by an abnormal number or shape of the chromosomes. Within this brief time approximately thirty "chromosomal diseases" have been recognized. In this complex spectrum of the relationship of the disease to inheritance—stretching from the relative crudity of chromosomal displacement to the obscurity of familial disposition for the development of neoplastic or degenerative diseases—greatest interest has always been centered on the so-called inborn errors of metabolism. Here the disease is thought to be related to abnormality of a single gene. Clarification of the disease mechanism has almost invariably shown the primary fault to be that of a single enzyme.

Recently an important book was published, entitled *The metabolic basis of inherited disease,* edited by Drs. John B. Stanbury, James B. Wyngaarden, and Donald S. Fredrickson, and published by McGraw-Hill Book Company, Inc., New York, 1960. It is appropriate to comment on this book in these columns, since Dr. Stanbury originally conceived the need for such a treatise and was instrumental in initiating its publication. Furthermore, eight of the forty-six contributors to this book are currently on the MGH staff and several others are former members of our Hospital community, including Drs. Wyngaarden and Fredrickson.

The diseases discussed in this book vary in their frequency and importance in clinical medicine—from diabetes mellitus to beta-aminoisobutyricaciduria. Protean in their clinical manifestations, they entice the investigator to try to find the biochemical basis of the disease mechanism. In some of the diseases the abnormality has been pinpointed with beautiful precision as that of a single enzyme. In the classical example of sickle-cell disease a new order of precision has been achieved with the demonstration of a single amino acid substitution in the abnormal globin as the determinant of disease. In other diseases, including gout and diabetes, the primary defect is still far from clear, despite the work of many investigators. This book does not attempt to give a definitive clinical description of the fifty or sixty diseases included. For this purpose, even its ponderous 1400 pages would not suffice. The main purpose of the book is to illustrate how far current biochemical and physiological investigations have been able to elucidate the primary enzymatic basis of a disease and how this relates to its clinical and pathological manifestations. As in any contributors' volume, the presentations vary in tone and completeness. Within the guidelines laid down by the editors, the general pitch of the book is uncompromisingly "advanced". It is a superb documentation of the impact of modern biochemistry on medical investigation.

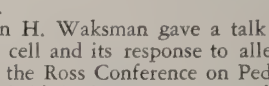
None of the inborn errors of metabolism can be cured in the sense that the absent or deranged enzyme be replaced. On the other hand, knowledge of the disease mechanism may allow a rational circumvention to be devised. If milk is withheld, the galactosemic patient is not seriously handicapped. If pyrimidine nucleotides are given, the block in nucleic acid synthesis characteristic of orotic aciduria may be bypassed. As more information on normal biological control mechanisms becomes available, such as feedback inhibition, these may be brought to bear on other metabolic errors. How many inborn errors of metabolism exist? Several have come to light since this book was submitted for publication, and hundreds of laboratories are working to insure their early obsolescence. It has been estimated without firm grounds that man has from 80,000 to 100,000 genes. In theory one might have a similar order of genetic diseases. Most genetic diseases may be lethal, since they involve enzymes whose activities are necessary for survival. Other genetic disorders may be trivial, involving enzymes whose activities are not required for health. Between these two extremes lie a large number of important and intriguing diseases. *The metabolic basis of inherited disease* is by far the most rewarding source currently available in which to read about them.

Lloyd H. Smith, Jr., M.D.,
Assistant Physician

We recommend highly an informative and attractive little book, *Every man our neighbor: A brief history of the Massachusetts General Hospital, 1811-1961,* written by Joseph E. Garland. Its 56 nine- by six-inch pages, plus many illustrations and a Foreword by Dr. George Packer Berry, Dean of the Faculty of Medicine, Harvard University, can best be abstracted by quoting the first paragraph in Mr. Garland's Preface to his book. It reads:

> About four months ago it occurred to some of the people who were planning the 150th Anniversary of the Massachusetts General Hospital that a short, more or less readable story of its history did not exist. Four consecutive accounts—adding up to two thousand pages (and the mountain from which most of the molehill that follows was sifted)—had been capably written, but they do not constitute in the aggregate an easy evening's entertainment or introduction. A bird's eye view was needed, and I agreed to be the bird. The result is a kind of sketch; it touches on the high points and avoids detail, and is intentionally inferential rather than comprehensive.

The book was published by Little, Brown and Company, Boston, and may be purchased at our General Store for the very modest price of $1.00. Everyone interested in any way in the Massachusetts General Hospital should not fail to procure a copy of Mr. Garland's book.



Brief bits:

Professor Ryo Takahashi, M.D., E.N.T. Clinic, Tokyo Jikei-Kai School of Medicine, Tokyo, Japan, has published a volume on the transsphenoidal approach to pituitary tumors and has sent a copy to Dr. Oscar Hirsch. The author dedicates his book to Dr. Hirsch, who is a pioneer in this approach.

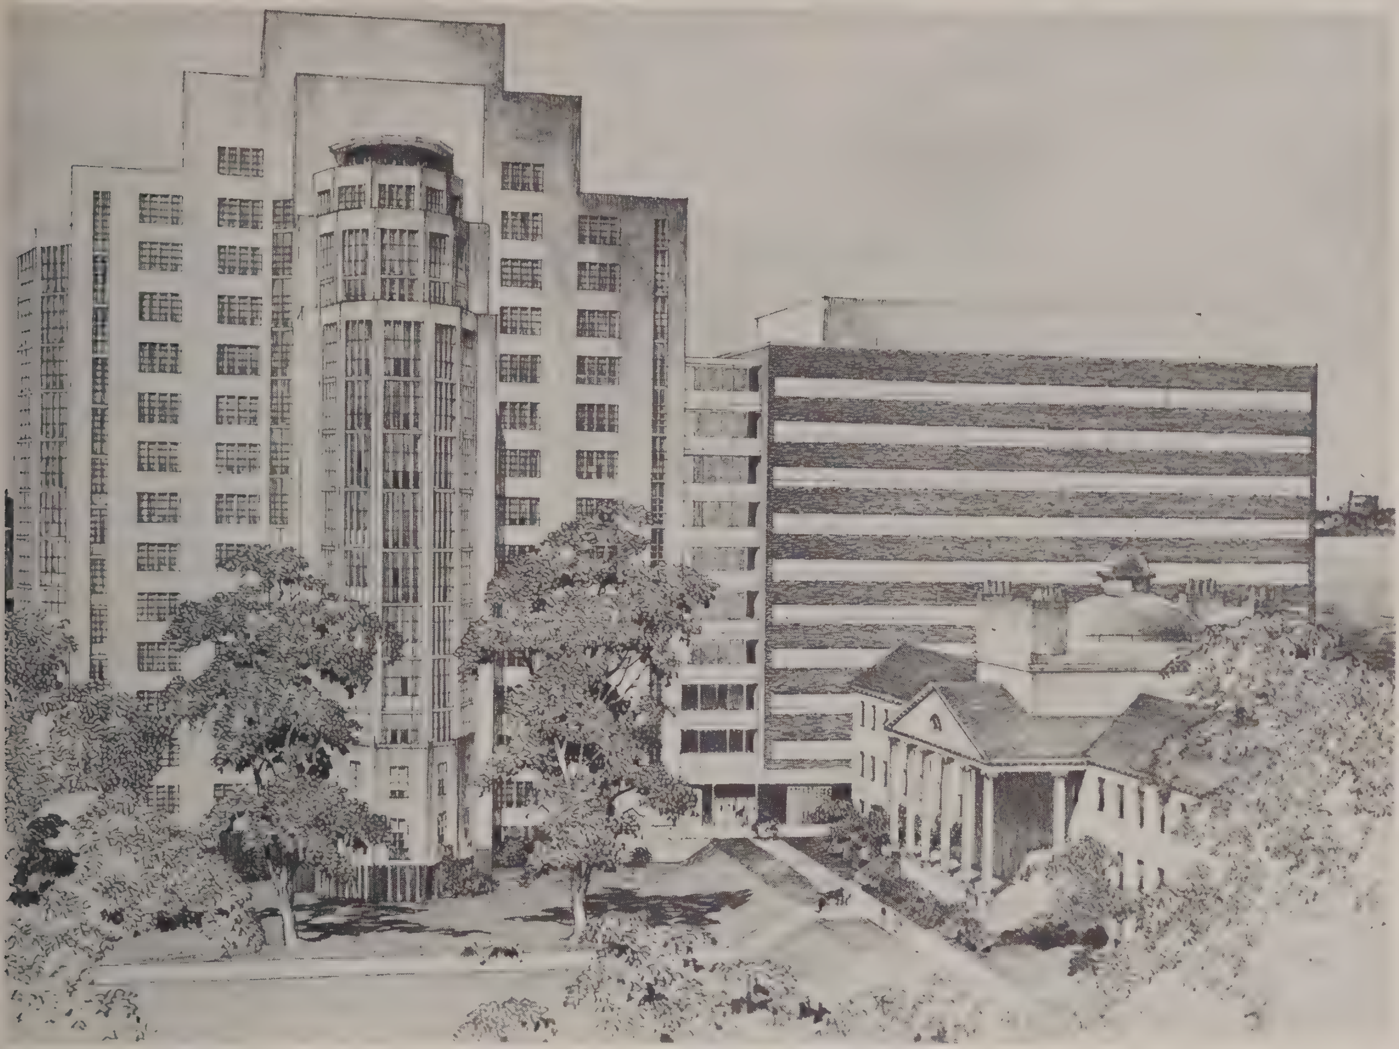
Dr. Byron H. Waksman gave a talk on "The normal cell and its response to allergic stimuli" at the Ross Conference on Pediatric Research, held in Denver on November 9 and 10. From November 10 to 12, Dr. Waksman delivered several lectures in a course on Clinical Immunology, given at the University of Washington School of Medicine in Seattle.

New addresses:

Dr. Nels W. Ahnlund (r.s. *Or.* 1943), Medico Dental Bldg., 6th and Santa Clara Sts., San Jose, Calif.

Dr. Erna G. Anderson (r.p. *C.M.* 1943), Medical Dept., Eastman Kodak Co., 1669 Lake Ave., Rochester 13, N. Y.

Dr. Niels L. Anthonisen (r.p. *Psychiat.* (*McL.*) 1932), Veterans Administration Hospital, White River Junction, Vt.



Architect's rendering of the proposed new Surgical and Special Services Building

Dr. Jason A. Aronson (a. *Psychiat.*), 50 Beacon St., Boston, Mass.
Dr. James H. Averill (*M.* 1947), 264 Elm St., Northampton, Mass.
Dr. Russel L. Baker (r.p. *N.* 1943), Medical Arts Bldg., 1020 S.W. Taylor St., Portland 5, Oreg.
Dr. Donald C. Balfour, Jr. (*E.M.* 1943), Las Encinas Hospital and Las Encinas Medical Foundation, 2900 E. Del Mar Blvd., Pasadena, Calif.
Dr. Fred B. Ballard (a.r.p. 1958), Medical Arts Bldg., Chattanooga 2, Tenn.
Dr. Peter R. Bally (a.r.p. 1956), Medizinische Universitätsklinik, Kantonsspital, Zürich, Switzerland
Dr. Bernard Bandler (r.p. *Psychiat.* 1941), Boston University-Massachusetts Memorial Hospitals Medical Center, 750 Harrison Ave., Boston 18, Mass.
Dr. Thomas B. Barnett (*M.* 1950), University of North Carolina School of Medicine, Chapel Hill, N. C.
Dr. John T. Bate (r.s. *U.* 1925), 301 W. Ormsby Ave., Louisville 3, Ky.
Dr. Richard F. Bedell (*C.M.* 1958), Scarswold Apts., Scarsdale, N. Y.
Dr. Lillian F. Bennett (*C.M.* 1946), 2299 19th Ave., San Francisco 16, Calif.
Dr. Howard W. Berg (r.p. *D.* 1936), Brigham Hall Hospital, 229 Bristol St., Canandaigua, N. Y.
Dr. George A. Berkheimer (r.s. *Or.* 1941), 325 N. Front St., Harrisburg, Pa.
Dr. John T. Binion (*M.* 1953), Doctors Bldg., 3707 Gaston Ave., Dallas 10, Tex.
Dr. William R. Blade (*r.p. R.* 1958), 1510 Seabright Ave., Santa Cruz, Calif.
Dr. Gordon L. Block (r.s. *U.* 1950), Doctor's Bldg., Cincinnati 2, Ohio
Dr. Daniel K. Bloomfield (r.p. 1957), Western Reserve University School of Medicine, Cleveland 6, Ohio
Dr. Frances J. Bonner (a. *Psychiat.*), 160 Lake Ave., Newton Centre, Mass.
Dr. Russell P. Borden (*W.S.* 1914), Langley, British Columbia, Canada
Dr. Harold F. Bosco (*Dn.* 1946), 300 Main St., New Britain, Conn.

Dr. Edward M. Bridge (*C.M.* 1927), University of Buffalo, 3435 Main St., Buffalo, N. Y.
Dr. Clyde O. Brindley (*M.* 1950), National Institutes of Health, Bethesda 14, Md.
Dr. F. Bert Brown (*Or.* 1937), 22 W. Gaston St., Savannah, Ga.
Dr. R. Gordon Brown (*Path.* 1942), 122 S. Michigan Ave., Chicago 3, Ill.
Dr. ~~Edward M.~~ Burns (r.p. *Psychiat.* 1935), 110 E. Main St., Madison 3, Wis.
Dr. Arthur C. Cairns (gr. stud. a. *M.* 1959), 119 Sunnyside Ave., Montreal, Canada
Dr. F. Phinizy Calhoun, Jr. (*E.M.* 1938), 478 Peachtree St., Atlanta, Ga.
Dr. Lewis Capland (r.p. *D.* 1940), 1680 Meridian Ave., Miami Beach, Fla.
Dr. Paul J. Catinella (a.d.), Medical Arts Bldg., 697 Cambridge St., Brighton 35, Mass.
Dr. Lee M. Cecil (*M.* 1950), 710 C St., San Rafael, Calif.
Dr. Richard B. Chapman (a. *Oph.*), 743 High St., Dedham, Mass.
Dr. Leon I. Charash (a.r.p. *C.M.* 1952), 146 Mount Joy Ave., Freeport, N. Y.
Dr. Jacob Christ (a. attend. psychiat. (*McL.*)), 51 Brattle St., Cambridge 38, Mass.
Dr. Herbert S. Cline (a.r.p. *Psychiat.* 1956), 185 Dean Rd., Brookline 46, Mass.
Dr. Cully A. Cobb, Jr. (r.p. *N.* 1948), Medical Arts Bldg., Nashville 12, Tenn.
Dr. Howard C. Coggeshall (*W.M.* 1935), 3710 Swiss Ave., Dallas 4, Tex.
Dr. Irwin J. Cohen (*C.M.* 1931), Veterans Administration ~~Central Office~~, Vermont Ave. and Eye St., Washington 25, D. C.
Dr. ~~Richard~~ B. Cohn (*Path.* 1933 and *E.S.* 1936), Stanford Medical Center, Palo Alto, Calif.
Dr. Paul Colokathis (a.r.s. *Or.* 1954), 146 Tarrytown Rd., Manchester, N. H.
Dr. Grant E. Colpitts (r.p. *Path.* 1952), St. Luke's Hospital, Duluth, Minn.
Dr. John B. Colquhoun (*Or.* 1927), 85 Spring St., Melbourne, Australia
Dr. Thomas B. Coolidge (*W.M.* 1929), 947 E. 58th St., Chicago 37, Ill.
Dr. Walter C. Cotter ~~(r.s. N.S. 1957)~~, 274 Benefit St., Providence, R. I.
E. Murray
Dr. Frederick H. Cummer, Jr. (sr. r.p. *Psychiat.* (*McL.*) 1950), Boston City Hospital, Boston, Mass.
Dr. Edward M. Daniels (assoc. psychiat. (*McL.*)), 26 Lyman Rd., Chestnut Hill 67, Mass.
Dr. Hadassah S. Daniels (a. attend. psychiat. (*McL.*)), 26 Lyman Rd., Chestnut Hill 67, Mass.
Dr. Jane E. Denton (*M.* 1946), Main St., Hopkinton, Mass.
Dr. Herman DeWilde (clin. assoc. *Dn.*), 403 Commonwealth Ave., Boston 15, Mass.
Dr. G. Richard Dickersin (a.r.p. *Path.* 1957), Brockton Hospital, Brockton, Mass.
Dr. Victor M. Dillon (*Or.* 1932), 2166 Hayes St., San Francisco 17, Calif.
Dr. Kenneth L. Dole (*E.S.* 1917), Cedar Point, Mackinac Island, Mich.
Dr. James H. Donald (*M.* 1947), Burns Bldg., Colorado Springs, Colo.
Dr. Truman G. Drake (a.r.p. 1937), 114 N. Taylor Ave., St. Louis 8, Mo.
Dr. J. Charles Drooker (s. *Otolar.*), 285 Commonwealth Ave., Boston 15, Mass.

Dr. Raymond J. Duffy (r.p. *Psychiat.* (*McL.*) 1935), Methodist Bldg., Wheeling, W. Va.
Dr. John W. Dulin (*Path.* 1933), Dey Bldg., Iowa City, Iowa
Dr. Edwin R. Durno (*E.S.* 1929), House of Representatives Office Bldg., Washington, D. C.
Dr. John H. Dwyer (a.r.p. *C.M.* 1956 and r.p. *Psychiat.* (*McL.*) 1958), Western Psychiatric Institute and Clinic, 3811 O'Hara St., Pittsburgh 13, Pa.
Dr. Henry W. Edmonds (r.p. *Path.* 1942), 110 Irving St., N.W., Washington 10, D. C.
Dr. Norman Egel (*Or.* 1938), 797 Elmwood Ave., Rochester 20, N. Y.
Dr. Frank R. L. Egloff (r.p. *Psychiat.* 1951), 31 Main St., Farmington, Conn.
Dr. Howard L. Elliot (r.p. *An.* 1942), Chestnut Hill, Harlan, Ky.
Dr. Joseph D. Enterline (*E.S.* 1943), Kings View Hospital, Reedley, Calif.
Dr. Frank R. Ervin (assoc. psychiat.), Massachusetts General Hospital, Boston 14, Mass.
Dr. John O. Esslinger (a.r.s. *Or.* 1952), 622 N. Woodward Ave., Birmingham, Mich.
Dr. Henry C. Everett, III (a.r.p. *Psychiat.* 1958), Johns Hopkins Hospital, Baltimore 5, Md.
Dr. Edward G. Ewer (*Or.* 1936), 419 30th St., Oakland 9, Calif.
Dr. Robert Fienberg (clin. assoc. *Path.*), Beverly Hospital, Beverly, Mass.
Dr. Francis M. Findlay (*E.S.* 1924), San Manuel Hospital, San Manuel, Ariz.
Dr. John T. Finkenstaedt (*M.* 1947), Cornell University Medical College, 1300 York Ave., New York 21, N. Y.
Dr. Harlan I. Firminger (sr. r.p. *Path.* 1947), University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore 1, Md.
Dr. E. Halsell Fite (*E.S.* 1926), Memorial Medical Bldg., 443 N. 16th St., Muskogee, Okla.
Dr. James A. Flagg (a.r.p. *An.* 1955), Bridgeport Hospital, Grant St., Bridgeport, Conn.
Dr. Clayton W. Fortune (*Or.* 1930), 626 James Place, Erie, Pa.
Dr. Dwight M. Fowler (*E.S.* 1946), Cove St., Duxbury, Mass.
Dr. Lewis Francis (a.r.p. *An.* 1950), 3022 Breckenwood Drive, Lexington, Ky.
Dr. Henry S. Fuller (*W.M.* 1943), Walter Reed Army Institute of Research, Washington 12, D. C.
Dr. Robert E. Funsch (a.r.s. *Or.* 1951), 950 Francis Place, Clayton 5, Mo.; 508 N. Grand Ave., St. Louis, Mo.
Dr. Henry B. Garrigues (*W.S.* 1939), 1301 Columbia St., Seattle 4, Wash.
Dr. Leo E. Gibson (r.s. *U.* 1926), 831 James St., Syracuse, N. Y.
Dr. Ross Golden, (h.p. *R.* 1921), University of California at Los Angeles Medical Center, Los Angeles 24, Calif.
Dr. Charles P. Graham (*E.S.* 1935 and *N.S.* 1936), 304 N. 11th St., Wilmington, N. C.
Dr. George J. M. Grant (r.p. *D.* 1932), 9 Central St., Lowell, Mass.
Dr. Ashton Graybiel (*E.M.* 1932), U.S. Naval Aviation Medical Center, Pensacola, Fla.
Dr. D. Crosby Greene (*C.M.* 1940), Washington County Health Dept., 1302 Pennsylvania Ave., Hagerstown, Md.
Dr. Nicholas M. Greene (a.r.p. *An.* 1951), Grace-New Haven Community Hospital, New Haven, Conn.
Dr. Richard W. Greene (*M.* 1945), 32 Johnson Ave., Newark, N. J.
Dr. James Greenough (*W.S.* 1920), 400 Main St., Oneonta, N. Y.
Dr. Robert A. Gregory (r.p. *N.* 1933), Provincial Hospital, Lancaster, New Brunswick, Canada
Dr. Samuel S. Hanflig (*Or.* 1931), 45 Pinehurst Rd., Belmont 78, Mass.
Dr. Richard B. Harvey (*M.* 1946), 251 Edwards St., New Haven, Conn.
George Hauser, Ph.D. (assoc. biochem. (*McL.*)), McLean Hospital, Belmont 79, Mass.
Dr. John W. Hayden (a.r.s. *Or.* 1955), Gundersen Clinic, 1836 South Ave., La Crosse, Wis.

Such wide and excellent coverage by the communications media—radio, television, magazines, and the press—was given to the Convocation ceremonies, which inaugurated the celebration of the 150th Anniversary of the Massachusetts General Hospital, that any further remarks here would add nothing. We do feel, however, that our readers would be interested in having for their permanent files the following pertinent data, as received from the office of the 150th Anniversary. concerning the individuals, hospitals, and institutions which were honored by or participated in the Convocation:

Fifteen of the world's outstanding hospitals and medical institutions, 15 outstanding doctors who received their early training at the Massachusetts General Hospital, 9 outstanding graduates of the MGH School of Nursing, and 3 outstanding members of the Social Service Department were honored by the Hospital during the Convocation. The institutions were selected because they are linked with the M.G.H. through their historical background or because of other considerations of a common purpose. The doctors were nominated by secret ballot from among the 2200 members of the MGH House Pupils Association, an organization made up of former interns and residents. The nurses were chosen by secret ballot of the members of the MGH Nurses' Alumnae Association, and the Social Service recipients were chosen by the Social Service Department.

Each of the recipients received a citation and a commemorative medal. The medal which was struck to commemorate the 150th Anniversary of the Hospital, shows on the obverse the profiles of the two founders of the Hospital—Dr. John Collins Warren and Dr. James Jackson. Just above their heads is a small clutch of poppies to symbolize the Hospital's first great contribution to medicine: the public demonstration of surgical anesthesia. On the reverse, the portico of the Bulfinch Building is shown. This view is recognized all over the world as the symbol of the Massachusetts General Hospital. The sculptor is Eberhardt Luttner, a young German artist who, although only 33 years of age, has made numerous distinguished bas-reliefs: Pope Pius XII and Pope John XXIII, Chancellor Adenauer, and many others. He has also executed a heroic-sized Madonna, which stands high above Maximilianstrasse in Munich.

The following hospitals and medical institutions were honored during the Anniversary Banquet at the Sheraton-Plaza Hotel:

Karolinska Institute of Stockholm—a great medical center which last year observed its 150th anniversary, was represented by Dr. Harry Boström, Head of the Department of Metabolic Research of the Wenner-Gren Institute for Experimental Biology at the University of Stockholm and Assistant Professor in Medicine at the Serafimer Hospital of Karolinska Institute. Dr. Boström participated in a scientific symposium on "Connective tissue and certain of its diseases" during the Convocation.

The All-India Institute of Medical Sciences in New Delhi—a significant achievement in India's medical progress, was represented by the Rajkumari Amrit Kaur, its President and founder and India's former Minister of Health. The Rajkumari participated in a symposium on "International health".

Allgemeines Krankenhaus of Vienna—the hospital at which Dr. James C. White studied in 1856, returning to become the first dermatologist at the M.G.H. and in America, was represented by Professor Dr. J. Tappeiner, its Director.

Guy's Hospital in London—honored as the prototype of the modern voluntary hospital and as the institution where Drs. James Jackson and John Collins Warren, co-founders of the M.G.H., studied under Sir Astley Cooper.

La Pitié of Paris—recognized as one of the great hospitals of Europe, where Dr. Jackson and other young members of M.G.H.'s first staff came under the influence of Dr. Pierre Charles Alexandre Louis.

Ospedale Maggiore di Milano, Italy—cited as the oldest voluntary philanthropic hospital in the world which is still in operation more than 500 years after its founding.

L'Hotel-Dieu de Quebec of Quebec—the first hospital in America, founded in 1638, was represented at the Convocation by Dr. Louis-Napoleon Larochelle, President of its Medical Bureau.

The Montreal General Hospital, the "M.G.H. of Canada"—represented by David A. Wanklyn, its President.

The two hospitals in the United States that are older than the Massachusetts General—Pennsylvania Hospital in Philadelphia, founded by Benjamin Franklin in 1751, and The Society of the New York Hospital, founded in 1771, represented by their respective Presidents, T. Truxton Hare, Jr. and Frederick K. Trask, Jr.

The Rockefeller Institute and Hospital in New York—honored for its contributions to and support of medical research, represented by its President, Dr. Detlev W. Bronk.

The Johns Hopkins Hospital, Baltimore—which raised teaching hospitals to the status of university graduate schools, represented by Walter F. Perkins, President.

The Yale University School of Medicine, New Haven—also celebrating its 150th anniversary this year, represented by Dr. Vernon W. Lippard, Dean.

The Boston Dispensary—founded in 1796 as the first organized effort to meet the needs of the sick poor in Boston, represented by Augustin H. Parker, Jr., President.

The Touro Infirmary, New Orleans—a salute to the memory of the Touro brothers, Abraham of Boston and Judah of New Orleans, who left major legacies to the M.G.H. and Touro Infirmary more than a century ago.

The citations and commemorative medals were presented to the 15 doctors at a luncheon in the Sheraton-Plaza, presided over by Dr. Nathan M. Pusey, President of Harvard University. The awards were given by Dr. James M. Faulkner, President of the MGH House Pupils Association and Acting Director of the Boston University-Massachusetts Memorial Hospitals Medical Center. The names of the recipients and their citations follow:

Dr. Fuller Albright (*W.M.* 1926), whose citation was accepted by his wife because of his illness—former Associate Professor of Medicine at Harvard Medical School, member of the Board of Consultation at the M.G.H. Dr. Albright, a highly original investigator in the field of endocrinology, attracted a group of brilliant medical scientists to work with him at the M.G.H. and discovered several endocrine disorders in the course of his researches. A graduate of Harvard College and Harvard Medical School, he is 61 and lives in Brookline.

A bold explorer and a keen observer, he took delight in opening new horizons to our vision.

Dr. Henry Knowles Beecher (*W.S.* 1934)—Henry I. Dorr Professor of Research in Anesthesia at Harvard Medical School and Director of Anesthesia and the Anesthesia Laboratory at the M.G.H. He was the first anesthetist, 25 years ago, to found a laboratory solely for research in anesthesia and related problems. Dr. Beecher has been a leader in demonstrating that the effects of drugs on the mind can be scientifically studied and measured. He has made original contributions to the investigation of pain and the effects on it of drugs. He is 56 and was educated at the University of Kansas and Harvard Medical School. Dr. Beecher lives in Canton.

His career has been a calculated campaign against pain, in which he has taken measure of the enemy forces and by dividing them has conquered.

Dr. Edward Delos Churchill (*W.S.* 1922)—John Homans Professor of Surgery at Harvard Medical School and Chief of the General Surgical Services at the M.G.H. He has made pioneering contributions to chest surgery, especially in respect to techniques for operating on the lungs and parathyroid glands. During World War II he was Consulting Surgeon to the North African and Mediterranean Theaters of Operations and led the way to new advances in military medicine. Dr. Churchill was educated at Northwestern University and Harvard Medical School. He is 65 and lives in Belmont.

A man of many talents, his contributions to thoracic surgery, to the education of young surgeons, and to military medicine have earned him the gratitude of a nation.

Dr. Frederick Amasa Coller (*W.S.* 1914)—Professor of Surgery, Emeritus, and Chairman, Emeritus, of the Department of Surgery at the University of Michigan. A great teacher and practising surgeon, Dr. Coller was educated at South Dakota State Teachers College and Harvard Medical School. He is 73 and lives in Ann Arbor, Michigan. He was not able to be present because of illness.

A surgeon's surgeon, beloved and respected by colleagues, students, and patients, from coast to coast.

Dr. Joseph Garland (*C.M.* 1919 and *E.M.* 1921)—Editor of the *New England Journal of Medicine,* member of the Board of Consultation of the M.G.H. A former Instructor in Pediatrics at Harvard Medical School, Dr. Garland practised pediatrics from 1922 until 1948. He is 68 and was educated at Harvard College and Harvard Medical School. He lives in Brookline.

Physician, author, editor, wit, and sage. He has placed the mortar of literacy between the stones of science and made the *New England Journal of Medicine* the conscience of our profession.

Dr. Rodolfo Eduardo Herrera (*E.S.* 1943)—Chief Surgeon and Director of Centro Medico and Clinical Professor of Surgery at the San Carlos University of Guatemala, Guatemala City, Guatemala. Dr. Herrera is the founder of Guatemala's medical center and a leader in the development of modern medicine in his country. He is a graduate of the University of Paris and Massachusetts Institute of Technology. He received medical degrees from Harvard Medical School and the San Carlos University of Guatemala. He is 45 and lives in Guatemala City.

A surgeon with the skill to transplant a graft of the M.G.H. to Guatemala City, with a highly successful result.

Dr. Chester Morse Jones (*E.M.* 1919)—Clinical Professor of Medicine, Emeritus, at Harvard Medical School and a member of the Board of Consultation at the M.G.H. President-elect of the American College of Physicians, Dr. Jones has for forty years been a leader in the investigation and treatment of diseases of the gastrointestinal tract. He is 69 and was educated at Williams College and Harvard Medical School. His home is in Newton.

Indomitable explorer of dark and devious passageways, his researches have illuminated a complex field and inspired a generation of followers.

Dr. Robert Ritchie Linton (*W.S.* 1928)—Assistant Clinical Professor of Surgery at Harvard Medical School and a member of the Board of Consultation at the M.G.H. Widely known for his contributions to the surgical treatment of diseases of the blood vessels, Dr. Linton was educated at the University of Washington and Harvard Medical School. He is 60 and lives in West Newton.

With the resourcefulness of a pioneer, he has blazed incredible new trails in vascular surgery.

Dr. James Howard Means (*E.M.* 1913)—Honorary Physician at the M.G.H., Jackson Professor of Clinical Medicine, Emeritus, at Harvard Medical School, and former Chief of the Medical Services at the M.G.H. Dr. Means established the metabolic research Ward 4 at the M.G.H. and was a pioneer in the field of endocrinology. Known for his forthright opinions in the area of medical economics, Dr. Means was educated at Harvard College and Harvard Medical School. He is 75 and lives in Boston.

A truly complete physician, as deft with the brush as with the pen, he coupled the science of physics to the art of physick.

Dr. Joe Vincent Meigs (*E.S.* 1921)—Clinical Professor of Gynecology, Emeritus, at Harvard Medical School, former Chief of the Vincent Memorial Hospital at the M.G.H., Consulting Visiting Gynecologist at the Vincent, and Consulting Visiting Surgeon at the M.G.H. For many years the name of Dr. Meigs and that of the Vincent Memorial have been synonymous, and he is one of the country's leading gynecologists. A graduate of Princeton University and Harvard Medical School, he is 68 and lives in Boston.

His skill as a surgeon, his talent as a teacher, and his integrity as an investigator have made him famed among men and blessed among women.

Dr. Francis Daniels Moore (*W.S.* 1940)—Moseley Professor of Surgery at Harvard Medical School and Surgeon-in-Chief at the Peter Bent Brigham Hospital, Boston. A brilliant operator and investigator, Dr. Moore has specialized in gastrointestinal surgery, tissue transplantation, and the metabolic aspects of surgical care. Educated at Harvard College and Harvard Medical School, he is 47 and lives in Brookline.

A versatile surgeon, as skillful with the spectrophotometer as with the scalpel. He has taught us how to reduce the biochemical dislocations of the postoperative state.

Dr. Walter Gray Phippen (*S.S.* 1906)—President, Emeritus, of the Staff and former Chief of the Surgical Service at the Salem Hospital. A past President of the Massachusetts Medical Society, Dr. Phippen is a respected leader in his profession who has been responsible by precept for raising the standards of community hospitals generally. Educated at Harvard College and Harvard Medical School, he is 84 and lives in Salem.

Surgeon, medical statesman, citizen. He has made the Salem Hospital a model for community hospitals throughout the nation.

Dr. Joseph Stokes, Jr. (*W.M.* 1921)—Professor of Pediatrics at the University of Pennsylvania School of Medicine and Physician-in-Chief at the Children's Hospital in Philadelphia. Dr. Stokes discovered the value of gamma globulin for the prevention of epidemic hepatitis during World War II and has led research in immunization against influenza, polio, mumps, and measles. He is 64 and was educated at Haverford College and the University of Pennsylvania School of Medicine.

His courage and skill in attacking and solving the immediate and baffling problem of hepatitis during the war helped bring victory to our cause and lasting benefits to all mankind.

No. 95 in a series of Staff photographs
Frederick T. Hatch, M.D., Ph.D., Assistant Physician—Chief of the Arteriosclerosis Unit

Dr. Paul Dudley White (*C.M.* 1911 and *W.M.* 1913)—Honorary Physician at the M.G.H. and former Clinical Professor of Medicine at Harvard Medical School. Dr. White, who began his career fifty years ago, on the Hundredth Anniversary of the M.G.H., actively continues a life devoted to the investigation and treatment of heart disease that has brought him international fame. He is 74, a graduate of Harvard College and Harvard Medical School, and he lives in Belmont.

The world is his clinic and the seas his laboratory. His name brings forth praise among great men and terror among great whales.

Dr. Robert Frederick Loeb (*W.M.* 1920)—Bard Professor of Medicine, Emeritus, at Columbia University and Consultant to the Presbyterian Hospital in New York. Dr. Loeb is a Trustee of the Rockefeller Institute and was a member of President Eisenhower's Science Advisory Committee. He is also a member of the Scientific Advisory Committee of the M.G.H. A graduate of the University of Michigan and Harvard Medical School, Dr. Loeb is 65 and lives in New York City.

One of the great teachers of his generation, he has exemplified the role which the exact sciences should play in the education of the modern physician.

Dr. Loeb, the final recipient, gave a short speech, in which he expressed the appreciation of all the doctors who had been cited by the MGH House Pupils Association.

The citations and commemorative medals were presented to the 9 outstanding graduates of the MGH School of Nursing at a banquet in the Hotel Somerset. The awards were given by Mrs. Madalene F. Calogiro, President of MGH Nurses' Alumnae Association, to the following:

Marie Scherer Andrews, Professor of Nursing Education and Chairman of the Department of Nursing, Graduate School, Boston College. Mrs. Andrews is President of the Massachusetts Nurses Association, Civilian Consultant to the United States Navy, and a member of the Watertown Board of Health.

Adele L. Corkum, Assistant Director of Nursing Service in the Baker Memorial of the M.G.H., a Director of the Alumnae Association, and a member of the fund-raising committee of the Boston University School of Nursing.

Katharine E. Faville, Dean of the Wayne State University College of Nursing, Detroit. Miss Faville is a Consultant to the Veterans Administration, a member of the Public Health Research Study Section of the Department of Health, Education, and Welfare, and a Director of the Michigan League for Nursing.

Edna S. Lepper, Associate Director of the MGH Nursing Service and Assistant Professor of Nursing on the Clinical Faculty at Boston University. Miss Lepper is Chairman of the National League for the Nursing Advisory Committee to Federal Nursing Services, and a member of the Board of Governors of the Human Relations Center at Boston University.

R. Louise Metcalf McManus, Director of the Division of Nursing Education at Columbia University Teachers College and of its Institute of Research and Services in Nursing Education. She is also Consultant to the Department of Nursing at Walter Reed Army Institute of Research in Washington.

Margaret G. Reilly teaches at the Boston College School of Nursing and at St. Joseph's College in Framingham. Miss Reilly is Chairman of the Old Colony Health Association's Committee on Education.

Ruth Sleeper, Director of the M.G.H.'s School of Nursing and Nursing Service. Recipient in 1959 of the Florence Nightingale Medal and a past President of the National League for Nursing, Miss Sleeper is Chairman of the Education Committee of the International Council of Nurses, a member of the Expert Committee on Nursing of the World Health Organization, and Honorary Civilian Consultant to the Surgeon General of the Navy.

Ellwynne M. Vreeland, Nurse Director of the Commissioned Corps of the United States Public Health Service, and Chief of the Research Grants and Fellowship Branch of the Division of Nursing of USPHS. She is Chairman of the Program Committee of the New York League for Nursing Education.

Helen Wood, Director of the Simmons College School of Nursing until her retirement in 1946. Miss Wood is a past President of the New York League of Nursing Education, and a former member of the Executive Board of the National League of Nursing Education.

The citations and commemorative medals were presented to the 3 outstanding members of the Social Service Department at a Reunion Dinner of the Department, given at the Boston Club. The awards were given to Miss Josephine C. Barbour, Chief of Social Service at M.G.H., Miss Harriett M. Bartlett, formerly of the Department and of Simmons College School of Social Work, and posthumously to Miss Ida M. Cannon.

* * *

The bronze medal, commemorating the 150th Anniversary of the Massachusetts General Hospital, may be purchased at the General Store. The price of the medal is $5.00. They make very handsome paperweights.

The News

No. 203 Boston, Mass. April 1961

CURRENT STATUS OF LEFT HEART CATHETERIZATION WITH SPECIAL REFERENCE TO MITRAL REGURGITATION

When recently requested by the editor of The News to review the current status of heart catheterization, I pondered as to the most effective approach to a very broad field. I concluded that this subject could be handled best from the viewpoint of my own special interests in this field. This point of view is, of course, a synthesis of my experience and clinical research in the laboratory of Dr. David Littmann at the West Roxbury Veterans Administration Hospital, at the cardiac laboratory at the Massachusetts General Hospital under Dr. Gordon Myers, Dr. Allan Friedlich, and Dr. Gordon Scannell, and presently in my own laboratory at the Memorial Hospital, Worcester, Massachusetts.

Cardiac catheterization by definition signifies the passage of a hollow tube into the heart. This was first accomplished by Forssman in 1927, but the practical applications awaited the work of Cournand in 1941. His work was amplified by others, leading to precision in the diagnosis of complex congenital anomalies of the heart, as well as some of the varieties of acquired heart disease, such as cor pulmonale and rheumatic heart disease.

These studies were based on *right* heart catheterization, which, fortunately for this new field, was quite safe and free of complications. A radio-opaque woven catheter was introduced through a peripheral vein, and under fluoroscopic control was maneuvered through the right atrium, into the right ventricle, and out into the pulmonary artery. Blood samples for oxygen content, and pressures, were obtained in the various sites. It was discovered that if the catheter was advanced out into a distal branch of the pulmonary artery so as to completely occlude the forward flow of blood through this segment, then the mean pressure fell 5 to 10 mm Hg. If the catheter was then withdrawn, it "snapped back" into the main pulmonary artery. The pressure pulse so recorded in the distal occluded pulmonary artery branch was considered to represent the pressure in the pulmonary capillaries, and was later shown to be equivalent to simultaneously measured left atrial pressure. This distal position was named the pulmonary artery wedge or pulmonary capillary ("PC") position. Left atrial pressure is, of course, an important parameter of left ventricular and mitral valve function. Thus, an important measure of left heart function could be estimated by the simple and safe technique of *right* heart catheterization.

In the early 1950's mitral valvulotomy for mitral stenosis became a practicable and safe procedure. Therefore the hydraulic formulae for the prediction of the area of the stenotic valve, introduced by Gorlin and Gorlin in 1951, were an important advance. The valve area was estimated simply by dividing the mitral valve flow rate by the product of a constant times the square root of the mitral gradient. This gradient was the pressure difference between the left atrium and left ventricle. The "PC" pressure was used as equivalent to left atrial pressure, and the left ventricular mean pressure was approximated at 5 mm Hg. In most cases, predicted valve area was equivalent to the surgeon's estimation at operation, so the above simple application of *right* heart catheterization provided important assistance in the selection of patients for mitral valvulotomy.

However, in time it became clear that in certain instances the calculations fell short, and the predicted critically narrowed valve (less than 1.0 to 1.2 cm^2) was not found to be significantly narrowed at surgery; actually, the lesion was predominant mitral regurgitation rather than stenosis. On re-examining the valve formulae several assumptions were questioned. First, was the "PC" equivalent to left atrial mean pressure? Yes, if rigid criteria defining the "PC" position were adhered to. Was the assumption that left ventricular diastolic mean pressure was equivalent to 5 mm Hg a valid one? Not infrequently this assumption was not correct. Thus, if left ventricular failure was present, then the diastolic mean pressure could be elevated to, say, 15 mm Hg. Lacking stenosis of the mitral valve, left atrial and "PC" would also approximate 15 mm Hg. As a result, a gradient of 10 mm Hg would be assumed when actually there was none; and a reduced mitral valve would be calculated in the absence of stenosis.

Procedures for the exact measurement of left ventricular pressure were developed to obviate the latter difficulty. These included transthoracic puncture of the left atrium, transbronchial puncture of the left atrium, and direct transthoracic puncture of the left ventricle. Most commonly the Bjork procedure was utilized: the left atrium was punctured by a long needle introduced from the right posterior thorax. Through this thin-wall needle a fine polyethylene catheter was advanced into the left atrial cavity; after a period of exploration, the catheter was usually advanced across the mitral valve orifice into the left ventricle. After recording pressure pulses in the left ventricle, the catheter was pulled back into the left atrium. Thus, the pressure difference across the mitral valve was directly measured, obviating the previous assumption. Furthermore, simultaneous left ventricular and systemic artery pressure recordings could be obtained, providing information as to aortic valve function. In aortic stenosis the left ventricular systolic mean pressure was significantly higher than that of a systemic artery, the brachial or femoral, and from calculations similar to those in mitral stenosis, the stenotic valve orifice was estimated.

Direct measurement of the mitral valve gradient did improve the results, but could not remove the assumption as to mitral valve flow. Mitral valve flow is based on the systemic cardiac output. This represents total effective *forward* flow from the heart. But with mitral regurgitation, mitral valve flow is greater than systemic flow. For example, if the cardiac output is calculated at 4 liters per minute, and if the mitral valve is sufficiently incompetent, so that, with ventricular systole, equivalent volumes are ejected out of the aortic valve and regurgitated back into the left atrium, then the mitral valve flow will be 8 liters per minute. As outlined above, valve area is directly proportional to valve flow. If actual flow is double the calculated flow, then the true valve area will be double the calculated one. In other words, the calculated area will be falsely smaller than the true area in mitral regurgitation. In the presence of severe regurgitation, an area calculated to be critically narrowed down to 1.0 cm^2 might at operation be found to be insignificantly reduced to from 2.0 cm^2 to 3.0 cm^2. Various interpretations of left atrial pressure pulses, as the rate of fall of the "V" wave, were introduced in order to estimate the presence and degree of regurgitation. The down slope and qualitative characteristics of indicator dilution curves were studied for the same purpose. But these and other techniques were not found to be sufficiently reliable.

Meanwhile, in the fall of 1958, I had returned from my two-year tour with the Air Force to Dr. Littmann's cardiac residency. At this time, Dr. Littmann was pursuing the study of coronary artery disease — perhaps his chief interest in medicine. He was working out a simplified technique of coronary arteriography. His method was an adaptation of the Seldinger procedure of percutaneous arterial catheterization. The method involved percutaneous cannulation of the femoral artery, introduction of a flexible-tipped wire guide through the cannula and into the lumen of the artery, removal of the cannula, and the threading of a special loop-end polyethylene catheter over the guide. When the catheter reached the skin, the catheter and guide were together advanced, so that the catheter was introduced into the arterial lumen. Then the wire guide was withdrawn until the flexible tip and the catheter tip were approximated. Under fluoroscopic control they were advanced up the aorta, over the arch, to a position just above the aortic valve. The wire guide was removed. Arteriography could then be performed by hand-injection of contrast material and the exposure of a rapid sequence of X-ray films.

One day during the spring of 1959, we had just reached the supravalvular position during a planned coronary arteriogram, when we suddenly noted that the diastolic pressure was unusually low. On examination of the pressure curve, it was clear that the catheter had passed the aortic valve leaflets in retrograde fashion and had entered the *left* ventricular cavity. The catheter was gradually withdrawn to the supravalvular aorta, with instantaneous rise in the diastolic pressure. With gradual readvancement of the catheter, left ventricular pressures were again obtained. The special loop-end, which had been designed to deliver contrast material evenly to the coronary sinuses, also facilitated traversing the aortic valve leaflets. Careful follow-up of this patient revealed no evidence of aortic valve damage or any untoward effect.

In the following weeks, left ventricular catheterization by the retrograde technique was attempted on all patients studied by coronary arteriography. Catheterization with rare exception was easily accomplished and well tolerated. The exception was the patient with tight aortic stenosis; we were not able to traverse the small deformed orifice with the relatively large-diameter catheter. Retrograde catheterization was combined with conventional *right* heart catheterization in patients with mitral stenosis. "PC" and left ventricular pressures were simultaneously recorded, their difference in diastole constituting the mitral gradient. Subsequent surgery corroborated the valve areas calculated from data obtained by this combined technique.

We had been aware of Lehman's 1957 report regarding left ventriculography as a method of demonstrating mitral regurgitation. This awareness was punctuated by his delivery of a lecture on this subject at the Peter Bent Brigham Hospital. His technique employed transthoracic needle puncture of the left ventricle, and pressure injection of contrast material into the cavity of the left ventricle. In mitral regurgitation, contrast material mixed with blood was regurgitated into the left atrium, resulting in left atrial opacification.

The value of left ventriculography was clear-cut, but the hazard of the approach, including cardiac tamponade and intramyocardial injection of contrast material, did not seem acceptable to us. At the next opportunity, retrograde left ventricular catheterization was performed, 30 to 40 ml of contrast material was hand-injected into the left ventricular cavity, and serial X-ray exposures made. Our expectations were satisfied, since the left ventricular cavity was well opacified and the procedure was well tolerated. In subsequent weeks we were able to study several patients with known mitral regurgitation, and at ventriculography the left atrium was densely opacified. The degree of opacification seemed to parallel the severity of regurgitation.

In July of 1959, I moved back to the Massachusetts General as cardiac resident. My interest in the problem of the diagnosis and quantitation of mitral regurgitation was equally shared by Dr. Charles A. Sanders and Dr. John D. Turner. We were fortunate in having the support of the entire Cardiac Unit, the encouragement and assistance of Dr. Stanley M. Wyman, and Mr. Oliver E. Merrill's technical competence in coaxing cooperation from the elegant but fussy Elema biplane radiographic apparatus. The net result was the production of more esthetically pleasing and sharply diagnostic angiocardiograms.

We found that the clinical problem of diagnosing and assessing mitral regurgitation was a remarkably frequent one. The detection of significant regurgitation accompanying stenosis of the mitral valve was not an esoteric problem. Dr. Scannell's "open heart" surgery program was operative, and if significant regurgitation was present, then an "open" rather than a customary closed valvulotomy was indicated. By the end of the fiscal year, we had accomplished some 25 such retrograde studies. In all of the operated cases, the surgeon's estimation of the degree of regurgitation was in agreement with Dr. Wyman's interpretation of the left ventriculograms. In one-third of these cases, the retrograde study was paramount in arriving at the correct diagnosis and pointing to the correct surgical approach.

Knowledge of the presence and severity of regurgitation improved the usefulness of the hydraulic valve formulae. When angiography excluded significant regurgitation, then the predicted mitral valve areas were in agreement with the surgeon's estimation of valve size. In some patients with a loud basal systolic murmur, successful retrograde catheterization of the left ventricle and demonstration of an insignificant aortic valve gradient helped to exclude important aortic stenosis. Fortunately, complications were not severe or permanent, and were largely limited to the local site of cannulation.

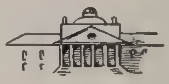
In surveying the diverse field of left heart catheterization, the variety of procedures is striking. Choice of the particular technique depends upon the clinical diagnosis, the patient's medical status, and the proposed therapy. For example, in the uncomplicated case of mitral stenosis without suspected regurgitation, the simple "straight" right heart study, perhaps combined with indicator dilution curves, is quite adequate and reliable. In the case of aortic stenosis, the new transseptal approach to left atrial puncture is the procedure of choice; but if the left atrial catheter fails to enter the left ventricle, then the more hazardous technique of direct transthoracic left ventricular puncture may have to be accepted. When mitral regurgitation is suspected, and aortic valve disease is absent, then retrograde left ventricular catheterization and angiography is the method of choice.

Thus we must conclude, as with all other segments of medicine, that we as physicians must be fully cognizant of all the clinical facets of each patient. Only then can the most appropriate of the variously hazardous diagnostic procedures be selected. And only then can the hemodynamic and angiocardiographic findings be correctly applied. At the same time, these techniques seem to provide valuable information not otherwise available, which is necessary for the decision as to the desirability of surgical intervention, and, if so, the method of correction.

Oscar E. Starobin, M.D.,
Clinical Assistant in Medicine

* * *

Drs. Stanley H. Appel and J. Richard Baringer, two members of our House Staff, received 1st and 2nd prizes in a nation-wide contest sponsored by the journal *Resident Physician.* Questions based upon the general medical literature, over a five-month period, were sent to all the contestants. Answers to twenty questions each month had to be found and submitted.



The Board of Trustees, at their meeting on January 27, voted:

That Ernest L. Dobson, Ph.D., Physiologist in Donner Laboratory and Lecturer in Pathology, University of California, Berkeley, California, be asked to give a Richardson Lecture at the Hospital on April 6.

To appoint:

Dr. Maureen K. Molloy as Assistant Resident in Orthopedic Surgery for one year, beginning April 1;

Dr. David C. Poskanzer as Clinical Assistant in Neurology, effective as of January 15;

Dr. Henry D. Wilde, Jr. as Assistant Resident in Orthopedic Surgery for one year, beginning April 1;

Dr. William E. Wilson as Senior Resident in Orthopedic Surgery, for a period of six months, beginning April 1.

At their meetings on January 18, and February 8, 15, and 21, the General Executive Committee voted:

That Dr. Peter Hacking begin his services as Clinical Fellow in Radiology on February 10 rather than June 1.

To promote:

Dr. Stanley P. Bohrer to the position of First Assistant Resident in Radiology for one year, beginning March 1.

To reappoint:

Dr. William C. Amman as Graduate Student Assistant in Medicine, assigned to Allergy, for one year, beginning January 10;

Dr. J. Paul Binette as Research Fellow in

Medicine, retroactive to November 1, 1960;
- Lorna J. Langer Gilmore, Ph.D. as Research Fellow in Biochemistry, in the Department of Pathology, for one year, retroactive to October 1, 1960;
- Murray V. King, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning January 1;
- Dr. Jan Koch-Weser as Clinical Fellow in Medicine for one year, beginning January 1;
- Dr. Hans B. Nevinny-Stickel as Clinical Fellow in Medicine for one year, retroactive to July 1, 1960;
- Annette M. C. Rapin, Ph.D. as Research Fellow in Medicine for one year, beginning February 1;
- Dorothy K. Stearns, Ph.D. as Research Fellow in Medicine for one year, beginning January 23;
- Dr. Hubert J. Wolfe as Clinical and Research Fellow and Acting Assistant Resident in Pathology for one year, beginning July 1.

To appoint:

- Arthur B. Callahan, Ph.D. as Research Fellow in Physics (Medicine) for one year, beginning March 1;
- Dr. David Flores (Perez) as Graduate Student Assistant in Orthopedic Surgery, for a period of three months, beginning January 3;
- Anund A. Hallén, M.K. as Research Fellow in Biochemistry (Medicine) for one year, beginning March 1;
- Dr. Alan C. Markland as Senior Assistant Resident in Urology, effective as of January 1;
- Dr. Mei Satake as Research Fellow in Medicine for one year, beginning September 1;
- Dr. Katuhiko Tokita as Research Fellow in Medicine for one year, beginning September 1.

MASSACHUSETTS EYE & EAR INFIRMARY

At their meetings held on November 28 and December 21, 1960, the Executive Committee of the Board of Managers of the Massachusetts Eye and Ear Infirmary voted to reappoint:

- Dr. James G. Dobbie — Fellow in Ophthalmology, attached to the Retina Service;
- Dr. Claes-Henrik Dohlman — Fellow in Ophthalmology, attached to the Retina Service;
- Dr. Benjamin Ziv — Fellow in Ophthalmology, as Director of the Electroretinography Laboratory.

To appoint:

- Dr. Lloyd M. Aiello — Resident in Ophthalmology, beginning July 1, 1962;
- Dr. Klaus F. Beyer — Resident in Ophthalmology, beginning April 1, 1962;
- Dr. Ernest H. Christman — Resident in Ophthalmology, beginning October 1, 1962;
- Dr. Allan G. Edwards, Jr. — Resident in Otolaryngology, beginning July 1;
- Dr. Simmons Lessell — Resident in Ophthalmology, beginning October 1, 1963;
- Dr. Saiichi Mishima — Fellow in Ophthalmology, to work with Dr. Sweebe on corneal transparency, beginning October 1, 1960;
- Dr. Anthony B. Nesburn — Resident in Ophthalmology, beginning January 1, 1962;
- Dr. Richard M. Robb — Resident in Ophthalmology, beginning October 1, 1962;
- Dr. Anwar Shah — Fellow in Ophthalmology, attached to the Retina Service, for one year, beginning January 1.

At the Annual Meeting of the Board of Managers of the Massachusetts Eye and Ear Infirmary, held on December 14, 1960, the appointment of Dr. Philip E. Meltzer was changed from Acting Chief of Otolaryngology to Chief of Otolaryngology for the remainder of his period of service.

At the meetings of the Executive Committee of the Board of Managers of the Massachusetts Eye and Ear Infirmary, held in November and on January 16 and February 27, the following appointments were made:

- Dr. Frank W. Brady—Assistant in Otolaryngology;
- Dr. Margaret Daly—Fellow in Anesthesiology;
- Dr. Raniero DiPiero—reappointed Fellow in Anesthesiology;
- Dr. Kamil Ergin—reappointed Fellow in Anesthesiology until July 1;
- Dr. John R. Gehring—Assistant in Ophthalmology;
- Dr. Fred Gottlieb—Fellow in Ophthalmology, assigned to the Retina Service, beginning March 1;
- Dr. Donald G. Keamy—Resident in Otolaryngology—beginning July 1;
- Dr. Roger C. Lindeman—Resident in Otolaryngology, beginning July 1, 1962;
- Dr. Daniel J. Reagan—Assistant in Otolaryngology;
- Klaus D. Scherrer, Ph.D.—Fellow in Otolaryngology, assigned to the Otolaryngological Biochemistry Laboratory, for six months, beginning April 1;
- Dr. William S. Tassman—Fellow in Ophthalmology, assigned to the Retina Service, beginning June 1.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Biochemistry

Parker, C. J., Jr., and Gergely, J.
The role of calcium in the adenosine triphosphatase activity of myofibrils and in the mechanism of the relaxing factor system of muscle.
J. Biol. Chem. 236:411.

Endoscopy

Benedict, E. B., and Nardi, G. L.
Dysphagia and esophageal obstruction.
In Current therapy—1960, p. 230.

General Medicine

Kelley, R. M., and Baker, W. H.
Progestational agents in the treatment of carcinoma of the endometrium.
New England J. Med. 264:216.

Neurosurgery

White, J. C., and Ballantine, H. T., Jr.
Intrasellar aneurysms simulating hypophyseal tumours.
J. Neurosurg. 18:34.

Orthopedic Surgery

Rowe, C. R., and Lowell, J. D.
Prognosis of fractures of the acetabulum.
J. Bone & Joint Surg. 43-A, no. 1:30.

Sakellarides, H.
Pseudarthrosis of the clavicle: A report of twenty cases.
J. Bone & Joint Surg. 43-A, no. 1:130.

Otolaryngology

Pullen, F. W., II, and Montgomery, W. M.
A clinical evaluation of the combination of dexbrompheniramine and d-isoephedrine (Disophrol).
Current Therapeut. Res. 3:51.

Psychiatry

Binger, C.
The pressures on college girls today.
Atlantic Monthly, Feb.:40.

Radiology

Potsaid, M. S.
Medical progress: Kineradiography.
New England J. Med. 264:178 and 232.

VOLUNTEER GROUPS

MGH STAFF WIVES ASSOCIATION

A true sign of spring was the annual Morning Coffee which the Staff Wives Association of the M.G.H. gave on April 4. The Staff Wives group, which includes friends of the General who are not necessarily doctors' wives, sent out invitations to all our visitors from other lands who are at present associated with Boston's "Hospital-on-the-Charles". These doctors and their wives, these nurses, technicians, research chemists, dietitians, these medical and postgraduate students in many fields, come from all over the world. They share with us their knowledge and energy, and receive, in exchange, new knowledge and techniques and fresh energies in this Hospital and in this city where medical pioneering never comes to an end. The April 4 Morning Coffee gathered together, for coffee, cakes, and conversation, visitors and MGH friends and colleagues in the pleasant, informal atmosphere of the Walcott House living room.

One of Boston's most distinguished music groups, the Marlboro Quartette of the Boston Recorder Society, will give a concert in the Chapel on May 10, under the auspices of the Music Committee of the MGH Staff Wives. It should be an interesting concert, as not everyone is as familiar with the recorder (forerunner of the flute, made of wood, and played from one end, like a clarinet) as he is with other musical instruments.

Dr. Stewart Sell, Intern in Pathology—born in Pittsburgh, Pennsylvania, January 20, 1935; B.S., College of William and Mary, Williamsburg, Virginia, 1956; M.D., University of Pittsburgh School of Medicine, 1960; married.

Dr. Leonard B. Shulman, Intern on the Dental Service—born in Boston, Massachusetts, March 29, 1934; graduated from Boston Latin School, 1951; A.B., Harvard College, 1955; D.M.D., Harvard School of Dental Medicine, 1960.

Dr. William B. Stason, Intern in Medicine—born in Ann Arbor, Michigan, August 24, 1931; B.S., University of Michigan, Ann Arbor, 1953; military service: Lieutenant (jg), U.S. Navy, aboard U.S.S. *Valley Forge*, 1953-56; M.D., Harvard Medical School, 1960.

Dr. Samuel O. Thier, Intern in Medicine—born in Brooklyn, N. Y., June 23, 1937; Cornell University, Ithaca, N. Y., 1953-56; M.D., State University of N. Y. College of Medicine, Syracuse, N. Y., 1960; married; one child.

Dr. Jacob C. Wolterbeek, Resident in Psychiatry, McLean Hospital, Belmont, Massachusetts—born in Kimberley, British Columbia, Canada, September 17, 1929; Gymnasium Haganum, The Hague, Holland, 1940; A.B., Hope College, Holland, Michigan, 1950; M.D., Northwestern University Medical School, Chicago, Illinois, 1954; Intern (rotating), Chicago Wesley Memorial Hospital, 1954-55; military service: Eleventh Field Hospital, U.S. Army, Augsburg, Germany, 1955-57, Ob-Gyn Service, Assistant Chief, General Practice, 1957-59.

Dr. Richard J. Wurtman, Intern in Medicine—born in Philadelphia, Pennsylvania, March 9, 1936; A.B., University of Pennsylvania, Philadelphia, 1956; M.D., Harvard Medical School, 1960; married.

New addresses:

Dr. Rodney F. Atsatt (*Or.* 1926), 88 C Thacher Rd., Ojai, Calif.
Dr. Florosa A. Bautista (a.r.p. *C.M.* 1958), Veterans Memorial Hospital, Quezon City, Philippine Islands
Dr. John A. Benson, Jr. (a.*M.* 1959), 3181 S.W. Sam Jackson Park Rd., Portland 1, Oreg.
Dr. Henry J. Carney (a. oral. s.), 403 Commonwealth Ave., Boston 15, Mass.
Dr. Thomas Cavanaugh (assoc. s. *Oph.*), 403 Commonwealth Ave., Boston 15, Mass.
Dr. Frederick A. Coller (*W.S.* 1914), St. Joseph's Mercy Hospital, Ann Arbor, Mich.
Dr. Diane Croll (r.p. *Path.* 1948), Veterans Administration Hospital, Oakland, Calif.
Dr. R. Clement Darling (*C.M.* 1954), 1180 Beacon St., Brookline 46, Mass.
Dr. James H. Duxbury (r.s.*U.* 1960), 624 Fort St., Victoria, British Columbia, Canada
Dr. Gerald M. Edelman (*M.* 1955), Rockefeller Institute for Medical Research, York Ave. and 66th St., New York, N. Y.
Dr. Sidney W. Ellery (*E.S.* 1943), 1090 Atlantic Ave., Long Beach, Calif.
Dr. Harry C.-H. Fang (a.r.p. *Psychiat.* 1952), 1919 7th Ave., South, Birmingham 3, Ala.

Dr. Ira A. Ferguson, Jr. (*S.* 1953), 1364 Clifton Rd., N.E., Atlanta 22, Ga.

Dr. Vassilike A.-C. Forbes (*C.M.* 1956), University of Buffalo School of Medicine, 3435 Main St., Buffalo, N. Y.

Dr. Clarence J. Gamble (*W.M.* 1922), 73 Adams St., Milton 87, Mass.

Dr. Phillip H. Gates (r.p. *Psychiat.* (*McL.*) 1942), 51 Brattle St., Cambridge, Mass.

Dr. Elvira Goettsch (*C.M.* 1931), University of Hawaii, Honolulu 14, Hawaii

Dr. Arnold M. Gordon (*C.M.* 1929), 4406 Greenwood Drive, Des Moines 12, Iowa

Dr. Hugh P. Greeley (*W.M.* 1910), 1901 Monroe St., Madison 5, Wis.

Dr. Frederick A. H. Greenwood (a.r.s. *Or.* 1959), Montreal General Hospital, Montreal, Canada

Dr. John B. Griggs (*C.M.* 1929), Breezy Hill Rd., Canton, R.F.D., Collinsville, Conn.

Dr. Walter C. Guralnick (a. oral s.), 328 Washington St., Wellesley Hills, Mass.; 29 Commonwealth Ave., Boston, Mass.

Dr. Howard B. Hamilton (*C.M.* 1945), 764 S. Emerson Ave., Indianapolis, Ind.

Dr. John W. Hammond, Jr. (*C.M.* 1911 and *W.M.* 1914), Orford, N. H.

A. Paul Hare, Ph.D. (assoc. sociol. *Psychiat.* 1961), Haverford College, Haverford, Pa.

Dr. Wayne M. Hebertson (r.p. *N.* 1957), 975 E. 1st St., South, Salt Lake City, Utah

Dr. Thomas F. Henley (*C.M.* 1939), 7 E. 78th St., New York 21, N. Y.

Dr. Robert J. Herm (a. *Oph.*), 42 Weston St., Waltham 54, Mass.

Dr. J. Mark Hiebert (*C.M.* 1933), 1450 Broadway, New York 18, N. Y.

Dr. Lawrence B. Hobson (*M.* 1944), Squibb Institute for Medical Research, 745 5th Ave., New York 22, N. Y.

Dr. W. Richard Hochwalt (*Or.* 1931), 2300 Far Hills Ave., Dayton 19, Ohio

Dr. William L. Holt, Jr. (r.p. *N.* 1937), Albany Hospital, Albany, N. Y.

Dr. Charles E. Hopkins (a.r.p. *C.M.* 1948), 113 N. Carroll St., Madison, Wis.

Dr. Robert S. Hormell (*Or.* 1942), 1152 Beacon St., Brookline 46, Mass.; 8 Porter St., Melrose, Mass.

Dr. William H. Horwitz (r.p. *Psychiat.* (*McL.*) 1951), 220 Bushkill St., Easton, Pa.

Dr. Jeannette A. Hovsepian (a.r.p. *R.* 1958), Johns Hopkins Hospital, Baltimore 5, Md.

Dr. Fred H. Howard (*C.M.* 1949), Dhahran Health Center, Dhahran, Saudi Arabia

Dr. William M. Huber (r.p. *D.* 1937), 512 Beacon St., Boston 15, Mass.

Dr. Harry C. Hughes (*Or.* 1937), 1750 Race St., Denver 6, Colo.

Dr. Alfred L. Hurst (a. *Otolar.*), 98 Adams St., Milton 87, Mass.

Dr. Gilbert T. Hyatt (*W.S.* 1931 and *Or.* 1934), 1106 W. Franklin St., Evansville 10, Ind.

Dr. James P. Isaacs (a.r.p. *An.* 1952), Johns Hopkins Hospital, Baltimore 5, Md.

Dr. Lionel M. Ives (r.p. *Psychiat.* (*McL.*) 1933), 130 Maple St., Springfield, Mass.

Dr. Henry Jackson, Jr. (*E.M.* 1919), Tryon, N. C.

Marie A. Jakus, Ph.D. (biol. *Oph.*), Retina Foundation, 30 Chambers St., Boston 14, Mass.

Dr. G. Watson James, III (*M.* 1944), Medical College of Virginia, Richmond 19, Va.

Dr. M. T. Jenkins (a.r.p. *An.* 1948), University of Texas Southwestern Medical School, Dallas, Tex.

Dr. Norman P. Johnson (*E. M.* 1925), 1409 Willow St., Minneapolis, Minn.

Dr. Edward V. Johnston (*W.S.* 1947), Rockwood Clinic, 312 W. 8th, Spokane, Wash.

Dr. Thomas B. Jones (*Thd. S.* 1924), 1351 Mount Hope Ave., Rochester 20, N. Y.

Dr. William N. Jones (*Or.* 1947), Massachusetts General Hospital, Boston 14, Mass.

Dr. William R. Jordan (*W.M.* 1930), 1631 Monument Ave., Richmond 20, Va.

Dr. A. Bradford Judd (*S.* 1955), 1170 Massachusetts Ave., Cambridge 38, Mass.

Dr. Raymond A. Justi (r.p. *Path.* 1956), Jackson Memorial Hospital, Miami 36, Fla.

Dr. Martin Kantor (a.r.p. *Psychiat.* 1960), Stanford University Medical Center, Palo Alto, Calif.

Dr. M. Ralph Kaufman (r.p. *Psychiat.* (*McL.*) 1933), Mount Sinai Hospital, New York 29, N. Y.

Dr. Robert P. Kennedy (*Thd. S.* 1924), Route 1, Box 262, Richmond, Ind.

Dr. Beatrice R. Kershaw (r.p. *Psychiat.* (*McL.*) 1939), 29 Louise Rd., Belmont 78, Mass.

Dr. William A. Key (*Or.* 1927), 23 Baldwin Ave., San Mateo, Calif.

Dr. Brian Kiely (*M.* 1952), University Hospitals, 1300 University Ave., Madison 6, Wis.

Dr. Richard M. Kilfoyle (a.r.s. *Or.* 1951), 457 Main St., S. Weymouth 90, Mass.

Dr. W. Bradley King, Jr. (a.r.p. *Path.* 1956), 700 Fleet St., Baltimore 2, Md.

Dr. Donald C. Klein (assoc. psychol.), Human Relations Office, 11 Abbott Rd., Wellesley, Mass.

Dr. M. Robert Knapp (a.r.p. *An.* 1955), 4601 E. Douglas, Wichita, Kan.

Dr. John J. Kneisel (*E.M.* 1940), 15 W. 12th St., New York 11, N. Y.

Dr. Margaret Single Kosek (a.r.p. *C.M.* 1958), Palo Alto Medical Clinic, 300 Homer Ave., Palo Alto, Calif.

Dr. Herbert L. Kraut (a.r.p. *D.* 1957), 1742 Summer St., Stamford, Conn.

Dr. Arthur R. Kravitz (*M.* 1955), Beth Israel Hospital, Boston, Mass.

Philip E. Kubzansky, Ph.D. (a. psychol.), Boston University, 308 Bay State Rd., Boston, Mass.

Dr. John G. Kuhns (*Or.* 1926), 416 Marlborough St., Boston, Mass.

Dr. J. Peter Kulka (a.r.p. *Path.* 1947), Robert Breck Brigham Hospital, 125 Parker Hill Ave., Roxbury 20, Mass.

Dr. Cornelius Lansing (*C.M.* 1948), North Carolina Memorial Hospital, Chapel Hill, N. C.

Dr. Jefferson Larkey (*W.S.* 1928), 431 30th St., Oakland, Calif.

Dr. Robert F. Legge (*Or.* 1935), Gorgas Hospital, Balboa Heights, Canal Zone

Dr. A. Denis Leigh (r.p. *Psychiat.* 1948), 150 Harley St., London W. 1, England

Dr. Joseph Leighton (r.p. *Path.* 1949), University of Pittsburgh School of Medicine, Pittsburgh 13, Pa.

Dr. Anthony T. Licciardello (*M.* 1948), 2875 Main St., Stratford, Conn.

Dr. George R. Livermore, Jr. (*W.S.* 1943), Baptist Memorial Hospital, 899 Madison Ave., Memphis 3, Tenn.

Dr. William K. Livingston (*W.S.* 1922), Camp Sherman, Oreg.

Dr. Herbert B. Locksley (*S.* 1950), University Hospital, University of Iowa, Iowa City, Iowa

Dr. Charles U. Lowe (*C.M.* 1948), 219 Bryant St., Buffalo 22, N. Y.

Dr. Alfred O. Ludwig (*E.M.* 1932), 2 W. Cedar St., Boston, Mass.

Dr. Alfred J. Luessenhop (r.s. *N.S.* 1957), Georgetown University Hospital, 3800 Reservoir Rd., Washington 7, D.C.

Dr. Ralph H. Luikart, II (*M.* 1944), 1532 Anacapa St., Santa Barbara, Calif.

Dr. Charles C. Lund (*E.S.* 1922), 319 Longwood Ave., Boston, Mass.

Dr. Lawrence K. Lunt (*W.M.* 1916), 1125 Pecos Rd., Santa Fe, N. M.

Dr. William B. Lytton (r.p. *Psychiat.* (*McL.*) 1937), St. Vincent's Hospital, St. Louis 14, Mo.

Dr. Andrew R. MacAusland (*W.S.* 1911), 218 Commonwealth Ave., Boston 16, Mass.

Dr. Samuel M. McCann (*M.* 1949), University of Pennsylvania School of Medicine, Philadelphia 4, Pa.

Dr. William K. McClelland (clin. assoc. *S.*), 497 Main St., Greenfield, Mass.

Dr. William D. McElroy (*Or.* 1932), 3716 Market St., Youngstown, Ohio

Dr. John B. McKenna (r.p. *Psychiat.* (*McL.*) 1932), Hitchcock Clinic, Hanover, N. H.

Dr. William B. McLaughlin (*Or.* 1931), 6077 Jenkins Arcade, Pittsburgh 22, Pa.

Dr. John D. McLean (a. podiatrist *Or.*), 38 Church St., Winchester, Mass.

Dr. Allan B. McNie (a.r.p. *Path.* 1957), 353 30th St., Oakland, Calif.

Dr. Stephen A. Mahoney, Jr. (*E.S.* 1926), 727 Dwight St., Holyoke, Mass.

Dr. Harry P. Makel (c.r.p. *An.* 1949), 2217 Webster St., San Francisco, Calif.

Dr. Joseph K. Maloy (*E.S.* 1947), 120 W. Ravine Rd., Kingsport, Tenn.

Dr. Elliott L. Mancall (a.r.p. *Path.* 1957), Jefferson Medical College of Philadelphia, 1025 Walnut St., Philadelphia 7, Pa.

Dr. Alfonso Mangoni (a.r.p. *Psychiat.* 1960), Medical Research Council, Woodmansterne Rd., Carshalton, Surrey, England

Dr. Clyde S. Marshall (r.p. *N.* 1927), Dept. of Public Health, Halifax, Nova Scotia, Canada

Dr. Foster L. Matchett (*Or.* 1934), 1830 Williams St., Denver 18, Colo.

Dr. Thomas J. Mathieu (r.s. *U.* 1954), 1120 W. Spruce St., Yakima, Wash.

Dr. Richard F. Mayer (a.r.p. *N.* 1957), Boston City Hospital, Boston 18, Mass.

Dr. James A. Meath (r.p. *N.* 1947), 1114 St. Paul St., Baltimore 2, Md.

Dr. Mortimer L. Mendelsohn (*M.* 1949), Hospital of the University of Pennsylvania, Philadelphia 4, Pa.

Dr. Bruce R. Merrill (a.r.p. *Psychiat.* 1941), 22 Peninsula Rd., Belvedere, Calif.

Dr. D. Franklin Milam, Jr. (*S.* 1949), 27 103rd Ave., N.E., Bellevue, Wash.

Dr. Ralph B. Miller (r.p. *R.* 1932), Box 12335, Laurel Heights Station, San Antonio 12, Tex.

Dr. Lloyd Mills, Jr. (*M.* 1944), 1136 W. 6th St., Los Angeles 17, Calif.

Dr. George Mixter, Jr. (*W.S.* 1943), Flower and Fifth Ave. Hospital, 5th Ave. at 106th St., New York 29, N. Y.

Dr. S. Halcuit Moore, Jr. (*C.M.* 1937), 4105 Live Oak St., Dallas, Tex.

Dr. Henry D. Moorman (*W.S.* 1943), 635 E. Union St., Pasadena, Calif.

Dr. John E. Moran (*N.* 1928), 219 Federal St., Greenfield, Mass.

Dr. John R. Moreton (*W.S.* 1944), Peter Bent Brigham Hospital, Boston, Mass.

Dr. Arthur M. Morrissey (a.s. *Oph.*), 24 Rural Ave., Medford 55, Mass.

Dr. E. James Morrissey (*Or.* 1935), 1121 Penn Ave., Wyomissing, Reading, Pa.

Dr. Harry L. Mueller (*C.M.* 1935), Children's Medical Center, Boston 15, Mass.

Dr. Jeannette Munro (*C.M.* 1929), 2 Queenston Place, Princeton, N. J.

Dr. Joseph E. Murray (clin. assoc. *S.*), Peter Bent Brigham Hospital, Boston, Mass.

Dr. Charles W. Neville, Jr. (r.p. *Psychiat.* (*McL.*) 1959), Mental Hygiene Consultation Service, U.S. Army Hospital, Fort George G. Meade, Md.

Dr. James W. Newell (*W.S.* 1943), Medical Plaza, Palo Alto, Calif.

Dr. Arnold P. Nicosia (a.r.p. *C.M.* 1949). 1554 Northern Blvd., Manhasset, Long Island, N. Y.

Dr. Frederick W. O'Brien, Jr. (a.r.p. *R.* 1951), Cleveland Clinic, 2020 E. 93rd St., Cleveland 6, Ohio

Dr. Richard G. O'Brien (clin. assoc. *R.*), Medical Arts Bldg., 697 Cambridge St., Brighton 35, Mass.

Dr. Denis S. O'Connor (*Or.* 1925), 237 Edwards St., New Haven 11, Conn.

Dr. Bertha Offenbach (a. *Oph.*), 51 Homer St., Newton Centre, Mass.

Dr. Austin F. O'Malley (a.r.s. *U.* 1957), 496 South St., Hyannis, Mass.

Dr. Joy A. Omer (*Or.* 1912), 2648 E. 7th St., Tucson, Ariz.

Dr. Robert L. Patterson, Jr. (*Or.* 1935), 166 E. 63rd St., New York 21, N. Y.

Dr. Harold O. Peterson (a.r.p. *R.* 1936), University of Minnesota Hospitals, Minneapolis 14, Minn.

Dr. William Pfeffer, Jr. (a.p. *C.M.*), 3 Seaward Rd., Wellesley, Mass.

Dr. Edgar B. Phillips, II (*C.M.* 1948), American Child Guidance Foundation, 18 Tremont St., Boston, Mass.

Dr. Nicholas S. Pickard (*Or.* 1940), 411

Dr. Robert B. Rosen (*C.M.* 1953), Children's Hospital of Michigan, Detroit 2, Mich.

Dr. Milton Rosenbaum (r.p. *Psychiat.* (*McL.*) 1937), Albert Einstein College of Medicine, Bronx, N. Y.

Dr. Earl H. Rosenberg (*Dn.* 1958), 328 Washington St., Wellesley Hills, Mass.; 29 Commonwealth Ave., Boston, Mass.

Brief bits:

Dr. Carl Binger has been appointed Visiting Professor of Psychiatry at the Medical School of the University of Cincinnati. This will mean two visits a year for three days each.

Dr. Gordon L. Brownell presented a paper at the 46th Annual Meeting of the Radiological Society of North America, held in Cincinnati, December 5-7, 1960. He attended the 5th Annual Meeting of the Biophysical Society, in St. Louis, February 16-18.

Dr. Oliver Cope was guest lecturer at the Postgraduate Course of the Honolulu County Medical Society, held on February 15-27, and gave lectures arranged by the Island County Medical Societies of Hawaii. Mrs. Cope went with him to Hawaii. Dr. Cope was Visiting Professor at the St. Louis City Hospital, under the auspices of the Institute of Medical Education and Research, and gave the Hodgen Lecture for the St. Louis Surgical Society on March 7. The title of his address was "Hyperparathyroidism: The experience in the diagnosis and treatment of 245 cases".

Dr. Churchill received a letter from Dr. Ben Eiseman, in which he said: "I thought you might like to know that last week I accepted the Chairmanship of the Department of Surgery at the new University of Kentucky Medical School in Lexington."

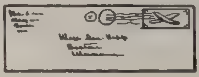
Dr. George Kelemen has returned from a three-month lecture tour to seven European countries. Twenty-one lectures were delivered on subjects in otolaryngic pathology and in comparative phonetics. The tour was sponsored by grants, from the Wenner-Gren Foundation for Anthropological Research and from the Swedish Research Council.

Dr. William V. McDermott presented a paper entitled "Perfusion and replacement of the canine liver" at the Society of University Surgeons meeting, held in Kansas City, Kansas, February 8-12.

Dr. Carter R. Rowe and B. David Grant, M.B. presented a paper at the American Academy of Orthopedic Surgeons' Meeting in Miami Beach, February 12. Its title was "Motor paralysis of the extremities in herpes zoster".

Dr. Harilaos Sakellarides presented a paper entitled "A long-term follow-up study of 180 cases of civilian peripheral nerve injuries" before the meeting of the American Society for Surgery of the Hand, held in Miami Beach on January 6.

Last December, Dr. John B. Stanbury gave a lecture, rounds, and CPC at the All-India Institute for Medical Sciences in New Delhi, a paper at the annual meeting of the Indian Society of Pathologists in Hyderabad, and a few days later attended a meeting of the International Atomic Energy Agency, in Bangkok, on "Endemic and tropical diseases", and presented a paper there. On the way home, he visited the Medical Department of the University of Kyoto.



The following letter has arrived from Dr. Harriet L. Hardy:

I know how much interest I take in reading about other people's trips and speeches. Quite frankly, I want the Hospital not to forget Occupational Medicine, so I am sending along a recount of the things I have been doing in the last six months.

1. I attended the International Conference on Sarcoidosis, sponsored by the National Academy of Sciences, in Washington, D.C., June 1-3, 1960, and presented a paper on "The definition of sarcoidosis".

2. I was Chairman of a session at the Thirteenth International Congress on Occupational Health, held at the Waldorf Astoria in New York in July 1960.

3. I read a paper on "Therapy of lead poisoning" at the Metal-Binding Conference of the National Academy of Sciences, held at the Pennsylvania State College in September 1960.

4. On November 7 and 8, 1960, I gave the annual Dearholt Lectures at Marquette University and the University of Madison, in Wisconsin, on "Occupational lung disease".

5. I read a paper on "Beryllium poisoning" at the Air Force-sponsored conference at the Kettering Laboratory of the University of Cincinnati on January 5.

A brief but informative letter has come from Major General Richard Collins (*E.S.* 1933), in reply to our inquiry regarding his current address:

I have enclosed the official address card in accordance with your request. Perhaps a little more information would be helpful in keeping your Archives records straight.

Here in Korea, I am serving as the Senior Member of the United Nations Command Element of the Military Armistice Commission. I have been here since the first of November and shall return to Washington about the first of May. At that time my official address will change, but I do not yet know what it will be, nor what my duties will be.

My present home address is 5111 8th Road, South, Arlington 4, Virginia. Mail can always get to me at that address.

Kindest regards to all at the "General".

The News

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 204 Boston, Mass. May 1961

THE RESEARCH ACTIVITIES OF THE THYROID CLINIC AND LABORATORY

The Thyroid Clinic is an outgrowth of the studies of oxygen consumption in patients, which were begun in 1913 in this Hospital by Dr. J. H. Means. The Clinic has always been primarily concerned with diagnosis and care of patients with thyroid and related diseases, but, in addition, has become increasingly occupied with studies of the metabolism of the thyroid gland in health and disease. Just now, as the Thyroid Group is moving into its new laboratory quarters, it seems fitting to review the research activities of the unit.

The thyroid gland performs its function of supplying the thyroid hormones by means of a complex matrix of interrelated biochemical events. These include not only the accretion of the elements which form the hormones, including the specific amino acids involved, but also the synthesis, storage, and degradation of the principal thyroid protein — thyroglobulin. In addition, the gland must perform those metabolic functions which it shares in common with other tissues, such as glycolysis, nucleotide synthesis, and the whole complex of steps which relates to the storage and expenditure of energy. It has been our working hypothesis that many inborn and acquired errors may occur at various points in this complex matrix to impair the function of the gland. Thus, a genetic deletion of an enzyme may critically limit the synthesis of hormone and cause a compensatory growth of the gland. One may equally well imagine that a specific impairment in a negative feed-back control system for a rate-limiting step might actually increase the rate at which a certain reaction is moving. It must also be assumed that thyroid disease can derive from errors in extrathyroidal control of thyroid function or in peripheral utilization of the thyroid hormones. Understanding thyroid disease in these terms, therefore, becomes a task in exploring the normal function of the thyroid and in defining the pathological physiology of thyroid disease states as exemplified in clinical experience.

For a dozen years the problems of patients with congenital hypothyroidism and goiter have been studied, and these patients have been categorized according to quite specific inborn errors of thyroid metabolism. Although the clinical end-result is more or less the same, the biochemical abnormality in each category is unique. Five biochemically distinct but clinically similar types of patients have been defined by workers in this laboratory. Members of each category have relatives who have thyroid disease, but without hypothyroidism. If one assumes that the type patients are homozygous for a rare recessive gene which leads to a specific enzymatic defect, then it seems quite clear that these relatives are heterozygous for the same genetic defect for which the type patients are homozygous. An interesting problem has been that of devising tests for demonstrating the heterozygous state for these genetic defects, and some success has attended efforts to develop these tests. Solution of this general problem could provide us with means for specifically categorizing those patients who now are lumped under the waste-basket terms, simple or nodular goiter, provided our hypothesis is true that these patients are heterozygotes for definable abnormal genes.

Recent developments in studies of the fine structure of hemoglobin in relation to disease have suggested that analogous changes in thyroglobulin might be related to thyroid disease. Thus it seems possible that altered thyroglobulin structure or its degradation could have consequences analogous to the consequences of altered structure of the hemoglobin molecule. Dr. Augusto Litonjua, from the Philippines, has just now completed an intensive study of proteolysis of the thyroglobulin molecule. This substance is peculiarly resistant to degradation by any proteolytic enzyme obtained from the thyroid gland. Dr. Mary Jane Spiro has adapted the methods of peptide analysis, or "finger-printing", to a study of thyroglobulin, has identified the terminal amino acids, and has begun a study of thyroglobulin from abnormal human glands, with the expectation that specific abnormalities of thyroid peptides might emerge. She has been ably assisted by Miss Visitacion Manipol of the University of the Philippines. The problem is a particularly difficult one because the thyroglobulin molecule has a molecular weight of over 600,000 whereas that of hemoglobin is only 68,000.

The oxidative step in the thyroid gland wherein iodide is converted to iodine has always been presumed to result from the action of a specific iodide peroxidase. Dr. Leslie J. DeGroot has recently been successful in solubilizing this enzyme and in obtaining it in far higher concentrations than in the native state. Certain patients appear to lack this enzyme on a genetic basis.

Thyroglobulin synthesis has been approached from quite another point of view by Dr. Provan Murray, a Rockefeller Fellow from Glasgow. Dr. Murray has studied the incorporation of C^{14}-labeled leucine by thyroid slices. Analysis of the resulting labeled protein has indicated that labeled thyroglobulin is indeed formed by these slices. Dr. José Barzelatto, a Kellogg Fellow from Santiago, Chile, has joined forces with Dr. Murray to study the effects of high energy radiation on slices, in terms of their capacity to incorporate leucine, oxygen, and iodine. The leucine incorporation was vastly more sensitive to radiation than was any other measured function. In addition, radiation produced a soluble and dialyzable product in the suspending fluid medium which specifically impaired the incorporation of iodine into an organic molecule but had no effect on other measured functions of the slices. This substance has been partially characterized, but not yet identified. Dr. Barzelatto has also recently completed a study of the effects of high energy gamma radiation on several iodinated amino acids. Under these conditions these amino acids are rapidly degraded.

Since the nucleic acids are so important in the synthesis of all proteins, Dr. Reginald Hall, a Commonwealth Fellow from Newcastle, England, has just begun a study of nucleic acid synthesis in thyroid slices. He has found that labeled formate is incorporated into nucleic acids by these slices. He intends to apply his techniques to slices obtained from the diseased thyroid glands, since it is possible that deficient or altered nucleotide synthesis might be related to certain kinds of thyroid disease.

Since enzymes determine function and genes determine enzymes, it has seemed promising to look for chromosomal abnormalities in thyroid disease. A section of the Thyroid Laboratory is devoted to the recently developed technique for the demonstration and study of the human chromosomes. Dr. Eric Engel of Switzerland, working jointly with the Thyroid Group and the Endocrine Unit, has established this technique here and is beginning this investigation.

Over the years the Thyroid Laboratory has had a close association with Dr. Gordon Brownell of the Physics Laboratory. The study of the kinetics of iodine and of calcium metabolism has been actively pursued. A puzzling and difficult problem has been the mathematical analysis of data obtained from labeled tracer doses in these experiments. Dr. Brownell and his group are active in the development of computer techniques for the analysis of metabolic data which have been obtained in the study of patients on Ward 4 with tracers of iodine, strontium, and calcium.

One of the most important practical

research activities of the Thyroid Clinic has been the study of the long-term effects of radiation on the thyroid gland, and on the patient as a whole. Interest in this derives from the fact that, beginning in 1941, increasingly large numbers of patients have been given radioactive iodine for the treatment of their thyroid disease. Follow-up of these patients is the primary interest of Dr. Earle M. Chapman and Dr. Farahe Maloof. This study includes a careful clinical follow-up of all patients treated, the encoding of an enormous amount of information obtained from these patients, and a statistical analysis of these results. In this project, Dr. Chapman is assisted by our statistician, Mrs. Irene Nobrega. It is important that careful study and follow-up of our 1500 patients treated with I^{131} over the past nineteen years has failed to disclose neoplastic changes attributable to this agent.

The introduction of the thyroxine analog triiodothyronine in 1951 by Dr. Rosalind Pitt-Rivers, who worked in our laboratory in 1954, highlights the principal research activity of Dr. Jacob Lerman, who has studied the metabolic activity of a large series of thyroxine analogs. These painstaking studies have been done in large part on Ward 4, and have been instrumental in defining the relationship of structure to function in these compounds.

Several other problems have occupied the attention of various members of the Thyroid Group. For example, over the years Dr. Edward Hamlin, Jr. has developed the technique of needle biopsy of the thyroid. This has been of invaluable aid as a diagnostic tool, as well as in the study of the long-term evolution of such thyroid diseases as Hashimoto's thyroiditis. In the interpretation of the pathological material, Dr. Hamlin has had Dr. Austin Vickery as a colleague. Drs. William McDermott and Oliver Cope, as well as others, have had a long interest in thyroid carcinoma, its occurrence, and its treatment. Dr. Cope has been especially interested in the involutionary effects of thyroid medication on various kinds of thyroid nodules.

Finally, a significant contribution of the Thyroid Laboratory to clinical practice in the Hospital should be noted. This is the development of new techniques for the study and diagnosis of patients with thyroid disease. A number of years ago, under the guidance of Dr. Douglas Riggs, the protein-bound iodine estimation was developed and has since been transferred to the Chemistry Laboratory. Techniques of radioactive iodine uptake, turnover, excretion, and scanning which began as investigations have developed to the practical stage. At the present time, the laboratory is setting up methods for I^{131} resin uptake determinations and for tanned red cell agglutination. These will be ready for routine clinical use at an early date.

One is always astonished by the ever-widening pathways for investigation in the thyroid field. There seems to be no limit, and there certainly is ample opportunity for clinical application of the information as it is developed. As the Thyroid Unit moves into its new quarters, optimal facilities for continued research are at hand, and possibilities for increased understanding of thyroid disease are within our grasp.

John B. Stanbury, M.D.,
Associate Physician

The Board of Trustees, at their meetings on February 17, and March 3 and 17, voted:

That William T. Irvine, M.D., F.R.C.S., Professor of Surgery at St. Mary's Hospital, London University, be invited to give a Richardson Lecture on February 17;

That Dr. Gunnar Sevelius, Chief of the Cardiovascular Section of Civil Aeronautical Research Institute, Oklahoma City, Oklahoma, be invited to give a Richardson Lecture on March 2;

To grant Dr. Howard Ulfelder leave of absence for the month of July, in order that he may accept an invitation to serve as McIlrath Visiting Professor of Gynecology at the Royal Prince Alfred Hospital in Sydney, Australia;

That Dr. Henry deF. Webster, now holding the position of Assistant Neurologist, be given the additional title of Assistant Neuropathologist in the Department of Pathology.

To accept the resignations of:

Dr. Willis H. Bower, Associate Psychiatrist at McLean Hospital, as of March 19, with regret;

Dr. John Q. Durfey from the position of Assistant in Anesthesia, effective March 31;

Dr. Gilman W. Haven from the position of Dental Surgeon at McLean Hospital, as of February 17.

To promote:

Dr. Francis L. A. de Marneffe from Assistant Psychiatrist to Associate Psychiatrist at McLean Hospital, effective March 20;

Dr. Richard H. Sweet to the position of Consulting Visiting Surgeon, effective July 1.

To appoint:

Dr. Barbara L. Aeschliman as Assistant Attending Psychiatrist at McLean Hospital;

Dr. Daniel C. Allensworth, III, as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;

Dr. George E. Battit as Clinical Fellow in Anesthesia, beginning April 1;

Dr. Hector V. Berezowski as Assistant Resident in Neurosurgery, for a period of three months, beginning April 1;

Dr. John H. Bowker as Clinical and Research Fellow in Orthopedic Surgery for one year, beginning July 1;

Dr. William G. Bush as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;

Dr. Ock S. Choi as Clinical Fellow in Medicine for one year, beginning July 1;

Dr. Paul A. Crabbé as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. Brian C. Dalton as Clinical Fellow in Anesthesia, to begin on or about February 17;

Dr. John T. Dunn as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Jon B. Glazier as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Richard N. Goldman as Assistant Resident in Urology, on assignment from the V.A. Hospital, for the period March 1 through May 31;

Dr. Walter Gruen as Associate Psychologist at McLean Hospital, as of January 9;

Dr. Andrew Huvos as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;

Dr. Raymond N. Kjellberg as Assistant in Neurosurgery;

Dr. Howard M. Kravetz as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Charles S. Lambdin as Clinical Fellow in Orthopedic Surgery, for the period January 15 through February 20;

Dr. John P. Lavender as Clinical Fellow and Acting Resident in Radiology, beginning October 1;

Dr. Margaret H. MacGillivray as Clinical and Research Fellow on the Children's Medical Service, beginning September 1;

Dr. Ira Marks as Exchange Assistant Resident on the Children's Medical Service, for the period March 2 through April 10;

Dr. Leonard A. Moroz as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Robson S. Newbold as Acting Assistant Resident in Surgery, for the period February 20 through April 30;

Dr. John E. Salvaggio as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Harold Simon as Clinical Fellow in Radiology, for the period April 1 through June 30;

Dr. Paul M. Stevens as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. William H. Sweet as Chief of the Neurosurgical Service, beginning July 1.

To appoint the following Interns for the period of one year, beginning July 1:

Medicine

Dr. Robert E. Burke
Dr. Norman R. Cohen
Dr. Howard B. Corning
Dr. Shalom Z. Hirschman
Dr. Axel Hoffer
Dr. Newton E. Hyslop, Jr.
Dr. Alan S. Keitt
Dr. John N. Loeb
Dr. Philip W. Majerus
Dr. John C. Parker
Dr. Kenneth I. Shine
Dr. James F. Spann, Jr.

Surgery

Dr. William M. Abbott
Dr. William B. DeLong
Dr. Josef E. Fischer
Dr. Elwin E. Fraley
Dr. Thomas R. Hakala
Dr. Charles A. Rodman, II
Dr. Dale E. Wenlund
Dr. Bruce E. Zawacki

Children's Service

Dr. Robert M. Kline
Dr. Stephan M. Marcy
Dr. Lester F. Soyka
Dr. Richard C. Talamo

In addition to the above votes, the General Director presented a recommendation, approved by the General Executive Committee, on a reorganization of the Children's Medical Service, which included changing the name to "The Children's Service", creating a Children's Service Executive Committee, and the use of Burnham 5 primarily as a surgical floor, and it was VOTED to approve this recommendation as presented.

At their meetings during March, the General Executive Committee voted:

To reappoint:

Dr. Anton T. Appels as Clinical and Research Fellow in Medicine for one year, beginning April 1;

Dr. Peter A. Freeman as Clinical Fellow in Orthopedic Surgery, for the period March 12 through May 31;

Dr. Jorgen G. Jacobsen as Clinical and Research Fellow in Medicine for one year, beginning April 1;

Elton P. Katz, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning April 28;

Gerald L. Mechanic, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning March 1;

Dr. Kenneth G. Potee, with a change of title to Clinical Fellow in Medicine, for one year, beginning March 1;

Dr. Edward J. Riseborough as Clinical Fellow in Orthopedic Surgery and Orthopedist-in-Charge of the Orthopedic Ambulatory Clinic for one year, beginning May 1;

Dr. Isadore Starr as Clinical Fellow in Medicine for one year, beginning April 15.

To appoint:

Dr. F. William Bora, Jr. as Clinical Assistant in Orthopedic Surgery, for the period March 15 through May 31, with the privilege of caring for the patients of Dr. William R. MacAusland, Jr., under the supervision of Dr. Richard A. Mayo;

Dr. Charles M. Lapiere as Research Fellow in Medicine for one year, beginning October 1;

Dr. C. Norman Shealy as Research Fellow in Neurosurgery, for nine months, beginning April 1.

* * *

MEMORIES OF THE M.G.H.

As a student in the Class of 1905 at the Harvard Medical School, the Massachusetts General Hospital gradually assumed in my mind a position akin to Heaven, Valhalla, or the Elysian Fields—a Paradise to be hoped for by all but attained by few. Examinations for the position of House Pupil were held in the late winter or early spring, and those were coveted positions. Reflecting that if nothing was ventured nothing was gained, I decided to try my luck, and so one evening I found myself sitting on a bench on a stair-landing in the Bulfinch Building, together with a group of fellow students waiting to be examined for the surgical House Pupil appointments for the coming year. These examinations were held in the Treadwell Library, then situated on the second floor of the central section of the Bulfinch Building. As I remember it, about six members of the Surgical Visiting Staff constituted the examining board. They were seated around a long mahogany table in the Library, and one by one the candidates were admitted, told to sit in a chair facing their inquisitors, and were grilled. The junior surgeon asked most of the questions, although any member of the board could add his bit. The questions were fair, basic, and practical; but, to the perspiring candidate, the ordeal was the equivalent of a session at the Spanish Inquisition. When dismissed, the departing candidate passed by his waiting companions, honor bound not to divulge in any way anything about the questions he had been asked, and fled into the night to compose his fears and nourish his hopes. It was not unusual for a man to have to make more than one try for the appointment, but, happily, I was successful in my first venture and was appointed to the South Surgical Service.

At that time there were twelve surgical House Pupils, four assigned to each of the Surgical Services—East, West, and South, and eight medical House Pupils, four for the East Medical and four for the West Medical Service. There was a fine *esprit de corps* in all the Services, each House Pupil being sure that his was the best, with the best physicians or surgeons and the best House Pupils, and that they took superior care of their patients. Surgical House Pupils looked down upon medical House Pupils, and vice versa. Each strove to write the best records, to have the greatest number of correct diagnoses, and to obtain the best results.

Bandaging was a fine art in those days. A fractured femur, put up in a Buck's extension, required bandaging from foot to crotch, with each V, where the bandage crossed, accurately spaced and with the edges turned in. The nurses vied with each other to see who could make the neatest charts, with perfect dots and connecting lines recording temperature, pulse, and respiration, and with the accompanying notes carefully printed or finely written. Such time-consuming perfection would not be countenanced now, but then it reflected a consecration to duty and service. It was a happy close-knit family, all intensely interested in their work in spite of long hours, and the patients were given the best care possible with all the medical knowledge which that period afforded. I was supremely happy and completely under the spell of the M.G.H.

Fate willed that after finishing my House Officership I should be separated from the M.G.H. until 1919, when I returned, fresh from World War I, as an Assistant Resident Physician (or Assistant Director, as the position is now called). Dr. Frederic A. Washburn was then and until 1934 the administrative head of the Hospital. Many thought him a cold, military martinet, but I remember him as a kind, loyal friend and teacher, the effect of whose wise government and prophetic vision is still in evidence in the Hospital he served and loved.

My duties as an Assistant Resident Physician introduced me to a new sphere of hospital life. As a House Pupil, all my attention had been focused on patients and professional matters. Now I was part of the organization that made the Hospital function and provided the doctors and nurses with the facilities with which to care for the patients. I was privileged to go anywhere, even to the rat-infested storage basement under the old Accident Room. Miss Clark, the housekeeper, with a huge ring of keys chained to her ample waist, showed me the hogsheads of sauerkraut which she laid down each year in the Bulfinch basement. Eric Frankson, the storekeeper, initiated me into the mysteries of the Store, where he roasted the green coffee beans himself, not trusting Chase and Sanborn to do a proper job. From Joe Godsoe I learned how to beat the pharmaceutical detail man. Real military inspections were held in rotation on the wards, where the head nurse presented a book containing a written inventory and everything was checked. Once, while counting the spoons (a despised chore), I discovered two coin silver dessert spoons which somehow had escaped pilfering. They were transferred to the Hospital safe. Mrs. Myers, the Librarian, who had boasted that all the Hospital medical records since 1821 were safely housed in the Treadwell vault, was somewhat nonplussed when I presented her with two full volumes of early medical records which I had discovered in a cupboard in the Bulfinch attic, where the records had been stored previously and which had been overlooked when the transfer to Treadwell was made. I read the Bowditch and Myers histories of the Hospital, all the Annual Reports and the minutes of the General Executive Committee, and absorbed much of the fascinating history and atmosphere of this wonderful institution. Of course, there was some drudgery—requisitions and checks to sign, and all that. But there was also much that dealt with medical problems, and there were no dull days. Just as I would think I had been confronted with every possible situation, a new one would pop up. It was a stimulating experience to feel that I was helping to make it possible for 350 in-patients and 1,000 out-patients to be cared for daily by the 150 doctors on the staff. It was something like being the navigator on a battleship, with the doctors and nurses being the fighting groups. In a slightly different way, the MGH spell was working just as it had done before.

Then came an earthquake. In 1922, Dr. Washburn figuratively pushed me, like a fledgling bird with (in my opinion) inadequate administrative wings, out of my comfortable MGH nest, to become the Director of the proposed hospital for the University of Rochester. At that time there was no medical school there, no hospital, only the money with which to build them. It was the responsibility of Dr. George H. Whipple, as Dean of the Medical School, to produce a school with faculty, and for me as Director, to produce a hospital with staff, nurses, and personnel. At the very outset I resolved to make the Strong Memorial Hospital as nearly like my beloved M.G.H. as was humanly possible. I think I succeeded to some extent, and the hospital was opened in January 1926. It was great fun and an exciting experience to plan this new venture. The University connection was exhilarating and Rochester was a friendly city. I settled down to spend the rest of my days there.

Earthquake number two arrived in 1935 in the form of an invitation to return to the M.G.H. as Director. It was hard to leave the Strong Memorial—my own child, as it were—but Boston and the M.G.H. won. To become Director of the finest hospital in the world was an honor that could not be refused. So, on July 1, 1935, here I was back in the Massachusetts General Hospital.

It was good to be home. Some of the old faces were still there: Sally Johnson was still Superintendent of Nurses; Miss Carstenson was at the Information Desk, with Conner on the night shift; Ripley was in the Purchasing Office; Decker and Parsons were in the shops; Barry and Henderson still headed the orderlies; Frankson called me "Dotter" as of old; and although Lee no longer drove the ambulance, son Willie ran a taxicab. The Baker Memorial had been added, and there were more doctors, more nurses, more laboratories, more employees, and the M.G.H. was bigger and busier.

Of course, my outlook now was different from what it had been as a House Pupil or as an Assistant Resident Physician. Now I was responsible for decisions. As a House Pupil, there was always the Visiting Surgeon to appeal to; as an Assistant Resident Physician, there was Dr. Washburn. At first I was scared, but I soon found there was a wonderful Board of Trustees who guided and sustained Directors; that there were competent, loyal, devoted persons everywhere—on the wards, in the offices, the shops, the kitchens—who really bore the burdens. A Director merely coordinated their activities. Again I found I was in the midst of a happy family. That characteristic of the M.G.H. had not changed.

Certain periods and events stand out above the routine. First came the thrill of planning and building the George Robert White Building—the present largest MGH unit. The Hospital was fortunate in having Henry R. Shepley as architect and Francis V. Bulfinch, the great-grandson of the Hospital's first architect, as engineer. They built well.

Next came World War II, with blackouts, rationing, and shortages of almost everything—the shortage of people being the most serious. The 6th General Hospital—the MGH unit—took a heavy toll. Altogether, 123 doctors, 158 nurses, and 175 employees joined the Armed Forces. Retired Staff members partially filled the gap in the Staff, but the shortage of nurses and employees would have been fatal had it not been for the Volunteers.

Dr. Frederick A. Coller, M.G.H. 1914, in his 1939 Ether Day Address, pointed out that it was the intimate association of the public and the doctors that had made and maintained the Hospital—the Staff giving of their time and skill and the public contributing their money, their interest, and their support. Only in a Democracy are humanitarian needs met by the self-sacrifice of individuals. As a result, people have a pride and confidence in institutions that are representative of their good impulses. He saw the M.G.H. as a logical outgrowth of this humanitarian spirit of Democracy.

That this is true was shown by the response of the community to the Hospital's cry for help. Volunteers poured in. In 1944, 2,000 persons gave 150,000 hours of service—the equivalent of 50 people a day. This did not replace those who had gone to war, but it helped, and their spirit helped even more. Business men worked as orderlies and cleaners; secretaries, clerks, and housewives as maids. The M.G.H. was their Hospital and they were bound to keep it going.

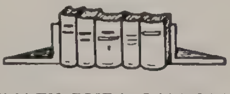
Right in the midst of the war effort came the Cocoanut Grove disaster. Fortunately, the Hospital had spent a year in developing a program of Civil Defense and so was able to meet the emergency. Within two hours, 114 casualties were received. Of the 59 living, all showed burns of varying degree, shock, and asphyxia. The Staff, nurses, and Hospital personnel responded gallantly and bore the first shock. Before they collapsed, Volunteers again came to the rescue—nurses from other hospitals, medical students, college students, members of our Ladies' Visiting Committee, Red Cross workers. Everybody wanted to help. Again the people demonstrated their love for their Hospital. As the result of their experience and research, the Staff prepared a special report on the treatment of burned persons that was adopted by the Armed Forces—a real contribution to the war effort.

I have detailed, perhaps *ad nauseam,* my association with the M.G.H. which has lasted, with several breaks in continuity, for over fifty years. First as House Pupil, next as an Assistant Director, then as Director, and now as Director Emeritus. The traditions and personality of the Massachusetts General Hospital have permeated my whole life. The influence of the Hospital upon me has been experienced in a similar manner by countless others—doctors, nurses, residents, interns, social workers, and employees of all grades and in all departments.

While I recognize the importance of this Hospital's performing competently the traditional functions of a hospital (as most hospitals do), while I am proud of the care it gives to patients, of its role in education, of its scientific contributions to medicine, of its influence on social welfare, I would select the influence of its personality upon the lives of all who have been connected with it as its greatest asset and contribution. It takes a great hospital to build character along with a knowledge of science, medical skill, and manual technique.

Everyone who spends any length of time within the walls of the Massachusetts General Hospital feels the impact of something he cannot readily explain—a spiritual quality, a soul existing in a material institution which has influenced and exalted him and has led to a deep devotion. It is this something—this spiritual quality—that has made this Hospital more than a refuge for the sick, a school, and a laboratory. It is this personality, which all who serve within its walls absorb and which affects their future lives, that makes the Massachusetts General a great and beloved Hospital.

Nathaniel W. Faxon, M.D.,
Director Emeritus



STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

General Medicine

Dawson, A. M., and Isselbacher, K. J.
Fat absorption.
Arch. Int. Med. 107:305.

Isselbacher, K. J.
Fat absorption and the esterification of fatty acids by intestinal mucosa. (Editorial)
Gastroenterology 40:259.

Willocx, R. G., and Isselbacher, K. J.
Chronic liver disease in young people: Clinical features and course in thirty-three patients.
Am. J. Med. 30:185.

Laboratory Science

Jeanloz, R. W., Glazer, Z. T., and Jeanloz, D. A.
2-amino-2-deoxy-D-idose (D-idosamine) and 2-amino-2-deoxy-D-talose (D-talosamine).
J. Organ. Chem. 26:532.

Jeanloz R. W., and Jeanloz, D. A.
3-amino-3-deoxy-D-idose and 3-amino-3-deoxy-D-gulose.
J. Organ. Chem. 26:537.

Morgan, W. S., and Hultin, T.
Chromatographic fractionation of liver "pH-5 fraction" and "S_{50}-protein" on TEAE-cellulose columns.
Biochim. et biophys. acta 47:190.

Neurology

Pearson, C. M., Waksman, B. H., and Sharp, J. T.
Studies of arthritis and other lesions induced in rats by injection of mycobacterial adjuvant. V. Changes affecting the skin and mucous membranes. Comparison of the experimental process with human disease.
J. Exper. Med. 113:485.

Waksman, B. H.
Experimental study of diphtheritic polyneuritis in the rabbit and guinea pig. III. The blood-nerve barrier in the rabbit.
J. Neuropath. & Exper. Neurol. 20:35.

Webster, H. deF., Spiro, D., Waksman, B., and Adams, R. D.
Phase and electron microscopic studies of experimental demyelination. II. Schwann cell changes in guinea pig sciatic nerves during experimental diphtheritic neuritis.
J. Neuropath. & Exper. Neurol. 20:5.

Physical Medicine

Watkins, A. L.
New name needed. (Editorial)
Arch. Phys. Med. 42:129.

Radiology

Potsaid, M. S., Irie, G., and Griscom, N. T.
Motility changes revealing esophagogastric junction.
Radiology 76:262.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

Brief bits:

Dr. Henry K. Beecher has just been made an Honorary Member of the Society of Anaesthetists of Finland.

Dr. Gordon L. Brownell gave a talk at the meeting of the Visiting Scientist Committee, held at the B. M. C. Durfee High School in Fall River on March 6.

Drs. Evan Calkins, Edgar S. Cathcart, George Fite, and Ralph C. Williams recently visited Guadalajara, Jalisco, Mexico, for the purpose of conducting a study on leprosy patients in the Instituto Dermatologico.

Dr. Oliver Cope spoke at the South Nassau Communities Hospital Teaching Day, in Oceanside, N. Y., on April 26. His subject was "Metabolism of calcium, phosphorus, and magnesium: Tests of parathyroid function". He also gave the Hale-McMillan Lecture at the Meharry Medical Hospital in Nashville, Tennessee, on April 27.

Dr. John Gergely gave a seminar on "The molecular basis of the control of muscle contraction and relaxation" in the Biophysics Department of Johns Hopkins University on March 20. He also acted as Chairman of the Intersociety Session on Muscle at the meeting of the Federation of the American Society of Experimental Biology, held on April 13 in Atlantic City.

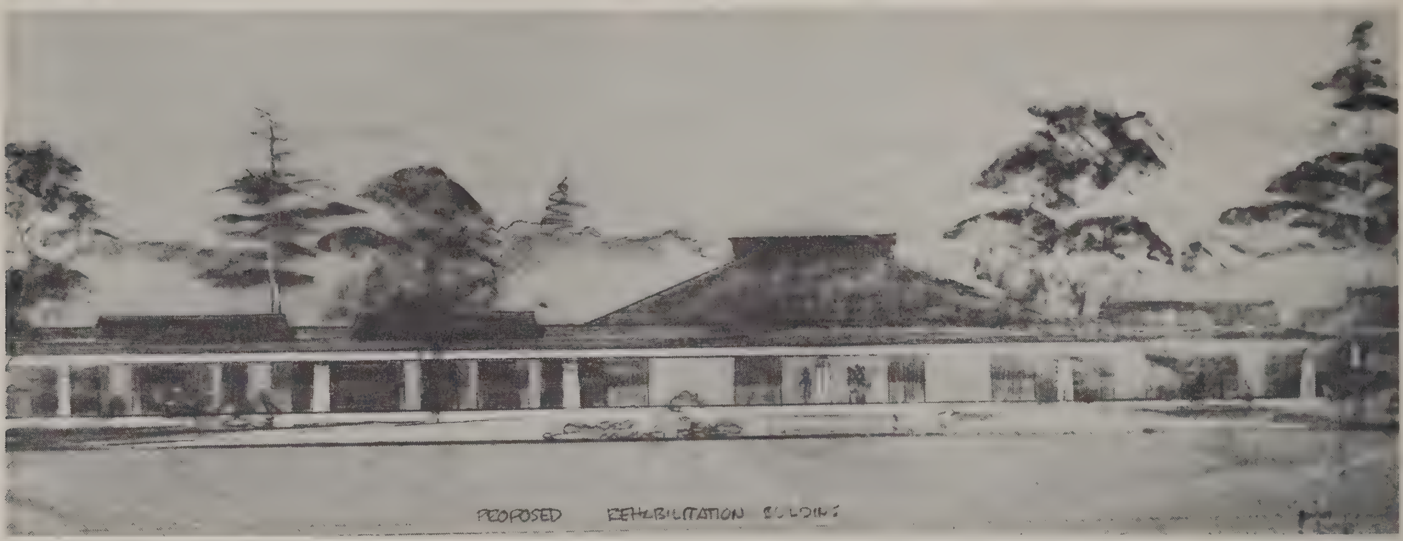
Dr. Earl A. Glicklich presented a paper written by himself and Dr. Lewis W. Kane entitled "The use of tetracycline and demethylchlor-tetracycline in the treatment of 590 cases of acne vulgaris" before the 4th Annual Meeting of the Noah Worcester Dermatological Society, held in Nassau, BWI, on March 23.

Dr. Robert S. Schwab went to the Island of Guam for the month of April. He had an appointment, under the National Institute of Neurological Diseases and Blindness, for research among the native Chamorros, in whom there is a phenomenal incidence of amyotrophic lateral sclerosis and a Parkinsonism-presenile dementia syndrome. His research included clarification of the electroencephalographic characteristics of patients and unaffected members of their families.

⁂

New addresses:

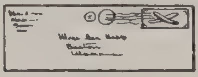
Dr. Scott Adler (sr. r.s. *Or.* 1959), 4105 Silver St., S.E., Albuquerque, N. M.
Dr. George B. Beaman (r.p. *Psychiat.* (*McL.*) 1936), 63 Nichols Rd., Cohasset, Mass.
Dr. Stanley Berlow (*C.M.* 1951), 710 E. Silver Spring Drive, Milwaukee, Wis.
Dr. Charles Boller (*E.M.* 1929), 267 Alexander St., Rochester, N. Y.
Dr. F. William Bora, Jr. (sr. r.s. *Or.* 1961), 15 Hannum Drive, Ardmore, Pa.
Dr. Willis H. Bower (r.p. *Psychiat.* (*McL.*) 1949), Colorado State Hospital, Pueblo, Colo.
Dr. Joseph L. Braudo (a.r.p. *C.M.* 1953), 904 Medical Center, Jeppe St., Johannesburg, South Africa
Dr. John F. Bresnahan (past Assistant Director), 4670 Pine St., Omaha 6, Nebr.
Dr. Robert N. Buchanan, Jr. (r.p. *D.* 1941), 706 Church St., Nashville, Tenn.
Dr. Sydney M. Bunker (past Assistant Director), 655 High St., Westwood, Mass.
Dr. C. Ethelyn Chapman (*An.* 1937), Veterans Administration Hospital, 13th and Harrison Sts., Oakland 12, Calif.
Dr. John S. Chase (*E.S.* 1940), 392 Pleasant St., Brockton, Mass.
Dr. ~~John~~ Josep F. Ciano (*Dn.* 1954), 1159 Hancock St., Quincy, Mass.
Maj. Gen. Richard Collins, MC, USA (*E.S.* 1933), 5111 8th Rd., South, Arlington 4, Va.
Dr. Charles D. Cook (a.r.p. *C.M.* 1949), Children's Medical Center, 300 Longwood Ave., Boston, Mass.
Dr. Thomas A. Devan (past Assistant Director), 325 19th Ave., N.E., St. Petersburg 4, Fla.
Dr. Carol C. Dickson (*M.* 1948 and *C.M.* 1949), 2 5th Ave., New York, N. Y.
Dr. Richard S. Dodge (a.r.s. *Or.* 1946), 4767 Kahala Ave., Honolulu, Hawaii
Dr. William L. Dunn (a.r.p. *Path.* 1960), University College Hospital Medical School, Gower St., London N.W. 1, England
Dr. John Q. Durfey (a. *An.* 1961), Kaiser Foundation Hospital, 2425 Geary Blvd., San Francisco, Calif.
Dr. Effie O. Ellis (*C.M.* 1951), 1514 Division St., Baltimore, Md.
Dr. James T. Fallon (*C.M.* 1925), 86 Whitmarsh St., Providence, R. I.
Dr. Harold J. Freedman (*C.M.* 1928), 454 Brookline Ave., Boston 15, Mass.
Marc A. Fried, Ph.D. (assoc. psychol.), Center for Community Studies, 50 Beacon St., Boston, Mass.
Dr. Leonard J. Friedman (*M.* 1956), 11 Huntwood Place, Mount Vernon, N. Y.
Mudlagiri K. Gaitonde, Ph.D. (a. biochem. (*McL.*)), Neuropsychiatric Research Institute, Woodmansterne Rd., Carshalton, Surrey, England
Dr. Alastair J. Gillies (a.r.p. *An.* 1952), 789 Howard Ave., New Haven, Conn.
Dr. Donald J. Glotzer (*S.* 1953), New England Medical Center, 171 Harrison Ave., Boston, Mass.
Dr. Lauren H. Goldsmith (*C.M.* 1923), 220 College Ave., Athens, Ga.



ARTIST'S SKETCH OF THE NEW REHABILITATION CENTER AT MCLEAN HOSPITAL

This building will provide for an admission unit, day-care program, civic center, coffee shop, Occupational and Recreational Therapy, art and music facilities, classrooms and meeting rooms, and office space for related professional services.

Dr. Charles P. Gore (a.r.p. *Psychiat.* 1952), Menston Hospital, Ilkley, England
Dr. John E. Gorrell (past Assistant Director), Electronic Associates, Inc., North Long Branch, N. J.
Dr. Lester H. Grant (a.r.p. 1957), Johns Hopkins University School of Medicine, 710 N. Washington St., Baltimore, Md.
Dr. John W. Grover (*S.* 1957), Boston Lying-in Hospital, 221 Longwood Ave., Boston, Mass.
Dr. Adolf L. Gundersen (*S.* 1950), Gundersen Clinic, 1836 South Ave., La Crosse, Wis.
Dr. Sigurd B. Gundersen, Jr. (*S.* 1949), Gundersen Clinic, 1836 South Ave., La Crosse, Wis.
Dr. T. Stewart Hamilton (past Assistant Director), Hartford Hospital, 80 Seymour St., Hartford 15, Conn.
Dr. Marlow B. Harrison (*E.M.* 1938), 2000 Van Ness Ave., San Francisco, Calif.
Dr. Donald Harting (*C.M.* 1947), USPHS. 330 Independence Ave., S.W., Washington 25, D.C.
Dr. William F. Havemeyer (a.r.s. 1948), 2509 E. Elm St., Tucson, Ariz.



A short but very welcome note has arrived from our past Chaplain—now The Very Rev. William B. Spofford, Jr., Dean of Saint Michael's Cathedral Parish in Boise, Idaho. Mr. Spofford enclosed a copy of his weekly Parish publication, in which he quoted from Dr. Jack E. Tetirick's letter, written from aboard the S.S. *Hope,* which appeared in the January issue of THE NEWS. Mr. Spofford says, in part:

> Just thought you would like to see that I'm plagiarizing from THE NEWS. We get homesick when it arrives. We are having fun, but it is sort of like trying to run General Motors. Much too busy.
>
> It is good to be back in pastoral ministry; but you have to take a lot that you are spared in chaplaincy. Also, you miss a lot of friends.
>
> Sorry to have missed the 150th celebration. Meet an occasional doctor round here who has had a course or so at M.G.H., and that makes it homey.

We received this note from Dr. James C. White:

> I am turning over the enclosed letter which has just reached me from Dr. Paul Spangler in Indonesia. It is one of the most fascinating surgical experiences I have read about for a long time.
>
> Paul Spangler was an H.M.S. classmate of mine, vintage 1923, and we both served as Interns on the Surgical Service here at M.G.H. during the next two years. He then went to Portland, Oregon, finally joined the Navy during World War II, and continued in the regular Naval Medical Corps. Now that he has retired, he has joined the S.S. *Hope* on its medical mission to the Far East.
>
> Use as much of the letter as you like, and please return the original to me.

Here is Dr. Spangler's letter:

> Dear Jim:
>
> Greetings from Indonesia! We are having a real trip out here and a wonderful experience. I thought it might be interesting to some back there to have a report.
>
> The last issue of the MGH NEWS which we have seen reported the fact that Jack Tetirick and I were aboard. What it did not tell is that all of the general surgeons we have had aboard are not only Harvard graduates but also MGH trained. No other school or hospital is as well represented as we are. This was by no design; but isn't it interesting that our surgeons would be the ones to respond to such a challenge as this. In the first group of rotators we had Jack Tetirick and John Ratcliffe. Now I am fortunate to have Dr. Tetirick's partner, Walt Haynes. Believe me, I am very fortunate and ever grateful to have three such fine associates with me on this venture. They are all men Harvard and M.G.H. can be proud of, and I am delighted to have them. I only hope their replacements will be up to their caliber. They are tremendous, not only professionally but they also have the personality and the devotion to the project which are so necessary in promoting goodwill and understanding which we are out here to generate.
>
> The clinical material here is unlimited and grandiose. The pathology is so neglected that everything which we have seen heretofore only in old textbooks is in the extremes here. It is fantastic. Dr. Haynes took out a parotid tumor today that weighed nearly three pounds. We see thyroids that literally hang down on the chest like supernumerary breasts. Fibroids the size of a term pregnancy. One ovarian cyst in a little woman weighed 48 pounds, and the poor girl had to lean over backward to ambulate. After her operation she had to learn to walk all over again. I had one lad with a lipoma of the back that made him look like the Hunchback of Notre Dame. And so it goes. Medically, besides the usual things we have at home, we see yaws, tuberculosis, malaria, leprosy, protein- and vitamin-malnutrition. They are making rapid progress in the control of yaws and it will soon be stamped out here by mass shots of penicillin. Leprosy they are handling well. They treat all but the most severe cases as out-patients and no longer make an effort to isolate them. There are thousands of lepers, but they can cure them now with the newer sulfones if the patients will stay with the treatment. They experience only about 5% recurrences in the arrested cases. They are making good progress in the control of malaria, too; but that is more difficult, as this is a big country and there is a lot of water to be sprayed and drained and there is lots of rain. Malaria is still a major problem and almost everybody has had it. It is still the great killer. We lost one of our crew who refused to take his antimalaria pills. Tuberculosis is a tremendous problem, and if anyone wants to study t.b., this is the place to do it.
>
> All the men who come out here are astounded at the pathology and the clinical opportunities that exist here. I am sure that if more people knew what a "ball" we are having, we would be swamped with doctors wanting to come out here. Dr. Walsh sends these men in the various specialties out here for periods of two or three months and, believe me, we keep them busy, for they are so badly needed by these people. One island we visited had one doctor for 500,000 people. We had our best stop there. Believe me, these people are really grateful to the S.S. *Hope* for giving them the opportunity to have their troubles attended to. Everywhere we go the need is most urgent. Many of the doctors here are well trained, but they are terribly handicapped by the lack of supplies and equipment and by the shortage of not only doctors but also of paramedical help.
>
> The people are most friendly and appreciative, and we have encountered nothing but the warmest pro-American feeling. People will stop us on the street and say "Amerika bagouse", which means "America, good, O.K." I know we are gaining in mutual friendship and understanding through the medium of health and the exchange of medical ideas and practices. It is all very much worth while and I only hope that a steady stream of young, ambitious Harvard and MGH men will continue to appear. If any are interested, have them call up Dr. Walsh in Washington, D.C. The telephone number is Metropolitan 8-3136. Tell them to call collect, and Dr. Walsh will put them on a plane and have them on their way.
>
> Give my best to all the old-timers still around.
>
> P.S. John Rock and Joe Meigs will be interested to know that choriocarcinoma is almost epidemic out here. One hospital had five cases in the house when we were there. We have had three on the ship. This high incidence has been only since 1952. These are the sorts of challenges we see all about us. Bladder stones very common, even in babies. You can scarcely believe what we see.

The News

No. 205 Boston, Mass. June 1961

THE ANESTHESIA LABORATORY IS TWENTY-FIVE YEARS OLD

On May 6, 1961, the Anesthesia Laboratory of the Harvard Medical School, at the Massachusetts General Hospital, was 25 years old. This quarter century has been notable for many developments in anesthesia. Some have made it less unpleasant for the patient and more satisfactory for the surgeon; some have made it safer, and a few have made heretofore impossible procedures possible. Leaving aside for the moment questions of safety, it must be agreed that it is far easier now for the less-than-expert anesthetist to give the surgeon satisfactory working conditions as far as surgical technique is concerned than it was a quarter of a century ago. At times this has seemed to be a mixed blessing; but improvement anywhere is reflected all along the line, and the expert who could, 25 years ago, give the surgeon as satisfactory conditions for his surgical performance as he now can, can today do it more easily. More safely? Eventually yes, and probably now, but the proof is not yet in. It is an ancient and regrettable tradition that violent controversies have raged, and still do, concerning anesthesia. The laboratory is the proper place for the resolution of many of them—not, as so often still is the case, through polemics.

This Laboratory was the first in the world to be established by an anesthetist and devoted solely to the study of anesthesia and its related problems. Its record has been published in 260 papers and several books, and in 11 languages: English, French, German, Italian, Spanish, Portuguese, Danish, Swedish, Greek, Russian, and Japanese. In other places many illustrious men have worked in this field: In 1799, 12 years before the founding of this Hospital, Davy, in Beddoes's Pneumatic Institution, carried out what A. J. Clark has called "a model of pharmacological research complete in all its stages" on nitrous oxide. Others who come easily to mind are Claude Bernard, H. H. and K. H. Meyer, Overton, John Snow, Warburg; the list is long and distinguished. And, more recently, Cullen, Dripps, Faulconer, Haugen, Dennis Jackson, Lundy, Papper, Waters, to name a few, and after them a still younger and impressive group. But the Laboratory here was *de novo* an anesthesia creation not only intellectually but physically, with the fine quarters (now crowded) we have occupied for a decade, paid for from private patients' fees.

It is evident that we and others have learned a great deal about the metabolic—and toxic—effects of anesthesia, about the "physiological trespass" of anesthesia, in John Gillies's memorable phrase. But anybody who has followed the literature knows that we are scarcely one whit further advanced in understanding the nature of the anesthesia process than Morton was when he carried out the first public demonstration of clinical anesthesia. With investigators like Linus Pauling turning their attention to this basic problem, it is likely that the next 25 years will have more to show than we now have. If, as I believe, the irritability of a cell—the response of a living cell to a stimulus—is the basic characteristic of life, then here is the central problem not only of anesthesia but of all biology, a problem deserving the attention of the ablest scientists.

For 15 years a principal interest has been to study the pain process as prototype for subjective responses in general. An understanding of the factors involved in the production and the relief of pain is essential to an understanding of anesthesia, for just as one cannot understand sleep without understanding wakefulness, I believe, one might gain insight into the anesthesia process by study of the problems of pain and its relief. (It is accurate to add that this view has not been universally held by my anesthesia colleagues over the country, but at least it has, after some stormy early years, been adopted by the pharmacologists.) As a long-time follower of Lord Kelvin's view that science has not been approached until one can place meaningful numbers in front of his observations, I have been interested in measuring subjective responses and, in particular, the quantitative effects of drugs on subjective responses. It was a puzzle years ago, and still is, why able pharmacologists would all agree that their proper field included study of the effects of drugs on the liver, or the kidneys, or the heart, but not on the mind. The situation is now changed. I would like to think that our Laboratory had something to do with this change. Here and there one can now find professors of neuropharmacology and committees on neuropharmacology who admit they are interested really in psychopharmacology (but they have been too shy so to label the matter). Progress continues, and it is now proper for pharmacologists to study the "psychotomimetic" agents. A principal interest of our Laboratory is in devising a quantitative approach to study of these fascinating but confusing agents. There is great and obvious relevance of such matters to anesthesia. Particularized as the Anesthesia Laboratory is, it does not stand apart from the fundamental biological sciences.

I like the symbolism one can draw from the fact that the first office of the Anesthesia Laboratory was in a windowless 7-by-9-foot room on an air-shaft in the attic of the Bulfinch Building, only a few yards from the room where Morton, after experimentation on one dog and several fish, made the first public demonstration of clinical anesthesia on an October morning in 1846. There are many places for laboratories, but for me the one in proximity to the sick man takes first place. This deep interest came to a public fruition in the recent series of Lowell Lectures—incidentally, the first event in the celebration of the Hospital's 150th Anniversary—on "Disease and the Advancement of Basic Science", wherein the view was set forth that for some kinds of advance in basic or conceptual science (its name is not important) one must go to the sick man. The fact that twenty of the busiest and most distinguished scientists in America enthusiastically participated in this venture of the Anesthesia Laboratory is proof that many thoughtful men share this view. The anesthetist has an extraordinary opportunity for significant studies in man; it is a pity that he so seldom utilizes it.

* * *

I gladly acknowledge that it was Dr. Edward D. Churchill, John Homans Professor of Surgery at Harvard University, who first had the vision of a scholarly approach to anesthesia in this Hospital. Whether or not his vision has been realized is beside the immediate point. His was the spark which ignited the tinder; how dully or brightly we have burned is for other men to judge in other years. Dr. Means, as well as Dr. Churchill, had a great deal to do with interesting me in respiration and this led quite naturally to my interest in anesthesia.

I am grateful for the wholehearted support of the Hospital's Trustees over the full 25 years. How is it possible that this group of men could have understood our needs so well, gathered as they were, and are, from the Church, the law, banking, and commerce, from men and women of affairs, with a distinguished scientist added only in recent years? I suspect that the answer lies in their perceptiveness and understanding of the Hospital and its needs as a whole, not in just this one Laboratory where, nonetheless, the need for their support has been crucial.

However brave the vision may have been, it could not have led to concrete events without money, and lots of it, supplied over many years by the Medical Research and Development Board of the

United States Army, the Air Force, the Public Health Service's National Institutes of Health, and the National Research Council through its Committee on Drug Addiction and Narcotics.

I am very proud to have in my study a photograph signed "From a long-time friend". Mr. Edward Mallinckrodt has been just that for many years, not only in the sums he has given our Laboratory each year, but in the warmth of his continuing interest in all things to do with anesthesia. It is quite possible that his unrestricted funds, freely given, have made the difference between success and failure of the Laboratory.

I cannot close these acknowledgments without mention of Charlotte Ford. Mrs. Ford over many years has kept me, by virtue of her unique knowledge of the history of anesthesia, from many a mistake. I am grateful to her.

It is impossible for me to express my debt to the extraordinary colleagues who have given life to this Laboratory over its 25 years. The record of their activities is here, in papers published; it needs no further comment from me. A few remarks may be added, however, for I should like to emphasize the inseparability of this Laboratory from our Clinical Department. The existence of the Laboratory has attracted better residents than we otherwise could have had. The best residents have brought problems to the Laboratory for solution. The result of this symbiosis is that, of the 172 residents and fellows trained clinically, 90 continue in academic institutions. Of these, 22 hold professorships, or the equivalent, in anesthesia in medical schools in Europe and in America. In addition, a source of strength to the Laboratory has been the considerable group who have chosen to work here, even though they never had any intention of becoming anesthetists. Of them, 14 now hold university professorships in fields other than anesthesia: 2 in anatomy, 1 in pharmacology, 1 in physiology, 2 in neurophysiology, 1 in biophysics, 1 in chemistry, 2 in medicine, and 4 in surgery.

Henry K. Beecher, M. D.,
Chief of the Anesthesia Service

* * *

JESSIE W. HARDING

(1880—1961)

The tall, regal figure of Mrs. Harding will no longer be seen in our corridors, but the remembrance of her vital personality will always be treasured here in the Massachusetts General Hospital.

Mrs. Harding was a volunteer at the Hospital from 1943 until the time of her last illness, early this year. Her record of service is an outstanding one. She was here on the job from nine to one, three days a week, fifty-two weeks in the year.

It was always a joy to meet her. She hailed some of us as "Sweetie" and others with a "Hi, there!" She very frequently had something amusing and interesting and pertinent to say. Fortunate were we who heard her funny stories—some of them a bit salty if she knew you very well, but never rude, and almost always with herself as the ridiculous butt of the joke.

I recall a question asked by one of the young Ward Helpers when Mrs. Harding was a volunteer in the Errand Service (formerly War Service). After Mrs. Harding had left the office for home one day, the young girl asked me, "Is it true that Mrs. Harding is the richest woman in Boston?" There was no time or reason for an answer at that time. But the answer today is, "Yes, in a very special way. And we, too, at the Massachusetts General will always be the richer for having had her with us."

She was never too busy to help solve the perplexities and problems of the many. Often, a lonely and bewildered person, lost in the maze of our corridors, has heard her ask," Where do you want to go?" or "What can I do for you?" Her questions were always to the point and her directions or explanations always clear and concise.

When more help was needed in the X-ray Department on White 2, Mrs. Harding was one of the first to suggest that the Volunteers meet this need and solve the difficulties. Their duties were manifold, and everyone in the Department will always remember their help.

Mrs. Harding gave unselfishly of her time and effort and was always ready to give kind and understanding comfort to anyone who might be troubled or in pain. She was loved and respected by all who knew her, and she will be greatly missed.

M. W. A.

The Board of Trustees, at their meetings on March 31, and April 14 and 28, voted:

That Dr. A. Earl Walker, Professor of Neurological Surgery at Johns Hopkins, be invited to be Chief of Service Pro Tempore during the first week of May 1961, and that he also be asked to give a Richardson Lecture while here.

To appoint:

Dr. Arthur K. Asbury as Assistant Resident in Pathology, assigned to Neuropathology, for one year, beginning July 1;

Dr. Edward P. Baker, Jr. as Junior Resident on the Neurosurgical Service, assigned to the Boston V.A. Hospital, beginning July 1;

Dr. Bob Bullwinkel as Assistant Resident in Anesthesia, beginning May 15;

Dr. Sheldon Cooperman as Clinical Fellow and Acting Resident in Pathology for one year, beginning July 1;

Dr. T. Corwin Fleming as Clinical Fellow in Neuropathology for one year, beginning July 1;

Dr. Jónas Hallgrímsson as Clinical Fellow in Pathology for one year, beginning July 1;

Dr. Peter R. Huttenlocher as Exchange Assistant Resident on the Children's Service, for the period April 11 through May 21;

Dr. Kewal K. Jain as Clinical and Research Fellow in Neurosurgery for one year, beginning July 1;

Dr. Herman M. Kalckar as a permanent ex officio member of the Committee on Research;

Dr. David M. Klein as Clinical Assistant in Neurosurgery, for the period May 1 through December 31, this appointment to run concurrently with his appointment as Resident in Neurosurgery;

Dr. Robert W. Lukens, Jr. as Clinical Fellow in Orthopedic Surgery, for the period May 15 through June 30;

Dr. William T. McCoy as Clinical Fellow in Radiology, retroactive to January 1, to act as Resident in Radiology;

Dr. Alexander M. McPhedran as Resident on the Neurology Service for one year, beginning July 1;

Dr. Denis R. Miller as Exchange Assistant Resident on the Children's Service, for the period May 22 through June 30;

Dr. Carl V. Moore as James Howard Means Visiting Physician, for the week of April 17;

Dr. Robert G. Ojemann as Assistant in Neurosurgery, beginning May 1;

Dr. Beale H. Ong as Third Assistant Resident in Surgery for one year, beginning July 1;

Dr. Arthur L. Prensky as Clinical Fellow in Neuropathology for one year, beginning July 1;

Dr. Edwin W. Salzman as Assistant in Surgery, effective July 1, and that he be granted a Dalton Scholarship for the period July 1, 1961 through June 30, 1962;

Dr. William H. Tingey, Jr. as Assistant Dental Surgeon at McLean Hospital;

Dr. Herman Turndorf as Assistant in Anesthesia, beginning September 1;

Dr. Karl H. Wegner as Clinical Fellow and Acting Resident in Pathology for one year, beginning July 1.

At their meetings on March 15, during April, and on May 3, the General Executive Committee voted:

To promote:

Dr. Khalil Abi-Torbey to the position of Resident in Urology for one year, beginning July 1;

Dr. Alphonse M. Prus to the position of Chief Resident in Anesthesia, beginning April 1.

To extend the appointments of:

Dr. Dorothy E. Ford as Clinical Fellow in Physical Medicine, from July 1 through August 31;

Dr. Hans Hacker as Clinical and Research Fellow in Neurosurgery, from August 1 through December 31.

To reappoint:

Dr. Barry G. W. Arnason, with a change of title to Clinical Fellow in Neurology, to act as Resident in Neurology, for one year, beginning July 1;

Dr. Monroe Cole, with a change of title to Clinical and Research Fellow in Neurology, for one year, beginning July 1;

Dr. John Hedley-Whyte as Clinical Fellow in Anesthesia for one year, beginning July 1;

Dr. John B. Isom, with a change of title to Clinical and Research Fellow in Neuropathology, for one year, beginning July 1;

Dr. Richard T. Johnson, with a change of title to Clinical Fellow in Neurology, to act as Resident in Neurology, for one year, beginning July 1;

Dr. Earl F. Jordan as Assistant Resident in Neurosurgery, but assigned to Neuroradiology, for the period July 1 through December 31;

Dr. Guy M. McKhann, with a change of title to Clinical Fellow in Neurology, to act as Resident in Pediatric Neurology, for one year, beginning July 1;

Albert F. Parlow, Ph.D. as Research Fellow in Biology, in the Department of Surgery, for one year, beginning March 1;

Dr. Ernest H. Picard, with a change of title to Clinical and Research Fellow in Neuropathology, for one year, beginning July 1;

Dr. Vincent W. Steward, with a change of title to Clinical Fellow in Neuropathology, for one year, beginning July 1;

Dr. William L. Strickler as Assistant Resident in Urology for one year, beginning July 1;

Dr. R. Lewis Wright as Assistant Resident in Neurosurgery, assigned to the private service, for the period April 1 through December 31;

Dr. Gilbert F. Young, with a change of title to Clinical Fellow in Neurology, to act as

Resident in Pediatric Neurology, for one year, beginning July 1.

To appoint:

Dr. Yoshitaka Shimizu as Research Fellow in Medicine for one year, beginning October 1;

Dr. Nicholas T. Zervas as Senior Resident in Neurosurgery, assigned to the Boston V.A. Hospital, for the period May 1 through December 31.

This interesting address was delivered a short time ago, at a meeting of the Advisory Committee to the Volunteer Department of the Hospital, by Mrs. C. Chauncey Gray of the Vincent Club.

THE VINCENT CLUB—ITS AIMS AND PURPOSES

The Vincent Memorial Hospital is considerably your junior, it being a mere seventy years ago that Phillips Brooks consecrated the ten-bed Vincent Memorial Hospital around the corner on Chambers Street. The then Board of Managers was called the Working Committee, and, incidentally, one of its members was Mrs. John Lowell, whose daughter, Mrs. Augustus Thorndike, is a member of the Vincent Hospital's Board of Managers today. The purpose of the Working Committee was the same as that of the present Board of Managers: the care and comfort of the patients. In the past, the ladies of the Working Committee gave most generously of their time in visiting patients, and in gifts to the Hospital. There were many other contributors in those early days. Miss Caroline Staples, one of the Vincent Hospital's earliest benefactors, gave us two and a half tons of coal in February of 1892; the "Young Ladies in Dedham" sent four flannel nightingales and six wash cloths; the Young Men's Christian Union contributed fifty-six tickets for streetcar rides and twenty-six harbor trip tickets for invalids. The list of gifts is long. Those from its most important contributor, the Vincent Club, were listed separately.

The Vincent Memorial Hospital's first annual report stated that the Vincent Club had been formed in March of 1892, with the aim of helping the Hospital. The instigator of the Vincent Club and for many years a member of the Hospital's Working Committee was also the young woman "with whom the idea first originated of founding and naming this Hospital in memory of the beloved actress, Mary Ann Vincent of the Boston Museum Stock Company; by her untiring efforts she raised much of the first money subscribed to it and was a faithful friend to the Hospital for many years". These phrases are engraved on the brass plaque directly opposite the door to the Vincent Club Room on the first floor of the present Vincent Memorial Hospital. The lady, Miss Lucy Derby, later Mrs. S. R. Fuller, was a woman with many friends and interests. She was active as a member of the Board of the Trinity Church Dispensary, from which this Hospital is an outgrowth, was an intimate friend of Phillips Brooks, and also had many friends in the theatrical world, including Edwin Booth and E. A. Sothern, whose son, E. H. Sothern, was her godchild.

In the winter of 1892, she brought together a small group of young girls to discuss the possibility of a club, its purpose to be the support of the Vincent Memorial Hospital. By March 25 of that same year, they were ready for their first formal meeting. A constitution was accepted, officers were elected, and the sixty-three charter members of the Vincent Club were ready to roll. Included in the second annual report of the Hospital, in 1893, is a report from the Vincent Club which says, in part: "The object of this Club shall be to give two or more entertainments annually to raise funds in aid of the Vincent Hospital." . . .

Now, I want to make one thing quite clear. The Vincent Club is not quite the usual hospital auxiliary. The first indication of this appears in the Hospital's fourth annual report in 1895, when the Club was barely three years old: "Some confusion having arisen in the public mind regarding the connection of The Vincent Club and the Hospital, the Club wishes to state that it is an entirely independent body, organized solely to benefit the Hospital, but unconnected with its management and working as a free agent for a good cause, without being responsible to the chief organization in any way." These remarks are softened by the final paragraph, when the Club says: ". . . It wishes to acknowledge the courtesy of the Vincent Memorial Hospital managers in kindly printing this brief report and the following lists." These were the lists of officers and members. Several years later, a member of the Board of Managers of the Vincent Memorial Hospital became President of the Vincent Club, and from then on the President of the Club has remained an ex officio member of the Hospital's Board of Managers. The officers and roster were printed in the Hospital's annual report until 1918. That year the Club's report was extremely brief: "In December, 1917, the Treasurer sent $500 extra to the managers for immediate expenses." . . .

The Club now has a membership of over 1700, 300 of whom live outside Greater Boston—by which I include Europe, Asia, and Africa. There is another group of about 500 who are still in college or graduate school. Others of our members are quite elderly; two of the original members died during the past year. To all of the inactive members we are most grateful, in that they maintain their membership—the $10 of their $15 going directly to the Hospital, while the remaining $5 is used for the general operating expenses and maintenance of the Club's headquarters.

To paraphrase Lerner and Loewe: What do the active folk do? First, they may become advisors to the 100 provisional members who are required to secure a certain number of advertisements for the Vincent Show program. Last year the program contained 440 pages, with over 1200 advertisements. These new members are not experienced saleswomen, and the mechanics of space, types, line cuts, and halftones need clarification. An additional requirement is that each provisional member must visit the Vincent Memorial Hospital, it having been arranged that someone will show her about. Still other members are needed to follow up and procure the advertising contracts that some of the provisionals are unable to complete during their brief time away from college. Incidentally, this provisional group procured nearly $15,000 of last year's total of $40,012 in advertising contracts. The advertiser's copy must be collected and sometimes even prepared for the printer. Then there is the job of proof reading, editing, and preparing the dummy for our telephone book. Typists are needed to type indexes, both alphabetical and classified. And, finally, there must be girls who sign up to sell these programs at the Show, and, later, others to deliver a program, with cuts, if any, to each of the 1200 or so advertisers. . . .

Tryouts are approximately five weeks before the opening curtain. It is then that the Third Vice President, in charge of public relations, gets into full speed, although many dates for feature articles, rotogravure, and society spreads, together with magazine articles, have already been lined up. Radio and TV interviews also are arranged.

The costume chairman and her committee take over the back room, for measuring, sewing, and pinning. The Scenery Committee designs and paints scenery, while the Property Committee scours the countryside for props. Its plea "Where can I find . . .?" is almost always answered successfully—one advantage of a large membership. . . .

In 1960 the Club equalled its previous year's gift of $45,000 to the Vincent Memorial Hospital. Since 1893 it has contributed $1,156,630, not including many gifts of equipment and supplies.

While continuing to function as a separate entity, one of the pleasantest occasions on the Club's calendar is a cooperative venture with the Hospital's staff. The House Committee is galvanized into action in early September, and fall cleaning is rushed through in order to be ready for the Club's annual cocktail party for the fifty doctors attending the Harvard Medical School's Postgraduate Course in Gynecology, given at the Vincent Memorial Hospital. The members of the Club's Board of Managers serve as both caterers and hostesses, and naturally are only too delighted to show off their Club house to these doctors who come from all over the world and who are given this opportunity to meet with their faculty, headed by Dr. Francis M. Ingersoll, and Dr. Howard Ulfelder, the Chief of Staff.

A portrait of Dr. James C. White, painted by Arthur Polonsky, was presented to the Hospital on Saturday afternoon, May 6. Drs. Jost J. Michelsen, H. Thomas Ballantine, Jr., and William H. Sweet had arranged for a simple unveiling ceremony in the Ether Dome in the name of a large group of Dr. White's former neurosurgical residents and fellows, associates on the Staff, and Harvard Medical School classmates, who had contributed toward the portrait.

Representing the donors were a number of MGH alumni and former fellows from out of town, including Drs. William B. Scoville of Hartford, Connecticut; Raymond M. P. Donaghy of Burlington, Vermont; Jack L. Ulmer of Richmond, Virginia; William J. James of Ventura, California; Howard J. Bagnall of Ottawa, Canada; John D. McQueen of Baltimore, Maryland; Alfred J. Luessenhop of Washington, D.C.; Richard L. Rovit of Montreal, Canada; and Edgar L. Gasteiger, Jr. of Rochester, N. Y. Among the guests were also members of the Society of Neurological Surgeons, who had just concluded their annual meeting in Boston with Dr. White as host.

Dr. Sweet introduced the speakers. Dr. Stanley Cobb gave an account of Dr. White's contributions to the Hospital and to the field of neurosurgery. Mr. Polonsky spoke of his rewarding experience in painting the portrait. After the unveiling, Dr. White mentioned with appreciation the pleasant hours of conversation with the artist while the painting progressed, and also the deep satisfaction he has derived from his 35 years on the Surgical and Neurosurgical Services here. Finally, Dr. Churchill, as Chairman of the General Executive Committee, accepted the portrait for the Hospital.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material*, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it.

The following new titles have been received:

Anesthesia

Levy, M. L., Palazzi, H. M., Nardi, G. L., and Bunker, J. P.
Hepatic blood flow variations during surgical anesthesia in man measured by radioactive colloid.
Surg. Gynec. & Obst. 112:289.

Behavioral Sciences

Farnsworth, D. L.
Mental health education: Implications for teachers.
Teachers College Record 62:263.

Laboratory Science

Jeanloz, R. W.
3, 6-di-*O*-methyl-D-glucosamine hydrochloride (2-amino-2-deoxy-3, 6-di-*O*-methyl-D-glucose hydrochloride).
J. Organ. Chem. 26:905.

Schmid, K., and Bürgi, W.
Preparation and properties of the human plasma Ba-α_2-glycoproteins.
Biochim. et biophys. acta 47:440.

Stearns, D. K., Naves, R. G., and Jeanloz, R. W.
3, 6-di-*O*-methyl-D-galactosamine hydrochloride (2-amino-2-deoxy-3, 6-di-*O*-methyl-D-galactose hydrochloride).
J. Organ. Chem. 26:901.

General Medicine

Smith, L. H., Jr., Sullivan, M., and Huguley, C. M., Jr.
Pyrimidine metabolism in man. IV. The enzymatic defect of orotic aciduria.
J. Clin. Invest. 40:656.

General Surgery

Kestens, P. J., Farrelly, J. A., and McDermott, W. V., Jr.
A technique of isolation and perfusion of the canine liver.
J. Surg. Res. 1:58.

McDermott, W. V., Jr.
Coma hepaticum.
In Proceedings of the International Congress of Gastroenterology, Leyden, 1960.

McDermott, W. V., Jr., Palazzi, H. M., Mondet, A., and Nardi, G. L.
Elective portal systemic shunt: An analysis of 237 cases.
New England J. Med. 264:419.

Nursing

Sleeper, R., Clark, D. A., Churchill, E. D., Bauer, W., and Lindemann, E.
Nursing's contribution to a famous Hospital: To the Hospital's progress, Ruth Sleeper; To hospital administration, Dean A. Clark; To the character of the Hospital, Edward D. Churchill; To the medical patient and medical research, Walter Bauer; To psychiatry, Erich Lindemann.
Nurs. Outlook 9:276.

Physiology

Wurtman, R. J., Roth, W., Altschule, M. D., and Wurtman, J. J.
Interactions of the pineal and exposure to continuous light on organ weights of female rats.
Acta endocrinol. 36:617.

Radiology

Dreyfuss, J. R.
The Department of Radiology at the Massachusetts General Hospital.
Bull. Soc. Nationales Radiol., Centre Antoine Béclere 10:1.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

Anan'yev, M. G.
New Soviet surgical apparatus.
New York, Pergamon Press, 1961.
(23H)

Anfinsen, C. B. (Editor)
Advances in protein chemistry, vol. 15.
New York, Academic Press, Inc., 1960.
(5B)

Anfinsen, C. B.
Molecular basis of evolution.
New York, John Wiley & Sons, Inc., 1959.
(2Am)

Bloch, K. B. (Editor)
Lipide metabolism.
New York, John Wiley & Sons, Inc., 1960.
(5D)

Boyd, W.
Textbook of pathology, ed. 7.
Philadelphia, Lea & Febiger, 1961.
(8A)

Boyer, P. D. (Editor)
The enzymes, vol. 5B.
New York, Academic Press, Inc., 1961.
(5C)

Directory of medical specialists, vol. 10.
Chicago, Marquis—Who's who, 1961.
(1A)

Elek, S. D.
Staphylococcus pyogenes and its relation to disease.
Edinburgh, E. & S. Livingstone Ltd., 1951.
(9A)

Gordienko, A. N. (Editor)
Control of immunogenesis by the nervous system. Translated from the Russian by A. Hofman.
Rostov-on-Don, Medical Institute, 1958.
(8G)

Hall, V. E. (Editor)
Annual review of physiology, vol. 23.
Palo Alto, Annual Reviews, Inc., 1961.
(4A)

Harris, R. S., and Ingle, D. J. (Editors)
Vitamins and hormones, vol. 18.
New York, Academic Press, Inc., 1960.
(5N)

Kavetskii, R. E. (Editor)
The neoplastic process and the nervous system. Translated from the Russian by J. Styr.
Kiev, State Medical Publishing House, 1958.

Ciba Foundation Symposium on Adrenergic Mechanisms.
Boston, Little, Brown and Company, 1960.
(5M)

Wolstenholme, G. E. W. (Editor)
Metabolic effects of adrenal hormones. (Ciba Foundation Study Group No. 6)
Boston, Little, Brown and Company, 1960.
(5K)

Brief bits:

Dr. Benjamin Castleman was the guest speaker at the 50th Jubilee Annual Meeting of the Japan Pathology Society, held in Tokyo during the first week of April. He also visited and lectured at the Nihon, Keio, and Jikei Universities, all in Tokyo, and conducted a Seminar before the Japanese American Society of Pathology. Outside Tokyo, he visited and lectured at the Osaka, Kyoto, and Kyushu Universities. During the two and a half weeks' stay in Japan, Dr. and Mrs. Castleman were royally entertained and given the full VIP treatment. Before returning to Boston, Dr. Castleman attended the meeting of the International Academy of Pathology, held in Chicago, where he was inducted as President.

Dr. Edwin F. Cave delivered four lectures during the period of April 20 to 24—one at the Postgraduate Course in Fractures and Other Trauma at the American College of Surgeons meeting in Chicago, two before the Texas Medical Association and Texas Orthopedic Association in Galveston, and a fourth before the Houston Orthopedic Club in Houston. His subjects were "Management of nonunion of long bones", "Injuries to the ankle", and "Knee derangements in the middle aged or older adult".

Dr. Earle M. Chapman gave a lecture on "The treatment of hyperthyroidism" at the Albany College of Medicine on April 6.

Dr. Reed Harwood lectured on "Diabetes" at the Centro Medico in Guatemala City on April 26.

From April 8 until April 15, Dr. William V. McDermott, Jr. participated in the newly established Visiting Professors Program at St. Joseph Hospital in Lancaster, Pennsylvania, and at Hamot Hospital in Erie, Pennsylvania. He spent several days at each hospital. On April 22, Dr. McDermott was guest speaker at a Senior Seminar of the University of Pennsylvania. His subject was "Cirrhosis and hepatic insufficiency".

Dr. J. Howard Means served as Visiting Professor, April 3 through 7, at the University of Illinois College of Medicine, in Chicago. On the way back he spent a day at the University of Rochester, Rochester, N. Y., visiting with Dr. Robert L. Berg and lecturing to the first year medical class on "Social and economic problems of medicine". Dr. Means took off again on April 13 for New Haven, where he gave the first Sigerist Lecture at the Yale University School of Medicine. His subject was "Urgent tasks confronting medicine". This lecture was sponsored by The Yale Medical Democrats—a student society which greatly admires the late Dr. Henry E. Sigerist.

Dr. Laurence L. Robbins was guest speaker at the 94th Annual Session of the Texas Medical Association, held in Galveston on April 24 and 25.

Dr. Byron H. Waksman delivered a lecture at the Annual Meeting of the American College of Physicians, held in Miami, Florida, on May 9. His subject was "Autoimmune mechanisms in disease". From June 25 to 28, Dr. Waksman will give a course at the University of Vermont on "Horizons for research in neuropathology", sponsored by the Pathology Study Section of USPHS. He will also speak on the subject "Immunologically induced demyelinating disease".

This interesting letter has come from Dr. Reed Harwood:

I recently went on an unusual mission to St. Croix, Virgin Islands, and I thought it of sufficient interest to report it to you. Perhaps you might want to use it in THE NEWS.

Early in March, I was consulted by the relatives of a seventy-two-year-old patient of mine who had fallen ill in St. Croix and had been hospitalized there with a serious illness. There were several features of the case, not the least of which were the anxiety of his relatives and my long association with the family, to make me wish to help out if I could. I had a long-distance telephone talk with the doctor in charge down there, who felt that the patient had acute congestive heart failure and some pneumonitis which was perhaps secondary to malignancy of the left lower lobe of his lung. It seemed to me that the local physician, a Dr. Evans, was doing everything possible under the circumstances, but that the situation, nevertheless, was deteriorating. The patient had become restless, confused, and disoriented. Before deciding to accompany the patient's daughter to St. Croix, I had to assure myself, first, that he was not moribund and, second, that he was not getting well; and because the local doctor was not available until ten minutes before flight time, I was obliged to make my decision from a phone booth at the Logan Airport. There, it was apparent that the patient's condition fell between these two extremes and that the family badly wanted me to go—so I went.

We spent the night at San Juan, Puerto Rico, and took an early plane to St. Croix. The son, who had already flown down and had been on duty with his father for seventy-two consecutive hours, seemed in good shape and took me promptly to the hospital—the Charles Harwood Memorial Hospital. When I saw the name of the hospital, I could not but feel that this was a good omen. The son left me in the car while he went in to see if Dr. Evans was there, and returned, saying that Dr. Evans was conducting his weekly Friday morning Grand Rounds and would very much like to have me join him.

Grand Rounds at the Charles Harwood Memorial Hospital are quite different from those at the M.G.H. They constitute a quick review of the important cases in the hospital at the moment. The doctor in charge leads the group into the patient's bedroom, where a simple introduction to the patient takes place. The doctor in charge then presents the salient features of the case outside the patient's closed door and a brief discussion follows, after which the group moves quickly on to the next case. In this way twenty or thirty cases are covered in the space of a couple of hours. I was interested to note that my opinion was not sought on a single case, but the group was very eager to show me that it was alert and took its job seriously. These doctors were glad to answer my questions, and I found that they were treating a good many conditions which I do not encounter in Boston, among them, filariasis, of which they still have a few—a very few—cases. It happened that they were having a mild epidemic of hepatitis at the time. The cases were widely spread geographically and no contact had been established between the various victims.

I found that I quickly tired on Grand Rounds, what with my long flight and only four hours of sleep. I was also quick to discharge my jacket, which someone unobtrusively hung up in a safe place, and to loosen my collar and roll up my sleeves, thereby approaching in costume that of the rest of the group. From this you can gather that in St. Croix that morning it was both hot and humid.

The relatives of my patient did not seem to mind the delay in examining him. I myself felt that the delay was justified and that the good will established thereby between the doctors and me would prove to be invaluable (as indeed it did). When the group had dispersed, Dr. Evans and I together examined my patient most thoroughly and, though our conference was interrupted countless times because Dr. Evans is a much-harried Commissioner of Health and Chief of Service and private practitioner, it was productive. The patient's mental state was somewhat improved, he was afebrile, but he had signs not only of fluid at the left base but of compression of the lung on that side. The X-ray showed a solid mass with a smoothly rounded contour in the left costophrenic angle and the rest of the left lung field was quite hazy.

Unfortunately, I had neglected to bring with me Dr. Stanley Wyman or some other radiologist on the MGH staff; and the local radiologist was making the rounds of the islands and would not be back on St. Croix for several days. By chance, I recalled at this point the old radiological trick of taking a PA view of the chest with the patient lying on his left side, and demonstrated to everyone's satisfaction that the "solid mass", obeying the well-known rule that water seeks its own level, had moved up toward the apex. That afternoon Dr. Evans made three unsuccessful attempts to withdraw fluid from the left pleural cavity. He was about to give up when I prevailed upon him to try a final tap closer to the spine and a little higher up. I was sure that fluid was present and that very likely, in addition, there was an empyema. We were gratified to strike "pay dirt" on the fourth attempt: pus was encountered immediately and 10 ml. was withdrawn for bacteriological tests. Subsequently, Dr. Evans was able to withdraw 500 ml. of straw-colored fluid, and a considerable improvement in the patient's respiratory exchange resulted. Despite this, his condition remained unsatisfactory, the chief difficulties being tachycardia, spells of disorientation with some hallucinations, and an obvious need for continued oxygen therapy. Three days later the X-ray maneuvers were repeated and it was again demonstrated that fluid was present, though there was less than on the previous X-ray. Again, several unsuccessful attempts at tapping it were made—this time by a Dr. Karell, a former professor of surgery in Estonia. However, when he finally placed the patient on his left side and tapped higher near the spine, 300 ml. of straw-colored fluid was easily removed. The cultures of both fluids proved that the infection was due to staphylococcus which was sensitive to Staphcillin, but to no other antibiotic. This drug was exhibited immediately in doses of 1 gram intramuscularly every four hours. Despite this, the patient continued to need oxygen, ran a high white count without any fever, and looked like a sick man. When he was removed from the oxygen tent, he quickly became cyanotic, with elevated pulse and respiration—all of them relieved when he was returned to the tent.

We now had to decide if the patient needed a thoracotomy and drainage of his empyema cavity, and if he could survive the trip either to San Juan (where facilities for such procedures are available) or to the M.G.H. It was a difficult decision for Dr. Evans and me, but we finally decided that the patient could safely be brought to Boston if proper precautions were taken. Emergency oxygen equipment was provided for the trip in a four-seater Piper plane to San Juan and for the trip from New York to Boston by private plane. On the jet flight from San Juan to New York a large tank of oxygen was roped underneath the patient's seat and the plane flew at a level of 31,000 feet with the cabin pressurized for 6,000 feet. There was a rule that no one might smoke while the oxygen apparatus was in use, but for the comfort of the passengers, I stopped the oxygen for about ten minutes out of every forty minutes. The cooperation of the captain and the crew and the 100 passengers left nothing to be desired; and at my request toward the end of the flight, one of the pretty hostesses blushingly made an impromptu speech over the squawk-box, thanking the passengers for their cooperation and patience.

During the oxygenless minutes, my patient's pulse and respirations went up perceptibly and he became moderately cyanotic. This was quickly relieved as soon as the oxygen was resumed. He tolerated the arduous eight-hour trip from the Charles Harwood Memorial Hospital to the Phillips House remarkably well and, at this writing, is steadily improving.

There are several additional observations which I'm sure will be of interest to your readers. First of all, I noted that where racial discrimination does not exist, the relationships between black and white can be normal and natural. I took an instant liking to Dr. Evans, who is a Negro, and to several others on his staff, and, I'm glad to say, they reciprocated these feelings. I could put my hand on Dr. Evans's shoulder unaffectedly, unself-consciously, and without any feeling of condescension. My relationships with the staff and the nurses and the laboratory were uniformly friendly. Everybody was cooperative in every possible way, and was eager to carry out any suggestions which I wished to make—and I made them as tactfully as possible.

The doctors are mostly Negroes, and have had a variety of training, but all are earnestly and diligently coping with the problems of their Island and its 13,000 inhabitants. They have all but stamped out filariasis and they have the ambition to eradicate tuberculosis. The people are becoming used to the advantages of good medical care, so that now they prefer to have their babies in the hospital and are willing to stand (since there are not even hard benches) in the corridors of the ambulatory clinic, which is even more crowded than our own. Their laboratories, like ours, are much overworked. They are run by a Miss Jardine, 62, white, who used to work at the Hitchcock Clinic in Hanover, New Hampshire, and then at the Hinton Laboratory in Boston, and who went to the Virgin Islands to retire. Judging from what I saw, she has another eight or ten years of hard work ahead of her.

There is a shortage of nurses on St. Croix. They are willing and sensible and good-natured. For a case like my patient, special nurses are not obtainable. He was "specialled" by his devoted son, a most level-headed, intelligent manufacturer whose dedication to his father should be an example to the relatives of patients brought to the Baker Memorial or the Phillips House. Once he reluctantly allowed me to be his father's special nurse for a period of three hours. For the most part, the son was "spelled" for brief periods by his sister; and the only night that I caught him off duty was the night he elected to sleep in the bed beside his sister, who was suffering from an attack of pancreatitis, while I was enjoying a respite.

Several of the doctors were political refugees. I have mentioned Dr. Karell, who performed the second chest tap with the utmost skill and patience. Another was a Dr. Por from Budapest. One night when I was nearly fainting from fatigue, he gave me an account of the retreat of the Hungarian Army which occupied a 100-mile sector of the Stalingrad front during World War II—a retreat which took place on foot, with the temperature at forty degrees below zero. He also told how his wife nearly lost her life in the bombing of Budapest, when a girder from another building was hurled into their patio a moment after she had crossed it. And, finally, he told me of his hair-raising escape to freedom when the Russian tanks returned during the revolt of 1956. He is Chief Resident there at the Charles Harwood Memorial, but back in Budapest, with the degrees D.M.D. and M.D., he had a thriving dental practice—a fact which today he prefers not to have advertised. He found that in order to get a license to practice dentistry outside Hungary, he would have had to undertake a great deal more training; whereas, by becoming a medical house officer, he was able to shift without trouble into a new and gratifying field. He is in his fifties, and is very humble about his ability to speak English, but I thought he did very well. I utilized his previous dental experience by having him treat my patient's daughter, who had ulcers on either side of her tongue and was very uncomfortable.

As might be expected, the cost of medical care is considerably less in the Virgin Islands than it is in Boston. The hospital in St. Croix is government-supported because the government is greatly interested in improving the conditions of the Islanders. Like other hospitals the world over, the Charles Harwood Memorial Hospital has its financial problems. For example, Dr. Evans was unable to obtain an auxiliary power plant, so necessary to the operation of any hospital (particularly one where the power keeps failing), until he had been appointed Commissioner of Health. He is very proud of the plant and gets a pleasurable excitement every time he hears it start. He is adding a wing to the hospital and in every way is trying to improve the facilities and the

Members of our Dental Staff—1961

services which can be rendered. I was much impressed by the efforts he is making, the demands on his time, and the responsibilities which he could share with so few people.

Your readers may also like to get a bit of warning from me. They should never drink a Planter's Punch without first making sure that their fluid losses have been replaced. I was appalled at what *one* Planter's Punch did to me, and only later that first day did I realize that there were certain unmistakable signs of fluid deficit from sweating, and that the alcohol in the Planter's Punch must have been absorbed as avidly as was the water in the drink. I stayed on my feet, but just barely.

This letter has come from Dr. James A. Halsted (*W.M.* 1932):

On June 1, I am leaving the office of the Vice President of the University of Kentucky Medical Center to take the position of Chief of the Department of Medicine of the Metropolitan Hospital and Clinics, which provides service for members of the Community Health Association of Detroit. This is a prepayment group health plan which is now getting under way after a considerable time of careful planning. My home address will be 32766 Bingham Lane, Birmingham, Michigan; office address, Metropolitan Hospital, 1800 Tuxedo Avenue, Detroit 6, Michigan.

I have not been receiving The News, presumably because I did not answer your kind note of September 22, requesting that I write you something for your paper regarding my experiences in Iran—a letter I have had in a "pending" file for such a long time I am afraid that anything I might write now would be out of date. I would, however, like to receive The News again at the above home address after June 1. [Dr. Halsted allowed his subscription to The News to expire, but it is now renewed. We still would like to have him tell us about his experiences in Iran. It is not too late.—Editor]

Dr. Frederick T. Hatch handed over to us this letter from Dr. Chiu-an Wang (*W.S.* 1944) which, as Dr. Hatch says, shows the "long reach" of The News.

I read with great interest your account which appeared in the March issue of The News on the work you and your associates have undertaken in the Arteriosclerosis Unit at the General. It suddenly dawned upon me that I must write you this note and tell you about some of the observations I have made from the work I have been doing out here.

First, arteriosclerosis is not a common disease among the average Chinese of any age or either sex. But it is fairly commonly encountered among the people of the higher social economical standing, such as business executives, bankers, etc.

Thrombosis, especially postoperative venous thrombosis, is very rarely encountered. I have not found one single case in all these years among the hundreds of my surgical patients.

Total cholesterol is as a rule very low among the average Chinese, but it is high, usually over 250 mg. per 100 ml. among the better-off group. I found that the average figure for the average Chinese is below 150 mg. per 100 ml. quite frequently.

Vegetarians and Buddhist priests showed practically no evidence of hypertension or arteriosclerotic heart disease. Their teeth were in the best shape (no regular dental care), and the body odor was sweet and pleasant.

What do all these observations mean? I wonder.

As I am to return to the General this summer, possibly you can enlighten me with your opinion on these observations. Perhaps I can take advantage of my presence there to carry out some more studies along this line.

♣ ♣ ♣

IMPORTANT NOTICE

It is one of the duties of the Archives Department to revise the Directory section of the Hospital's *Annual Report* each year. A very simple request has appeared in The News many times, asking all our alumni and members of our professional staff, of all categories, to inform the Hospital promptly of any change of address. These appeals have been disregarded by a discouraging number of individuals. Unless each one of you cooperates in this respect, much extra work is entailed to keep our Directory up to date.

Members of the House Staff who are about to finish their services at the Hospital on June 30 are especially urged to comply immediately with this request. If you are planning on traveling about for a while, or have not made definite arrangements for the opening of your office or your future association with an institution, please give us an address from which mail may be forwarded to you until your plans for the future are determined. Send your new address to either the Archives Department or the Secretaries' Office, after which it will appear in The News and in the following year's Directory.

The News

No. 206 Boston, Mass. October 1961

THE LANGUAGE CLINIC AND THE CORTICAL FUNCTION TEST LABORATORY

History. It was at the suggestion of Dr. James B. Ayer, at that time head of the Neurology Service at the Massachusetts General Hospital, that the writer went to New York to observe and participate in the work of Dr. Samuel T. Orton of the Language Research Unit at the New York Neurological Institute. It was there that Dr. Orton (a pioneer among neurologists investigating the relationships between speech and reading disorders and neurological make-up, who first pointed out the importance of hereditary factors) was working. As a result of this experience and again with the encouragement of Dr. Ayer, I opened during the summer of 1934 what came to be known as the Language Clinic. At that time this was a very informal set-up, as part of the Nerve Out-Patient Department, consisting of a doctor and a few patients. The Clinic met once a week, and all that could be done was a certain amount of evaluation of patients. Very soon, however, volunteers who thought this would be an interesting field in which to work presented themselves. The volunteers were largely teachers who, for one reason or another, felt that individual work with speech and learning problems of various sorts would be more satisfying to them. At this time, the Clinic received considerable encouragement from Dr. Stanley Cobb, who had been interested in speech problems. Throughout the early years of the Clinic's existence, much stimulation and encouragement was received from Dr. Charles A. McDonald, at that time a consultant in the Neurology Department.

At the outset, the work of the Clinic was dependent entirely on volunteer help. Patients having speech problems were referred largely from other departments in the Hospital. These cases consisted of children with delayed speech, children having articulatory defects of varying etiology, young people who were troubled by stuttering or stammering, and aphasic patients. This latter group was predominantly an adult group. In addition to these speech problems, a number of learning problems in school children were presented to the Clinic. These were children who were suffering from what Dr. Orton had described as "specific reading disability". It was interesting to see that most generally they were referred in their early years by the Eye Clinic. The child failed to learn to read in school and the school referred him to the Eye Out-Patient Department as a solution of his problem.

The Language Clinic, of course, benefited tremendously from the rich opportunity for consultation which the Out-Patient staff provided at that time, and still provides. This made it possible to have a pretty thorough work-up of a patient in spite of a rather limited staff and a very limited time schedule.

Even in the early days, training was provided for teachers who wanted to enter the field of remedial speech or remedial reading or language training, as the therapy was called. In return for training, these trainees gave many hours of therapy to Clinic patients who could not otherwise have received any help at all. However, the Clinic suffered very much from having no permanent staff, and it became increasingly clear that the usefulness of the Clinic would be much curtailed without more of a dependably regular staff than it was possible to have on a purely volunteer basis.

During the early years of the Clinic's existence, it became apparent that there was a very great demand for a carefully conducted testing service. Again we were fortunate in having the encouragement of both Dr. Ayer and Dr. Cobb, and, as a consequence, the Cortical Function Test Laboratory was established at that time. At first, it consisted of a room for testing and for the storage of materials, and of one part-time psychologist. Demands on the Clinic grew rapidly as a result of requests for psychological testing of all types of neurological patients, as well as the regular Language Clinic patients, and soon the staff was increased. The first few years of activity gave the Laboratory a very valuable opportunity for learning to make accurate evaluations in all types of brain-injured patients, as well as evaluations in the various types of hereditary language difficulties. These consisted of the developmental speech handicaps, such as motor speech delay, articulatory defects and stuttering, and the over-all learning defects referred to as specific reading disability.

World War II made quite specialized demands on the activities of the Language Clinic. The Veterans Administration was faced with the problem of providing adequate care and applying the correct rehabilitative measures for large numbers of head-injured veterans who were suffering from some forms of aphasia. Techniques of therapy were not understood, and possibly, even more important, outstanding therapists with experience and training in the field did not exist. Consequently, several training centers for therapists, which also would serve as centers for therapy for veterans, were established by the Veterans Administration. The Boston area was one of these centers. As a matter of fact, it was the chief center in the eastern section of the United States, and the Language Clinic at the M.G.H. became the chief Out-Patient Clinic for veterans in this vicinity who were discharged from hospital care in a veterans' hospital. The M.G.H. also became the center for the development of techniques for therapy in aphasia and for procedures for the training of would-be therapists, and in these various ways the work of the Language Clinic was multiplied very rapidly in this much-needed field.

One result of this increased demand for the services of the Clinic was that the Clinic obtained for the first time a fixed and discrete space within the Hospital and a permanent staff. During these busy times the Clinic benefited by the participation in its work of various physicians who had recently completed training or were completing training at the Hospital. Among them I would mention Dr. Preston Robb of the Montreal Neurological Institute, Dr. Gardner Quarton, Dr. William Timberlake, Dr. Edwin Goodall, and finally Dr. Vincent Perlo who, I am glad to say, has remained a member of the Language Clinic staff.

With the end of the war, came a decrease in demand from the Veterans Administration for therapy for aphasic veterans. The Veterans Language Clinic contracted considerably and finally was closed by the Veterans Administration, as the demand did not seem to justify its continuation.

During the postwar years, as the population pressure was exerted on the schools, both public and private, this pressure began to be transmitted to the Language Clinic. We began to see large numbers of children who were handicapped in learning, either in speech or in reading and sometimes in both. Crowded schools and inadequate teaching staffs were perhaps some of the factors which prompted parents to bring children to hospitals, such as the M.G.H., for a clarification of their educational problems. Very rapidly the Language Clinic and the associated Cortical Function Test Laboratory were overwhelmed by cases requiring help. Similarly, there was an increase in the demand for trained language therapists who would be versed in the field of appropriate teaching techniques designed to aid children who were having specific reading disabilities. I am very certain that part of the problem stemmed from the inadequate reading techniques which were current in schools quite generally in those days and which, unfortunately, are still very common. Children's learning problems could not be understood or could not be remedied in many schools. As a result, many teachers came to the Language Clinic for training, in order to become proficient in helping children who required extra teaching.

As a natural outgrowth of our Clinic activity, departments for language therapy were established in a number of schools, such as Phillips Academy in Andover, the Phillips Exeter Academy, St. George's School in Newport, Rhode Island, Dana Hall School in Wellesley, the Cambridge School in Weston, and others. These departments were staffed and supervised by therapists and staff members who had been trained and were experienced in the Language Clinic at the Massachusetts General. At the same time, numbers of therapists who trained here at our Clinic worked with children in neighboring public schools, and, as far as was possible, in our Language Clinic itself. In addition to intensive work during the school year, schools felt the need for language therapy during a summer program, and, as a result of this, those trained in the Language Clinic were working intensively in several summer schools within easy reach of Boston. Pupils have come to these summer schools from all over the country to benefit from the Language Clinic evaluation and the intensive, individual therapy which trained therapists from our Clinic are able to administer. During the summer of 1960, over 80 pupils were enrolled in this work with graduates from our own Language Clinic.

Recent developments. Two years ago, the therapeutic services of our Language Clinic, now situated on the third floor of the Out-Patient Building, were opened to patients of all income levels. This move seemed desirable because no service of this nature was available elsewhere in the community. Since that time, aphasic patients, a certain number of speech problems and a few reading problems of pupils who were above the original Clinic income level but who could not otherwise have the assistance of the Clinic service, have been cared for in the Language Clinic. We feel that this has worked out well. One large group is a college-age group of stutterers, referred by several of the colleges and the universities in the Greater Boston area. These students could not ordinarily have had help in the Language Clinic because of the income restriction. I am glad to report what I think all of us would expect: that there has been no obstacle in implementing this broader spectrum of patient approach—broader spectrum from the point of view of income.

The Speech Clinic, which is part of the Language Clinic, has shown very rapid growth during the past few years. Problems ranging from infantile speech, delayed speech, sound substitutions, omissions of sounds, stuttering, aphasia, the speech of those suffering from Parkinson's disease and multiple sclerosis and cerebral palsy, are handled regularly in the Clinic. Referrals come from within our own Hospital, from public schools, and from other hospitals, as well as from practising physicians and from nearby colleges and universities. The speech staff is headed by Mr. Robert Weinberg, who is the Supervisor. He is ably assisted by Miss Gail Plotkin and Mr. Don Sandy who are with us full time, and Miss Judith Nemzoff part time. All our therapists are working in graduate study beyond the Masters degree. Speech therapy within the Clinic employs individual and group approaches. Patient demand has made a Thursday evening Clinic a very active one. Three groups of adult stutterers are now being seen on that evening. Saturday morning Clinics, for both children and adults, seem near at hand because of the increased demand. During the past two years, the Language Clinic has cooperated with the Boston University Speech Department in providing training for a certain number of graduate students at B.U. whose field is in speech. These university trainees come to us for between twelve and eighteen hours a week to work in the Clinic. Their program calls for observation and actual therapy administered under the close supervision of our regular staff. We feel that this program has been most successful for both the Clinic and the trainees who have come to us. It has increased the teaching and the service to speech patients which the Clinic can provide.

The Reading Clinic, also a part of the Language Clinic, has grown very rapidly during the past few years. Reading cases are referred largely from a number of neighboring schools, mostly public schools, and from other departments in the Hospital. The first job for the Reading Clinic in each case is to make a careful evaluation of just what the problem is. Such evaluations are made by Dr. Perlo or me, in conjunction with testing procedures carried out by the Cortical Function Test Laboratory. Occasionally therapeutic programs for patients in the neighboring area can be set up in the Language Clinic. In other instances, a therapist with some teaching experience is discovered in the neighborhood where the patient lives and supervision is given for a training program outside the Clinic, but supervised by the Language Clinic staff.

The Reading Clinic staff consists of two full-time workers and two part-time, well-trained reading therapists. In addition to this regular staff, a program for teachers who wish to become proficient in this sort of work is arranged for at the Language Clinic. During the school year as many as six teachers in training work regularly in the Clinic. They are supervised by the reading supervisor, and they devote their time in the Clinic to the teaching of children who are handicapped by specific reading disabilities and who are dependent on the Clinic for the therapy they must have in order to overcome their disabilities. This training program is carefully worked out in seminars, discussions, and lectures, as well as in the actual day-to-day work with the patients. Each trainee gives 300 hours in the Clinic to complete the training course. Needless to say, this training program serves a two-fold purpose: It provides a skilled personnel to go out into the community to continue with this sort of work where it is needed, and it gives training to children who are handicapped by reading disabilities and who could not otherwise have help.

In addition to these programs, the Reading Clinic is engaged in an active consultation program. Members of the Clinic staff act as consultants in a number of schools—more recently in public schools, also. The supervisor goes to the public school to act as a consultant and also to aid in the evaluation of difficult pupils who, as need arises, can be referred to the Language Clinic. In addition, the supervisor advises and aids in the therapeutic program at the school, consulting with members of the regular school staff. Still further, the supervisor is available for general talks and discussions covering the subject of reading disabilities. We feel that in this way many children can have the advantages of the experience of the Language Clinic who otherwise could not benefit from this help. Mrs. Alice Garside is an able and competent supervisor of the reading part of the Language Clinic program, and she is ably aided by Mrs. Frank Plunkett, long a member of our staff, and Mrs. Caroline Peck.

Since a previous article about the work of the Cortical Function Test Laboratory appeared in the December 1953 issue of the Massachusetts General Hospital News, the work of this Laboratory has practically doubled. At the present time, the staff is headed by Miss Elisabeth E. White, the chief clinical psychologist in charge, with her assistants, Miss Wilma French, Miss Elaine Stella, and Mrs. Elizabeth Mack. Their work is greatly aided through the efforts of Miss Jessie McMeekin, secretary in the Laboratory. The Cortical Function Test Laboratory is still actively engaged in evaluations of neurological patients as they are referred either privately or from the Neurology Ward. It is also actively engaged in the evaluation of aphasic patients, carrying out tests that help to determine which avenues of communication are most and which are least impaired in order to aid therapists in planning the course of retraining.

Approximately 40% of the referrals to the Laboratory in the last three years have come through the Language Clinic, either for Clinic cases or for private cases in the language field. Referrals come from a number of private physicians who want to investigate school problems of their patients.

The purpose of testing in the Language Clinic is twofold. The initial testing is diagnostic, to evaluate the language problem, to help decide if it is the type which can be handled in the Clinic, and, if it is, to give the language therapists some preliminary suggestions about what direction the work might take. Secondly, periodic retesting is carried out to give an objective measure of progress and to help decide when the work has achieved optimal results and can be discontinued with an individual patient.

Our patients include a wide range of ages, from preschool children with speech problems through elderly aphasics. In the former cases, the purpose of testing is to determine whether the delayed speech is one aspect of generally slow mental development or whether the retardation is limited to speech. A large proportion of the older children are referred to us because of specific reading disability. In such cases, the testing must determine whether or not the child is mentally capable of learning and whether he has, in fact, been able to learn in areas other than reading but has been handicapped in learning language subjects by directional confusion. Our adult patients are usually stutterers, or aphasics such as those already referred to. With stutterers, an attempt is made in testing to get at the dynamics of the problems. Though the testing in the Cortical Function Test Laboratory is strictly individual, members of the Laboratory staff have carried out work with groups in various independent schools in this area. For example, group testing is carried out with the incoming class and all new students in one nearby school each fall, to help screen out those pupils who will need extra strengthening in language subjects in order to make full use of their abilities in school work. Such group testing, of course, is followed up by individual testing, to evaluate mental abilities and different aspects of language usage in those who are selected as needing language training. Members of the Laboratory staff also participate in the summer school programs referred to above.

Needless to say, the chief problems of the Language Clinic and the Cortical Function Test Laboratory are problems common to most hospital departments. By that I mean space problems. Many more patients could be taken care of, much more creative work could be done, and much better teaching could be carried out if we had more adequate space. Fortunately, due to the able administrative work of Mrs. Jean Yarborough, our secretary in the Language Clinic, the best possible use is made of our facilities. The Clinic has grown very rapidly, as the following statistics indicate: Five years ago, in May 1956, there were 86 visits from reading cases and 259 visits from speech cases. In May 1960, there were 413 visits from reading cases and 264 visits from speech cases. Since January 1955, each of 42 trainees has completed 300 hours of language training courses. During the past two years, 5 speech trainees from Boston University have done clinical work in our Clinic.

During the past two years, approximately one-quarter of the speech cases have been private Language Clinic patients, while three-quarters remain regular Clinic patients. Of the reading cases, approximately one-sixth have been private Language Clinic patients, and five-sixths have been regular Clinic patients.

What the future holds for the Language Clinic is hard to say. There is a very heavy demand for the sort of work that is being carried out here, and we are glad to be able to meet the demand with a well-trained and experienced Clinic staff. There are, of course, many other problems in the over-all field of communication which have not yet been approached by our Clinic and which we hope to have the opportunity of tackling. We see this field as a unique area of interaction between medicine, in the form of neuropsychiatry, and the field of education, in which many questions remain quite unanswered. Indeed, many have probably not even been asked.

Edwin M. Cole, M.D.,
Neurologist

* * *

Dr. Henry K. Beecher was awarded the honorary degree of Doctor of Medicine by the University of Lund, in Sweden. The citation which accompanied the award reads:

> Your exciting journeys of discovery into the vast, frightening and largely unknown space of unconsciousness to explore fundamentals of human physiology have been planned with inspiring originality and have been carried out with far-sighted capability and a breath-taking vitality under the strictest rules of medical consideration.
>
> You have shared your stimulating ideas, your remarkable results and your wide clinical experience with medical men from all over the world with that generosity characteristic of your country and specific of your frank personality to the benefit of many also of this country and this university. It was a pleasure therefore for the Medical Faculty today to bestow upon you, in accordance with rules guarding our old traditions, the insignia that will open to you the embracing arms of Alma Mater Carolina Lundensis.

On June 15, Dr. Edward D. Churchill received from Harvard University an honorary degree of Doctor of Science. The citation given by President Pusey was:

> The skill and humanity of this illustrious surgeon have inspired generations of students of the healing art.

Each of the only four medical students to graduate from Harvard Medical School *summa cum laude* since 1940 was awarded the prized Boylston Medal and $1000 at the 150th anniversary dinner of the Boylston Medical Society of Harvard University, given on May 25 at the Harvard Club. One of the four was Dr. Zanvil A. Cohn (*M.* 1954), Class of 1953, research associate at the Rockefeller Institute for Medical Research and assistant physician at the Rockefeller Hospital.

Dr. John H. Gibbon (res. fel. *S.* 1930-31, 1934-35) was given an honorary degree of Doctor of Science at the Two Hundred Fourteenth Commencement at Princeton University last June. The text of the citation is:

> Professor of Surgery at the Jefferson Medical College of Philadelphia, a fifth-generation physician whose professional skill and bold pioneering initiated a direct approach to open heart surgery, an epoch-making achievement in the relief of suffering and the saving of lives. Such technical mastery and dedication of spirit make shine with new meaning the Prayer-Book's injunction to lift up our hearts.

Dr. John N. Loeb, another of the four medical students who have graduated from Harvard Medical School *summa cum laude* since 1940, also was awarded the Boylston Medal and $1000 at the 150th anniversary dinner of the Boylston Medical Society of Harvard University, given on May 25 at the Harvard Club. Dr. Loeb is a member of the Class of 1961, and began his internship in Medicine on July 1 here at Massachusetts General Hospital.

Dr. Robert F. Loeb (*W.M.* 1920), father of the above Dr. John H., was awarded the honorary degree of Doctor of Science at the 207th Commencement exercises at Columbia University on June 6. The text of his citation, conferred by Dr. Grayson Kirk, president of the university, reads:

> As a beloved teacher, skilled investigator, able administrator and wise physician, you have brought rare gifts to this university and to the great vocation of medicine. No man of your profession in this generation has been more greatly or more justly honored. Your four decades of association with Columbia have been rich in achievement and rich in benefit to mankind. Generous in spirit and broad in your interests, you hold not merely the respect but the warm affection of all who have had the privilege of your friendship. It is with pride that the university bestows upon you the Doctorate of Science, *honoris causa*.

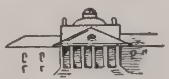
Dr. Joe V. Meigs was the recipient of the honorary degree of Doctor of Medicine, conferred by the University of Turin, Italy, last June, for "service rendered to science and humanity".

Miss Ruth Sleeper was made an Honorary Fellow of the College of Nursing of Australia last April. She addressed the annual meeting of the college in Melbourne on April 26.

Dr. Paul D. White was awarded the New York University medal for distinguished service in his field. More than 500 graduates of the university school of medicine attended the special program at which the award was presented.

The Soviet News Agency Tass reported in Moscow on May 30 that the Soviet Academy of Sciences had elected Dr. White its first American member, at the 15th session of the Academy's general meeting. Academy membership is purely honorary. Dr. White has been working actively to become acquainted with Russia's leading heart specialists since he first went to Moscow in 1956. In 1957 small groups of Russian cardiologists came here to this country, and in 1958 Dr. White met them again at the Third World Congress of Cardiology in Brussels. "We established a very pleasant entente," Dr. White said. In 1959 an agreement was signed between the U.S.A. and the U.S.S.R. to join forces against heart disease, cancer, and polio. "It was an historic event," Dr. White said. Last May five Russian cardiologists came to the United States and, with American doctors (of whom Dr. White was one) began to prepare a program. The Russians visited medical schools and hospitals in Washington, New York, Cleveland, and Boston, where Dr. White was their host. "It was a very successful series of visits," Dr. White said. Regarding his election to the Soviet Academy of Sciences, Dr. White is reported to have said that he had "a little suspicion that something might be in the offing" when he was asked about details of his life during a visit to Russia earlier in May.

In addition to the above distinctions, Dr. White received an honorary degree of Doctor of Laws at St. John's University in New York on June 11.



The Board of Trustees, at their meetings during May, June, July, and August, voted:

That Mr. Harold Dodd of London be invited to give a Richardson Lecture at the Hospital on October 9;

That the Dental Service be renamed "Dental Medicine";

To approve changing the name of the Staff Wives Association to "Massachusetts General Hospital Service League".

To accept the resignations of:

Dr. Evan Calkins with regret, from the position of Associate Physician, effective July 31, and to extend to him congratulations on his appointment as Professor of Medicine at the University of Buffalo;

Dr. Virginia B. Calkins with regret, from the position of Assistant in Medicine at McLean Hospital, effective July 1;

Dr. Thomas A. Carey from the position of Second Assistant Resident in Radiology, effective June 30;

Dr. Joseph Stokes, III, with regret and appreciation for his able service to the Hospital, from the position of Assistant Physician, effective September 30;

Dr. William R. Waddell with regret and appreciation for his able service to the Hospital, from the position of Associate Visiting Surgeon, effective August 31.

To promote:

Lewis L. Engel, Ph.D. from the position of Associate Biochemist to that of Biochemist in Medicine;

Roger W. Jeanloz, Ph.D. from the position of Associate Biochemist to that of Biochemist in Medicine;

Anne Parsons, Ph.D. from Assistant Social Anthropologist to Associate Social Anthropologist in the Department of Social Science at McLean Hospital, beginning July 1.

To grant leave of absence to:

Dr. Chiu-chen Wang, Associate Radiologist, for one year, beginning July 1;

Dr. Louis Wener, Assistant in Radiology, for service in the Air Force, beginning July 1.

To change the titles of:

Dr. Richard R. Curtin from Assistant in Surgery to that of Clinical Associate in Surgery, beginning August 1;

Dr. Paul R. Dinsmore to Clinical Fellow in Psychiatry at McLean Hospital, beginning July 1;

Dr. Gerhart A. Duda to Clinical Fellow in Psychiatry at McLean Hospital, beginning July 1;

Dr. Gordon G. Globus to Clinical Fellow in Psychiatry at McLean Hospital, beginning July 1;

Dr. S. Sheila Hafter to Clinical Fellow in Psychiatry at McLean Hospital, beginning July 1;

Dr. John M. Kuldau to Clinical and Research Fellow in Psychiatry at McLean Hospital, beginning July 1;

Dr. Egbert H. J. Mueller to Clinical and Research Fellow in Psychiatry at McLean Hospital, beginning July 1, this reappointment contingent upon licensure;

Dr. David G. Satin to Clinical Fellow in Psychiatry at McLean Hospital, beginning July 1;

Dr. Richard A. Weinberg from Clinical Fellow in Dermatology, beginning July 1, to Assistant Resident in Dermatology, effective August 1.

To extend the appointments of:

Dr. Jesse F. Scott, Associate Biophysicist in Medicine, from July 1, 1961 through June 30, 1962;

Dr. Narayana C. Surya as Visiting Psychiatrist pro tempore through August 25.

To reappoint:

Dr. Edward F. Bland to the Social Service Advisory Committee for a three-year period;

Dr. Jacqueline Gauthier as Clinical Fellow in Psychiatry at McLean Hospital, beginning July 1;

Mr. Donald Moreland to the Social Service Advisory Committee for a three-year period;

Miss Ruth Sleeper to the Social Service Advisory Committee for a three-year period.

To appoint:

Dr. Man M. S. Ahuja as Clinical and Research Fellow in Medicine for one year, beginning October 1;

Dr. Elroy E. Anderson as Clinical Associate on the Children's Service, effective July 1;

Dr. Homer L. Ash as Resident in Dental Medicine for one year, beginning July 1;

Dr. Stanley Austin as Clinical Fellow in Anesthesia, for the period May 1 through October 31;

Dr. Laurence I. Barsh as Intern in Dental Medicine for one year, beginning July 1;

Dr. Guido Belsasso-Prister as Assistant Resident in Psychiatry, beginning July 1;

Dr. Martin A. Berezin as Attending Psychiatrist at McLean Hospital, beginning September 1;

Dr. Hector V. Berezowski as Clinical and Research Fellow in Neurosurgery for one year, beginning July 1;

Dr. John B. Blennerhassett as Second Assistant Resident in Pathology for one year, beginning July 1, 1962;

Dr. Joseph H. Brenner as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Charles M. Bryant as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Joseph W. Burnett as Clinical and Research Fellow in Dermatology for one year, beginning July 1;

Dr. George P. Canellos as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Robert W. Carey as Clinical Fellow in Medicine for one year, beginning July 1;

Dr. Randolph Catlin, Jr. as Assistant Resident in Psychiatry for one year, beginning July 1;

Dr. Francisco Civantos as Third Assistant Resident in Pathology for one year, beginning July 1, 1962;

Dr. John K. Cobb as Assistant in Radiology, beginning July 1;

Dr. Stanley Cohen as Clinical and Research Fellow and Acting Third Assistant Resident in Pathology for one year, beginning July 1, 1962;

Dr. Efrain O. Contreras as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Giulio J. D'Angio as Assistant Radiologist, beginning June 5;

Dr. Charles A. M. Y. Nagant de Deuxchaisnes as Clinical and Research Fellow in Medicine for one year, beginning July 15;

Dr. Paul R. Dinsmore as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Gerhart A. Duda as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Arthur W. Duff as Clinical Fellow in Pathology for one year, beginning July 1, 1962;

Dr. Ralph Earle, Jr. as Exchange Assistant Resident on the Children's Service, for the period July 1 through August 9;

Dr. William H. Eger as Assistant Psychiatrist, beginning July 1;

Prof. Shinichiro Endo as Clinical and Research Fellow in Neurosurgery for one year, beginning approximately September 1;

Richard A. Erle, M.A. as Assistant Psychologist at McLean Hospital, beginning July 24;

Dr. Paul Field as Second Assistant Resident in Surgery for one year, beginning July 1;

Dr. Joan W. Flacke as Assistant Resident in Anesthesia, beginning October 1;

Dr. Dorothy Ford as Assistant in Physical Medicine;

Dr. Alvin E. Friedman-Kien as Clinical and Research Fellow in Dermatology for one year, beginning July 1;

Dr. Theodore Friedmann as Exchange Assistant Resident on the Children's Service, for the period August 10 through September 18;

Dr. Nicoll F. Galbraith, Jr. as Second Assistant Resident in Surgery for one year, beginning July 1;

Dr. James A. Gardner as Second Assistant Resident in Surgery, for a period of six months, beginning August 1;

Dr. Phillip H. Gates as Assistant Psychiatrist, effective July 1;

Dr. Jacobus M. Greep as Clinical and Research Fellow in Surgery, beginning June 15;

Dr. S. Sheila Hafter as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Murray H. Helfant as Clinical and Research Fellow in Neurosurgery, for the period July 1 through December 31, 1961, and as Assistant Resident in Neurosurgery for one year, beginning January 1, 1962;

Dr. Norman G. P. Helgeson as Assistant Resident in Pathology for one year, beginning July 1, 1962;

Dr. Albert E. Herman as Resident in Psychiatry at McLean Hospital, beginning July 1;

Dr. Pelagio V. Iriarte as Exchange Assistant Resident on the Children's Service, for the period July 1 through December 31;

Dr. Koichi Ishikawa as Clinical and Research Fellow in Surgery for one year, beginning July 1;

Dr. David C. Jackson as Clinical Fellow in Anesthesia, beginning December 1;

Dr. Oleg Jardetzky as Consultant in Pharmacology;

Dr. Frederick D. Jarvis, Jr. as Clinical Fellow in Psychiatry for one year, beginning July 1;

Dr. Pierre Johannet as Assistant Psychiatrist, effective July 1;

Herman M. Kalckar, Ph.D. as Biochemist in Medicine;

Dr. Martin Kantor as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Leo T. Kelly as Assistant in Anesthesia, effective July 1;

Helen J. Kenney, Ed.D. as Consultant in Education in the Department of Psychology at McLean Hospital, beginning July 1;

Dr. Peter G. Kimball as Clinical Assistant in Dental Medicine, beginning July 1;

Dr. George Küry as Clinical Fellow in Pathology for one year, beginning July 1;

Dr. Keith A. Lamont as Clinical Fellow in Surgery, assigned to Gynecology, with the privilege of assisting Dr. Joe V. Meigs in the care of his private patients;

Dr. Lawrence M. Leonard as Senior Orthopedic Resident, for a period of six months, beginning July 1;

Dr. James G. Manson as Assistant Resident in Orthopedic Surgery for one year, beginning July 1;

Dr. Michael T. McGuire as Assistant Resident in Psychiatry for one year, beginning July 1;

Dr. Richard Masters as Clinical and Research Fellow in Dermatology for one year, beginning July 1;

Dr. John A. Mills as Assistant in Medicine, beginning May 26;

Dr. Paul R. Minton as Clinical Assistant in Medicine at McLean Hospital, effective July 1;

Dr. Yuji Miyazaki as Clinical and Research Fellow in Neurosurgery for one year, beginning approximately September 1;

Dr. David R. Moloney as Resident in Dermatology for one year, beginning July 1;

Dr. John J. Monahan as Assistant Resident in Orthopedic Surgery for one year, beginning July 1;

Dr. West T. Moore as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Henry P. Pendergrass as Assistant Radiologist, beginning September 1;

Dr. Robert S. Pinals as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Donald B. Rae, D.D.S. as Assistant Dental Surgeon;

Dr. Mudundi R. Raju as Research Fellow in Physics (Medicine) for one year, beginning September 1;

Dr. David E. Reiser as Assistant Psychiatrist, beginning July 1;

Dr. Georg Riccabona as Clinical and Research Fellow in Medicine for one year, beginning February 1, 1962;

Dr. Victor J. Rosen, Jr. as Clinical and Research Fellow in Pathology, for the period July 24, 1961 through June 30, 1962;

Dr. Jens G. Rosenkrantz as Assistant in Surgery, for the period July 1 through August 31; Dr. Rosenkrantz returned as First Assistant Resident in Surgery on September 1;

Dr. Christopher VanA. Rowland, Jr. as Assistant Resident in Psychiatry for one year, beginning July 1;

Dr. Lawrence C. Salvesen as Clinical Fellow in Psychiatry for one year, beginning July 1;

Dr. Benjamin T. Santoro as Second Assistant Resident in Surgery for one year, beginning July 1;

Dr. David G. Satin as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Murray Sidman, Ph.D. as Psychologist to the Neurology Service, beginning July 1;

Dr. Jeremiah E. Silbert as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Lt. Col. Kirpal Singh, AMC, as Visiting Psychiatrist pro tempore, for the period July 1 through September 30;

Dr. Charles Sorbie as Clinical Fellow in Orthopedic Surgery for one year, beginning July 1, with the privilege of assisting Dr. Cave in the care of his private patients;

Dr. John B. Spillane as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Danuta M. Stachiewicz as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. J. Henry Stempien as Assistant Dental Surgeon on the Dental Service, effective July 1;

Dr. Joseph F. Stocks as Clinical Associate on the Children's Service, effective July 1;

Pierre J. J. Stoffyn, Ph.D. as Assistant Biochemist in the Research Department at McLean Hospital, beginning July 1;

Dr. Alan A. Stone as Assistant Psychiatrist at McLean Hospital, beginning August 1;

Dr. Lawrence Sweeney as Clinical Fellow in Radiology, beginning July 1;

Dr. Chiu-an Wang as Clinical Fellow in Surgery, with the privilege of assisting Dr. Claude E. Welch and his associates in the care of their private patients;

Barbara K. Watson, Ph.D. as Assistant Bacteriologist, beginning September 1;

Dr. Kurt Wiemers as Clinical Fellow in Anesthesia, for the period July 1 through December 31;

Irving Wolf, Ph.D. as Associate Psychologist in the Department of Psychiatry, beginning June 1;

Dr. Jacob C. Wolterbeek as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Paul I. Yakovlev as Consultant in Neuropathology (Neurology) for one year, beginning July 1.

To rescind the appointment of:

Dr. Beale H. Ong as Third Assistant Resident in Surgery.

At their meetings on May 10, 17, 24, and 31, and during June, July, and August, the General Executive Committee voted:

To accept the resignations of:

Dr. Jean P. Binette from the position of Research Fellow in Medicine, effective as of September 30;

Eubert J. Daniel, Ph.D. from the position of Research Fellow in Orthopedic Surgery, effective as of August 31;

Dr. Derrick Felix-Davies from the position of Clinical and Research Fellow in Medicine, effective as of July 1;

Dr. Peter R. Holt from the position of Clinical and Research Fellow in Medicine, effective as of August 31;

Dr. Serge D. Orloff from the position of Clinical and Research Fellow in Medicine, effective as of July 31;

Dr. Felix Palubinskas from the position of Clinical Fellow in Radiology, effective as of August 22;

Dorothy K. Stearns, Ph.D. from the position of Research Fellow in Medicine, effective as of June 30.

To promote:

Dr. Joseph R. Barrie to the position of Third Assistant Resident in Surgery for one year, beginning July 1;

Dr. Sheldon C. Binder to the position of Third Assistant Resident in Surgery for one year, beginning July 1;

Dr. John D. Burrington to the position of Third Assistant Resident in Surgery for one year, beginning July 1;

Dr. Ruben F. Gittes to the position of Third Assistant Resident in Surgery for one year, beginning July 1;

Dr. Nathan T. Griscom to the position of First Assistant Resident in Radiology, beginning July 1;

Dr. Donald B. Halverstadt to the position of Third Assistant Resident in Surgery for one year, beginning July 1;

Dr. Stephen E. Hedberg to the position of First Assistant Resident in Surgery for one year, beginning July 1;

Dr. Arthur L. Herbst to the position of Second Assistant Resident in Surgery for one year, beginning July 1;

Dr. John B. Herrmann to the position of First Assistant Resident in Surgery for one year, beginning July 1;

Dr. Nelson R. Lampert to the position of Second Assistant Resident in Surgery for one year, beginning July 1;

Dr. Lucian L. Leape, Jr. to the position of Second Assistant Resident in Surgery for one year, beginning July 1;

Dr. John L. Lewis, Jr. to the position of Second Assistant Resident in Surgery for one year, beginning July 1;

Dr. Ronald A. Malt to the position of Resident in Surgery for one year, beginning July 1;

Dr. Anthony P. Monaco to the position of First Assistant Resident in Surgery for one year, beginning July 1;

Dr. Ashby C. Moncure to the position of Third Assistant Resident in Surgery for one year, beginning July 1;

Dr. Gerald S. Moss to the position of Third Assistant Resident in Surgery for one year, beginning July 1;

Dr. Gustave C. E. Mueller to the position of Second Assistant Resident in Surgery for one year, beginning July 1;

Dr. Eldred D. Mundth to the position of Second Assistant Resident in Surgery for one year, beginning July 1;

Dr. Leslie W. Ottinger to the position of Third Assistant Resident in Surgery for one year, beginning July 1;

Dr. John M. Reed to the position of Third Assistant Resident in Surgery for one year, beginning July 1;

Dr. John P. Remensnyder, Jr. to the position of Second Assistant Resident in Surgery for one year, beginning July 1;

Dr. Stewart Sell to the position of Third Assistant Resident in Pathology for one year, beginning July 1;

Leonard B. Shulman, D.M.D. to the position of Assistant Resident on the Dental Service for one year, beginning July 1;

Dr. David B. Skinner to the position of Second Assistant Resident in Surgery for one year, beginning July 1;

Dr. Quentin R. Stiles to the position of First Assistant Resident in Surgery for one year, beginning July 1;

Dr. John T. Truman to the position of Chief Resident on the Children's Service for one year, beginning July 1, 1962;

Dr. Harold C. Urschel, Jr. to the position of First Assistant Resident in Surgery for one year, beginning July 1;

Dr. Richard H. Wohl to the position of Second Assistant Resident in Surgery for one year, beginning July 1.

To extend the appointments of:

Dr. Gianfranco DalSanto as Clinical Fellow in Anesthesia, through September 5;

J. Veronica F. King, Ph.D. as Research Fellow in Medicine, from September 12 through September 26;

Dr. Melvin Lederman as Clinical and Research Fellow in Surgery, from July 1 through August 31;

Dr. A. David McGugan as Resident in Dermatology, from July 1 through December 31;

Koscak Maruyama, D.Sc. as Research Fellow in Medicine, through September 10;

Leslie Parker, B. Sc. as Research Fellow in Physics (Medicine), from September 1 through December 31;

Dr. Mahmoud Sadrieh as Clinical and Research Fellow in Surgery, from July 1 through August 31;

Dr. Harilaos T. Sakellarides as Clinical and Research Fellow in Orthopedic Surgery for one year, beginning July 1;

Dr. Dorothy A. Westcott as Clinical Fellow in Anesthesia, from July 16 through October 31.

To reappoint:

Dr. David W. Allen as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Neil Baggett, B.Sc. as Research Fellow in Biochemistry for one year, beginning September 1;

Dr. William H. Batchelor as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. Donavin A. Baumgartner, Jr. as First Assistant Resident in Surgery, beginning July 1;

Dr. J. Claude Bennett as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. John A. Bolzan, with a change of title to that of Clinical Fellow in Medicine, for one year, beginning July 1;

Dr. Caesar Briefer, Jr. as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Mortimer J. Buckley, Jr. as Second Assistant Resident in Surgery, beginning July 1;

Donald G. Comb, Ph.D. as Assistant Biochemist (Medicine) for one year, beginning September 1;

Dr. Albert Damon as Clinical Fellow in Medicine for one year, beginning September 1;

Dr. Roman W. DeSanctis as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;

Dr. Leon M. Edelstein as Assistant Resident in Dermatology for one year, beginning July 1;

William H. Ellett, B. Sc. as Assistant Physicist (Medicine) for one year, beginning September 24;

Dr. Alvin Essig as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Abdollah Gashgai as Second Assistant Resident in Surgery, beginning July 15;

Dr. Richard F. Gibbs as Assistant Resident in Anesthesia for one year, beginning July 15;

Dr. Herbert A. Haessler as Research Fellow in Medicine for one year, beginning July 1;

Dr. Reginald Hall as Clinical and Research Fellow in Medicine, for the period September 1, 1961 through February 28, 1962;

Dr. Earle I. Hammer as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. John Hedley-Whyte as Clinical Fellow in Anesthesia, with the additional title of Acting Chief Resident in Anesthesia, for one year, beginning July 1;

Dr. Peter R. Holt as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Wallace A. Jones, with a change of title to Clinical and Research Fellow in Pathology only, for one year, beginning July 1;

Dr. Sigetosi Kamiyama as Research Fellow in Medicine for one year, beginning September 1;

Shelby Kashket, Ph.D. as Research Fellow in Medicine for one year, beginning July 1;

Marvin R. Lamborg, Ph.D., with a change of title to Assistant Biochemist (Medicine), for one year, beginning July 1;

Dr. Burnham E. Lamkins as Assistant Resident in Dermatology for one year, beginning July 1;

Dr. Austra Likais as Clinical Fellow in Medicine for one year, beginning June 1;

Dr. S. Bert Litwin as Clinical and Research Fellow in Surgery for one year, beginning July 1;

Dr. Myron Lotz as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Tecla O. Lovina, with a change of title to Clinical Fellow in Medicine, for one year, beginning July 1;

Dr. Donald McCaughan as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. William F. McCourt as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Donald M. McKee to the position of Second Assistant Resident in Surgery for one year, beginning July 1;

Dr. Bucknam McPeek as Assistant Resident in Anesthesia for one year, beginning July 15;

Dr. Francis D. Milligan as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Hans B. Nevinny-Stickel as Clinical Fellow in Medicine for one year, beginning July 1;

Dr. Harry S. Olin as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Anthony S. Patton as Second Assistant Resident in Surgery, beginning July 1;

Mr. James L. Pinter as Research Fellow in Physics (Medicine) for one year, beginning September 1;

Dr. John T. Porvaznik, Jr. as Second Assistant Resident in Surgery, beginning July 1;

Dr. Walter G. J. Putschar as Consultant in Pathology, beginning May 1;

Dr. Mitchell T. Rabkin as Clinical and Research Fellow in Medicine, for six months, beginning July 1;

Dr. Allan I. Sandler as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Robert H. Schapiro as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. T. David Seigne as Clinical Fellow in Anesthesia for one year, beginning June 1;

Dr. John R. Senior as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Mary J. Spiro, Ph.D. as Research Fellow in Medicine for one year, beginning July 1;

Mary L. Stephenson, Ph.D. as Assistant Biochemist (Medicine) for one year, beginning July 1;

Dr. Claire M. Stiles as Assistant Resident in Anesthesia for one year, beginning July 1;

Anne M. Stoffyn, Ph.D. as Research Fellow in Medicine, for the period May 13 through August 30;

Dr. Shizuko Takahashi as Research Fellow in Medicine for one year, beginning September 15;

Dr. Judith A. Tassie as Clinical Fellow in Anesthesia, acting in staff capacity, beginning June 30;

Dr. C. Gene Wheeler to the position of Second Assistant Resident in Surgery for one year, beginning July 1.

To appoint:

Dr. Fethiye Ayral as Graduate Student Assistant in Orthopedic Surgery, for three months, beginning June 12;

Colin H. Bolton, Ph.D. as Research Fellow in Biochemistry (Medicine) for one year, beginning September 1;

Dr. Kusum P. Dalal as Research Fellow in Pathology, assigned to Cytology;

Harold M. Flowers, Ph.D. as Research Fellow in Biochemistry (Medicine) for one year, beginning September 1;

Dr. Carlos M. Garrido as Research Fellow in Pathology for one year, beginning September 1;

Dr. Mithat Ilhan as Research Fellow in Neurology, assigned to the Electroencephalographic Laboratory, for one year, beginning July 1;

Dr. Kamnuan Kachachiva as Graduate Student Assistant in Orthopedics, for the period July 14 through October 13;

Henry A. Leon, Ph.D. as Research Fellow in Pathology for one year, beginning June 1;

Nancy K. Mello, Ph.D. as Research Fellow in Psychology for one year, beginning July 1;

Dr. Arif Poryali as Research Fellow in Neurosurgery for one year, beginning July 1;

Dr. Martinez E. Rosas as Graduate Student Assistant in Orthopedics, for three months, beginning July 11;

Dr. Hiroshi Shida as Research Fellow in Surgery, for the period July 5 through September 30;

Marvin Snider, Ph.D. as Research Fellow on the Children's Service for one year, beginning July 1;

Kathleen Stratton, Ph.D. as Assistant Physicist (Medicine) for one year, beginning September 1;

Dr. Julius W. Taylor as Graduate Student Assistant in Orthopedics, for a period of two months, beginning August 1;

Dr. Toshiji Umezawa as Research Fellow in Radiology, beginning September 1;

Sylvia D. Wittkower, M.S. as Research Fellow in Psychology, in the Department of Psychiatry, for one year, beginning September 1.

* * *

THE JAMES HOWARD MEANS METABOLIC RESEARCH LABORATORIES

The dedication of our James Howard Means Metabolic Research Laboratories, given in memory of Aimee and Winthrop Sargent, took place on June 7. During a luncheon, served in Bartlett Hall, three speakers addressed the invited guests: Mr. Phillips Ketchum, President of the MGH Corporation, who presided over the ceremonies; the Right Reverend Henry Knox Sherrill, Honorary Chairman of our 150th Anniversary Program and past President of our Board of Trustees; and Dr. C. Sidney Burwell (*W.M.* 1919), Samuel A. Levine Professor of Medicine, *Emeritus*, and Special Consultant to the Dean of the Faculty of Medicine, Harvard University.

Dr. Burwell, the principal speaker, paid the following tribute to Dr. Means:

It is a great pleasure to participate in a ceremony that establishes these laboratories as a center of light and learning, and that attaches to it the name of James Howard Means, also a source of light and learning.

Before I speak about the qualities of James Howard Means and about the significance of these laboratories, I want to make a brief apology. It is in the form of a story, and, I am afraid, a well-known one, but it is highly relevant. It concerns my friend and colleague, the Dean of the Harvard Law School, who, contemplating the recent migration from that School to service in Washington, is said to have remarked plaintively, "Old Deans never die; they just lose their faculties."

This occasion is to dedicate and to name the James Howard Means Metabolic Research Laboratories, given in memory of Aimee and Winthrop Sargent. It is a wise thing to put such a broad definition on the function of the laboratories. No one can tell what new avenues of research will open, and therefore a fundamental principle of wise organization is to install flexibility of purpose in such laboratories as these, so that the workers in them can follow their problems where they take them, or so that new types of workers may be sought. This kind of freedom is a priceless asset for an investigator, and it ought not to be limited by restrictive titles of laboratories or of special fields in medicine.

Let us turn our attention now to the individual in whose honor these laboratories are named—James Howard Means. In general, one can say that doctors in academic medicine do four things: they take responsible care of patients; they advance knowledge through research; they teach their successors; and they do the administrative work necessary to the organization of all of these activities. Throughout his professional life in the Harvard Medical School and the Massachusetts General Hospital, Dr. Means has taken care of patients, and after his statutory retirement from these institutions in 1951 he played an important role in the Health Service at the Massachusetts Institute of Technology. His own research has been imaginative, solid, and based on physiology. He has taught students, house officers, and colleagues more by example than by formal instruction. I well remember that some years ago I sought a demonstration of the art of history-taking for the introductory course in Medicine in the second year. Dr. Means came to the classroom and interviewed a patient whom he had never seen. On the basis of his skillful questioning, his equally skillful reasoning, and his careful listening, he arrived at a picture of the patient, of the environment in which the patient lived, and of the disease from which she suffered. I suspect that the second year students were as impressed as I was.

He has been active and successful in administration, both in the Hospital and in the Medical School. He was made the Jackson Professor of Medicine at the age of 38 and was a senior statesman in the Faculty from then until his retirement, functioning as an active, working, communicating member of the Faculty and of many of its most important committees. Many of you here know well the role that he has played in the organization and development of the Massachusetts General. Thus we can say that he has had distinguished careers in these areas of patient care, of research, of teaching, and of administration.

However, no one who knows of him would think of limiting his careers to these. Quite aside from his admirable book, *Thyroid disease*, and his long list of scientific articles, he is a distinguished author. He has written *Doctors, people, and government;* he has written a fine history of *Ward IV;* and he has recently published an enchanting history of the Association of American Physicians, obviously written with the greatest pleasure on his part, and, as I can attest, read with the greatest pleasure by those who have taken part in that great society. I think I can visualize Dr. Means sitting at his desk, plunging happily into the writing of this history. It is a pleasure to think of someone actually enjoying writing, especially for those of us to whom writing is difficult and who can think of a hundred reasons for postponing it.

The artistic quality of this book reminds me of another career of Dr. Means, namely, his admirable career in painting. Here is another creative activity through which he has expressed his vigorous personality in fascinating interpretation of the visible world.

My own acquaintance with Dr. Means covers many types of experience. When I was a medical student he was a teacher; when I was a house pupil at the M.G.H. he was one of the productive and influential people in the laboratory and the clinic. He was studying metabolism in his laboratory when I was learning about the electrocardiogram in Dr. White's laboratory. I remember running up and down stairs as a subject for Dr. Means's studies of oxygen consumption. I think it was to find out why I was thin and other house officers were fat. We have had a long association as colleagues in the Faculty of Medicine and now we have a highly agreeable association in our retirement.

On the basis of all these types of experience and of certain other extracurricular evidence as well, I have certain conclusions about his career and about his qualities. His career seems to be characterized by excellence of original equipment, excellence of training, and excellence of performance. As to his qualities, there is one unique quality in James Howard Means—a salient characteristic. I think the word for this is *gusto*. He qualifies for this term in almost all of the meanings given by Webster and by the Oxford dictionary: keen or zestful appreciation; high relish or enjoyment; artistic style; aesthetic perception; lofty spirit or taste; appreciation of flavor. (Dr. Means has retired from the Harvard Medical School, from the Massachusetts General Hospital, and from the Massachusetts Institute of Technology, but I am not able to describe him as a naturally retiring man.)

Now as to the laboratories. It has been pointed out to me that the James Howard Means Metabolic Research Laboratories are located in the cellar of the Bulfinch Building. Nothing could be more suitable. The cellars of hospitals are in general the areas where research activities germinate (like mushrooms), and the cellar of the Bulfinch is a place where the wine of research goes through the gradual metabolic evolution that makes good wine and sound knowledge.

It is pleasant to think that the name of James Howard Means will continue to be associated with productive research in the field of metabolism. Several years ago, in a Foreword to Dr. Means's book on *Ward IV*, I wrote these words:

"When one contemplates the history of research in general, in industry, and in medicine, it appears that there are advantages to having research on a broad spectrum going on in a group of people where communications are good and where ideas can be exchanged. It is particularly good to have what is called basic or fundamental research going on in the same place as applied research. It has been learned that ideas developing at any point of this spectrum may illuminate other parts. Fundamental advances may be transferred into application. Observations in practical situations may have implications for the understanding of fundamental problems."

It seems obvious from what I know of the institutions concerned that these principles are going to be applied in these laboratories. One can be confident that basic information concerning metabolic phenomena will be produced by its workers. One can be sure also that matters immediately applicable to the study and care of patients will emerge. Therapeutic advances based on physiology will help patients to health. I am sure that diagnostic procedures will be devised; but, knowing that the people who will work in these laboratories will have an adequate historical background, I am confident that in spite of the name of the laboratories none of the diagnostic procedures will be labeled "the Means test".

It has been said that if you want your name remembered you had better arrange to have a mountain or a river named for you. It seems to me quite as permanent and a great deal more suitable that the name of James Howard Means should be perpetuated in a laboratory for metabolic research. In such a laboratory his qualities of scholarship, enthusiasm, and originality, appearing as we hope they will in his successors, will contribute to the continuing and beneficent progress of medicine.

The laboratories were open for inspection from two to four-thirty on the afternoon of the dedication day.

THE MILDRED M. BURGIN HOUSE OFFICERS' LIBRARY OF THE CHILDREN'S SERVICE

This library was given in memory of Mrs. Mildred M. Burgin by her family and friends in order to perpetuate her very deep interest in the welfare of the house staff of the Children's Service.

This library, which is attractively furnished, is located on the 4th floor of the Burnham-Vincent Building, and is frequently used for conferences and study by those working on the Burnham floors.

Anyone wishing to contribute to the support of this library may do so by adding to the "Mildred M. Burgin House Officers' Children's Service Library Fund".

* * *

A cable address for Massachusetts General Hospital has been registered with Western Union Telegraph Company. It is the one-word address "MASSGENRAL", and henceforth any cable addressed to Massgenral Boston will be delivered to Fruit Street.

It is important that this be known in order to be of value.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

Biological Chemistry

Hatch, F. T., Larrabee, A. R., Cathou, R. E., and Buchanan, J. M.
Enzymatic synthesis of the methyl group of methionine. I. Identification of the enzymes and cofactors involved in the system isolated from *Escherichia coli.*
J. Biol. Chem. 236:1095.

Takeyama, S., Hatch, F. T., and Buchanan, J. M.
Enzymatic synthesis of the methyl group of methionine. II. Involvement of vitamin B_{12}.
J. Biol. Chem. 236:1102.

Endoscopy

Benedict, E. B.
Benign stenoses of the esophagus.
Am. J. Digest. Dis. 6:570.

General Surgery

Kestens, P. J., and McDermott, W. V., Jr.
Perfusion and replacement of the canine liver.
Surgery 50:196.

Long, R. T., and Cope, O.
Emotional problems of burned children.
New England J. Med. 264:1121.

Laboratory Science

Bürgi, W., Schmid, K.
Preparation and properties of Zn-α_2-glycoprotein of normal human plasma.
J. Biol. Chem. 236:1066.

Gitlin, D., Schmid, K., Earle, D. P., and Givelber, H.
Observations on double albumin. II. A peptide difference between two genetically determined human serum albumins.
J. Clin. Invest: 40:820.

Kamiyama, S., and Schmid, K.
Partial elucidation of the oligosaccharide chains of the human barium α_2-glycoproteins.
Biochim. et biophys. acta 49:250.

Morgan, W. S., and Hultin, T.
In vivo and *in vitro* distribution of labeled amino acids in soluble protein fractions of rat liver as shown by column chromatography.
Exp. Cell Res. 23:431.

Schmid, K.
Les globulines sériques du système gamma. Leur nature et leur pathologie. By J. Heremans.
J. Am. Chem. Soc. 83:2026.

Schmid, K., and Binette, J. P.
Polymorphism of α_1-acid glycoprotein.
Nature, London 190:630.

Physiology

Meyer, C. J., Wurtman, R. J., Altschule, M. D., and Lazo-Wasem, E. A.
The arrest of prolonged estrus in "middle-aged" rats by pineal gland extract.
Endocrinology 68:795.

Psychiatry

Beecher, H. K.
Surgery as placebo: A quantitative study of bias.
J.A.M.A. 176:1102.

Benda, C. E.
"Narcissism" in psychoanalysis and the "love of oneself" in existential psychotherapy.
Dis. Nerv. Syst. 22:69.

Klein, D. C., and Lindemann, E.
Preventive intervention in individual and family crisis situations.
In Prevention of mental disorders in children, Gerald Caplan, Editor, New York, Basic Books, chap. 13.

Lindemann, E., and Felsinger, J. M.
Drug effects and personality theory.
Psychopharm. 2:69.

Sifneos, P. E.
Dynamic psychotherapy in a psychiatric clinic.
In Current psychiatric therapies, New York, Grune & Stratton, Inc., part 6, p. 168.

Weisman, A. D., and Hackett, T. P.
Predilection to death: Death and dying as a psychiatric problem.
Psychosom. Med. 23:232.

Books

Benda, C. E.
The image of love: Modern trends in psychiatric thinking.
New York, Free Press of Glencoe, Inc.

Dr. Farrokh Saidi (a.r.s 1960), Nemazee Hospital, Shiraz, Iran

Dr. Edgar J. Schoen (a.r.p. *C.M.* 1954), University of Utah College of Medicine, Salt Lake City, Utah

Dr. Richard E. Senghas (sr. r.s. *Or.* 1961), 40 Evergreen St., Framingham, Mass.

Dr. Irwin I. Ship (*Dn.* 1957), Graduate School of Medicine, University of Pennsylvania, Philadelphia, Pa.

Dr. Harold Simon (r.p. *R.* 1961), New England Center Hospital, 171 Harrison Ave., Boston 11, Mass.

Dr. Jack Spencer (r.p. *R.* 1934), Union Hospital, Fall River, Mass.

Dr. David Spiro (a. path. 1960), Columbia University College of Physicians and Surgeons, 630 W. 168th St., New York, N. Y.

Dr. James H. Stempien (*Dn.* 1960), 328 Washington St., Wellesley Hills, Mass.; 29 Commonwealth Ave., Boston, Mass.

Dr. William G. Stewart, Jr. (*S.* 1960), Children's Medical Center, 300 Longwood Ave., Boston, Mass.

Dr. Joseph F. Stocks (a.r.p. *C.M.* 1961), 67 Silver St., Waterville, Maine

Dr. Alan A. Stone (r.p. *Psychiat.* (*McL.*) 1958), McLean Hospital, Belmont, Mass.

Dr. Louis W. Sullivan (clin. fel. & acting r.p. *Path.* 1961), Boston City Hospital, Boston, Mass.

Dr. Chung-Chang Tan (*Or.* 1943), 1951 N. Fresno St., Fresno 3, Calif.

Dr. Nathan S. Taylor (clin. & res. fel. and acting a.r.p. *Path.* 1961), Beverly Hospital, Beverly, Mass.

Dr. William M. Thurlbeck (a.r.p. *Path.* 1958), Dept. of Pathology, McGill University, Montreal, Canada

Dr. John D. Turner (*M.* 1957), National Heart Institute, National Institutes of Health, Bethesda, Md.

Dr. John Urquhart, III (*S.* 1960), National Institutes of Health, Bethesda, Md.

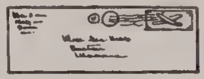
Dr. Frederick H. Verhoeff (cons. c. *Oph.*), 252 Pleasant St., Marblehead, Mass.

Dr. William R. Waddell (*W.S.* 1944), University of Colorado School of Medicine, Denver, Colo.

Dr. James P. Whittemore (*C.M.* 1946), 2330 N.W. Flanders St., Portland 10, Oreg.

Irving Wolf, Ph.D. (assoc. psychol.), Dept. of Psychology, Boston University, 308 Bay State Rd., Boston, Mass.

LCDR Edwin T. Wyman, Jr., MC, USN (sr. r.s. *Or.* 1960), Quarters G, U.S. Naval Hospital, Camp Lejeune, N. C.



Brief bits:

Dr. Edward B. Benedict attended the meetings of the American Gastroscopic Society and the American Gastroenterological Association in Chicago last May. He also attended the Editorial Board luncheon for *Gastroenterology.*

On the final day of the 74th annual meeting of the American Orthopaedic Association, held last May, Dr. Edwin F. Cave, president of the Association, announced the adoption of the following resolution: "That the American Orthopaedic Association go on record . . . as approving such an international program as will bring about a better mutual understanding among the physicians of the world, and a well-planned program of international medical research." Dr. Howard A. Rusk, in an article which appeared in the *New York Times* of May 28, said, "This was an unprecedented action of real significance. It expressed succinctly the recognition by these leaders in American medicine that the problems of health and medical research know no national boundaries."

Dr. Edward D. Churchill was one of the two speakers at a joint luncheon of the Harvard Foundation for Advanced Study and Research and the Law School Alumni Association, during the Harvard graduation exercises last June.

Dr. Allan L. Friedlich was elected president of the Massachusetts Heart Association's Greater Boston Chapter at the annual meeting of the organization, held last June.

Dr. Oscar Hirsch has been awarded a grant by the Massachusetts Division of the American Cancer Society, for a continuation of his research on malignancies in pituitary tumors during 1961.

Dr. Daniel J. Holland assumed his duties as

No. 97 in a series of Staff photographs

Dr. Edwin M. Cole, Neurologist—Head of the Language Clinic and the Cortical Function Test Laboratory

president of the Harvard Dental Alumni Association at the annual reunion of the Association, held last June.

Dr. John H. Knowles delivered three lectures which we have just learned about. On February 16 he spoke at the Cardiovascular Symposium of the Richmond Area Heart Association on "The pathophysiology of the pulmonary circulation in primary lung disease"; on February 18, at the University of Texas School of Medicine, Galveston, he lectured on the same subject; and on April 25 he addressed the House Officers' Association at Boston City Hospital on "The aging lung and emphysema".

Dr. George L. Nardi attended the Dijkzigt Conference, held in Rotterdam, Holland, last May. He addressed the Conference on the subject "A twenty-year review of thromboembolism at the Massachusetts General Hospital—1939-1959".

Dr. Carter R. Rowe was the guest speaker on the Orthopaedic Section at the meeting of the Medical Society of the State of New York, held on May 10. His paper was entitled "The management of osteomyelitis following fractures of the extremities".

Dr. Walter T. St. Goar gave a lecture to the Lahey Fellows at Lahey Clinic on May 10. His subject was "Diagnosis of osteoporosis". On June 6, at Emerson Hospital in Concord he spoke on "Pseudohypoparathyroidism".

Dr. C. Norman Shealy, Assistant Resident in Neurosurgery, left early in April for a 9-months' sojourn in Australia. He will be working in neurophysiology at the Australian National University in Canberra, under Sir John Eccles.

Dr. Lamar Soutter is now Area Chief of Surgery at the Veterans Administration Area Medical Office, 330 Stuart St., Boston.

Dr. Joseph Stokes, III, has gone to Hawaii for five years. He will be Director of Medical Education at Queen's Hospital, 1301 Punchbowl St., Honolulu 13, Hawaii.

Dr. Richard H. Sweet was elected president of the American Association for Thoracic Surgery, for the ensuing year, at the Annual Meeting of the Association, held last April.

Dr. Grantley W. Taylor read a paper at the 10th Middle East Medical Assembly, held in Beirut, Lebanon, while he was on a State Department tour. His subject was "Carcinoma of the breast". On April 28, Dr. Taylor spoke on "Relationship of liver dysfunction to the development of mouth cancer" at the Strasburger Conference, held at Memorial Hospital in New York.

Dr. Thomas V. Urmy (*E.M.* 1928), director of health at Williams College since 1946, was installed as president of the American College Health Association on April 29.

As part of its continuing program to educate physicians and future physicians about myasthenia gravis, the MG Foundation will again this year sponsor a series of research scholarships for promising young medical students. Eight outstanding students will receive awards, named for the founder of the first MG Clinic at Massachusetts General, Dr. Henry R. Viets. Their work will be carried out during vacation months.

Dr. William R. Waddell has been appointed professor and chairman of the Department of Surgery in the University of Colorado School of Medicine.

Mr. John B. Rideout, Administrative Assistant to Mr. Joseph W. Degen since 1955, resigned his position on July 31, to accept an appointment as Director of Nurses at Danvers State Hospital. Mr. Rideout is well equipped for his new duties. He is a graduate of McLean Hospital School of Nursing and has a B.S. degree from Boston University School of Nursing. Before coming to M.G.H. he served as Head Nurse and Supervisor and Clinical Instructor at McLean, and was Assistant Director of Nurses at Spring Grove State Hospital in Catonsville, Maryland.

Mr. Donald Withee, Director of our Photography Laboratory since 1952, resigned his position on July 6, to become Head of Medical Photography at the Scripps Clinic and Research Foundation in La Jolla, California.

Mr. Withee and his family drove out to the West Coast, camping on the way and planning to continue to camp out until he finds a house in a section of La Jolla which overlooks the ocean.

We happened to meet Mr. Withee just as he was driving out of the parking lot on his last day here. He said, "Please tell everybody at M.G.H. that I shall miss them all, and that I want to take this opportunity to thank all the doctors for the privilege of having been able to associate so pleasantly with them during these past few years. Also please tell all my friends at M.G.H. to drop in and say 'Hello' whenever they are in or near La Jolla."

A note from Dr. Chiu-chen Wang (r.p. *R.* 1952), written on July 10, says:

> As of the first of July, I shall be residing in Berkeley for a year. I wish to inform you of my new address, so we can keep in touch. It is Donner Laboratory, University of California, Berkeley 4, Calif.
>
> Please don't forget to mail me The News here. I have always enjoyed reading it and I don't want to lose track of my friends back home.

This interesting letter from Dr. Stuart Ragland, Jr., LCDR, MC, USN (*M.* 1951), was written from 791 Connell Drive, Cordova Park, Pensacola, Florida, and reads:

> Thank you for your letter of June 19 regarding my present status.
>
> On 3 January 1961 I accepted a commission as Lieutenant Commander, Medical Corps, United States Navy, and came to the Naval School of Aviation Medicine at NAS Pensacola, where I was designated a Naval Flight Surgeon on 23 June 1961. At my request I have been ordered to a refresher jet pilot course which should lead to designation as a Naval Pilot, so that I shall eventually have the title of Naval Aviator Flight Surgeon. It is anticipated that after this I will participate in the Man-Machine Test Program aspect of aerospace research, and hope it will mean that I shall eventually be the first physician into space.
>
> Although I am stationed at NAS Pensacola, it will probably be best to send The News to me at my home address as indicated on the letterhead above. Upon subsequent moves due notice will be sent to you for the necessary change of address.
>
> My very best to all my friends at M.G.H.

The News

No. 207 Boston, Mass. November 1961

On April 18, 1949, the Board of Trustees of the Massachusetts General Hospital announced the appointment of Dr. Dean A. Clark to the position of General Director of the Hospital, succeeding Dr. Nathaniel W. Faxon, who was retiring as Director after twenty years of association with the M.G.H.

Dr. Clark brought to the Hospital a long experience in public health. Since 1939 he had been a commissioned officer in the Regular Corps of the U.S. Public Health Service, reaching the rank of Surgeon, from which he took a leave of absence in 1945 to plan, develop, initiate, and administer the medical services of the Health Insurance Plan of New York. He took over the direction of the Hospital on October 1, 1949, moved with his family into the Resident Physician's House on the Hospital grounds, and plunged with a fresh approach into the torrent of MGH problems.

Almost immediately the plans for the new Research Building came off the architects' drawing boards and the structure began to rise on the northeast corner of the Hospital property, which necessitated Dr. Clark's moving with his family to Cambridge, where they have lived ever since. The Research Building was dedicated in May 1951, and at the dedication ceremonies Dr. Clark announced the 10-year plan of expansion and development of the Hospital, to culminate in the 150th Anniversary in 1961. The broad objectives of the 10-year plan are familiar to all of us at the M.G.H. Dr. Clark said at the dedication of the Research Building, "So that the Massachusetts General Hospital may be able in the future to continue to render the high standard of care of which we are rightfully proud, we must also have teaching; and to improve the effectiveness of our care and our teaching, we must have research. The three are inseparable in a hospital of this kind." He pointed out the need for $6,600,000 in additional endowment for patient care, in order to extend the charitable services of the Hospital. To strengthen teaching and research, the full-time medical and surgical staff would have to be enlarged if teaching and research, done in collaboration with the Harvard Medical School, were to be carried on and extended in the framework of the Hospital. To support these additional full-time men, the Hospital and Medical School together would require $7,500,000 in new endowment. In addition to a modest endowment for research, new buildings to replace some of the older ones at the Hospital were needed. Moderate expansion of clinical and basic research laboratories in the immediate future was also spelled out in considerable detail in the 10-year plan.

Following the Research Building, the new Nurses' Residence (Bartlett Hall) was completed in 1953. The Warren Building opened in 1956, providing new quarters for Pathology, Neurology, Dermatology, Psychiatry, and Neurosurgery, with added space for research activities. On top of these, five floors for doctors' offices were made available for the staff.

Besides the new construction, many older buildings were revamped. With a little paint, new floor covering, and new furniture, the old Out-Patient Department took on a new look. The Phillips House and Baker Memorial were extensively renovated, with new beds provided to make up for those which were sacrificed to the new Ambulatory X-ray in Baker. Several additions were made to the White Building for Anesthesia and Orthopedic Research; and the laboratories in the Bulfinch Building were extensively renovated and new ones provided for thyroid, allergy, hematology, and gastroenterology research. A significant improvement in patient care was made possible with a post-operative recovery room in the White Building. All this brought modifications in staff organization, a stronger administration, more advanced methods of accounting, and the delegation of administrative responsibilities to an administrative committee headed by Dr. Ellsworth T. Neumann, Administrator of the Hospital. In addition, the MGH Associates came into being.

During recent years, plans were developed for the implementation of the remaining elements in the 10-year plan. These were announced in 1959 as objectives for the 150th Anniversary. During the last eighteen months of Dr. Clark's administration, a sum of more than $11,000,000 for the implementation of the Anniversary Program has been assembled. This year, on the occasion of the 150th Anniversary, a Convocation was held at the Hospital, which focused national and international attention on the achievements of the M.G.H. during its 150 years. As Mr. Francis C. Gray, Chairman of our Board of Trustees, has said, "The President of the United States and the Governor of the Commonwealth, the press, radio and television, newspapers and magazines have singled out the Massachusetts General Hospital this year during the celebration of its 150th Anniversary with words of praise for its achievements during the past century and a half. We know the greatness of the M.G.H. lies in the sum of its parts; each doctor, each department, each laboratory and clinic contributes to the excellence of the Hospital."

In June of 1961, Dr. Clark offered his resignation, which was tabled until the meeting of the Board of Trustees on September 29. At that time, the resignation was accepted and the Trustees issued the following statement, "Dr. Dean A. Clark has tendered his resignation as General Director of the Massachusetts General Hospital, and it has been accepted. After time off for a vacation, he is planning to re-enter the field of Public Health. Dr. Clark has done many constructive things for the Massachusetts General Hospital during his twelve years as General Director, for which we are deeply grateful, and he will take with him the good will of us all."

D.C.C.
[David C. Crockett]

THE McLEAN HOSPITAL REHABILITATION CENTER

The ground breaking for the new Rehabilitation Center at McLean Hospital will soon take place, and the building will be completed by Christmas of 1962.

This will be the first new building for the use of patients at McLean in many years, and it is made possible as a result of contributions to the 150th Anniversary Drive and funds obtained from the United States Government under the Hill-Burton Hospital Construction Act. While some of the contemplated facilities already exist at the Hospital, centralizing them will help achieve a more integrated approach to the patient's treatment.

McLean was built on the present site between 1892 and 1895 for another age of psychiatric treatment, when achieving isolation and segregation of patients was thought to be a desirable goal. For many years, we have been trying to avoid as much as possible unnecessarily isolating patients from each other, their families, and the community; but when a patient is hospitalized it inevitably leads to some dislocation in interpersonal relationships. We encourage interaction between the patients, but this is handicapped somewhat by the distance separating the various areas which patients visit.

The idea underlying the Rehabilitation Center is that the hospitalized psychiatric patient in his course toward recovery and full participation in the life of his community needs opportunities for graduated participation in many different working and social situations. Prior to admission, the patient often took his work and past activities for granted, yet they played an important part in maintaining his emotional equilibrium. When hospitalization occurs, these meaningful relationships are to some extent interrupted, albeit temporarily, and this contributes to the feeling of estrangement and isolation which often complicates the emotional problems which necessitated the patient's admission in the first place.

While psychotherapy and family treatment have been the primary therapeutic tool at McLean Hospital, the need to make optimal use of the "other 23 hours in the day" has been recognized. Therefore, we have for many years also emphasized patient activities: social, vocational, educational, recreational, occupational, etc. These are seen not merely as filling up the time and relieving boredom, but as providing the patient with opportunities to acquire personal experiences in a variety of social situations, and providing substance to, as well as testing of, the psychotherapeutic work.

The Rehabilitation Center will consist of five major areas: the Occupational Therapy Area, the Library and Music Room, the Civic Center, the Day Care Center, and the Educational Department. The Patients' Library will be moved from its present location to the new building. The Music Room will be a great improvement on the present facilities, and will make the serious study and practice of music possible. The other three areas deserve special attention, as they make possible major additions to the treatment program.

Day Care Center

At present McLean has about fifty day patients who, under the supervision of a staff psychiatrist, come to the Hospital for periods varying from a few hours a week to several hours each day. While still living in the community, they participate in many of the daytime activities which the Hospital offers, as they did during their full-time hospitalization. The present facilities at McLean, however, have necessitated limiting this service to former in-patients of the Hospital; and due to lack of space, it has not been possible to make this treatment program available to patients admitted directly from the community.

Inquiries received from families, referring physicians, and potential patients lead us to believe that there is a demand for this kind of service in the community. Some people need the kind of treatment that only a hospital can provide, but need it only on a part-time basis. A patient will be admitted directly from the community to the Day Care Center, and over a period of a few days will receive a full psychiatric, medical, psychological, social, vocational, and educational evaluation (as indicated), often without having to spend more than a few hours a day at the Hospital. This would result in minimal dislocation of the patient's relationship to significant people in the home environment, such as family members and friends, as well as work colleagues. Upon completion of such an evaluation, a treatment program will be prescribed which may include psychotherapy, biological therapy, case work, educational and vocational rehabilitation, and a wide variety of activity therapies, as well as other psychiatric treatments. Many of these would be provided within the building itself. On the other hand, if Day Care is not sufficient to meet the patient's clinical needs, admission to the In-Patient Service could be readily accomplished in surroundings with which the patient is already familiar, and this again would minimize the estrangement and isolation which frequently follow from hospitalization.

The flexibility which this program allows would make it possible to tailor the types of treatment much more precisely to the specific clinical needs of the individual patient.

The Day Care Center will be in charge of a staff psychiatrist, with a head nurse who will be the coordinator of the day patients' activities in the Hospital. A few rooms have been set aside for resting, but the space has been deliberately limited to prevent the patient from isolating himself.

Across the entrance hall from the Day Care Center will be the Admission Area, where the process of admission directly to Day Care will take place.

Adjoining the Day Care Center will be the Recreational Therapy Area, which will be continuous with the Day Care Lounge. This will contain an area for card games, ping-pong, pool, etc.

Also adjoining the Day Care Center will be an area for elderly patients. We believe that it is important for elderly patients to have the opportunity to participate sometimes, if only as observers, in the life of younger people, while at the same time giving them the opportunity to retain some degree of privacy and to remove themselves from the comings and goings of people younger than themselves. Activities for the elderly will be developed, such as gardening, reading clubs, etc.

We believe that there are in the community elderly people with psychiatric disorders who remain in their families in spite of behaviour detrimental to the family as a whole and to themselves, as they are not receiving fully effective treatment; and there are others who are sent to mental hospitals or nursing homes for custodial care, where the opportunities for rehabilitation are less than the patients can use. We envisage the Day Care Center as making possible a combination of family life and hospitalization for these elderly patients. Elderly patients can be brought to the Day Care Center in the morning (say, by a relative on his way to work), can remain throughout the day, engaged in an interesting and therapeutic way (perhaps including psychotherapy), then can return to the family to spend the night. The family will be free of the responsibility of caring for the patient during the day and will resume the responsibility in the evening. This would prevent the complete segregation of the elderly person from his family by total hospitalization; and both the interest of the family as a whole would be served and the clinical needs of the patient would be met. In addition, we believe that there are a substantial number of elderly patients who suffer from depressions masked by symptoms interpreted as of organic origin. We expect to provide opportunities for the exercise of the remaining intellectual faculties, and, by combining these activities with a psychotherapeutic approach, we hope that the process of aging may be rendered less distressing to the individual concerned and his family. While this area will be primarily for the use of day patients, it will be open to suitable elderly in-patients.

Educational and Vocational Area

The number of adolescent patients has been growing, and we have been faced with the opportunity to provide them with their education, so as to minimize the educational loss resulting from leaving school to be hospitalized. We now have four teachers, and a high school education program is in operation. About fifteen patients are carrying on the average of two high school courses in a classroom setting. In addition, individual tutoring is available as needed. The new building will contain several classrooms, including one equipped with a laboratory for the study of physics, chemistry, and other sciences. In addition, there will be offices for individual tutoring and for the teachers. Between two of the classrooms there will be one-way screens, to make research possible in the educational process of the mentally ill.

We expect that most students will receive academic credit for their school work done here. Our present program of vocational testing and rehabilitative work needs to be expanded, in order to assist our patients in planning for their employment after discharge, and the necessary space is being provided in this part of the building.

Civic Center

In this area there will be meeting rooms, beauty shop, barber shop, post office, bank, coffee shop, and store. This will be built on the idea of the "Village Green", and will provide the setting for several activities which most people outside the hospital take for granted.

Frequently the patient who is convalescing from a serious mental illness has to relearn and practise some of the most elementary activities, i.e., how to make an appointment with a hairdresser, how to make a phone call, how to buy something, or how to establish a relationship. At the time of a patient's discharge a serious problem is often created by the sense of strangeness which the patient feels when he finds himself once again in the community, having to perform some of these elementary activities. By providing some of these activities within the Hospital, in a setting as unlike the traditional mental hospital as possible and similar to a small-town community center, we believe that it will be possible often for the seriously ill patient to continue to do for himself those things which he can do and thus diminish the amount of artificially induced incapacities which sometimes result from hospitalization. We also expect that this area will be used by the patient to learn and relearn some social and vocational skills which will be of benefit to him after discharge.

While not in the Civic Center, it is worth mentioning here that in the O. T. Department of the Rehabilitation Center there will be a home-making area, with a kitchenette and dining space which patients will be able to use for these rehabilitative purposes just described above.

To summarize, the Rehabilitation Building will be used by patients who are living in the community, as well as those residing in the Hospital. We see it providing for the in-patient of the Hospital an environment quite unlike that found in many traditional mental hospitals, and similar in many ways to that commonly found in the community. For the patient who is living in the community, we see it providing these facilities — psychiatric and otherwise — which only a mental hospital can provide, and, most importantly, providing them to the extent required by the patient's clinical condition.

The Rehabilitation Center will offer a patient residing in the community the type of hospital treatment he needs, and the patient in the Hospital the type of "community treatment" that he can benefit from. It will bridge the gap between the mental hospital and the community, and bring the Hospital closer to the patients who are living in the community and the community closer to the patients living in the Hospital.

Francis de Marneffe, M.D.,
Associate Psychiatrist,
McLean Hospital

♣ ♣ ♣

Dr. Francis D. Moore (*W.S.* 1940) received the honorary degree of Master of Surgery from the National University of Ireland, at ceremonies held in Dublin in September during the meetings of the International Society of Surgery. Dr. Moore is Moseley Professor of Surgery at Harvard Medical School and Surgeon-in-Chief at Peter Bent Brigham Hospital.

♣ ♣ ♣

Dr. John H. Knowles has been appointed to the newly created post of Director for Medical Affairs of the Massachusetts General Hospital, effective September 15, 1961. This position was established to help coordinate and support the efforts of all members of the Staff in medical advances and projects. His office is in the room immediately adjoining the Secretaries' Office on the ground floor of the White Building.

Dr. Knowles is a graduate of Harvard College and of Washington University School of Medicine. He came to the Massachusetts General Hospital as an intern in Medicine in 1951 and, except for military service and two years at the University of Rochester Medical School, has been here ever since. He was Chief Resident in Medicine in 1958. At present, he is an Assistant Physician on the Hospital Staff and an Associate in Medicine at the Harvard Medical School. He has been Chief of the Pulmonary Unit of the Hospital for the last two years, and is a diplomate of the American Board of Internal Medicine.

The Board of Trustees, at their meetings on August 31, and September 15 and 29, voted:

To grant a leave of absence of four months to Dr. Benjamin Castleman, beginning about November 1;
That the Warren Triennial Prize for the year 1962 be awarded jointly to Dr. George Palade of the Rockefeller Institute, New York City, and Dr. Keith Porter of the Biology Laboratories of Harvard University, in recognition of their contributions to our knowledge of the ultrastructure of cells.

To accept the resignations of:

Dr. Willard Dalrymple from the position of Assistant in Medicine, effective August 31;
Dr. William A. Tisdale from the position of Assistant in Medicine, effective August 31.

To appoint:

Dr. George P. Baker, Jr. as Clinical and Research Fellow in Medicine, effective as of July 1;
Dr. Hugh R. Butt as Visiting Physician, during the period November 13 through November 18;
Dr. Frederick J. Duhl as Assistant in Psychiatry, effective as of July 1;
Dr. Florence Geller as Exchange Assistant Resident on the Children's Service, for the period September 19 through October 25;
Clara W. Mayo, Ph.D. as Assistant Psychologist for one year, beginning September 1;
Dr. William J. Otto, Jr. as Second Assistant Resident in Radiology, beginning July 1, 1962;
Dr. Jorge E. Piza as Graduate Student Assistant and Clinical Fellow in Pathology for one year, beginning September 1;
Ernest T. Pritchard, Ph.D. as Assistant Biochemist at McLean Hospital, effective September 1;
Dr. Richard W. Sagebiel as Third Assistant Resident in Pathology for one year, beginning July 1, 1962;
Dr. Richard J. Steckel as Second Assistant Resident in Radiology, beginning July 1, 1962;
Anne M. Stoffyn, Ph.D. as Assistant Biochemist at McLean Hospital, effective September 1.

At their meetings on August 30, and September 6, 20, and 27, the General Executive Committee voted:

To promote:

Dr. Alan C. Aisenberg to the position of Assistant Physician, effective as of September 1;
Dr. Robert M. Kline to the position of Assistant Resident on the Children's Service for one year, beginning July 1, 1962;
Dr. S. Michael Marcy to the position of Assistant Resident on the Children's Service for one year, beginning July 1, 1962;
Dr. Lester F. Soyka to the position of Assistant Resident on the Children's Service for one year, beginning July 1, 1962;
Dr. C. Gene Wheeler to the position of First Assistant Resident in Surgery, effective as of July 1.

To reappoint:

Dr. Louis H. Edmunds, Jr. as Second Assistant Resident in Surgery, beginning October 1;
Dr. Eric Engel as Clinical and Research Fellow in Medicine for one year, beginning October 1;
Dr. Murray Feingold as Assistant Resident on the Children's Service for one year, beginning July 1, 1962;
Dr. George M. Perrin as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Annette M. Coe Rapin, Ph.D., with a change of title from Research Fellow in Medicine to that of Research Fellow in Biochemical Research for one year, beginning September 1;
Dr. Stephen L. Reynolds as Assistant Resident on the Children's Service for one year, beginning July 1, 1962;
Dr. Peter P.-E. Schuntermann as Assistant Resident on the Children's Service for one year, beginning July 1, 1962.

♣ ♣ ♣

The recent death of Dr. H. Robert Dudley, Jr., who left the Massachusetts General Hospital in July to become Professor and Chairman of the Pathology Department at Emory University, shocked everyone who had known him during the past ten years as a medical student, intern and resident, and member of the Staff. Some of his friends have established the Hugh Robert Dudley Memorial Fund in the Pathology Department, and anyone wishing to give to this Fund may send a contribution to Mr. George S. Weld, Secretary and Assistant Treasurer of the Massachusetts General Hospital, 45 Milk Street, Boston. Checks should be made payable to the Massachusetts General Hospital.

♣ ♣ ♣

A memorial fund has already been established by friends and associates of Miss Ida M. Cannon who desire to express their affection and honor her memory.

Miss Cannon was one of the great pioneers in social work and was associated with Dr. Richard C. Cabot as a founder of medical social work. Her career in this field covered a span of thirty-nine years (1906-1945), all spent at the Massachusetts General Hospital. During the last thirty-one of these years she served as Chief of Social Service.

Beyond her work at the Hospital and her activities in extending the field of medical social work in the United States and other countries, Miss Cannon made important contributions to community welfare and to the social work profession. She published two distinguished books and numerous articles about medical social work. She taught in schools of social work and was active in local, national, and international conferences. Although the years of her long professional career were centered in the Massachusetts General Hospital, her influence was world-wide.

The Ida M. Cannon Memorial Fund will be used for projects within the area of Miss Cannon's greatest interests — better understanding of the needs of patients, the social aspects of health and medical care, and the role and requirements of social work in these fields. This Fund will finance grants to social workers and members of associated professions in the United States and other countries for carrying on such projects.

The establishment of this Fund provides an opportunity for those who are interested, to participate in this memorial to Ida M. Cannon.

Gifts or bequests may be made out to Massachusetts General Hospital Ida M. Cannon Memorial Fund, and sent to Mr. Henry R. Guild, Treasurer, Massachusetts General Hospital, 45 Milk Street, Boston.

Gifts may be payable in installments extending up to three years, and are deductible for income tax purposes.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material*, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the name of the hospital department with which you are affiliated

The following new titles have been received:

Anesthesia

Beecher, H. K.
Der Anästhesist und seine Stellung im Wandel der Zeit.
Triangel 5:11.

Beecher, H. K.
The present status and the future development of the physician anaesthetist.
Triangle 5:11.

Beecher, H. K.
Situation actuelle et perspectives de l'anesthésiste.
Triangle 5:11.

Arthritis

Balboni, V. G.
Septic arthritis: With a discussion of the role of infection in rheumatic disease.
In M. Clin. North America, Philadelphia, W. B. Saunders Company, 45:1155.

Calkins, E., Cohen, A. S., and Short, C. L.
Long-term chloroquine therapy in rheumatoid arthritis.
In M. Clin. North America, Philadelphia, W. B. Saunders Company, 45:1219.

Ropes, M. W.
Conservative treatment in rheumatoid arthritis.
In M. Clin. North America, Philadelphia, W. B. Saunders Company, 45:1197.

Endoscopy

Benedict, E. B.
The differential diagnosis of gastric lymphoma, carcinoma and gastritis by gastroscopic biopsy.
Current M. Pract. 5:189.

General Surgery

Nardi, G. L., and Zuidema, G. D.
The postoperative use of dextro pantothenyl alcohol.
Surg. Gynec. & Obst. 112:526.

Laboratory Science

Morgan, W. S., Perlmann, P., and Hultin, T.
Autoradiographic analysis on agar plates of antigens from subcellular fractions of rat liver slices.
J. Biophys. & Biochem. Cytol. 10:411.

Pediatrics

Brazelton, T. B.
Psychophysiologic reactions in the neonate. I. The value of observation of the neonate.
J. Pediat. 58:508.

Brazelton, T. B.
Psychophysiologic reactions in the neonate. II. The effect of maternal medication on the neonate and his behavior.
J. Pediat. 58:513.

Psychiatry

Lindemann, E.
Die soziale Organisation der menschlichen Lebewesen.
Praxis der Psychotherapie 6:49.

Books

Nardi, G. L., and Zuidema, G. D., Editors.
Surgery. A concise guide to clinical practice.
Boston, Little, Brown & Company.

VOLUNTEER GROUPS

DISTAFF CLUB

The following officers have been elected for the coming year:

President — Rachel Wohl
Vice-President — Eunice Porvaznik
Corresponding Secretary — Eleanor Skinner
Directory Secretary — Pat Sell
Treasurer — Beth Strickler
Area Coordinator — Anne Barlow
Newsletter Staff — Nancy Mundth, Lisa Lampert, Lee Herbst
Projects Chairman — Chris Patton
Volunteers — Joan Ottinger
Publicity — Barbara Goldfinger
Hospitality — Dottie Smith
Housing — Jean Canellos
Christmas Party Chairman — Ruth DeSanctis
Spring Dance Chairman — Mary Lou Monaco

Professor Robert H. Anderson spoke to our Club on "Elementary education" on September 12. Sixty members were present — one of the largest turnouts in Distaff history.

On October 3, Mrs. Oliver Cope discussed the workings of the community through its social agencies.

On October 29, a tea was given at the home of Dr. and Mrs. Walter Bauer for doctors and their wives from other countries.

Our questionnaire has been distributed, and groups — such as the MGH Volunteers and the Book Review Club — are getting under way. Area meetings were held during October, and in November we are looking forward to a talk by Dr. Paul D. White about his recent world trip.

THE CHILDREN'S SERVICE

On recommendation of the General Executive Committee, the Board of Trustees, at their meeting of March 17, 1961, approved a reorganization of the Children's Medical Service as follows:

1. That the name of the Service be "The Children's Service" of the Massachusetts General Hospital.
2. That there be created a Children's Service Executive Committee, the members of which will be nominated by the Chief of the Children's Service and appointed by the General Executive Committee. Its composition would include the Chief of the Children's Service as Chairman, and representatives of the Children's Medical Committee, the Children's Surgical Committee, the Children's Service Staff, the Hospital Administration, and a representative of the Massachusetts Eye and Ear Infirmary.

   It is understood that additional temporary or permanent members of this Committee may be appointed by the General Executive Committee from time to time upon nomination by the Chief of the Children's Service.
3. That Burnham-5 be designated as primarily a surgical floor, with the understanding that this does not preclude the admission of non-surgical patients to the floor when need arises and beds are available, nor the admission of surgical patients to the other Burnham floors when necessary.
4. That all the Burnham floors will be available to both Service and private patients.
5. That surgeons assigned to the Children's Service, and to be designated as such in the Annual Report, will be in charge of all surgical patients admitted to the Chil-

dren's Service, unless otherwise designated by the Chief of the General Surgical Services or specialty surgical service or unless the patient is a private patient of a staff member assigned to a bed in the surgical unit.

6. That, besides the Surgeons to the Children's Service, the Burnham surgical floor be staffed with:
   - A visiting pediatrician, serving as consultant
   - An assistant resident from General Surgery assigned full-time, in rotation
   - An assistant resident from Children's Medicine
   - An intern from Children's Medicine

   It is understood that the house staff assigned from Children's Medicine will participate, under direction of the surgeon in charge, in the working up of patients, in the operating room, in post-operative care, and in the follow-up clinic.
7. That each of the various general and special medical and surgical Services be asked to assign a staff visiting member as its liaison with the Children's Service and that these assignments be designated in the Annual Report.
8. That there be appointed by the General Executive Committee on joint recommendation of the Chairman of the Children's Surgical Executive Committee and the Chairman of the Hospital Surgical Executive Committee, after consultation with their respective committees, including the Chief of the specialty Service or assignment directly concerned,
   (a) A Children's Surgical Committee:
      - Two representatives from General Surgery, one of whom shall be Chairman
      - Representative from Urological Surgery
      - Representative from Orthopedic Surgery
      - Representative from Neurological Surgery
      - Representative from Plastic Surgery
      - Representative from Radiology
      - Representative from Dental Medicine
      - Chief of the Children's Service or his designated representative to act as liaison with Children's Medicine
      - Representative of the Hospital's Administration, who shall be Secretary

   (b) A Children's Medical Committee: Appointed by the General Executive Committee on joint recommendation of the Chairman of the Children's Service Executive Committee and the Chairman of the Hospital Medical Executive Committee after consultation with their respective committees, including the Chief of Psychiatry and the Chief of the specialty Service or assignment directly concerned.
      - Chief of Children's Service, who shall be Chairman
      - Two or three representatives from Adult Medicine
      - Representative from Psychiatry
      - Representative from Neurology
      - Representative from Dermatology
      - Representative from Hospital's Administration, who shall be Secretary

   It is understood that the composition of these two committees may be changed from time to time.
9. That the purpose of the above organizational changes is to promote the functioning of the Children's Service as a coordinated whole, with suitable autonomy within it for Children's Surgery and for other medical and surgical specialties. It is understood that there is no intention now or in the foreseeable future to establish a separate training program for the surgery of children.
10. That Physicians to Children's (Medical) Service henceforth be called Pediatricians, Associate Pediatricians, Assistant Pediatricians, etc.

* * *

PSYCHIATRY

Many members of our staff and of the faculty of Harvard Medical School, and others in the medical profession, need no introduction to Dr. David Stafford-Clark of London. He was in this country on a Nuffield Travelling Fellowship during 1949 and 1950, serving at Massachusetts General as resident and clinical fellow in psychiatry and at Harvard Medical School as a teaching fellow. After returning to his native England, he was appointed to the staff at Guy's Hospital, and is now Physician-in-Charge of the Department of Psychological Medicine and Director of the York Clinic at Guy's, and also Physician to the Bethlem Royal and Maudsley Hospitals, and to the Institute of Psychiatry of the University of London.

Several members of our staff attended the Third World Congress of Psychiatry, held in Montreal on June 6, and heard Dr. Stafford-Clark present an interim report on a research project by Prof. John Butterfield, Dr. Bernard L. Mallett, and Dr. Stafford-Clark, all of Guy's Hospital. A few days after the Montreal meeting, Dr. Stafford-Clark delivered a most interesting address here at M.G.H.

Since several of our doctors had already spoken so highly about Dr. Stafford-Clark's Montreal paper, we succeeded in securing a copy of the Montreal speech while he was here, and we give it to you now so that those who were unable to go to Canada may know more about the type of work being carried on at Guy's under Dr. Stafford-Clark's direction.

DISORIENTATION

An approach to the psychophysiology of confusion, with particular reference to psychiatric emergencies in a general hospital

Preliminary statement of aims and object research

Psychiatric emergencies arising in the wards of a general hospital can be divided into two main groups: the toxic confusional reactions on the one hand; and, on the other, acute so-called functional psychoses precipitated by the stress of illness and hospitalization.

Characteristic of the former group, and occurring not infrequently in the latter, particularly in the schizophreniform reactions, is a disturbance in the patient's perception of reality. One common aspect of this is disorientation in time and space and sometimes in identity, resultant upon a greater or lesser degree of clouding of consciousness, failure of recent memory, and failure of attention, concentration, and judgment. These disturbances of mental function in turn rest upon an underlying neurophysiological and biochemical disequilibrium.

It is of course well recognized that the factor of emotional stress is of profound importance in cases of this kind. Nevertheless, when the patient's response to stress assumes a form both unquestionably psychotic on the one hand, but relatively rapidly reversible on the other, it presents us with a unique opportunity for studying all aspects of the psychophysiological disequilibrium which has occurred.

The York Clinic is an in-patient psychiatric unit completely integrated with the medical and surgical practice of Guy's Hospital. The conditions therefore are exceptionally suitable for a combined psychiatric clinical and biochemical investigation. Current research, jointly undertaken by the departments of Psychological and Experimental Medicine, is directed particularly towards the disturbances of protein and catecholamine metabolism which may underlie confusional states. Attempts are also being made to develop new techniques for the direct study of cerebral circulation and carbohydrate metabolism.

Clinical background

One of the ways in which a department of psychological medicine makes its most consistent and productive contribution to the teaching and, indeed, to the whole climate of opinion in the school and hospital, of which it is a part, is through the services which it can perform and the example which it can set in the cure of those patients whose illness combines some form of structural disorder with some impairment or estrangement of normal behaviour.

These are the patients who develop states of toxic confusion, delirium, or psychotic illness, in the course of previously routine medical or surgical illness. They include patients in whom the emotional stress or threat of some physical disorder overwhelms their normal capacity for contact and cooperation with those who look after them. A few illustrative examples are appended.

Case 1:

A 35-year-old childless housewife, with relatively severe valvular disease of the heart, was seen at the request of an eminent surgical colleague who had proposed operation to relieve her intense physical disability secondary to her heart disease. While under his care, and receiving the appropriate attention and preliminary investigation for the brilliant operation which he was prepared to undertake, she became increasingly alarmed and began to develop delusional ideas: for example, that her heart had been punctured during the course of the investigations and was collapsing like a shrivelled balloon; and that it would not be safe for her to eat anything because her intestines had become a series of gutters in danger of overflowing their contents, which would then accumulate and putrify in the bottom of her pelvis. Psychiatric examination revealed a history of schizophrenia in her family, and in her own case there could be little doubt that the basic psychiatric syndrome was a chronic paranoid schizophrenia with bodily delusions released by the stress and fear of the approaching ordeal.

Appropriate treatment was successful in restoring completely her morale and mental and emotional clarity. She lost her delusional symptoms, and after four months was considered fit to undergo the operation, which, in fact, proved highly successful.

Case 2:

A young girl of 19 had suffered from a lifelong disability due to congenital heart disease, for which surgical repair had been considered possible. She, too, developed symptoms of marked emotional disturbance. She wandered about the surgical ward into which she had been admitted, trailing her nightgown and tearing and scattering pieces of paper on which she had scribbled numerous incoherent messages. Her behaviour resembled that of an imaginative schoolgirl acting the part of Ophelia.

This proved to be an hysterical reaction, provoked by the conviction that she could not hope to survive an operation upon an organ as vital as the heart, whose disability had caused her relatively complete invalidism throughout her whole life. Yet she had been unable either to express her fears or to weigh up the alternatives, and felt herself inexorably destined to die under the anaesthetic without having communicated her anxieties to anyone. She, too, received a combination of psychotherapy and quiet confident nursing and supervision in the Psychiatric In-Patient Unit to which she was admitted. Her disturbed behaviour was tolerated without comment, while its causes were gradually revealed and dealt with by appropriate psychotherapy, and its manifestations modified by tranquilizing drugs. Nevertheless, it took this extremely vulnerable and immature young woman five months to be fit for operation. When eventually the operation was undertaken, it, too, proved completely successful. It is perhaps an interesting and ironic observation on the attitude of patients to their own emotional disabilities, that this girl subsequently received a request from a weekly magazine to write a personal account of the treatment and operation which had turned her from a total invalid into a vigorous and healthy young woman. Her ghosted account omitted completely any reference to the five months' work by the Psychiatric Department which had enabled her to undergo the operation which formed the turning point in her life.

Case 3:

A 40-year-old married woman, with two children, had suffered from severe pulmonary tuberculosis, for which ultimately partial pneumonectomy offered promise of final cure. She had been extremely apprehensive about the operation, but had not disclosed her apprehensions to the surgical team who undertook it. Following the operation she had the misfortune to develop complications in the form of a small empyema, which required suction drainage and naturally held up her recovery.

She became exceedingly depressed, withdrawn, and ultimately deluded, believing that everyone else in the ward despised her because "the operation had gone wrong" and because "everyone is complaining about the smell". In fact, at her own request, she was nursed on the balcony, and, although the characteristic odour of the empyema was noticeable to her, it had at no time provoked comments from other patients or nurses.

Nevertheless, her delusional depression culminated in a determined suicidal attempt when she sought to smother herself with her pillows and caused considerable alarm to those looking after her. All her symptoms, both of depression and of punitive and paranoid delusions, disappeared within four days of her admission to the Clinic. Complete acceptance of her as a person, followed by a full discussion of her anxieties, guilt, and apprehension about her operations and the outcome, were the key to her restoration. She spent the rest of her convalescence from the empyema until its closure in the Clinic, maintaining that she felt safe there, because "You really understand me and for the first time you've given me courage to understand myself."

Case 4:

A widow of 47 noticed a small lump in her right breast which she feared—correctly, as it proved—might be malignant. She was referred by her doctor to the Surgical Out-patients' Clinic of a nearby hospital, where operation was advised. She went home, horrified at the implied confirmation of her fears, and for three months could not summon the courage to return. Eventually she persuaded her doctor to refer her to another hospital, because "I could not face going back and admitting to have been a coward."

The same very considerable aura of misery and apprehension surrounded her attitude towards this undoubtedly severe threat to her whole existence as that characterized by a patient previously described (Case 3).

The second hospital she attended arranged her immediate admission and undertook preliminary biopsy as a first stage procedure. This is, in fact, an unusual practice in the United Kingdom, since operations of this kind are normally performed in a single stage, with examination of frozen sections of the removed mass while the patient is still anaesthetised, so that second stage radical mastectomy can be immediately undertaken if necessary. As it was, this lady recovered consciousness with a small wound, only to learn a few days later that a second operation would be required. "What is this for?" she enquired timidly. "Just a deeper cut," was the foolish, well-intentioned, but devastatingly misleading reply. When she awoke from the second operation she discovered that she had had a total radical mastectomy.

Her reaction was to develop a severe psychotic depression, with hysterical paralysis and numbness of the arm on the affected side and bizarre delusional convictions that she was "no longer really a woman. . . . They have taken out things inside me, as well as removed my breast. . . . I am something like a zombie, something awful, a living corpse, no longer a real person at all . . .".

She, too, required patient, imaginative and constructive combination of psychological and physical treatment before her mental state could be restored to normal. The illness in this stage lasted over three months, and throughout most of it her contact with reality and her judgment remained fundamentally disturbed.

These are a few simple instances of the type of case which attracted our attention to the possibility of seeking a clue to the nature of the physiological and psychological components of psychotic illness in these reversible, although often severe, reactions to overwhelming stress in general hospital patients.

Other examples have included patients who become paranoid, catatonic, stuporous, and disoriented in the course of hypoxia from chronic bronchitis and emphysema, or temporary episodes of heart failure.

Procedure and progress report to date

The actual programme of research was begun on May 1st, 1960, under the joint supervision of the Professor of Experimental Medicine and the Physician-in-Charge of the Department of Psychological Medicine at Guy's Hospital. Its object was essentially to gain further insight into the nature of the biochemical basis of mental illness, with particular reference to the factors already outlined. To this end it was planned to investigate, both clinically and biochemically, patients admitted to the general medical, surgical, and obstetric wards of Guy's Hospital in apparently normal mental health, who became mentally disturbed during the period of their admission. The Research Fellow, Dr. B. L. Mallett, established close liaison with the doctors and ward sisters concerned, so that he was at once informed when such cases occurred.

Clinical studies

The first problem was to collect clinical information. A careful medical and psychiatric assessment of all relevant cases has therefore been made to determine the incidence and true nature of the mental disturbances encountered in a large general hospital. No similar study had been previously reported in Great Britain, nor could useful inferences be drawn (because of differences of definition and method) from three comparable but smaller studies carried out elsewhere. Accordingly, the investigation proceeded along the following lines:

(1) A medical and psychiatric assessment was made of all patients referred from the general wards because of mental disturbance, from 1 May 1960 to 31 December 1960. During this period 49 cases were seen by Dr. Mallett and/or one of the psychiatric consultants; and a further 26 cases were seen and treated by Dr. Mallett alone, without further reference to a consultant psychiatrist.

(2) An analysis was made of the case reports of all in-patients referred from the general wards for psychiatric opinions during the preceding five years. This work was carried out with the help of Dr. J. J. Fleminger, Consultant Psychiatrist at Guy's Hospital throughout the whole of the period under review, who had examined the majority of these patients himself.

The data obtained give an analysis of 300 cases, together with reason for admission, reason for referral, the psychiatric diagnosis made, and the treatment required. In general it is concluded that mental illnesses arising in the setting of a general hospital do not differ clinically from those occurring in the population at large. Thus the "hospital psychosis" is similar to the "postoperative psychosis" and the "puerperal psychosis" which it embraces, in that it is composed of a variety of common reaction types. The differential incidence of the affective, schizophrenic and organic reaction types in the present series is similar to that noted by Stengel *et al.* (1958) in a series of 80 postoperative psychoses. Shepherd *et al.* (1960), some time after the start of the present investigation, published an account of psychiatric consultations requested during one year in a smaller general hospital in S.E. London. These included fewer schizophrenic and neurotic reactions and a higher incidence of toxic and organic reactions. The reason for this is not yet clear. Useful information will come from further comparison of the present findings with the incidence of mental illness occurring in out-patient clinics and in general practice.

With the approval of the Nuffield Foundation a full report of this work will be submitted to the medical press, with conclusions and recommendations regarding psychiatric services in general hospitals.

Biochemical studies

The proposed biochemical enquiry has been tailored to suit both the clinical material and the laboratory facilities available in the hospital; thus, difficulties in getting the amino-acid chromatographic columns working have delayed any analysis of C.S.F. amino-acids. Experimental biochemical studies have proceeded along the following lines:

(1) Protein electrophoresis of serum taken from acutely psychotic patients at the height of the illness and on recovery has been carried out as suggested in the original project.

(2) Assays of urinary 5 hydroxy-indole acetic fractions. In view of the negative results obtained by other workers, this project was abandoned and in its place blood glutathione and cysteine estimations have been carried out.

(3) Preliminary work has been carried out on the direct *in vivo* study of cerebral metabolism by a method using radio-isotopes, which will be applied to cerebral glucose and non-esterified fatty acid metabolism.

(1) Serum protein electrophoresis

The research which, during the last five years, has carried the greatest implications for the possible aetiology and rational therapy of schizophrenia is that concerned with the demonstration of an unidentified toxic substance in the blood of schizophrenics. This substance has been called "taraxein" and is believed to be a globulin related to ceruloplasmin. It has been extracted, with varying degrees of success in different laboratories, by a chemical process involving 29 separate procedures, taking some four days and yielding a labile substance which deteriorates in about four hours. It seemed to us that an objective physicochemical characterization of plasma proteins might detect taraxein in psychotic serum, if indeed it exists.

Using the Tiselius electrophoretic apparatus, Dr. A. Shore, protein biochemist in the Medical School, Guy's Hospital, examined sera from 13 cases of acute psychosis both during the acute phase of the illness and, where possible, after recovery. The results suggested that where abnormalities of the electrophoretic pattern occurred the clinical picture, involving both somatic illness and psychiatric disturbance, was so interwoven that correlation of protein abnormality with mental state could not be clearly shown.

Accordingly, it was decided to carry out a similar investigation in undoubted cases of acute schizophrenia occurring in physically healthy subjects. Through the courtesy of Dr. M. Radzan, the Medical Superintendent, Dr. Mallett has been granted access to patients in Bexley Mental Hospital, and a series of such cases is at present being investigated. A starch-gel technique may be used in place of the present Tiselius method if it is considered that this will permit of more accurate separation of that portion of the protein spectrum believed to contain taraxein.

(2) Glutathione and cysteine estimations

The original work on taraxein was the outcome of an alleged relationship between raised globulin levels, increased speed of adrenalin oxidation, and lowered glutathione levels in the blood of psychotic patients. It has been suggested that sulphhydryl linkages may play a vital role in the metabolism of schizophrenia, and in the metabolic action of chlorpromazine. The evidence, however, is inconsistent and it was decided to measure glutathione and cysteine levels in the blood of patients under our care.

Dr. R. Rodnight, in the Department of Biochemistry of the Institute of Psychiatry of the University of London, has been working on this problem and has kindly agreed to carry out these estimations. To date, four have been investigated—a number too small to warrant any conclusions being drawn. One showed a high cysteine value during the period of greatest mental disturbance which fell during the recovery phase.

(3) *In vivo* studies of cerebral circulation and metabolism

Preliminary experiments carried out in collaboration with Mr. N. Veall, M.R.C., Physicist at Guy's Hospital, suggest that it will be possible to obtain a continuous measurement of cerebral blood flow, using radioactive xenon in a dosage much lower than has been used heretofore. The advantage of thus minimizing the exposure of patients to radiation does not need to be stressed.

Practice punctures of the internal jugular vein and jugular bulb on cadavers, with injection of dye and subsequent dissection, have been undertaken.

Subsequently we have been able to produce a concentration of radioactive xenon within the cerebral circulation, which can be detected and measured by appropriate counting devices linked to an autoanalyser simply by inhaling air in which carefully measured and controlled quantities of the appropriate gas have been introduced. This appears to be a safe method of introducing radioactive tracers into cerebral circulation and, of course, is infinitely preferable for patients who are already disturbed or frightened.

If this method can be practically applied it will be possible, utilizing autoanalytic techniques which have already been developed in the Department of Experimental Medicine and successfully applied to the peripheral tissues, to measure directly the cerebral glucose threshold and other aspects of carbohydrate metabolism in abnormal mental states. The method will also be used for the investigation of cerebral non-esterified fatty acid metabolism. Since recent reports have demonstrated a greater than normal anti-insulin activity in the blood and urine of schizophrenics, together with certain defects in oxidative phosphorylation and a restoration of a more normal pattern of carbohydrate metabolism following glutathione infusion, the present work will be of particular significance.

Plans for further research

With the approval of the Nuffield Foundation Committee, it is proposed to develop the above research along the following lines:

(1) Protein analysis will continue until it has been shown that an abnormality of the type indicated does or does not exist in the serum of schizophrenic patients.

Reduced glutathione and cysteine estimations will be carried to a similar conclusion.

(2) It is believed that direct *in vivo* studies of fundamental cerebral metabolic processes in both normal and abnormal subjects are most likely to throw light on some of the biochemical aberrations which may underlie the functional psychoses. It is proposed, therefore, to direct a considerable part of the available facilities and time towards the development of

techniques which will enable accurate measurements to be made of various aspects of cerebral carbohydrate metabolism in health and disease.

Comment

The clinical observations made during this period were germane to the general problem of the diagnostic validity and prognostic significance of the terms "schizophrenia" and "depressive reaction", i.e., the subdivisions of the so-called functional psychoses. An attempt is being made to resolve this question, since it is of fundamental importance not only to the present investigation but also to the practice of psychiatry in general, by examining the results of a follow-up study initiated earlier of 186 young adult psychotic patients admitted to the Professorial Unit of the Maudsley Hospital and the Institute of Psychiatry of the University of London. Young adult patients were chosen for this study, since it is in such cases of early onset of psychosis that diagnostic confusion most often arises. The results indicate that the broad Kraepelinian diagnostic categories are valid and useful, and that it is possible to differentiate the schizophrenic and affective psychoses by symptomatology, outcome, and nature of subsequent illness should relapse occur.

New addresses:

Dr. Martin A. Berezin (attend. psychiat. (*McL.*)), 90 Forest Ave., West Newton 65, Mass.

Dr. Cecil H. Coggins (*M.* 1959), 627 Barron Ave., Palo Alto, Calif.

Dr. Willard Dalrymple (*M.* 1947), University Health Services, Princeton University, Princeton, N. J.

Dr. Henry Field, Jr. (*C.M.* 1921 and *E.M.* 1922), 804 Lawrence St., Ann Arbor, Mich.

Dr. Robert G. Hall (*W.M.* 1910), 731 S.E. 41st St., Portland, Oreg.

Dr. Roger I. Lee (*E.M.* 1907), 446 Walnut St., Brookline 46, Mass.

Dr. Irwin H. Rosenberg (*M.* 1960), Bldg. 16A, National Institutes of Health, Bethesda, Md. (This office will forward his mail.)

Dr. Theodore Sack (r.p. *Psychiat.* (*McL.*) 1958), 75 Blake Rd., Brookline 46, Mass.

Brief bits:

Dr. Hannibal Hamlin writes us that he gave two lectures in Spain last March. He addressed the Sociedad de Neurologia, Neurocirugia y Psiquiatria de Madrid on the subject "Tratamiento de los tumores hipofisarios"; at the Colegio Medico de Madrid he spoke on "Hipofisectomy, indicaciónes y metodos"; and on September 7, at the Second International Conference of Human Genetics, in Rome, his subject was "Hypophyseal tumors — Biologic and genetic factors".

Dr. Roger W. Jeanloz attended the Fifth International Meeting of Biochemistry, in Moscow, last August. He delivered a paper and served as chairman of the section on the Biochemistry of Carbohydrates.

Dr. Hsi-Chin Tsai, Professor of Medicine at the College of Medicine, National Taiwan University, and Physician-in-Chief at the Taiwan University Hospital, has returned to the M.G.H. to spend six months in the Cardiac Unit, under the auspices of the China Medical Board. Dr. Tsai was a graduate student here in 1953-54, and has been particularly concerned with the problems of rheumatic fever and of coronary heart disease in his country.

On July 17, Dr. Edward W. Webster read a paper at the 4th International Congress of Medical Electronics, held in New York City. His subject was "Limitations of combined image amplifier-television systems for medical fluoroscopy". From September 4 to 8, Dr. Webster was in Vienna as a consultant to the International Atomic Energy Agency, presenting a report on therapeutic dose distributions with high energy radiation.

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 208 Boston, Mass. December 1961

TRAUMA AND THE ORTHOPAEDIC SURGEON

Presidential Address,
American Orthopaedic Association,
Yosemite, California, May 24, 1961

. . . The founding of our organization was preceded only by that of the American Medical Association in 1847, the American Surgical Association in 1880, the American Clinical and Climatological Society in 1884, and three specialty groups: ophthalmology, otology, and gynecology. Many have followed; most of them larger, but none more select than ours. This selectivity carries with it a strong obligation. Election to The American Orthopaedic Association does not mean that we have reached the top and can rest—quite the opposite. It indicates added responsibility in directing the teaching and practice of orthopaedic surgery in North America and influencing it to a considerable extent throughout the globe.

This is the Seventy-fourth Annual Meeting of the oldest orthopaedic society in the world. Our organization has met annually since its founding, except in the year 1945, marking the end of World War II.

Of our Canadian membership, which began in 1906 with the election of B. E. Mackenzie, we can be justly proud. Mackenzie has been followed by a list of distinguished surgeons north of the border, all of strong character, ability, and accomplishment. Six of those men have been President of the Association. This friendship and association with Canadian orthopaedic surgeons will be preserved. It benefits all of us. We may predict, also, that Latin American membership in our society will increase to our advantage.

In 1887, fifty-five million people lived in the United States and four million in Canada. Both countries were prospering. President Cleveland was serving his first term. In England, Queen Victoria presided at the opening of Parliament; and, in Germany, Bismarck spoke forcibly in the Reichstag, stating: "Our friendship with Russia is beyond doubt and we shall never attack France". Henry Ward Beecher, preaching in Brooklyn, remarked: "I would have been a Democrat were it not for the Democratic Party". Lillian Russell was performing in Boston, and John L. Sullivan had broken his carpal navicular on striking the back of the neck of an opponent. Florida lots of 5,000 square feet could be bought for $10.00, and custom-made pantaloons sold for $5.50.

These were some of the happenings in the year of the founding of our society. Our organization has witnessed the extraordinary growth of America since 1887. Our country has been through six economic crises, two of them major ones; we have survived four wars.

1887—forty-one years after the first public demonstration of the use of sulphuric ether for anesthesia, thirty years after Pasteur's epoch-making investigations, twenty years following Lister's great discovery, and nine years prior to Roentgen's contribution of the x-ray. All of these great advances revolutionized surgery in all forms and made possible the development of the surgery of our specialty, which was due to come some years after the actual founding of our society.

The name of our branch of surgery certainly does not describe it adequately, nor does it indicate that trauma has any place at all in our specialty. Baer in 1924 wrote: "It occurs to me that our specialty may be somewhat handicapped by its name. Perhaps the word 'paidos' is the cause". But we ask ourselves, would we or can we give up the name of orthopaedics or orthopaedic surgery? Of course not. By those names our specialty has been designated since Andry coined the word *orthopédy* in 1741.

Early in the existence of the Association an awareness of the importance of trauma as a part of orthopaedic surgery was shown when in 1894 Phelps observed: "It is my earnest conviction that within a very few years fractures and dislocations will be treated by the orthopaedic surgeons". In 1906 Mackenzie of Canada expressed concern that orthopaedic surgeons were not taking their full responsibility in the management of trauma.

Actually, however, orthopaedic surgery was reborn and expanded during and after World War I, largely because trauma to the extremities became a part of orthopaedic surgery for the first time. In fact, many members of this Association were made by their war experience. Some had no formal training as we know it today, but after World War I contributed greatly to the development of the specialty in the years to follow.

Outstanding in the development of the traumatic side of orthopaedic surgery in World War I were Goldthwait, Osgood, Allison, Baer, Leo Mayer, and Gallie; also Porter and MacKenzie Forbes, who were successively Presidents of the Association during the war years 1917-1918. Of the younger group who gained vast experience during the first great war and who later rose to eminence in their specialty were Frank Dickson, Key, Ober, Wilson, Abbott, Smith-Petersen, Harris, Robertson, Lewin, James Dickson, and Ghormley, to name just a few.

Porter in his presidential address in 1917 stated: "I believe a new era has begun for our specialty through the impetus given by war. The old conception of orthopaedic surgery is undergoing transformation rapidly".

In 1919, Galloway wrote: "The war has done more to bring orthopaedic surgery into its true inheritance than would have been accomplished by any other agencies in many years".

Although the traumatic side of orthopaedic surgery was greatly reinforced by experience in World War I, relatively few orthopaedic clinics throughout our country had the privilege of caring for fractures and other trauma after the war of 1914-18; at best, they shared the management of extremity trauma with the general surgeons. In a few established fracture clinics the orthopaedic surgeon was usually an associate chief or a consultant. More frequently than not, the efforts of the orthopaedic services were confined to the management of joint fractures, ununited or malunited fractures, and minor fractures which did not involve soft parts.

World War II changed all of this. The sections of orthopaedic surgery in military hospitals often represented the largest divisions on the surgical services. Surgical teams sent to the forward areas were staffed by orthopaedic surgeons as the supply would allow. Wounds of the extremities made up 70 per cent of the case load of evacuation hospitals. If the development of orthopaedic surgery was enhanced by World War I, it was expanded tenfold by the experience gained in the War of 1939-45, thanks in no small measure to one of our members, the late Major General Norman T. Kirk, who was at that time the Surgeon General of the Army. All spine and extremity surgery came more and more under the care of the orthopaedic surgeon, including surgery of the intervertebral disc, hand surgery, certain forms of plastic surgery to the extremities, and certain problems of vascular and peripheral nerve surgery. . . .

Recently, an effort has been made to evaluate the activities of orthopaedic surgery, particularly in regard to the management of trauma, basing our opinions on replies from eighty-three directors of orthopaedic training centers. A 100 per cent response was obtained.

And now I must give some figures: The Emergency Ward was the subject of the first question. Sixty-four of eighty-three replies (77 per cent) indicated that general surgeons are in charge of emergency wards. This compares with Stewart's report before the Southern Surgical Society in 1959, when he summarized the results of his studies of emergency wards in 271 hospitals. He found that 84 per cent were being directed by general surgeons. In his survey, however, 41 per cent of emergency-ward admissions had traumatic lesions, whereas only 5 per cent of the total admissions had non-traumatic, acute abdominal disease.

Eighty-one of eighty-three of our replies stated that fractures are largely in the hands of the orthopaedic surgeons. Thirteen indicated that general surgeons are treating fractures in their clinics. The majority of skin grafts are being done by plastic surgeons, but second in this endeavor are the orthopaedic surgeons. In eighty-one clinics amputations are done by orthopaedic surgeons; in sixty-three of these they are shared with the general surgeons. Tendon surgery is done by orthopaedic surgeons in seventy-three centers, by general surgeons in sixty-one, and by plastic surgeons in twenty-five. In seventy-four of the eighty-three installations, hand surgery is done by orthopaedic surgeons; in forty-four by general surgeons; and in thirty-three by plastic surgeons. Directors of twenty-two training centers reported that they had separate hand services.

A significant observation was that children's orthopaedics in relation to trauma is decreasing. Seventeen installations replied that this was definitely so, and another twenty-one stated that there was a relative increase in fractures and other trauma. This impression is substantiated by figures from one Shriners' Hospital, which showed that in 1925 there were 49 per cent cases of poliomyelitis and in 1957 only 12.4 per cent. Tuberculosis decreased from 5.9 to 1 per cent. Mental defectives, cerebral palsy cases, etc. increased from 1.8 to 12.0 per cent and congenital deformities increased from 6.3 to 24.4 per cent. "Accidents to children remain the leading cause of death in the younger groups—perhaps not so much because of any great actual increase in accidents as because of the continued decrease in deaths from infectious disease." The fact is that trauma is now the commonest cause of death under the age of thirty-six years in the United States.

Curtis, in a review of forty-eight children's orthopaedic installations, concluded that ten years ago these installations were almost entirely devoted to orthopaedics. Now, 25 per cent of the work in these facilities is carried on by other specialties and at that only three-fourths of the beds are occupied. Curtis also found that where there is a large concentration of population, children's orthopaedics has dropped remarkably, and adult services have increased. Serious consideration is being given to a trauma service in many of the installations included in Curtis's survey.

Fortunately, there is still a desire on the part of the vast majority of orthopaedic centers to require for the trainee preliminary training in basic surgery. Forty-eight of the eighty-three in our study believe that one year of general surgery is sufficient; twenty-six prefer two or more years; and only five are of the opinion that preliminary surgical training prior to specializing is unnecessary. In this connection a Committee from the Council of Medical Education and Hospitals, the American Board of Surgery, and the American College of Surgeons is making an effort to provide a minimum of two years of basic surgical training for the surgical specialties. It is proposed by them that two years as an assistant resident in general surgery be a prerequisite for acceptance into any training center for a surgical specialty. I am sure that the real hope is to raise the standards of all branches of American surgery. Frank Glenn has remarked editorially: "The success of such a plan would be dependent upon a complete understanding of the objectives and an unreserved, dedicated cooperation upon the part of the general surgeons and those in the surgical specialties". I suggest that members of The American Orthopaedic Association and other qualified orthopaedic surgeons join in this effort and insist that adequate, basic, surgical training for the specialist be provided by the general surgical services in our country. This point of view is not inconsistent with maintenance of our independence and a demand for a stronger voice in directing the departments of surgery in our medical schools, as was so vigorously advocated by Abbott in 1947.

The majority of us are primarily surgeons. Our patients are the first to insist that we know what we are doing and that we do it properly when they are on the operating table and during their postoperative care. Our research laboratories in orthopaedic surgery are gradually increasing in number and in quality. The need for basic research is fundamental. The Orthopaedic Research and Education Foundation deserves strong praise. We do not yet have in our ranks, however, a sufficient number of men adequately trained to instruct our younger members in broad, basic, surgical principles, not so much in techniques—we can provide that—but in the knowledge of wound healing, the treatment of shock, the role of the endocrines, fluid balance, and of total preoperative and postoperative care.

Naffziger, himself a neurosurgeon, has remarked: "Specialization is essential to progress but to be useful as a teacher the specialist must be able to investigate his work in the entire field of surgery".

Next to obstetrics and gynecology we represent the largest single specialty group in surgery. The proposal to establish a Board of Trauma was correctly opposed in 1957. Nevertheless, such an occurrence will be a possibility unless we as orthopaedic surgeons equip ourselves in order to cope with the problem of trauma in a general sense.

One may ask how this can be accomplished with our present requirements in medical schools and in postgraduate training. Time in postgraduate training cannot be sacrificed. Where, then, can we economize on time? It must be done in our colleges and in our medical schools. This can be done without sacrificing training in basic science. A graduate of a college may go directly to business and, as a rule, work eleven or eleven and a half months a year. Medical students are not engaged in required study for twelve months out of the forty-eight in their course of instruction. Is it not time that medical-school curricula be altered to meet the needs in post-graduate training? R. A. Moore, President of the Downstate Medical Center of New York, suggests elimination of the summer vacation and an acceleration of the program for brighter students. Some experimentation in this regard is under way at Western Reserve, Johns Hopkins, and Northwestern Medical Schools. Boston University is combining in six years, training in liberal arts and medicine, and is utilizing the summer months in so doing. In these changing times we find ourselves as did those famous cartographers, Rand and McNally, after World War I, when maps were constantly changing according to the wishes of those recorded as victors. In the words of Newman Levy:

"Time was when this business of ours was
 grand,"
Said Mr. McNally to Mr. Rand,
"When our toughest job was to sit and think
Shall France be purple and Britain pink?
Shall Spain be tinted a bright cerise,
And perhaps a dash of green for Greece?"

"Remember those days," McNally said,
"When we'd plan a map a month ahead,
And we'd know, if it came out at noon,
 let's say,
It was up to date the entire day?"

"Those days," said Rand, "are gone *totally*."
"You said it, brother," said Mr. McNally.

While much has been accomplished in caring for the injured patient throughout our land, and while many individual orthopaedic surgeons have done their part, our societies of orthopaedic surgery have done little as organizations toward this end. The Instructional Courses of The American Academy of Orthopaedic Surgeons provide an excellent source for the teaching of trauma to the younger orthopaedic surgeons, yet in 1960 of a total of 111 courses given, only twenty-one dealt with fractures and other forms of trauma, and all but four of these had to do with injury to bone alone. With the relative decrease in children's orthopaedics and an increase in trauma, should there not be some realignment in the residency training of orthopaedic surgeons?

The British orthopaedic surgeons are a step ahead of us in trauma management. Worth noting is the *Memorandum on Accident Services—1959,* published by a committee representing The British Orthopaedic Association. The situation in Britain where the population is concentrated is admittedly bad. It is far worse in our land where distances are greater, and adequately trained personnel to care for the wounded are widely scattered.

The American Orthopaedic Association has taken the lead in advancing orthopaedic surgery throughout its seventy-four years. I think, however, we have not put forth our best effort toward the injured patient. Let us pick up the challenge and adopt a positive attitude toward the necessity of greater participation in the management of trauma. We must be aggressive in our approach. We must be the leaders. Said Pericles to the Athenians: "We do not imitate—but are a model to others". Whether we like it or not, the care of the wounded has fallen upon our shoulders. We can no longer simply sit as consultants. Theodore MacManus wrote:

> Man was not made to sit a-trance,
> And press, and press, and press his pants;
> But, rather, with an open mind,
> To circulate among his kind.
>
> And so, my son, avoid the snare
> Which lurks within a cushioned chair;
> To run like hell, it has been found,
> Both feet must be upon the ground.

Realizing that three-fourths of all trauma is to the skeletal system, I believe frankly that we as orthopaedic surgeons are not responding sufficiently to our opportunity and responsibility in the management of trauma. Mitchell expressed the same feeling in 1959 when he insisted that greater emphasis be placed upon training in all phases of trauma to the trunk and extremities.

I am convinced that the future of orthopaedic surgery will lie to a great extent in the field of trauma.

Many conditions which the orthopaedic surgeon has treated in the past can and should be prevented or corrected early in their development; namely, congenital dislocation of the hip, club-foot, and, possibly, scoliosis. At a meeting of the International Society of Orthopaedic Surgery and Traumatology held in New York in 1960, a day and a half was spent discussing congenital dislocation of the hip. Perhaps a more appropriate audience would have been that of obstetricians and pediatricians. Certainly these two specialty groups must bear a heavy responsibility in detecting congenital anomalies early in life, when treatment is far simpler.

Bryan McFarland in his *Editorial of A.D. 2000,* which, after all, is only thirty-nine years away, wrote: "The incidence of bone and joint injury has increased and today we pay respect to the gallant efforts of our forefathers who perforce spent so much of their time in treating congenital dislocation of the hip, clubfoot, and other deformities that are seldom seen today except in museums". Let us hope this day will come.

In closing my remarks, I like to remember that William T. Councilman, Professor of Pathology at Harvard, in his last formal lecture in 1922, referred to the three great epochs of life as birth, marriage, and death. A fourth great epoch in the life of any orthopaedic surgeon would surely be that of Presidency of this great society.

I recall my predecessors in this office with admiration, and when I think of my teachers I am more than grateful; to Nathaniel Allison, who first encouraged me to study orthopaedic surgery; to Ralph Ghormley, whom I revered all of my professional life; and to my chief, Marius Smith-Petersen, that unique and stimulating character, whose contributions to our special branch of surgery will live forever, and who taught me so much.

. . . for the great honor that you have given me, I thank you.

Edwin F. Cave, M.D.,
Consulting Visiting Orthopedic Surgeon

Reprinted from *The Journal of Bone and Joint Surgery,* June 1961, with deletions as indicated above.

There has been wide interest in the recent venture of our Fracture Service into the area of case teaching. The fracture office publishes monthly an illustrative fracture problem and discussion of therapy, much along the lines of the Clinical-Pathological Conferences presentations by the Pathology Department in the *New England Journal of Medicine.* The Fracture Service case report appears in the last issue of the *Journal of the American Medical Association* each month.

The Board of Trustees, at their meetings on October 13 and 27, voted:

To accept the resignation of Dr. Louis Bakay from the position of Clinical Associate in Neurosurgery, effective as of September 30;

To grant Dr. George P. Canellos a Dalton Scholarship of $458.33 per month for the months of November and December.

To appoint:

Dr. Mira Ahuja as Clinical Fellow in Pathology for one year, beginning October 16;
Dr. Noel H. Aldridge as Assistant Radiologist, beginning October 13;
Dr. Kenneth A. Arndt as Assistant Resident in Dermatology for one year, beginning July 1, 1962;
Dr. George P. Canellos as Assistant Resident in Medicine for one year, beginning July 1, 1962;
Dr. Hugh P. Chandler as Assistant Resident in Orthopedic Surgery for one year, beginning October 1;
Dr. John R. Collins as Clinical and Research Fellow in Medicine, beginning July 1, 1962;
Dr. Arthur Z. Eisen as Clinical Fellow in Dermatology, beginning July 1, 1962;
Dr. Wolfgang K.-R. Entzian as Clinical and Research Fellow in Neurosurgery, beginning January 2, 1962;
Dr. William F. Gallagher, Jr., as Assistant Resident in Dermatology, beginning July 1, 1962;
Dr. Mehran Goulian as Clinical and Research Fellow in Medicine for one year, beginning January 1, 1962;
Dr. Alfred Leitner as Assistant Resident in Medicine for one year, beginning July 1, 1962;
Dr. Gordon F. Lupien as Assistant Resident in Orthopedic Surgery for one year, beginning October 1, 1962;
Prof. Heinz Osser of Berlin as Visiting Radiologist, for the period October 16 through October 21;
Dr. Peter B. Rosenberger as Exchange Assistant Resident on the Children's Service, for the period October 26 to December 4;
Judy F. Rosenblith, Ph.D. as Associate Psychologist in the Department of Psychiatry, effective as of October 1;
Dr. Robert L. Scheig as Clinical and Research Fellow in Medicine, beginning July 1, 1962;
Dr. Alfred L. Weber as Assistant Radiologist, beginning October 13;
Dr. Ralph A. Williams as Clinical Fellow in Psychiatry, for a period of nine months, beginning October 1;
Dr. Gerald F. Winkler as Clinical and Research Fellow in Neurology for one year, retroactive to July 1.

At their May 26 meeting, the Trustees voted to give Gordon L. Brownell, Ph.D., the permanent appointment as Applied Physicist, to begin July 1. This vote was delayed in reaching the office of The News until November 10.

At their meetings on October 11, 18, and 25, and November 1, the General Executive Committee voted:

To promote from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1, 1962:

Dr. Robert E. Burke
Dr. Norman R. Cohen
Dr. Howard B. Corning
Dr. Shalom Z. Hirschman
Dr. Newton E. Hyslop, Jr.
Dr. Alan S. Keitt
Dr. Philip W. Majerus
Dr. John C. Parker
Dr. Kenneth I. Shine
Dr. James F. Spann, Jr.

To reappoint:

Dr. Robert E. Kahn, with a change of title from Clinical and Research Fellow to that of Clinical Fellow in Medicine, for one year, beginning November 1;
Dr. Manuel Nava (y Gutierrez de Velasco) as Clinical and Research Fellow in Medicine, for the period December 1, 1961 through June 30, 1962;
Dr. Krishna M. Saxena as Clinical and Research Fellow on the Children's Service for one year, beginning July 1;
Dr. Boris Senior as Clinical and Research Fellow on the Children's Service for one year, beginning November 1;
Dr. Juan F. Sotos as Clinical Fellow on the Children's Service for one year, beginning July 1;
Dr. Hsi-Chin Tsai, with the title of Visiting Fellow in Medicine, for the period October 2, 1961 through March 31, 1962;
Dr. Weiert M. Velle as Research Fellow in Medicine for one year, beginning October 1;
Irving Weliky, Ph.D., with a change of title from Research Fellow in Medicine to Assistant Biochemist (Medicine), effective as of October 1;
Chuan-Tao Yu, Ph.D. as Research Fellow in Medicine for one year, beginning November 2.

To appoint:

Peter L. Bergquist, Ph.D. as Research Fellow in Medicine, effective as of September 12;
Hilda Dickoff, Ph.D. as Research Fellow in Psychiatry, effective as of September 21;
Kerstin G. C. Gezelius as Research Fellow in Medicine for one year, beginning January 15, 1962;
Dr. George F. Kwass as Clinical and Research Fellow in Pathology, for the period October 1, 1961 through June 30, 1962;
William R. Meyers, Ph.D. as Research Fellow in Psychology, effective November 1;
Dr. Triplicane A. Sundararajan as Research Fellow in Biochemical Research for one year, effective as of September 1.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material*, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

General Medicine

Holt, P. R., Isselbacher, K. J., and Jones, C. M.
The reversibility of Whipple's disease. Report of a case with comments on the influence of corticosteroid therapy.
New England J. Med. 264:1335.

Shafer, W. H., and Isselbacher, K. J.
Uridine metabolism in chronic liver disease.
Gastroenterology 40:782.

General Surgery

Cope, O., Barnes, B. A., Castleman, B., Mueller, G. C. E., and Roth, S. I.
Vicissitudes of parathyroid surgery: Trials of diagnosis and management in 51 patients with a variety of disorders.
Ann. Surg. 154:491.

Huggins, C. E.
Survival of hamsters after 4 hours of cardiac arrest at O°C.
In Surg. Forum, XII:413.

Laboratory Science

Finkel, R. M., and Gergely, J.
Studies on cardiac myofibrillar adenosine triphosphatase.
J. Biol. Chem. 236:1458.

Gergely, J.
The biochemistry of muscular contraction.
In Neuromuscular disorders 38:70.

Hultin, A. von d., Arrhenius, E., and Morgan, W. S.
Amino acid incorporation by liver microsomes and ribonucleoprotein particles.
In Biological structure and function 1:221.

Isselbacher, K. J.
Solubilization and purification of glucuronyl transferase from rabbit liver microsomes.
Biochem. & Biophys. Research Communications 5:243.

Isselbacher, K. J., and Krane, S. M.
Studies on the mechanism of the inhibition of galactose oxidation by ethanol.
J. Biol. Chem. 236:2394.

Jeanloz, R. W., Rapin, A. M. C., and Hakomori, S.-I.
Partial esterification of 1, 6-anhydro-β-D-glucopyranose.
J. Organ. Chem. 26:3939.

Martonosi, A., and Gouvea, M. A.
Studies on actin. VI. The interaction of nucleoside triphosphates with actin.
J. Biol. Chem. 236:1345.

Rebouças, G., and Isselbacher, K. J.
Studies on the pathogenesis of the ethanol-induced fatty liver. I. Synthesis and oxidation of fatty acids by the liver.
J. Clin. Invest. 40:1355.

Orthopedic Surgery

Cave, E. F.
Fracture of the month—one year. (Editorial)
J.A.M.A. 177:258.

Otolaryngology

Kelemen, G.
Anatomy of the larynx as a vocal organ: evolutionary aspects.
Logos 4: no. 2, 46.

Miscellaneous

Boardman, D. W.
The doctor's office laboratory.
Am. Pract. & Digest Treat. 12:423.

Chafetz, M. E.
Alcoholism problems and programs in Czechoslovakia, Poland and the Soviet Union.
New England J. Med. 265:68.

Garland, J.
A fourth estate.
New Physician 10:71.

Garland, J.
Relations between medicine and pharmacy.
World M. J. 8:231.

Garland, J.
United States Food and Drug Administration and the pharmaceutical industry.
Brit. M. J. 1:1452.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

Apple, D. (Editor)
Sociological studies of health and sickness.
New York, McGraw-Hill Book Company, Inc., 1960.
(613) Cabot Memorial Room

Brachet, J., and Mirsky, A. E. (Editors)
The cell, vol. 3.
New York, Academic Press, Inc., 1961.
(2Am)

Brecher, G. A.
Venous return.
New York, Grune & Stratton, 1956.
(15C)

Ciba Foundation Symposium on somatic stability in the newly born, edited by G. E. W. Wolstenholme and M. O'Connor.
Boston, Little, Brown and Company, 1961.
(26E)

Clifton, C. E. (Editor)
Annual review of microbiology, vol. 15.
Palo Alto, Annual Reviews, Inc., 1961.
(9A)

Eyring, H. (Editor)
Annual review of physical chemistry, vol. 12.
Palo Alto, Annual Reviews, Inc., 1961.
(5A)

Freidson, E.
Patients' views of medical practice.
New York, Russell Sage Foundation, 1961.
(362) Cabot Memorial Room

Greenberg, D. M. (Editor)
Metabolic pathways, vol. 2.
New York, Academic Press, Inc., 1961.

Cerebral infarction.
London, Her Majesty's Stationers Office, 1961.
(19J)

The 115th anniversary of Ether day was observed in the Moseley Rotunda on October 16, with Dr. Ellsworth T. Neumann presiding. Mr. Elliot L. Richardson, a member of our Board of Trustees, brought greetings from the Board and discussed the functions of the Trustees and their interest in and appreciation of each worker in the Hospital. Dr. Nathaniel W. Faxon gave a talk on "The M.G.H. Service Pins: Why, when, and how", in which he described the several pins which have been used over the years at the Hospital. Much research went into the development of Dr. Faxon's address, and we are planning to give you the text of his speech at an early date.

Over 240 pins were awarded for 5 years of continuous service at the Hospital, 84 (the largest number ever) for 10 years, 9 for 20 years, 10 to members of the professional staff for 25 years of unbroken service, 11 for 30 years (including 5 doctors), and 3—Miss Alice M. Harrington, Miss Nora Lordan, and Mr. John T. Keating—for 40 years.

Also on Ether Day, afternoon and evening symposia on cancer, another feature in observance of our 150th Anniversary, were held in the Morse Auditorium of the Museum of Science, Boston. The subject for the afternoon was "Symposium on viral oncogenesis and the problem of human cancer", organized by Dr. John F. Enders of the Children's Hospital Medical Center in Boston, with Dr. Peyton Rous, a Member (*Emeritus*) of the Rockefeller Institute, New York, as Chairman. The speakers and their subjects were:

Dr. Wilhelm Bernard, Institut de recherches sure le Cancer Gustave Roussy, Villejuif, France—"The nature of tumor viruses";
Dr. Renato Dulbecco, California Institute of Technology, Pasadena—"The response of isolated cells to tumor viruses";
Dr. Richard E. Shope, Member of the Rockefeller Institute, New York—"Are animal tumor viruses always virus-like?";
Dr. Wallace P. Rowe, Dept. of Health, Education & Welfare, Bethesda—"The epidemiology of a murine tumor virus";
Sir Christopher Andrewes, until lately Deputy Director, National Institute for Medical Research, London—"Viruses in relation to the whole cancer problem".

The subject for the evening symposium was "Clinical aspects of research in neoplastic disease", with Dr. Grantley W. Taylor and Dr. Claude E. Welch acting as Chairmen. The speakers and their subjects were:

Dr. Warren Cole, University of Illinois, Urbana—"Application of research to surgical treatment of cancer";
Dr. D. W. Smithers, Director, Royal Marsden Hospital, London—"The co-operation of surgeons and radio-therapists in the management of patients with neoplasia";
Dr. Sidney Farber, Director of Research, Children's Cancer Research Foundation, Boston—"The status and potential of cancer chemotherapy";
Dr. J. R. Heller, President, Sloan-Kettering Cancer Center, New York—"Cancer control—saving lives today".

During the dinner, between the two symposia, the annual Treadwell Library Award was conferred upon Dr. Joseph C. Aub by Dr. James Howard Means. The text of the citation reads:

> Distinguished pupil and associate of Walter B. Cannon, you were a leader in that small group which first brought the research laboratory into the Hospital, to the great enrichment of medical knowledge. Your pioneer work in human metabolism has become a classic. By charting the pathways of lead metabolism you plotted a course to a rational treatment and prevention of lead poisoning. You have added significantly to our understanding of the cancer problem. Your individual contributions have been many times multiplied by the inspiration you have given to a host of students and colleagues.

As an added tribute to Dr. Aub and his work, the following paper was written and passed on to us:

Our hero was born in Cincinnati in 1890. He graduated from Harvard College in 1911 and from Harvard Medical School in 1914. After that he served a medical internship at the Massachusetts General Hospital (*E.M.* 1915).

Even in medical school days he showed a keen interest in research, inspired in considerable measure by that great man, Dr. Walter B. Cannon, with whom he began a lifelong friendship.

During house staff days he caught the eye of the then new full-time Chief of Medicine, Dr. David L. Edsall, who at once recognized him as very promising material for academic medicine.

On finishing his internship, he went off to New York for a year under Graham Lusk and Eugene F. DuBois at the Russell Sage Institute at Cornell and Bellevue Hospital. Here he became, under this wonderful tutelage, an accomplished calorimetrist.

After this he returned to the M.G.H. and served for a year as resident (one of the very early ones) on the East Medical Service. For his research effort at that time, he worked on a problem of the specific dynamic action of protein in liver disease, in the primitive basal metabolism laboratory which only lately had been established by Dr. James Howard Means.

Come the spring of 1917, the United States had got into World War I and Aub went off to France with the U.S. Army Base Hospital No. 6, along with many other MGH-ers. This unit was stationed near Bordeaux, a long way from the front, and Aub was delighted when he got ordered to an advanced area to do research on shock with his friend Cannon.

After World War I, Aub went for a time into Physiology in Cannon's department at Harvard Medical School, rising to the rank of Assistant Professor of Physiology. More work on shock was done, and at the instigation of Edsall he embarked on a long-term study of lead poisoning, the basic foundation of which was done with Cecil Drinker, also in the Department of Physiology at Harvard Medical School.

In 1924 he returned to medicine and the M.G.H., where he continued until 1928. It was during these years that he did a really great work on the lead program. Both the basic and clinical aspects were studied at the M.G.H. It was in 1925 that the Research Ward 4 was opened, and it was Aub who then made the major use of it. Means, in his history of Ward 4, says that it was Aub's "outstanding ability as an investigator that set the high standards of operation that have characterized the work of Ward 4 ever since." The results of the lead program were far reaching and distinguished. The whole metabolism of lead was elucidated: how it enters the body; circulation in the blood, whence it exerts its toxic action; how it gets stored in bones, where it is relatively innocuous; and how it is excreted. More important still, it was found out how its absorption can be delayed and its excretion accelerated. The prophylaxis and treatment of plumbism was thus revolutionized.

Aub spent the years from 1928 to 1942 in charge of research at Harvard's Huntington Memorial Hospital which, perforce, was related to cancer, and this was probably the beginning of his career in cancer research which has continued ever since, and which is the accomplishment for which he is best known today. During these years he also had the appointment of Physician at the Peter Bent Brigham Hospital, to permit him to keep in touch with the broader reaches of medicine.

In 1942, Harvard closed the Huntington Hospital, but transferred the funds to maintain the Huntington Laboratory to the Massachusetts General. Aub returned then to the M.G.H., with the Huntington Laboratory in his pocket, so to speak, and has been here ever since. The M.G.H. opened its Research Building in 1951, and Aub got a floor of that. Under his brilliant leadership, the work steadily gained in distinction and became one of the top flights of cancer research enterprises in the country.

After some years as Associate Professor of Medicine at Harvard Medical School, Aub became Professor of Research Medicine in 1943. In 1956, due to the inexorable working of University rules, Aub became *emeritus*, but he has kept right on doing research in a small lab of his own at the M.G.H., while Dr. Paul C. M. Zamecnik has taken over the leadership of the Huntington.

Aub has carried on innumerable special activities and assignments during his long professional life. One of the most entertaining was his study of the endocrinology of deer antlers with Dr. George Wislocki. In the course of this, they found it convenient to shoot steroid pellets into the buttocks of deer with an air rifle.

He has worked in many ways for Harvard, on all sorts of committees, and especially as Chairman of the Department of Medicine for many years. During World War II, he devoted his energies to the study of shock, as part of a collaborative program sponsored by the Office of Scientific Research and Development, under Dr. Vannevar Bush, along with Drs. Cannon, Donald Van Slyke, and Jacob Fine, here in Boston, and others.

Aub has served the government in various ways, and societies of one sort or another. He has travelled far and wide to Europe, India, and elsewhere, on teaching missions. He has received many honors, both at home and abroad—too many to mention here. Perhaps the most distinguished of all is his membership in the National Academy of Sciences. Not many M.D.'s are admitted to that very learned body.

Joe Aub has had a full and rewarding life. In addition to his intellectual achievements, he has warmed the hearts of many by his friendship and kindliness. With his fine wife, Elizabeth, he has created a home in Belmont which has extended endearing hospitality to persons from all quarters of the earth.

Anonymous

Another event which took place on Ether Day this year was the business meeting of the Massachusetts General Hospital House Pupils Association, at which time the following officers were elected for a term of three years:

Dr. Langdon Parsons—President
Dr. Richard Chute—Vice President
Dr. Briant L. Decker—Secretary-Treasurer

* * *

VOLUNTEER GROUPS

Distaff Club

On November 14, Dr. Paul D. White talked to us about his recent world trip and showed us many very interesting slides. Husbands were invited to attend.

Mrs. Charles E. Huggins invited the Distaff-ers to her home on November 8, to hear Dr. Jane Hallenbeck, noted child psychiatrist, speak on "Normal child development".

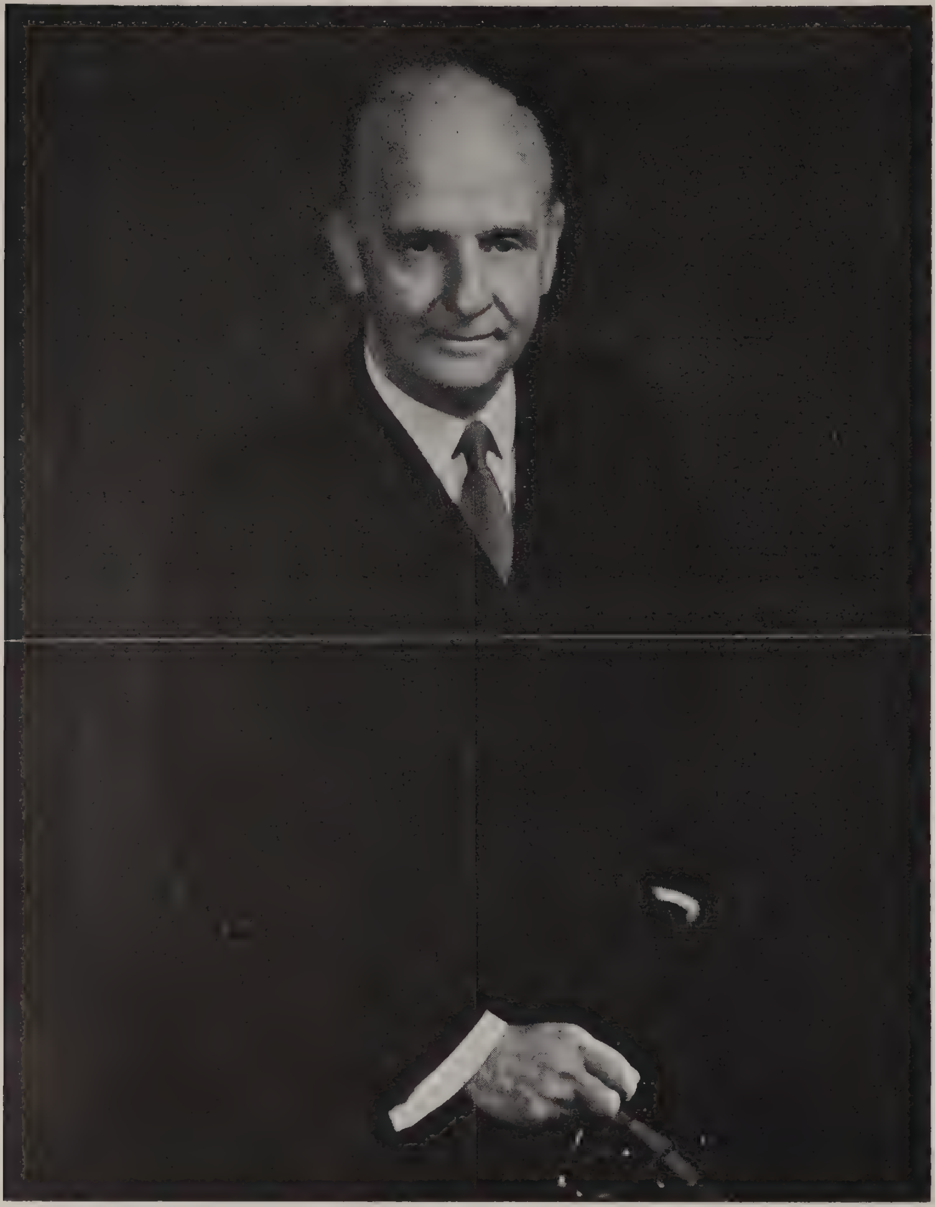
Our Volunteer Group in the Burnham Memorial is a very active one, under the supervision of Dr. Nathan B. Talbot and Miss Mary E. Quinlan.

Interesting group meetings have begun in the fields of child study, current events, book reviews, and sewing.

Our plans for December include gift wrapping for the MGH Christmas Party.

MGH Service League

The Massachusetts General Hospital Service League (formerly the M.G.H. Staff Wives Association) gave its fall tea on the afternoon of October 24, in the Walcott House. This tea is given annual-



No. 98 in a series of Staff photographs
Dr. Edwin F. Cave, Consulting Visiting Orthopedic Surgeon

ly to honor the professional visitors from other countries who come to the Massachusetts General Hospital for study and training. At the present time, these visitors represent 42 different countries.

Sandwiches and cakes, tea and coffee were served from the attractively decorated table, while the guests chatted with old friends and made new acquaintances. The truly international tone of the party was emphasized when ladies from India appeared in their native attire; and Dr. Nava's little girl, from Mexico, was the center of interest when she arrived.

This tea is only one of the many ways in which the Massachusetts General Hospital Service League extends hospitality and assistance to our professional visitors from other parts of the United States and from other lands.

New addresses:

Dr. Mervyn F. Burke, Jr. (a.r.s. 1961), 1950 Hopkins St., Berkeley 7, Calif.

Dr. Clarke T. Case (*W.S.* 1943), 1402 Genesee St., Utica, N. Y.

Eubert J. Daniel, Ph.D. (res. fel. *Or.* 1961), 27 Park Ave. West, South Weymouth, Mass.

Dr. Briant L. Decker (*C.M.* 1931 and *W.M.* 1932), 75 Mount Auburn St., Cambridge, Mass.

Capt. Oscar S. DePriest, III, MC, USAR (*S.* 1955), Medical Field Service School, Fort Sam Houston, Tex.

Dr. James Greenough (*W.S.* 1920), Box 22, Cooperstown, N. Y.

Dr. Walter F. Lever (a.r.p. *D.* 1938), Boston Dispensary, 25 Bennet St., Boston 11, Mass.

Dr. M. Morris Pinckney (*W.M.* 1932), 3500 Kensington Ave., Richmond, Va.

Dr. Leonard H. Plotkin (*C.M.* 1955), Williams, at Ridge Rd., Longmeadow, Mass.

Dr. Philip J. Porter (*C.M.* 1957), Boston City Hospital, Boston, Mass.

Dr. Dwight R. Robinson (*M.* 1958), Dept. of Biochemistry, Brandeis University, Waltham, Mass.

Dr. Richard H. Sweet (*E.S.* 1928), Nelson Star Route, Keene, N. H.

Brief bits:

Dr. Gordon L. Brownell has assisted in the Isotope Committee lectures at the Hospital.

Rev. James H. Burns, past Chaplain at M.G.H., has been installed as Executive Director of the New Haven Council of Churches. His address is 65 Lake St., Hamden 17, Conn.

Dr. Morris E. Chafetz visited Hungary, Yugoslavia, Bulgaria, and Roumania during July and August, to study their alcoholism programs. He lectured to the Academy of Science in Sofia, Bulgaria, on the subject of alcoholism.

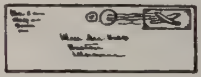
Dr. Willard Dalrymple (*M.* 1947) will assume the duties of Chairman of Princeton University's Department of Health on January 30, 1962.

Dr. Ferdinand Haase, Jr., past Assistant Director at M.G.H., informs us that the Albany Hospital has changed its name to Albany Medical Center Hospital.

Dr. Kurt J. Isselbacher has recently been appointed to the Gastroenterology Training Grants Committee of the National Institutes of Health for a period of five years, and has also been appointed to the Steering Committee of the Gastroenterology Research Group for five years. This group sponsors, twice a year, symposia relating to gastrointestinal physiology and pathophysiology.

Last October, Dr. John B. Stanbury attended a Colloquium on the Thyroid, under the sponsorship of the Institute of Biophysics in Rio de Janeiro and the 5th Pan American Congress of Endocrinology in Lima. Between meetings, he visited the Medical School of the University of São Paulo.

Dr. Byron H. Waksman gave an address on "Isosensitization to nervous substances" before the Fourth International Congress of Allergology, in New York, on October 19. Dr. Waksman was also invited to present a paper on "Tissue damage in the 'delayed' (cellular) type of hypersensitivity", as part of the Second International Symposium on Immunopathology, at Brook Lodge, Michigan, on October 24.



This letter has come from Dr. Fernando A. Cardenal (a.r.s. *Or.* 1959). Dr. Cardenal's many friends here at M.G.H. will be interested in his new address—Organisation Mondiale de la Santé, Hôpital de Befalé (par Boende), Province Equatoriale, République du Congo (Léo). The letter reads, in part:

> Would you be so kind as to continue sending me The News at the above address. I miss very much your publication and all the familiar names and your accounts of the activities going on at Massachusetts General.
>
> It may come as a surprise to you to receive this request from here. As a matter of fact, I had planned this journey before leaving Boston, but I was not sure it would come to reality. It is now only two months since I arrived in Congo, after a long stay in Venezuela and a shorter one in Europe.
>
> There is a tremendous amount of most interesting work to be done here. I have a modern hospital, fairly well equipped for a tropical area. Usual commodities and even food are scarce or lacking very often; but, on the other hand, the surroundings and the climate (so far) are wonderful.

♣ ♣ ♣

A painting, depicting the first public demonstration of the use of ether for major surgery here in our Ether Dome on October 16, 1846, has been done by Robert Thom, the well-known artist for Parke Davis and Co., in recognition of our 150th Anniversary.

The painting will be on loan to the Archives Department from December 8 to 23, and will be exhibited in the lobby of the Warren Building. A great deal of research went into the execution of this picture, and everyone associated with Massachusetts General should avail himself of the opportunity to see it while it is here.

The Massachusetts General Hospital 1811 News

No. 209 Boston, Mass. January 1962

THE LABORATORY FOR CARBOHYDRATE RESEARCH OF THE MEDICAL SERVICES

In 1951, I was invited by Dr. Walter Bauer, then Chief of the Arthritis Unit, to become a member of the Robert W. Lovett Memorial Group for the Study of Crippling Disease, and to organize a laboratory for the study of the chemical structure of the polysaccharides of connective tissue and of related biochemical problems. Ten years later (July 1, 1961), the Lovett Group was formally reorganized into four independent units of the Medical Service and I was appointed Head of the Laboratory for Carbohydrate Research. Although the space allotted to our group on the second floor of the Research Building remains the same as it was at its opening, my staff has more than tripled.

As an organic chemist interested in biological and biochemical problems, I greatly appreciated the opportunity to study substances I had been interested in since the time of my doctoral thesis. I had always felt that the chemical study of complex biological substances needed the full-time effort of a small integrated group of scientists. Because of their complexity and their lack of a definite biological activity, the polysaccharides of connective tissue, composed of alternating units of hexosamine (D-glucosamine or D-galactosamine) and of uronic acid (D-glucuronic or L-iduronic) with additional sulfate ester groups, had not attracted the interest of the large research groups of the pharmaceutical industry, and were left open to the efforts of half a dozen university laboratories located in this country, England, Sweden, and Japan.

Before joining the Lovett Group, I had studied the chemical structure of hyaluronic acid at the Worcester Foundation for Experimental Biology. Rapidly it became evident that short-cut methods, like the periodate oxidation, used with success in the case of simpler polysaccharides, would not be successful with more complex polysaccharides. It was then necessary to resort to the well-tested method of methylation, in which each free hydroxyl of the polysaccharides is transformed into an acid-resistant methyl ether. The methylated substance is then hydrolyzed, and the free hydroxyl groups appearing correspond to the position of the linkage between the monosaccharide units, or between the sulfate group and the monosaccharide unit.

This method had already been attempted without positive results in this field. The main difficulty resided in the fact that degradation of a methylated polysaccharide made of units of hexosamine and uronic acid could give rise to seven different methylated hexosamines. At the start of our study, only three of the seven possible methylated derivatives of D-glucosamine and one of the seven possible methylated derivatives of D-galactosamine, to be used as references, were known. To study the practicability of the method, it was first necessary to synthesize all of the known and missing reference substances, and then attempt to separate and identify them in artificial mixtures. We were encouraged in this long task by the knowledge that if the method could be shown to be efficient, it could be applied not only to the elucidation of the structure of the acidic polysaccharides of connective tissue (hyaluronic acid, chondroitin sulfates, heparins), but also to more complex substances containing amino sugars, like the blood group active substances from secretions, the glycolipids of brain, nervous tissue and erythrocytes, the antigenic polysaccharides of bacteria, the glycolipids of the bacterial cell wall, and also to numerous amino sugar-containing glycoproteins, some of them possessing enzymatic or hormonal activity.

It was gratifying to see the deep interest evinced by other laboratories in this method. In fact, they have been requesting so many reference substances that, at the present time, one research assistant is working full time solely to replenish our dwindling supplies. Thus, the study by other laboratories of the chemical structure of brain glycolipids, of the biologically active oligosaccharides of human milk, of the enzymatic degradation products of connective tissue polysaccharides, and of bacterial antigenic polysaccharides, has been made possible by the availability of our synthetic reference substances.

I was greatly helped in this synthetic approach, which took ten years to be accomplished, by Dr. Pierre J. Stoffyn of the University of Brussels, who joined our group in 1953 and stayed until 1961, with an interruption of two years which he spent in Brussels. He has recently joined the research group at the McLean Hospital, to work on the chemistry of brain glycolipids. I also had the cooperation of Drs. Dieter M. Schmid and Charles P. Gansser, who have returned to Switzerland to join research laboratories in the pharmaceutical industry, and of Drs. Dorothy K. Stearns, Renée G. Naves, and Christine Bothner-By. At the present time, the separation and identification of these reference products are studied with the modern techniques of organic chemistry: infrared spectra, paper electrophoresis, paper chromatography, etc.

This synthetic approach has opened up many problems in carbohydrate chemistry, especially in amino sugar chemistry. Basic problems of transformation of one sugar into another were studied by Mrs. D. A. Jeanloz; and the synthesis of D-gulosamine, the third 2-amino hexose to be isolated from a natural source, was accomplished by Dr. Z. Tarasiejska (Glaser), formerly of the University of Brussels and presently a member of the Worcester Foundation for Experimental Biology. This sugar had been shown to be a basic constituent of the antibiotics streptolin and streptothricin. In addition, new amino sugars not as yet known in natural products, have been synthesized: D-allosamine, D-talosamine (an artefact in the degradation of chondroitin sulfate), 3-amino-D-idose and 3-amino-D-gulose. The interest in 3-amino sugars has greatly increased since the recent isolation of 3-amino-D-ribose and of 3-amino-D-glucose from puromycine and kanamycine, respectively, both antibiotics possessing anti-tumor activity. During the past few years, synthetic studies directed toward the preparation of derivatives of D-galactosamine have been carried out by Dr. Tarasiejska (Glaser).

New methods of preparation of the methylated amino sugars have been investigated by Mrs. D. A. Jeanloz and Mrs. D. Baggett, in order to prepare large amounts for biological testing. Since glucosamine and especially its derivative with lactic acid, muramic acid, have been shown to be main constituents of the bacterial cell wall, it is felt that derivatives of glucosamine may interfere with the formation of the cell wall.

Using the method of methylation established with the help of the synthetic methylated derivatives, we have determined the chemical structure of hyaluronic acid. This substance has been demonstrated not only in most connective tissues but also as an excretion product of some bacteria, especially of Streptococcus hemolyticus. Because of the extremely high viscosity of its solution, it has been ascribed the role of maintaining the rigidity of tissues, of barrier against infection, and, because of its chemical properties, of control in the exchange between the vascular system and the cells.

In 1953, we were able to show that the D-glucuronic moiety of hyaluronic acid was linked to the hydroxyl at C_3 of the D-glucosamine unit. The elucidation of the location of the second type of linkage, the D-glucosaminyl, with the D-glucuronic moiety, was solved by reducing the latter residue into a D-glucose residue and comparing the methylated glucose obtained with the reference substances already synthesized. Thus, we were able to show that the C_1 of D-glucosamine residue was attached to the oxygen at the C_4 of the D-glucuronic acid residue.

The elucidation of the chemical structures of the chondroitin sulfate isolated from adult mammalian cartilage (chondroitin 4-sulfate or chondroitin sulfate A), and of the dermatan sulfate (also chondroitin sulfate B or β-heparin), was accomplished mainly through the efforts of Dr. P. J. Stoffyn, with the help of Dr. Monique Trémège-Cleland for the latter substance. Both substances possess water retention and probably play a role in connective tissue similar to the one of hyaluronic acid, in addition to their high ion-binding capacity. Chondroitin 4-sulfate has been mainly isolated from cartilage, but it has also been detected in skin, in umbilical cord, and in granulation tissue. Dermatan sulfate is one of the main constituents of the connective tissue of skin, but it has been isolated also from lungs, and detected in tendons, heart valves, and aorta. It possesses a definite antithrombic activity and differs in this respect from chondroitin 4-sulfate. Dermatan sulfate is stored in large amounts intracellularly in Hurler's syndrome (a systemic disease of connective tissue) and is also excreted in the urine. The proportions of hyaluronic acid, chondroitin 4-sulfate, as well as of dermatan sulfate, seem to vary with age.

The problem presented by the elucidation of the chemical structure of chondroitin 4-sulfate and dermatan sulfate was similar to the one presented by hyaluronic acid, with the additional complication of one sulfate group located on the hexosamine part. The position of the sulfate group was established by comparing the products resulting from the degradation of the methylated polysaccharide with those obtained from the polysaccharide desulfated before methylation. In the latter product, the position originally occupied by a sulfate group was now occupied by a methoxyl group. Before investigating the nature of the linkages between moieties, it was necessary to show the nature of the uronic part of dermatan sulfate. After reducing it to a hexose residue and comparing it with a synthetic sample, it was possible to demonstrate that it was L-iduronic acid. This substance up to now has not been detected in any other biological material.

The method of methylation proved the position of the sulfate group in chondroitin 4-sulfate and in dermatan sulfate to be at C_4 of the galactosamine moiety. For both substances, also, it was demonstrated that the galactosamine moiety was located at the C_4 of the uronic moiety (D-glucuronic acid for the former, L-iduronic for the latter), and that the uronic moiety was attached to the oxygen at C_3 of the galactosamine moiety. The interesting conclusion from these studies is that for the three polysaccharides of connective tissue so far studied (hyaluronic acid, chondroitin 4-sulfate, and dermatan sulfate), the differences do not reside in the type of the linkage of their building blocks, but in the nature of these building blocks: D-glucosamine and no sulfate for hyaluronic acid, D-galactosamine with a sulfate group at position 4 for chondroitin 4-sulfate and dermatan sulfate, D-glucuronic acid for hyaluronic acid and chondroitin 4-sulfate, and L-iduronic acid for dermatan sulfate. These results require some interesting hypotheses for the specificity of the enzymatic systems involved in the biosynthesis of these high molecular substances.

The elucidation of the structure of dermatan sulfate required synthetic work on the sugar L-idose and the preparation of some of its methylated derivatives. This was accomplished by Dr. Pierre Stoffyn and by Dr. Neil Baggett, who received his training at the University of Birmingham, England. Dr. Baggett is presently working on the synthesis of the uridine-diphosphate derivative of L-iduronic acid, a substance involved in the biosynthesis of dermatan sulfate. He is also attempting to elucidate the chemical structure of the anticoagulant polysaccharide heparin. Dr. Anund A. Hallén, from the Karolinska Institutet in Stockholm, has recently joined our group. He is studying the chemical structure of chondroitin 6-sulfate, a polysaccharide isolated from the cartilage of animals of a lesser degree of evolution than those containing chondroitin 4-sulfate, like the shark. A similar polysaccharide seems to exist in mammalian tissues, but its identity with the substance isolated from shark cartilage has not been clearly shown. In addition, the chemical structure of chondroitin 6-sulfate is not definitely established, since it has only been suggested through comparison of its infrared spectra with those of synthetic monosaccharides.

As early as 1955, it was felt that the methods devised for the study of the polysaccharides of connective tissue could be applied to more complex molecules. Dr. Sen-itiro Hakomori, from the University of Sendai in Japan, undertook the very large task of purifying the substances responsible in erythrocyte for blood group specificity. He started with more than 100 liters of typed human blood, A (+) and B (+), and, after many purifications, obtained from each blood batch less than 100 mg. of substance of glycolipid nature in which the activity resided. Further studies showed that both substances were still probably mixtures, but it was possible to establish a difference in the chemical structure of the two glycolipids. These substances are composed of sphingosine, fatty acids, and various amounts of galactose, glucose, glucosamine, and galactosamine. It is probable that the end groups of the carbohydrate chains of the glycolipids have the same chemical structure as the end groups of the carbohydrate chains of the blood group substances isolated from the mucous secretions of the same person, thus explaining the cross reaction between the two types of substances. Further work on this problem would require not only a very large scale isolation process not available in our laboratory, but also a better knowledge of the general chemistry of glycolipids. After working on some problems of basic carbohydrate chemistry, Dr. Hakomori returned to Sendai University, with the intention of rejoining our group at some future date.

Dr. Nathan Sharon of the Weizmann Institute of Israel spent one year with our group after having been associated with Dr. Fritz Lipmann. He brought us his interest in the chemistry of bacterial polysaccharides, a field in which I hope to see our laboratory very active in the future. From one strain of Bacillus subtilis, which synthesizes extracellularly large amounts of polyglutamic acid, he isolated a polysaccharide containing three amino sugars: D-glucosamine, D-galactosamine, and an unknown diamino sugar, in addition to amino acids. He could demonstrate that the diamino sugar had two amino groups at positions 2 and 4, and was a 6-deoxy sugar. Further work on its structure is being carried out by Dr. Sharon in Israel, but it was agreed that attempts to synthesize it would be done here, in our laboratory.

Dr. Annette M. C. Rapin, who had received her training at the University of Geneva, spent two years on this problem, and was successful in preparing 2,4-diamino-D-glucose and 4-amino-D-glucose. Succeeding Dr. Hakomori, she studied the chemistry of 1,6-anhydro-glucose, a carbohydrate which is the potential source of many derivatives of glucose, especially of those containing O^{18} or N^{15}. After this training in organic chemistry, Dr. Rapin has returned to her original interest in biology and has moved to the fifth floor to work with Dr. Kalckar.

Dr. Sharon, whom we hope to see again for a temporary stay in the near future, has been followed by another scientist from the Weizmann Institute, Dr. Harold Flowers, who is known for his syntheses of cerebrosides. He has just started working on the chemistry of the cell wall of bacteria, especially on the synthesis of muramic acid derivatives.

With the arrival in 1958 of two biochemists from the Harvard Medical School Quadrangle — Dr. E. Eylar, from Dr. Oncley's group, and Dr. R. Spiro, from Dr. B. Hastings's group — our laboratory began the study of the carbohydrate portion of glycoprotein. This line will, I hope, become one of our major fields of research in the future. In view of our association with Dr. K. Schmid's group, in which the isolation and characterization of glycoproteins has been very actively carried out for many years, it was quite natural that we should be attracted by the study of the chemical structure of their carbohydrate parts. In 1955, Dr. Allan Dixon, a British physician, had already carried out in our laboratory a preliminary study of ovomucoid and of the α_1-acid glycoprotein of human plasma. It was only after the arrival of the two abovementioned biochemists, however, that an intensive study was undertaken. Our work has been mainly directed toward the glycoproteins of plasma. Some of them, like the α_1-acid glycoprotein, show very great increase in certain types of diseases. Our main objectives are to establish the sequence of monosaccharide units in the carbohydrate part, and the mode of liaison between the carbohydrate and protein moieties. Dr. Eylar worked on the structure of the α_1-acid glycoprotein of human serum and was able to isolate by acid degradation a disaccharide, a tetrasaccharide, and an octasaccharide. The identity of the first one with lactosamine was established, and chemical structures were proposed for the two latter ones. Periodate oxidation of the glycoprotein and of products obtained by enzymatic degradation, as well as a preliminary study by methylation, suggested a definite structure for a large part of the carbohydrate moiety of the α_1-acid glycoprotein. It seems clear that this moiety is composed of a small amount (between 3 and 10) of high molecular oligosaccharides (or low molecular polysaccharides) possessing a very branched structure. The end chain of the branches is composed (starting from the end) of neuraminic acid linked by its position 2 to the position 4 of D-galactose, which in turn is linked by its position 1 to the position 4 of N-acetylglucosamine. The inside core, linked to the protein, is composed of D-glucosamine and D-mannose.

Dr. Eylar has left, to occupy a position in the Department of Biochemistry at the University of Indiana Medical School. He has been replaced by Dr. Annemarie Closse of the University of Freiburg in Breisgau, Germany. She has carefully studied the degradation of the carbohydrate part with enzymes and is presently studying the effect of prolonged periodate oxidation. She has also undertaken the separation of the products resulting from the degradation of the methylated glycoproteins.

The work of Dr. R. Spiro on fetuin, a glycoprotein of calf fetal blood, has already been described in THE NEWS, in the 1960 report on the whole Lovett Group. After purifying fetuin and studying its physical properties and chemical composition, Dr. Spiro was successful in obtaining pure glycopeptides. Their amino acids and carbohydrate composition, as well as their molecular weight, were characterized. Further studies on fetuin included acid and enzymatic degradation, and periodate oxidation of the carbohydrate part. Dr. Spiro is now a member of the Baker Research Laboratory at the Deaconess Hospital.

The elucidation of the chemical structure of glycoproteins is also approached by the study of the chemistry of their components, and by synthesis. Dr. Stearns and Dr. Tarasiejska (Glaser) have studied the chemical structure and the preparation of derivatives of neuraminic acid, a major component of glycoprotein and glycolipids. Dr. Colin Bolton, from the University of Birmingham, England, has just joined our group and is attempting to synthesize the linkage between the carbohydrate and the protein parts, in preparing various glycopeptides containing aspartic acid and D-glucosamine or D-mannose.

Recently we have been in close contact with several groups and we have joined our efforts in common projects with those of Dr. Endre A. Balazs at the Retina Foundation, Dr. B. D. Davis of the Department of Bacteriology and Immunology, Harvard Medical School, and Dr. W. Pigman of the New York College of Medicine.

With the increase in the size of our group and the acquisition of considerable heavy equipment, we have now arrived at the point where space is at a great premium. It is our hope that before our twentieth anniversary we will have moved into more spacious accommodations.

I would like to take this opportunity to extend my deep and sincere appreciation to Dr. Walter Bauer, Chief of the Medical Services. His confidence and his belief that chemical and biochemical research are vitally necessary for the advancement of medicine have made possible our work. I would also like to express my gratitude to the numerous governmental and private agencies for their financial support: the National Institutes of Health (Institutes for Arthritis and Metabolic Diseases and for Cancer Research), the National Science Foundation, the Atomic Energy Commission, Eli Lilly and Company, the Arthritis and Rheumatism Association, the American Heart Association, the Helen Hay Whitney Foundation, the American Cancer Society, and the Damon Runyon Fund.

Roger W. Jeanloz, Ph.D., Biochemist,
Head of the
Laboratory for Carbohydrate Research

Dr. Walter Bauer, Chief of our Medical Services, has announced (as of July 1, 1961) the reorganization of the Robert W. Lovett Memorial Group for the Study of Crippling Disease. On that date Dr. Evan Calkins resigned from the Lovett Group to become Professor of Medicine at the University of Buffalo. Since Dr. Calkins's departure, the Lovett Group has been formally organized into four independent units, held together by a common interest of its members in the biology, chemistry, and diseases of connective tissue.

Dr. Jerome Gross has been named head of the Biology Laboratory; Dr. Roger W. Jeanloz as head of the Carbohydrate Research Laboratory; Dr. Stephen M. Krane as head of the Arthritis Unit; and Dr. Karl Schmid as head of the Protein Chemistry Research Laboratory.

Dr. Gross, who has made fundamental contributions in the area of collagen structure and metabolism, has been at the M.G.H. since 1948, and is at present Associate Biologist at the Hospital and Assistant Professor of Medicine at Harvard Medical School.

Dr. Roger W. Jeanloz, who is well known for his work on the chemistry of polysaccharides, has been at the M.G.H. since 1951, is Biochemist at the Hospital and Associate Professor of Biological Chemistry at the Medical School.

Dr. Krane has been at the M.G.H. since 1951, and served as Chief Resident in Medicine in 1957. He has been engaged in research on diseases and metabolism of the skeleton, and is at present Assistant Physician at the M.G.H. and Associate in Medicine at Harvard Medical School.

Dr. Karl Schmid, who has been at the M.G.H. since 1952, has made many contributions concerning the structure and characterization of serumproteins, particularly the glycoproteins. He is also in charge of the ultracentrifuge and electrophoresis service, and holds the titles of Associate Biochemist at the M.G.H. and Associate in Physical Chemistry in the Department of Medicine at the M.G.H. at Harvard Medical School.

The Lovett Memorial Group is a unique association of investigators and clinicians of widely different backgrounds and training. It is expected that this association will continue to result in a better understanding of connective tissue and its diseases.

* * *

Dr. Walter Bauer and Dr. Paul C. Zamecnik, Director of the Huntington Laboratories, have announced the appointment of Dr. Alan C. Aisenberg as Chief of the Medical Tumor Group, as of September 1, 1961. The new group will consolidate those hospital activities concerned with the medical care of patients with malignant disease. These activities include out-patient care of and in-patient consultation on individuals with malignant lymphoma, as well as the hormonal and chemotherapeutic treatment of individuals with other malignant disease. An integral part of the activities of the new group will be research on basic aspects of the neoplastic process.

Dr. Aisenberg is engaged in research on tumor metabolism. He has been associated with the clinical activities of the Medical Services and the Tumor Clinic since coming to the M.G.H. in 1956. A graduate of Harvard College and Harvard Medical School, he also received a Ph.D. degree in Biochemistry from the University of Wisconsin. His book, *The glycolysis and respiration of tumors,* was published last year by Academic Press.

Dr. Morton N. Swartz, Chief of the Infectious Disease Unit, returned on November 1, 1961 after a year's leave of absence spent in the Biochemistry Department at Stanford University Medical School. While there, he worked in Dr. Arthur Kornberg's laboratory on studies of the mechanism and replication of the DNA of certain bacterial viruses. Dr. Swartz will not participate in the clinical activities of the Infectious Disease Unit until July 1, 1962, in order that he may devote this time to reorganizing the clinical and research activities of the Infectious Disease Unit, and to continuing his studies of DNA synthesis. Once Dr. Swartz's new plan is in effect, the Hospital will have very strong representation in the infectious disease field.

Dr. Robert F. Loeb (*W.M.* 1920), Bard Professor of Medicine Emeritus at Columbia University, has been awarded the honorary degree of Doctor of Science at Oxford University. Dr. Loeb, whose work on the metabolism of sodium and potassium and on the treatment of Addison's disease won him international recognition, has been serving temporarily at Oxford, taking the place of Sir George Pickering, Regius Professor of Medicine, who has been visiting the United States.

The Board of Trustees, at their meetings on November 10 and 22, voted:

To grant leave of absence to Dr. Leonard W. Cronkhite, Jr. because of call to duty in the Armed Forces.

To appoint:

Dr. K. Frank Austen as Assistant in Medicine, effective January 1;

Dr. Anthony F. H. Britten as Clinical and Research Fellow in the Blood Bank, beginning January 15;

Dr. Padraic Burns as Clinical Fellow in Psychiatry, retroactive to October 1, 1961;

Dr. Champlain Charest as Clinical Fellow in Radiology, beginning July 1;

Dr. John P. Connelly as Assistant in Pediatrics, with the privilege of seeing a limited number of private patients in the Hospital;

Dr. Christopher R. Eliot as Junior Assistant Resident on the Children's Service for one year, beginning July 1;

Dr. Alvin Essig as Assistant in Medicine, effective as of November 1, 1961;

Dr. George Fostiropoulos as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Freddy H. Frankel as Clinical and Research Fellow in Psychiatry, beginning December 1, 1961;

Dr. Neva M. Johnson as Clinical Fellow in Radiology for one year, beginning January 1;

Dr. Philip C. Kelleher as Clinical Fellow in Medicine for one year, beginning November 1, 1961;

Dr. Edwin J. Lieberman as Clinical Fellow in Psychiatry, retroactive to October 1, 1961;

Dr. Richard A. Norton as Clinical Fellow in Medicine, retroactive to November 1, 1961;

Dr. June E. Osborn as Junior Assistant Resident on the Children's Service for one year, beginning July 1;

Dr. Daniel M. Philbin as Assistant Resident in Anesthesia, beginning July 1;

Dr. Mitchell T. Rabkin as Chief Resident in Medicine, beginning January 1;

Dr. Francis P. Shea as Assistant in Radiology, beginning July 1;

Dr. Barton K. Slemmons as Clinical Fellow on the Orthopedic Service, for the period November 16, 1961 through December 31, 1961;

Dr. Myron R. Stocking as Clinical Fellow in Psychiatry, retroactive to October 1, 1961.

At their meetings on November 15, 22, and 29, the General Executive Committee voted:

To accept the resignation of Albert F. Parlow, Ph.D. from the position of Research Fellow in Biology in the Department of Surgery, effective as of February 28;

To rescind the promotion of Dr. Peter Schuntermann to the position of Assistant Resident on the Children's Service, effective July 1.

To appoint:

Dr. Marc R. Playout as Research Fellow in Medicine for one year, beginning July 1;

Dr. Gentaro Usuku as Research Fellow in Medicine, for the period September 1, 1962 through October 31, 1963.

To reappoint:

Dr. Edward Lowenstein as Assistant Resident in Anesthesia for one year, beginning November 7, 1961;

Dr. Justus S. Saurbrey as Clinical and Research Fellow in Surgery for one year, beginning October 1, 1961.

* * *

RADIOLOGY DEPARTMENT

Several members of our Radiology Department attended and participated in the 47th Annual Meeting of the Radiological Society of North America, held in Chicago from November 26 to December 1, 1961.

Dr. Laurence L. Robbins delivered the Annual Oration, in honor of the memory of Donald S. Childs, M.D. He spoke on "Education of the radiologist: Thence and whence".

Dr. Majic S. Potsaid received the Magna Cum Laude Award for his scientific exhibit entitled "An in-phantom radiation dosimeter".

Drs. Milford D. Schulz and C. C. Wang received the Special Mention Award for their exhibit on "A simple method of indexing and filing of radiation therapy records and of patient follow-up". They also presented a paper on "The place of radiation therapy in the management of carcinoma of the rectum and rectosigmoid colon".

Dr. Henry P. Pendergrass presented a paper on "Roentgen technics in the diagnosis and localization of pheochromocytoma".

Dr. Paul F. J. New presented a Refresher Course on "Plain film examination of the skull".

Dr. Edward W. Webster presented a Refresher Course on "Fluoroscopy: Physics, electronics, and physiology". He also participated in Refresher Courses on "Total-body irradiation" and "Introduction to cineradiography". In addition, he presented a paper entitled "A system for stereoscopic fluoroscopy involving electronic storage" and presided at the Physics Program, presented on November 30.

Dr. Potsaid participated in the Refresher Course on "Introduction to cineradiography".

Dr. Stanley M. Wyman presided at the Section on Diagnosis.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

Biology

Drabikowski, W., Kuehl, W. M., and Gergely, J.
Inhibition of actin polymerization by mercurials without removal of bound nucleotide.
Biochem. & Biophys. Res. Comm. 5:389.

Gergely, J., and Drabikowski, W.
The effect of desoxycholate treatment on actin.
Abstr. 1st Internat. Biophys. Congr. Stockholm.

Gergely, J., Drabikowski, W., and Kuehl, W. M.
Exchange of ATP with bound ATP of G-actin and the possible role of phosphate transfer to bound ADP.
5th Internat. Congr. Biochem. Moscow.

Maruyama, K., and Gergely, J.
Dissociation of actomyosin at low ionic strength.
Abstr. 5th Ann. Meeting, Biophys. Soc., TC 11.

Maruyama, K., and Gergely, J.
Removal of the bound calcium of G-actin by ethylenediamine tetraacetate (EDTA).
Biochem. Biophys. Res. Comm. 6:245.

Maruyama, K., and Martonosi, A.
Protective action of nucleoside triphosphates against the inactivation of G-actin by ethylenediaminetetraacetate.
Biochem. Biophys. Res. Comm. 5:85.

Cardiology

Currens, J. H., and Grant, M.
Blood thrombotest versus prothrombin test: Comparison in patients maintained in bishydroxycoumarin and related drugs.
J.A.M.A. 178:168.

Currens, J. H., and White, P. D.
Half a century of running: Clinical. physiologic and autopsy findings in the case of Clarence DeMar ("Mr. Marathon").
New England J. Med. 265:988.

Orthopedic Surgery

Grant, B. D., and Rowe, C. R.
Motor paralysis of the extremities in herpes zoster.
J. Bone & Joint Surg. 43-A:885.

Pathology

Richardson, E. P., Jr.
Progressive multifocal leukoencephalopathy.
New England J. Med. 265:815.

Radiology

Dreyfuss, J. R., Robbins, L. L., and Murphy, J. T.
Disposable, plastic unit for barium enema examination.
Radiology 77:831.

New, P. F. J.
Diagnostic radiology.
In Surgery, G. L. Nardi and G. D. Zuidema, Editors, chap. 40.

Simon, H., and McCoy, W. T.
X-ray Seminar, No. 4: Acute mediastinal enlargement.
J.A.M.A. 178:318.

Simon, H., and McCoy, W. T.
X-ray Seminar No. 5: Left upper quadrant mass.
J.A.M.A. 178:750.

Wang, C. C., and Schulz, M. D.
Basic principles of radiation therapy.
In Surgery, G. L. Nardi and G. D. Zuidema, Editors, chap. 41.

Weylman, W. T., and Simon, H.
X-ray Seminar, No. 3: Unusual bone manifestations of a common disease.
J.A.M.A. 177:855.

Miscellaneous

Churchill, E. D.
Medical wants and needs in mature and developing nations.
M. Times 89:1169.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

VOLUNTEER GROUPS
MGH Service League

The MGH Service League, formerly the MGH Staff Wives Association, is concluding a successful program of activities for the fall season.

One of the most gratifying projects sponsored by the Service League is the program of concerts given in the Chapel. They are attended by wheel-chair and ambulatory MGH patients. On November 15, Lodowick Crowfoot, a student at Harvard College, gave a piano recital. Mr. Crowfoot's father trained at the Massachusetts General Hospital and his mother was a nurse here. His concert attracted one of the largest attendances ever present in the Chapel — 25 patients in wheel chairs, 11 ambulatory patients, and many other visitors. On November 29, Minuetta Kessler gave a piano concert of her own compositions, and on December 13, the girls of the Beaver Country Day School sang Christmas songs, under the direction of Ingeborg Jarratt. On January 3, Dorothy McKenna gave a piano recital, together with assisting artists.

The Hospitality Committee chairman, Mrs. Grant V. Rodkey, reports that the hospitality of many of the Massachusetts General Hospital families' homes was extended to our visitors from other lands during the holiday season.

New addresses:

Dr. Karl-Erik Åström (clin. & res. fel. *N.* 1957), Hannebergsgatan 24, Solna, Sweden
Dr. Stanley Austin (clin. fel. *An.* 1961), c/o A. Frank Banks, ACIA, Dunelm Chambers, Blue Coat St., Nottingham, England
Dr. Mervyn F. Burke, Jr. (a.r.s 1961), University of California Medical Center, San Francisco 22, Calif.
Dr. Richard A. Currie (*S.* 1950), West Virginia University Medical Center, Morgantown, W. Va.
Dr. Habibolah Davanloo (a.r.p. *Psychiat.* 1959), Montreal General Hospital, Montreal, Canada
Dr. Robert H. Detwiler (*C.M.* 1940), 3120 N. 13th St., Arlington, Va.
Dr. Robert E. Dinsmore (a.r.p. *R.* 1961), Radiodiagnostic Dept., Hammersmith Hospital, Postgraduate Medical School of London, Ducane Rd., London W. 12, England
Dr. Robert G. Frost (a.r.p. *An.* 1961), Anesthesia Dept., Stanford Medical Center, Palo Alto, Calif.
Dr. Joshua J. Hurwitz (a. *U.*), 1152 Beacon St., Brookline, Mass.
Dr. Arthur S. Keats (a.r.p. *An.* 1951), Baylor University College of Medicine, Texas Medical Center, Houston, Tex.
Dr. Clarence N. McPeak (r.p. *R.* 1929), 96 Highland St., Gardner, Mass.
Dr. Robert F. Moore (*M.* 1954), 425 North St., Randolph, Mass.
Dr. Sholem Postel (a. *M.*), 75 Mount Auburn St., Cambridge 38, Mass.
Dr. Elihu M. Schimmel (clin. & res. fel. *M.* 1960), 55 Stimson Rd., New Haven 11, Conn.
Dr. Edgar J. Schoen (a.r.p. *C.M.* 1954), Kaiser Foundation Hospital, 280 W. MacArthur Blvd., Oakland 11, Calif.
Dr. Oscar E. Starobin (*M.* 1955), 27 Elm St., Worcester 8, Mass.
Dr. William A. Tisdale (*M.* 1952), Dartmouth Medical School, Hanover, N.H.
Dr. Giles D. Toll (*S.* 1952), Presbyterian Hospital, Denver 18, Colo.

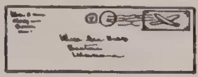
Brief bits:

Dr. Alexander Breslow (a.r.p. *Path.* 1959) began his new duties on September 1, 1961, as Assistant Professor of Pathology at the George Washington University Hospital, Washington, D.C.

Last August Dr. John Gergely presented papers at the first International Biophysics Congress in Stockholm and the fifth International Congress of Biophysics in Moscow. In November he lectured at the University of Minnesota Medical School and at the Institute of Enzyme Research of the University of Wisconsin.

Dr. Oscar Hirsch participated in the Second International Congress of Neurosurgery, held in Washington, D.C., last October. This was by invitation of the president of the Congress. An exhibition of Dr. Hirsch's work on pathology was arranged by Dr. Hannibal Hamlin in such an attractive way that it was favorably commented upon by the visitors at the Congress. A motion picture entitled "Symptoms and treatment of pituitary tumors by the transsphenoidal method" —the first movie, ever, of this kind—taken during Dr. Hirsch's operations on patients, demonstrated his special technique.

On November 15, 1961, Dr. Carter R. Rowe read a paper before the Peninsula Medical Society in Hampton, Virginia, on "Acute and recurrent dislocations of the shoulder".



In response to an appeal from us, this most interesting letter has come from Dr.

Dr. Roger W. Jeanloz, Biochemist — Head of the Laboratory for Carbohydrate Research

John W. Ratcliffe (*W.S.* 1946), whose new address is 104 St. Matthews Avenue, San Mateo, California:

The good ship *Hope* is safely back in her berth in San Francisco, after an unprecedented medical mission to Southeast Asia which lasted a year. It was the unique and unforgettable privilege of Jack Tetirick, Paul Spangler, and me to open the surgical service when the *Hope* arrived in Jakarta, in the fabled island of Java, on October 19, 1960. I have enjoyed the fine letters in The News from my *Hope* colleagues. I should like to give you a few notes on my thoughts about Project Hope nearly a year after my return.

The story of Project Hope has captured the most intense interest of laymen. At a time when so much publicity has been given to our failures in foreign aid as an instrument of foreign policy, it has gladdened many a heart to hear this simple success story. Doctors and nurses have responded well to the opportunity for service which *Hope* has given them. It is necessary to observe, however, that there is a large fund of doubt and skepticism in the profession, particularly in academic circles, regarding the technique and philosophy of Project Hope. These doubts have merit and deserve to be discussed thoroughly. Satisfactory resolution of these doubts is crucial to the further progress of this program. If the idea of medical technical assistance for the developing and needful nations is to be implemented on the necessary scale, our profession must lead the way. Our opportunity is great and our effort up to this time must be described as negligible. One ship and a handful of medical people may comprise a pilot experiment in people-to-people aid, but they do not acquit the medical profession of its responsibility to lead the way to an effective aid program. In the following paragraphs I should like to discuss several aspects of Project Hope that will dissect some of the doubts. I should like to conclude with some suggestions as to the actions our great medical schools and hospitals might take to render aid to the underdeveloped countries.

COST OF PROJECT HOPE

The cost of Project Hope, about 3.5 million dollars for the first year (the approximate cost of one jet fighter), has disturbed many people. An analysis of cost per patient treated might yield a figure deemed by experts as uneconomic. Certain factors affected the number of patients who could be treated by the *Hope* forces. Foremost among these was the fact, particularly apparent in general surgery, that a great majority of the patients we were asked to manage suffered from advanced stages of their diseases, as well as from anemia, malnutrition, and parasitosis. This tended to make the arduous therapeutic effort focus on a relatively small number of patients compared with what might have been accomplished from the standpoint of sheer volume if the problems had been of a more routine nature.

Although many critics saw the use of a ship and crew of American merchant mariners as an unnecessary expense, experience in Indonesia and South Vietnam has shown the impact of the *Hope* as a visible and tangible symbol. Millions of people literally *saw* the ship, and its fame spread to the remotest island *kampongs*. Means of cutting ship-crew costs are being studied. The scope and efficiency of Project Hope may also be extended by greater utilization of mobile hospital and clinic units employing air transport to remote interior areas.

TEACHING MISSION

The mission of the *Hope* as a teaching task force was widely heralded in advance in Indonesia, and the doctors there had earmarked and collected for our care astonishing lists of patients with problems of the first magnitude. These patients and their eager doctors were a perfect setting for a fruitful adventure in education. But how could the small *Hope* group contribute significantly to medical education in a society whose medical needs verge on the catastrophic, whose over-all physician-population ratio approximates 1:60,000? Such a contribution is indeed small, and yet it was applied at a crucial point. In Jakarta, Surabaja, and Makassar the *Hope* staff worked intimately with the medical school faculties. The effect was that of an intensive postgraduate course and, as such, was stimulating to all who participated. Accustomed as we are to rapid and widespread dissemination of medical knowledge, we can hardly imagine how starved for outside communication the Indonesian doctors are. Owing to curious currency and travel restrictions, as well as to the relative poverty of the people, it is virtually impossible for the Indonesian doctors to leave their country for study. Even worse, it is almost impossible for them to subscribe to our technical literature because of their lack of dollars. Thus, Dr. Monadjat of Jakarta, the only plastic surgeon in this country of 90 million people, could not renew his subscription to *Plastic and Reconstructive Surgery.*

We taught by means of lectures, but principally by informal conferences and innumerable surgical demonstrations done with the assistance of Indonesian residents and young faculty members. I am confident that Dr. Walter Tambunon of the University of Indonesia, Jakarta, will henceforward be able to perform a commando operation. He has the tumor surgery assignment there and had done 11 radical necks but had lost his only attempt at a commando procedure. He has now seen such a procedure, perhaps the first successful one in Indonesia. Similarly, Dr. Lium Djie Swie of Surabaja will tackle arteriovenous aneurysms and congenital megacolon with new confidence as a result of the visit of the *Hope.* Early postoperative ambulation, precise postoperative orders and daily rounds, recovery room techniques, restricted use of antibiotics, close doctor-nurse teamwork, and other ideas and practices which we take for granted, excited the Indonesians as novelties. *We* learned new respect for the durability of the human constitution under adverse environmental circumstances. We also learned a new dimension in hospitality and friendliness from the Indonesian people. We shall forever be enriched by our visit to Indonesia.

* * * *

In conclusion, I should like to make two suggestions to our profession:

(1) Individuals and medical societies could make a great contribution in sending books and journals out of our abundance to established medical schools and hospitals out there.

(2) Great hospitals and medical schools in this country and in Europe could adopt, found, and nurture to a condition of self-sufficiency medical schools in Asia, Africa, and South America. Government financial backing would be required and amply justified. We can create a revolution in the health of the people of the world. This sounds visionary, but my visit to Indonesia has shown me that great possibilities abound in the world. Our opportunity and responsibility lie clearly before us. It would be in the character and tradition of the Massachusetts General Hospital to blaze this trail.

The News

No. 210 Boston, Mass. February 1962

ARTHRITIS UNIT OF THE MEDICAL SERVICES

In 1929, Dr. Walter Bauer was asked to organize a research group jointly at Harvard Medical School and the Massachusetts General Hospital for the purpose of studying articular disease. Over the past thirty years, the Robert W. Lovett Memorial Laboratory for the Study of Diseases Causing Deformities has flourished. In the late 1940's, Dr. Bauer brought together a small group of laboratory investigators for the purpose of instituting more fundamental approaches to the study of connective tissue and its diseases.

The success of this venture is indicated by its steady growth in size and reputation. On July 1, 1961, Dr. Evan Calkins resigned as Chief of the Unit, to move to Buffalo as Professor and Chairman of the Department of Medicine. At this time Dr. Bauer reorganized the Lovett Group as follows: Dr. Jerome Gross became Chief of the Biology Laboratory; Dr. Roger W. Jeanloz became Chief of the Carbohydrate Chemistry Laboratory; Dr. Karl Schmid became Chief of the Protein Chemistry Laboratory; and the author was appointed Chief of the Arthritis Unit. The Lovett Group continues as an association of its members with a common interest in connective tissue and its disorders. The present report deals with the activities, since July 1961, of the Arthritis Unit as one part of the Lovett Group.

The major function of the Unit continues to be the study and care of patients with rheumatic disease and related disorders. We have an active clinic where 20 to 30 patients are seen each week, some of whom have been followed for 30 years. It is truly a revelation to me, as a relative newcomer, to see what can be accomplished in a disease such as rheumatoid arthritis when both doctors and patients have an understanding of chronic illness. Since the approach in this clinic has been in general a conservative one, it has been possible to obtain valuable information concerning the natural history of the arthritic diseases. This has been a major contribution of Drs. Bauer, Charles L. Short, and Marian W. Ropes. All the staff members of the Unit, as well as the clinical fellows, attend the clinic regularly—whether or not they are primarily occupied with clinical or laboratory problems. Drs. Bauer, Short, and Ropes have used the clinic as the major tool for long-term follow-up of patients with various rheumatic diseases, in an attempt to accurately document the natural history of these disorders. Dr. Short is at present particularly interested in those patients with rheumatoid arthritis who have had a long remission of their disease.

It has also been possible to use the clinic in carrying out controlled studies of effects of various treatments in rheumatoid arthritis. The efficacy of chloroquine and related compounds has been carefully examined—most recently in a double-blind study in which this clinic cooperated with nine others throughout the country. Dr. Alan S. Cohen, formerly a member of this clinic and now Director of the Rheumatology Unit at Boston University, has played a major role in this work. It is anticipated that similar programs will be pursued in the future.

Dr. Ropes is continuing her studies in several areas relating to the rheumatic diseases. One is the evaluation of Congo red retention as an indication of amyloidosis in patients with rheumatoid arthritis followed over many years and the determination of the effect of treatment with ascorbic acid on the dye retention. Another is the elucidation of some of the factors affecting the therapeutic and toxic blood levels of salicylates. A third is the characterization of the natural history of disseminated lupus erythematosus (D.L.E.) in the large group of patients who have been seen at this Hospital. In contrast with other institutions, there are a number of patients with D.L.E. in this clinic who have never received adrenocorticosteroids and who have had spontaneous remissions of their disease. Dr. Ropes is now assembling this wealth of material which indicates that the course of D.L.E. may be more benign in many patients than has been generally appreciated.

Dr. John A. Mills, formerly on the medical house staff, joined the Unit as a full-time staff member in October 1960. He has assumed a major role in the supervision of fellows and students, and in postgraduate teaching functions. He still manages to devote a considerable portion of his time to laboratory investigation, mainly in the field of immunology. One of his current projects is a collaborative one with Dr. Edgar Haber, a resident on the Medical Service. Drs. Mills and Haber are studying the effect on antigenic specificity of an alteration in the spacial configuration of a protein. Dr. Haber, working with Dr. Christian Anfinsen at the National Institutes of Health, had previously found that reduction and reoxidation of the enzyme ribonuclease under controlled conditions resulted in the formation of derivatives which, although chemically identical with native ribonuclease, had different spacial configuration and had lost enzymatic activity. Drs. Mills and Haber are now studying the ability of such altered proteins to cross-react with an antibody to normal ribonuclease.

In another project, Dr. Mills has been studying the pathogenesis of delayed hypersensitivity by means of passive transfer, using lymph node lymphocytes of animals sensitized by injections of protein. Initial work has involved attempts to simplify the experimental passive transfer system and to determine to what extent the viability of donor lymphocytes is important.

Dr. J. Claude Bennett is pursuing another approach to problems of antigen-antibody reactions, relating to the molecular structure of specific antibodies. The recent development of two experimental techniques has made this approach possible. The first is that of controlled enzymatic degradation of antibodies whereby fragments of much smaller size, but retaining biological activity, can be obtained. The second is the reduction of disulfide bridges of the protein, which breaks up the very complex molecule composed of intertwining peptide chains into single chains which can then be separated. By application of these two techniques in sequence, an antibody with a molecular weight of about 160,000 can be specifically degraded to fragments of molecular weight 13,000 – 15,000. Dr. Bennett has made considerable progress in these studies and shortly will be able to examine these fragments with respect to amino acid sequence and sites of biologic activity, and use the techniques to determine structural differences between normal and abnormal globulins.

In July 1961, Dr. Jeremiah E. Silbert joined our Unit as a research fellow. Dr. Silbert had his house staff training at Barnes Hospital in St. Louis and subsequently spent two years in Dr. Carl Cori's Department of Biological Chemistry, working with Dr. David Brown. Dr. Silbert has been interested primarily in the mechanisms and pathways of biosynthesis of mucopolysaccharides, using a mast cell tumor which is readily transplantable in mice. This particular tumor has high content of heparin, as well as other polysaccharides. It has been possible to demonstrate the formation of uridine diphosphate glucosamine by homogenates of this tumor, and it appears likely that it is a precursor of heparin.

He is now attempting to obtain heparin synthesis by cell-free preparations of this tumor, investigating the point at which the uronic acid is incorporated and when sulfation occurs.

In the author's laboratory, studies have been in progress over the past 2½ years in collaboration with Dr. Melvin J. Glimcher of the Orthopedic Research Laboratories, concerning the mechanism of mineralization and resorption of bone. Dr. Glimcher and I have been able to show that purified collagens from a variety of sources bind inorganic orthophosphate at physiologic temperatures and pH. Although most of the phosphate is bound loosely and has the characteristics of electrostatic bonding, part of the phosphate combines in a fashion indistinguishable from a covalent bond. The site or sites on the collagen molecule where phosphate interacts have not yet been identified, although we have several clues as to what they might be. Presumably, this reaction is of importance for several reasons. The most significant is the relation of this phosphate-collagen complex to the nucleation process, in which collagen in a particular molecular aggregation state can induce the crystallization of apatite (the calcium-phosphate crystal of bone mineral) from solutions of calcium and phosphate in concentrations approaching physiological ones.

Dr. Glimcher and I have also been studying the adenosine diphosphatase activity associated with connective tissue. This activity appears to be associated with collagen and remains with it upon purification of this protein. Moreover, the integrity of this particular enzyme correlates directly with the integrity of the collagen structure. In the course of these studies, we found that the inorganic crystals of bone (apatite) participated in this reaction. It was found that bone, when ashed at high temperatures, continued to retain the ability to split adenosine triphosphate. Subsequently, we were able to show that *synthetic* inorganic apatite crystals were able to bind various nucleotides and form crystal-phase inorganic pyrophosphate, one phosphorus deriving from the crystal and the other from the nucleotide. This reaction has taught us a great deal about the structure of phosphate crystals and is an interesting model for protein catalysis. We hope that such a collaboration between our two laboratories will continue to be fruitful.

Dr. Charles Nagant, from Louvain, Belgium, joined our group last fall and is beginning clinical studies on bone metabolism, using the short half-lived isotope of calcium—Ca^{47}. We plan to use the techniques previously developed here in cooperation with Drs. Gordon L. Brownell, John B. Stanbury, and Elias C. Dow to investigate rates of bone formation and destruction in the localized osteoporosis associated with rheumatoid arthritis, as well as in other skeletal disorders.

Dr. Robert S. Pinals, as a trainee of the National Institute of Arthritis and Metabolic Disease, has been active this present year in consultations on the Hospital wards, in conjunction with the senior members of the Unit. He has undertaken studies, in cooperation with members of the Howe Laboratory, of posterior capsular cataracts which seem to occur with greater frequency in patients with *long-standing* rheumatoid arthritis who have received long-term steroid treatment. He has also begun clinical studies of patients with uveitis, which include bacteriological studies of blood and the genitourinary tract in cooperation with Dr. Louis Dienes.

At first glance it might seem that in our investigative efforts we are circumventing the problem of rheumatoid arthritis. We feel, however, that our group is composed of individuals who are all interested in problems relating to the biology and chemistry of connective tissue such as those described above. Each approaches the problem from his particular point of view in relation to his previous training and interest, retaining a common interest in the patients and their disease. We share our interest with the members of the other laboratories of the Lovett Memorial Group, hoping by our cooperative effort to make some headway in a complex field.

I think it still pertinent to quote Dr. Bauer from his 1950 report to the MGH NEWS, as Dr. Jerome Gross did in 1953: "The failure to disclose specific leads as to the etiology or pathogenesis in the clinical studies of rheumatoid arthritis and the related diseases has . . . reoriented us to a more fundamental approach—namely, a characterization of the tissues involved, so that as the normal is defined we can better interpret the alterations produced by the disease. Such an approach necessitates also a study of the reactions of tissues *in vivo* and *in vitro* and of the individual as a whole to insults of various types. These studies will be pursued in the years to come."

Stephen M. Krane, M.D.,
Assistant Physician
and *Chief of the Arthritis Unit*

The Board of Trustees, at their meeting on December 8, 1961, voted to appoint:

Dr. Joseph N. Blau as Clinical and Research Fellow in Neurology for one year, beginning January 1;
Dr. Lawrence D. Egbert as Assistant in Anesthesia, effective as of December 8, 1961;
Dr. Khalil Germanos as Assistant Resident on the Orthopedic Service for one year, beginning January 1;
Dr. Alexandra M. Kail as Assistant Resident in Psychiatry for one year, beginning July 1;
Dr. Gabriel B. Mirkin as Assistant Resident on the Children's Service for one year, beginning July 1;
Dr. John W. Mitchell as Exchange Assistant Resident on the Children's Service, for the period December 5, 1961, through January 16, 1962;
Dr. Jean C. Siegfried as Clinical and Research Fellow in Neurosurgery, for the period January 1 through June 30;
Dr. Seymour Zimbler as Assistant Resident on the Orthopedic Service for one year, beginning January 1.

At their meetings on December 6, 13, and 20, the General Executive Committee voted:

To terminate the appointments of:

Dr. Anton T. Appels as Clinical and Research Fellow in Medicine, effective as of November 28, 1961;
Dr. Sigetosi Kamiyama as Research Fellow in Medicine, effective as of November 19, 1961.

To promote:

Dr. Edward P. Baker, Jr. to the position of Assistant Resident in Neurosurgery, assigned to Neuroradiology, for eight months, beginning January 1;
Dr. George B. Carter to the position of Resident in Radiology, beginning January 1;
Dr. Anthony P. Monaco to the position of Resident Surgeon, effective July 1, with the privilege of receiving the American Cancer Society Clinical Fellowship award at the rate of $3600 in addition to his hospital salary;
Dr. Robert A. Nebesar to the position of First Assistant Resident in Radiology, beginning January 1;
Dr. James W. Tanner to the position of Resident in Radiology, beginning January 1;
Dr. Harold C. Urschel, Jr. to the position of Resident Surgeon, beginning January 1.

To reappoint:

Dr. William C. Amman as Graduate Student Assistant in Medicine, assigned to Allergy, for the period January 10 through June 30;
Anthony L. Andrikides, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning November 1, 1961;
Laurence C. Bonar, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning January 1;
Dr. Milan Fiala as Clinical and Research Fellow in Medicine, for the period January 1 through June 30;
Dr. Bruce W. Fischberg as Clinical and Research Fellow in Psychiatry for one year, beginning January 1;
Dr. Ulf Å. Friberg as Research Fellow in Orthopedic Surgery for one year, beginning November 1, 1961;
Lorna J. Langer Gilmore, Ph.D. as Research Fellow in Biochemistry, in the Department of Pathology, for one year, retroactive to October 1, 1961;
Samuel R. Kamhi, Ph.D. as Research Fellow in Orthopedic Surgery for one year, retroactive to October 1, 1961;
Murray V. King, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning January 1;
Dr. Jan Koch-Weser as Clinical Fellow in Medicine for one year, beginning January 1;
Dr. Preecha Lojananond as Research Fellow in Pathology, assigned to Cytology, for one year, retroactive to October 1, 1961;
Dr. Edward A. Nalebuff as Clinical Assistant in Orthopedic Surgery for one year, retroactive to October 1, 1961;
Dr. Nathan T. Sidley as Clinical and Research Fellow in Psychiatry for one year, retroactive to September 1, 1961.

To appoint:

Dr. Alberto Diaz-Cabello as Graduate Student Assistant in Surgery, for the period October 31, 1961 through January 31, 1962;
Dr. John B. Foster as Research Fellow in Neurology, assigned to Neuropathology, for the period January 1 through June 30;
Sharad G. Joshi, Ph.D. as Research Fellow in Medicine for one year, beginning January 15;
Mr. James J. Muller as Research Fellow in Psychology, in the Department of Psychiatry, effective as of December 15, 1961;
Dr. Inga K. Samuelsson as Research Fellow in Neurology, for the period November 1, 1961 through June 30, 1962;
Dr. Siavoush Sehhat as Graduate Student Assistant in Surgery for one year, retroactive to September 7, 1961;
Dr. Sigmond N. Titte as Graduate Student

Assistant in Surgery for one year, retroactive to July 1, 1961;

Dr. Isaac J. Velasco as Graduate Student Assistant in Surgery, for a period of six months, retroactive to July 1, 1961.

To assign:

Dr. Murray H. Helfant as Junior Resident in Neurosurgery at the Boston V.A. Hospital, for eight months, beginning January 1;

Dr. Earl F. Jordan as Assistant Resident in Neurosurgery to the private service, for eight months, beginning January 1;

Dr. C. Norman Shealy as Senior Resident in Neurosurgery at the Boston V.A. Hospital, for eight months, beginning January 1;

Dr. R. Lewis Wright as Assistant Resident in Neurosurgery to Laboratory service.

* * *

Dr. Raymond D. Adams has been recognized by the New York Academy of Sciences with the honor of Fellowship in the Academy. This honor is in recognition of the achievements of Dr. Adams's work in Science. Fellowship in the New York Academy of Sciences is awarded to a Member who has attained outstanding recognition for scientific achievement or for the promotion of Science, and is accordingly recognized as an honor in the world of Science.

Dr. Jack R. Dreyfuss has been elected to Fellowship in the American College of Radiology. He will receive the degree at a convocation in New York City on February 10.

Dr. Thomas B. Fitzpatrick has been appointed to the editorial boards of the *New England Journal of Medicine,* the *Journal of Investigative Dermatology,* and the *Archives of Dermatology.*

At the meeting of the American Academy of Dermatology and Syphilology, held in Chicago last December, Drs. Makoto Seiji, Thomas B. Fitzpatrick, and M. S. C. Birbeck received the Gold Award of Merit of the Scientific Exhibits for their original display entitled "The melanosome: The metabolic unit of melanin formation".

Dr. Fitzpatrick will be Chairman of the Program Directors' Meeting of Dermatology Training Grants, which will be held in Washington on February 9.

Dr. Richard P. Stetson, President of the Medical Foundation, Inc., has announced the award of a three-year fellowship to Dr. Edwin W. Salzman, an Assistant in Surgery on our Staff. Dr. Edward D. Churchill commented, on the occasion, "Dr. Salzman's career as a contributor to the advancement of surgery is assured by his innate talents, his long education, and demonstrated competence."

The Medical Foundation, a United Fund agency, supports young investigators in basic research through fellowships. Dr. Salzman is studying the way the body controls bleeding. "This complicated process keeps us from bleeding to death from small cuts, but sometimes does not function properly as in heart attacks and strokes," says Dr. Salzman. He is currently studying the surface of platelets (blood cells concerned with the coagulation of blood and contraction of the blood clot). He hopes to be able to find the mechanism that makes them work. If he does, the solution for handling both clotting and hemorrhaging will be that much nearer.

Dr. Salzman is one of the few surgeons doing research in this area—studies of the blood usually being confined to pathologists, internists, and physiologists.

His interest in blood disease has also extended to the operating room, where recent advances have made it safe to operate on patients with bleeding disorders who formerly were denied surgery.

George A. Talland, Ph.D. was awarded the 1961 Monograph Prize in the Physical and Biological Sciences by the American Academy of Arts and Sciences, for his manuscript entitled "The amnesic syndrome: A psychological study".

The Monograph Prizes of the Academy are intended to encourage and assist the publication of scholarly contributions to knowledge, too long for articles in the learned journals and too specialized or too short for a general book. In response to this prize competition, more than two hundred manuscripts were submitted by scholars and scientists from all parts of the English-speaking world.

THE NEW GEORGE W. HOLMES MEMORIAL LIBRARY

IN THE DEPARTMENT OF RADIOLOGY

The Department of Radiology has recently redecorated and equipped the Seminar Room on White 2 as an X-ray Staff Library and Conference Room. With the approval of the General Executive Committee, the room has been renamed the George W. Holmes Memorial Library.

Dr. Holmes, who was Chief of the Department of Radiology from 1917 to 1941, came to the Hospital as assistant to Dr. Walter James Dodd in 1910 and was appointed Assistant Skiagrapher. Following Dr. Dodd's death, he became the second Chief of Radiology. During World War II, Dr. Holmes was recalled to the Hospital and served as Acting Chief of the Department from 1942 to 1945. He died at his home in Belfast, Maine, in 1959, aged 82.

Many of Dr. Holmes's former residents have contributed toward a Fund which will eventually be used to endow a larger memorial library when the Department is able to increase its floor space. In the meantime, it was decided to use the old Seminar Room for this purpose, the room now being too small to accommodate the House Staff and Physicians who attend the Department's seminar on Wednesday afternoons.

The library has been painted green, and gold-colored draperies have been hung at the windows. On one wall is the oil painting of Dr. Holmes, presented by his former pupils when he retired. On the opposite wall is a photograph of Dr. Dodd, above which, in a small glass case, is the first X-ray tube used at the Massachusetts General Hospital in 1896—four months after Roentgen's momentous discovery. Dr. Holmes's desk has been refinished and placed in the room, together with a new set of matching chairs. An excellent collection of radiologic textbooks has been assembled on the library shelves, and around the room are photographs of every physician who has trained in the Department since the beginning of the X-ray residency training program in 1915. Incidentally, Dr. Holmes was the first radiologist in the United States to start a formal residency program in Radiology. Among his many pupils were Drs. Merrill Sosman, Aubrey Hampton, John Camp, Harold Peterson, Ross Golden, Alexander Macmillan, Charles Martin, as well as Drs. Robbins and Wyman.

The Department has collected memorabilia of Dr. Holmes, including, in addition to material already in the Department, many early photographs of Dr. Holmes, certificates, citations, letters, and medals which have been contributed by Dr. Holmes's family. Worthy of special mention among these are the gold medals he received from the American Roentgen Ray Society and the Radiological Society of North America. Much of the material will be placed on display in the library. Some of it will be given to the Historical Collection in Radiology to be assembled in the new Countway Library of Medicine at Harvard Medical School. This latter collection will memorialize the pioneers of Radiology in the Boston area and will also contain original pieces of early X-ray equipment.

On December 15, 1961, Dr. Holmes was honored by the New England Roentgen Ray Society at its meeting at Longwood Towers, in Brookline, Massachusetts. The material collected by the Department was on display, including manuscripts, letters, awards, and photographs of the X-ray Department as it appeared in the 1920's. It was noted by Dr. Lloyd Hawes, who, together with Dr. Jack Dreyfuss, assembled the material for the exhibit, that Dr. Holmes is considered the father of radiological training in the United States, and that there is hardly a major teaching hospital in this country which does not have a radiologist trained by Dr. Holmes or one of his followers.

* * *

An account of our Ether Day activities appeared in the December 1961 issue of THE NEWS. At that time we said that the text of Dr. Faxon's interesting address, delivered in the Moseley Rotunda on the afternoon of October 16, would appear at an early date. To our regret, space accommodations have prevented its appearance until now.

SERVICE PINS: WHY, WHEN, AND HOW

The Massachusetts General Hospital expects everyone to do his duty. It sets a high standard of performance and promptly admonishes those who fail to meet this standard. It seldom praises. Today, however, is an exception, for on this 115th anniversary of Ether Day the Massachusetts General Hospital, for the 16th consecutive year, praises and shows its appreciation for length and excellence of service by the awarding of Service Pins.

It is always interesting and often instructive to explore the genesis and development of customs such as this. Why, when, and how did the M.G.H. decide to award Service Pins? As usual, this event is an example of how one thing leads to another, and we shall find that three other types of pins preceded our present Service Pin.

The story starts in 1942 or 1943, during World War II, when the American Hospital Association issued a pin to be given to hospital employees to show that they were not draft-dodgers, but were working in institutions which the government considered essential for the welfare and health of the nation. This was pin #1.

Now we come to pin #2. (This is complicated, but bear with me, please.) Volunteers have served the M.G.H. ever since 1869, when the Ladies' Visiting Committee was formed. Red Cross Gray Ladies and unpaid O.P.D. secretaries continued and expanded the idea of volunteer service. As World War II developed, so many doctors, nurses, and employees joined the Armed Forces that hospitals literally had to depend upon volunteers in order to keep operating. At the M.G.H. they served as house men and orderlies, house maids and ward maids and kitchen help—in fact, in almost every non-professional department of the Hospital. In 1943, over 1200 individual volunteers gave over 150,000 hours of service. This is the equivalent to adding 50 people to the Hospital personnel, working all day for every day in the year.

Naturally, the Hospital (and especially Miss Eleanor Greenwood, who was the Head of the Volunteer Service at that time) felt that some recognition for this service was indicated, and largely through Miss Greenwood's efforts action was taken. In 1942 the Volunteer Service Bureau of Boston, which was a part of the Community Fund (now known as the United Community Services) designed a pin which was adopted by the Boston hospitals and issued to volunteers after they had given 100 hours of service in one year. The volunteers had to pay $1.50 for the pin, but Miss Greenwood states that they always showed up promptly after completing their 100 hours and were very proud of their pin. It was of blue and white enamel, and bore the words "Hospital Volunteer Service" and the seal of the American Hospital Association.

The right to use this seal came about in this way: The A.H.A. had in 1933-34 approved the establishment of "prepayment plans for group hospitalization" and in 1935 had made recommendations governing the formation of "Hospital Service Plans", as this group hospitalization came to be called. In 1939, the A.H.A. officially adopted the name "Blue Cross" and at the same time the present Blue Cross symbol, with the A.H.A. seal in the center, as the national symbol of the Hospital Service movement. The Blue Cross name and symbol, but with a different center, had originated in Wisconsin. The Associated Hospital Service Corporation of Massachusetts, formed in 1937, immediately adopted this symbol for its letterhead and was generally spoken of as the Massachusetts Blue Cross. When, in 1942, Miss Greenwood and the Volunteer Service Bureau representatives asked Mr. Cahalane (then the Executive Director of the Massachusetts Blue Cross and also the Head of the Commission on Blue Cross of the A.H.A.) for permission to use the A.H.A. seal on their volunteer pin, he gave them the desired permission and the pin was designed and issued to the Boston hospitals. It was such a success that in 1944 the A.H.A. decided to adopt the idea and the pin as a national volunteer emblem, and so the Volunteer Service Bureau relinquished to the A.H.A. all rights and privileges connected with the emblem. The A.H.A. added the words "American Hospital Association" along the lower sides of the shield, but retained the general design. These pins were sold to member hospitals in the United States and Canada. This pin continued in use until 1954, when the design was changed to a hexagonal pin, in gold and blue enamel, with the words "Hospital Volunteer Service" surrounding the A.H.A. seal. This design is still used.

Now we come to pin #3. The pin we have been talking about was for 100 hours of service, but many of the volunteers had served for much longer periods—some for years, and so Miss Greenwood designed a little red ribbon bar which bore a bronze star for each year of service as a War Service Worker. War Service Workers were volunteers, but were an especially devoted and separate group. This ribbon caught the attention of the Boston Hospital Council and was adopted for use in other Boston hospitals. It was issued, in addition to the volunteer pin, from 1944 to the end of World War II.

One more step before we come to Service Pins. A hospital, probably more than any other institution, seems to collect, over the years, a group of loyal and dedicated persons who, by reason of long service and character, stabilize and leaven the larger body of those who come and go. To show appreciation of this devoted service, the Trustees of the M.G.H. began at McLean Hospital, in 1941, to present certificates of service to employees who had been with the Hospital for 20 years or more.

Now, all these different ideas were brought together, and the M.G.H. Service Pin is the result. First the A.H.A. war pin, then the volunteer pin and ribbon, and lastly the M.G.H. employee certificate. Credit for this synthesis should go to Mrs. Lois N. McCoy, who was Personnel Director at that time. She suggested to me (and the Trustees agreed) that, although the idea of certificates was good, a more tangible and visible recognition of length of service would be better appreciated by employees. Such a Service Pin would be a badge of honor for the wearer and an incentive to those who had not already earned one. Consequently, on April 6, 1945, the Trustees voted: "To authorize the award of Service Pins to those with more than ten years of service to the Hospital."

So, 16 years ago—on Ether Day, October 16, 1945—the first ceremony of awarding Service Pins was inaugurated, and Mr. John R. Macomber, then President of the Corporation, handed pins to 241 persons. I quote from the November 1945 issue of the M.G.H. News:

> The pins bear the Hospital seal, and include one star for each ten years of service rendered. Many received pins with one star, several with two, fewer with three, and Miss Genevieve C. Chase, our Record Librarian, was awarded a pin with four stars for more than forty years of service. Then came the high point in the program. Two men—Mr. Eric Frankson, our Storekeeper, and Mr. Robert Henderson, Dean of Orderlies—were presented with pins, similar in design, but fashioned entirely of gold. These special pins signify over fifty years of association with the Hospital.

It was an auspicious beginning for a ceremony which has now been continued for 16 years. The following year, McLean Hospital awarded pins to 125 faithful members of their Hospital family.

At first, Service Pins were given only to employees. They wore them with such pride that the doctors felt neglected; and so, in 1952, Service Pins were awarded to all members of the Active Staff who had served the Hospital continuously for 25 years or more. On that Ether Day, 16 physicians received pins bearing the designation "25 years", and Dr. Joe V. Meigs received a pin with three stars, denoting 30 years on the Active Staff.

Furthermore, the high regard for the pins led the Trustees to establish a new category for five years of service. This pin bears no star, but at the end of five more years may be exchanged for a pin bearing one star, denoting ten years of service.

Pins go very well on ladies' clothes but not so well on men's coats, and so, in deference to the men's wishes, since 1954 the men have received smaller lapel buttons of the same design as the pins still issued to the ladies.

It would be historically impressive if I could tell you how many persons have received this honorable badge of recognition for years of service at the M.G.H. Unfortunately, the records have not been accurately kept. Some years are complete; others are blank. Also, the record is complicated by reason of persons graduating from one decade to another, from one star to two stars and upward. It is fair to say, however, that well over 2,000 persons have received Service Pins.

While an accurate record would be interesting and impressive, it is not really important. What *is* important is the fact that Service Pins are recognized as an honorable reward for faithful service, an honor both to the wearer and to the

Hospital, and that they are worn as such with pride.

I should like to close these remarks with a personal comment. Although I have served the Massachusetts General Hospital at three different times—first as a House Officer, next as an Assistant Director, and lastly as Director, I have not accumulated enough consecutive years of service to be awarded a Service Pin. The tenth commandment says: "Thou shalt not covet . . . any thing that is thy neighbor's", but I now confess that I do envy those of you who can wear an M.G.H. Service Pin.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

Biochemistry

Pathak, M. A.
Mechanism of psoralen photosensitization and *in vivo* biological action spectrum of 8-methoxypsoralen.
J. Invest. Dermat. 37:397.

Seiji, M., Shimao, K., Fitzpatrick, T. B., and Birbeck, M. S. C.
The site of biosynthesis of mammalian tyrosinase.
J. Invest. Dermat. 37:359.

General Surgery

Barnes, B. A., and Cope, O.
Carcinoma of the parathyroid glands: Report of 10 cases with endocrine function.
J.A.M.A. 178:556.

Grillo, H. C., and Potsaid, M. S.
Studies in wound healing: IV. Retardation of contraction by local X-irradiation, and observations relating to the origin of fibroblasts in repair.
Ann. Surg. 154:741.

Laboratory Science

Hakomori, S.-I., and Jeanloz, R. W.
Isolation and characterization of glycolipids from erythrocytes of human blood A (plus) and B (plus).
J. Biol. Chem. 236:2827.

Mills, J. A., Calkins, E., and Cohen, A. S.
The plasma disappearance time and catabolic half-life of I^{131}-labeled normal human gamma globulin in amyloidosis and in rheumatoid arthritis.
J. Clin. Invest. 40:1926.

Perlmann, P., and Morgan, W. S.
Immunological studies of microsomal structure and function.
In Biological structure and function. T. W. Goodwin and O. Lindberg, Editors, New York, Academic Press, Inc., vol. 1, p. 209.

Orthopedic Surgery

Rowe, C. R., and Sakellarides, H. T.
Factors related to recurrences of anterior dislocations of the shoulder.
Clin. Orthop. 20:40.

Rowe, C. R., and Sakellarides, H. T.
Recent advances in treatment of osteomyelitis following fractures of the long bones.
In Surgical Clinics of North America. Philadelphia, W. B. Saunders Company, vol. 41, no. 6, p. 1593.

Physiology

Blank, I. H., and Gould, E.
Penetration of anionic surfactants into skin. II. Study of mechanisms which impede the penetration of synthetic anionic surfactants into skin.
J. Invest. Dermat. 37:311.

Psychiatry

Abram, H. S., and Gill, B. F.
Predictions of postoperative psychiatric complications.
New England J. Med. 265:1123.

Talland, G. A., and Cairnie, J.
Aging effects on simple, disjunctive, and alerted finger reaction time.
J. Gerontol. 16:370.

Next month's issue of THE NEWS will be the last in which 1961 titles will appear.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

Christmas cards arrived as usual, this year, from many MGH alumni and past members of our Staff. The greetings bore the postmarks of several cities and towns from here to California and from such faraway places as Thailand. Each card was enjoyed very much. Because the Christmas letter from our past chaplain, the Very Reverend William B. Spofford and his family, would be of interest to all who knew "Bill" while he was here, we give it to you now. The letter reads:

> We debated staying out of the Christmas letter business again this year, and sending the equivalent amount to feed some one of the world's children, but your cards and letters started to arrive and we missed you and wanted to talk with you. . . . We won't give you two years' accumulation of news—just the high spots:
>
> Bill left Massachusetts General Hospital chaplaincy in mid-October in 1960 to become Dean of St. Michael's Cathedral, Boise. He keeps trying to figure out how one administers a large parish pastorally. He now has accumulated a complete and highly-trained staff, each member of which is qualified to train seminarians and clergy, so his basic interest in relating the work of the parish to seminary education is kept alive. For recreation, he skis, is a member of Boise Little Theater (just got through hamming in The Desk Set), and batted .302 for the St. Michael's soft-ball city champs in the summer. Like accounts of Mark Twain's death, accounts of his heart attack were exaggerated.
>
> Polly runs the house and, also, is attending Boise Junior College to get her degree in education so that, when the "mob" gets in college, we can help them along. Her recreation runs towards skiing and working with the League of Women Voters.
>
> Tim completed two years at Lenox School and then, this fall, transferred to Boise High, since the distance to Massachusetts and the cost were too much for us to manage. He pushes six feet in height and is, currently, exploring colleges to attend.
>
> The triplets are also monster-like (in size and, on occasion, in action): Steve works regularly in a bicycle shop; Mark and Andy take care of irrigating, lawn-mowing, and snow-shoveling activities. They seem to enjoy life to the full, but parents keep having to recall that we did sing "Three Itty Fitties", which isn't much more refined than "Who Put the Bomp in the Bomp-a-Bomp".
>
> Dan practises the piano and relates to our four-legged family members (Grundoon, who is getting a bit grey, but doesn't seem too senile, and Churchy La Femme, who lives up to his name in a caterwauling manner!). All the boys do well in school, thank heavens, and each and all are wild about skiing.
>
> For our vacation, this year, we went up to Glacier and hiked. A tremendously refreshing and humbling experience.
>
> We do miss all our friends on the East Coast, but are continually thrilled by the bigness and openness of the inter-mountain West.
>
> In October, naturally, we remained confident that the best team would win. It did! To our anti-Yankee friends we maintain a haughty, but compassionate, attitude.
>
> The state of the world bothers us, as it should all men. Outside of Christ working in people, we see no resolution. But we know that the Holy Spirit bloweth where He listeth and still calls men to repentance and conversion. We were proud that the Episcopal delegation to New Delhi saw a vision of a reunited Church and that the entire Church, at Detroit, intends to do something about it.
>
> Our love to you all, and may the world win through to a fuller measure of peace and the abundant life for all men in 1962. The forces of struggle and dissension are always more noisy than the quiet forces of love and goodness. We continue to stake our souls and beings on the latter, and hope to continue to light a "small candle of understanding" in our lives.

The letter is signed "Bill, Polly, Tim, Mark, Andrew, Stephen, Daniel, Grundoon, and Churchy La Femme".

THE RESEARCH ACTIVITIES OF THE GASTROINTESTINAL UNIT

In 1957, when Dr. Chester M. Jones retired from his position as Head of the Gastrointestinal Unit at the Massachusetts General Hospital, this Unit and the laboratory, which he had personally established, had achieved a position of eminence and excellence at the clinical level, in the care and treatment of the sick, and in the investigation of diseases of the gastrointestinal tract. We have attempted to maintain the high standards and goals set by Dr. Jones, and the present report will deal with some of the investigative activities of the laboratory during the past five years.

The research activities of the Gastrointestinal Unit have continued to be those related to the physiology and pathophysiology of the gastrointestinal tract and liver. While some of our problems have frequently been approached along biochemical lines, we continue to carry out investigations on patients, realizing that by studying and observing the patient and his disease, we may not only learn something of the abnormal state but, also, if we are astute enough, enhance our knowledge of basic physiologic processes.

One of the major interests in our laboratory has been in the area of the absorption and malabsorption of fat by the small intestine. It will be recalled that normally, when fat is ingested, it is broken down or hydrolyzed partially, if not completely, in the lumen of the small intestine by the combined action of pancreatic lipase and bile salts. In the course of this digestive process, approximately 50 to 60 percent of the ingested neutral fat (triglyceride) is completely hydrolyzed into its component parts (viz., glycerol and fatty acids), and another 30 to 40 percent is partially broken down to monoglycerides and diglycerides. We have concentrated our efforts on learning more of the mechanism whereby these major products of lipid digestion cross the intestinal mucosa and enter the systemic circulation. In the case of fatty acids, it has been observed by others that long-chain fatty acids, after they traverse the intestinal mucosal cell, appear in the lymphatic system in the form of triglyceride rather than as free fatty acids. In other words, as the fatty acid passes through the cell, it is re-esterified to a triglyceride. It was previously believed that this re-esterification process was carried out by a lipase, similar to if not the same as pancreatic lipase. This problem was investigated by Dr. Anthony M. Dawson, who came to us from Professor Sheila Sherlock's laboratory in London. Dr. Dawson demonstrated that the esterification of fatty acids by the intestinal mucosa was in fact an energy-requiring process, not catalyzed by a lipase, and required specifically two cofactors—adenosine triphosphate (ATP) and coenzyme A (CoA). It is of interest and importance that this esterification mechanism is greatest and most active in the upper segments of the small intestine, where fat absorption *in vivo* is normally also maximal. In subsequent studies, Dr. John R. Senior, who will shortly be returning to the University of Pennsylvania Medical School, demonstrated that the initial step in fatty acid esterification was the formation of an "activated" fatty acid—that is, the formation of a fatty acid-CoA derivative. Dr. Senior also observed that this fatty acid activating enzyme system, as well as other enzymes responsible for lipid synthesis, is located in the microsomal membranes of the intestinal epithelial cell. This finding is significant, since it has been found by cytologists that when the mucosal cell is viewed under the electron microscope the absorbed fat is surrounded by specific membranes which seem to be similar to the microsomal membranes isolated by Dr. Senior.

The mechanism of monoglyceride transport and absorption has also been investigated. We have attempted to ascertain by which pathway monoglycerides are converted to diglycerides and then to triglycerides in the mucosal cell. In the course of these studies, Dr. Senior has discovered a completely new pathway for the esterification of monoglycerides—one not previously observed in any other tissue. The specific reaction involves the direct esterification of the monoglyceride molecule with activated fatty acids. This pathway has such great activity in the intestinal cell that it undoubtedly plays an important role in the metabolism and transport of monoglycerides within the intestinal epithelial cell.

In the course of these studies, it became evident that bile salts influence fat absorption not only by functioning as emulsifying agents or detergents in the intestinal lumen, but also by exerting an effect directly on metabolic processes within the cell. In studies carried out by Dr. Dawson, and more recently by Drs. Peter R. Holt and Herbert A. Haessler, it has been shown that the naturally occurring bile salts, such as glycocholate and taurocholate, markedly stimulate such processes as fatty acid esterification, glucose utilization, and the conversion of glucose (a 6-carbon sugar) to the glycerol molecule which forms the 3-carbon "backbone" of the triglycerides in the cell. Of importance has been the demonstration that while conjugated bile salts, such as taurocholate and glycocholate, enhance lipid transport and synthesis in the cell, free bile salts, such as cholate or deoxycholate, lack this property and, in fact, exert an inhibitory influence on many metabolic reactions. The adverse effects of the free bile salts is even apparent morphologically. Dr. Dawson was able to demonstrate that, even in the presence of relatively low concentrations of free bile salts, the mucosal cells are damaged and are subject to necrosis. Since bacteria in the intestinal tract are able to convert conjugated bile salts to free bile salts, it is possible that these free bile salts contribute to the malabsorption often found under conditions where an abnormal or excessive bacterial flora occurs in the small intestine.

Dr. Haessler, who came to our laboratory from the Children's Service and is interested in gastrointestinal disorders of children, has also observed that, contrary to previously held concepts, the glycerol liberated by the hydrolysis of neutral fat is in fact actively utilized by the mucosal cell. He is currently attempting to elucidate the pathway (or pathways) by which this metabolism of glycerol occurs.

While attempting to obtain a better understanding of mechanisms and factors influencing the normal absorption of fat, we have also directed our attention to the investigation of diseases in which malabsorption of fat occurs. Whipple's disease is one such entity which is characterized by the accumulation in the intestinal mucosa of macrophages containing material giving a positive periodic-acid-Schiff (PAS) reaction. In electron microscopic studies conducted by Dr. Alan S. Cohen, formerly of the Arthritis Unit, together with Drs. Peter R. Holt and Elihu M. Schimmel of our group, it was found that these macrophages contain unusual dense bodies, whose ultrastructure resembles that of microorganisms. These observations have now been confirmed by workers in other laboratories, and thus the findings suggest that this rare disorder may indeed be an infectious disease. We now must attempt to prove this theory by direct microbiologic procedures. Sprue or celiac disease has long been of interest to the laboratory, even back to the time when the Unit was under the direction of Dr. Jones. It is now well known that the symptoms of patients with this disorder usually disappear when the wheat protein gluten is omitted from their diet. There is evidence to suggest that after these patients ingest gluten, glutamine-containing peptides appear in the blood stream. This seems to us to be an important clue to the nature of this hereditary disorder. Therefore, Dr. Paul A. Crabbe, a Fulbright scholar from the University of Louvain, Belgium, and Gerald Sandler, a fourth year medical student from New York University, are currently attempting to characterize and isolate these peptides from the serum by the technique of high-voltage electrophoresis.

In addition to the intestinal tract proper, our laboratory is also actively investigating various phases of liver physiology and disease. We have carried out numerous studies on the metabolism and conjugation of bilirubin. Several years ago we demonstrated that the liver, in addition to converting bilirubin to bilirubin glucuronide, also synthesizes and secretes a sulfate conjugate of bilirubin into the bile. In animals and in man, a hereditary form of jaundice exists which is associated with a deficiency in one of these conjugating mechanisms—namely, the one responsible for the formation of glucuronide conjugates. We have studied this glucuronide conjugating enzyme system, called glucuronyl transferase, which is located in the microsomal fraction of the liver cell. During the past year, we succeeded for the first time in solubilizing this enzyme (i.e., releasing it from the microsomal membranes) and purifying it. As a result, we have been able to demonstrate that more than one glucuronyl transferase exists in the microsome of the liver cell. This observation has now been extended by others, with the finding that only one of these glucuronyl transferases is deficient in patients with congenital non-hemolytic jaundice.

The manner by which alcohol causes derangements in liver function and produces liver damage (i.e., fatty liver, cirrhosis) has also been under intensive study during the past three years. One of the most intriguing and clinically important questions relates to the mechanism whereby alcohol ingestion produces a fatty liver. This problem was first investigated in our laboratory by Dr. Gilberto Rebouças, a Kellogg Fellow from the University of Bahia, Brazil, and more recently by Drs. Robert H. Schapiro and Yoshitaka Shimizu—the latter a Fulbright Fellow from the University of Tokyo. The problem thus far has been studied primarily in the rat and, to a large extent, by utilizing the technique of the artificially perfused isolated liver. As a result of these studies, it has become evident that most of the fat which accumulates in the liver is not synthesized *de novo* in the liver, but comes to the liver from the peripheral adipose tissue stores via the blood stream in the form of free fatty acids. The recent studies of Drs. Schapiro and Shimizu also emphasize that alcohol causes a decrease in the release of fat from the liver. The findings to date suggest that alcohol causes 1) a release of epinephrine which results in an increased mobilization of fat from peripheral fat stores, and 2) a decreased release of fat from the liver, perhaps by a direct inhibition of hepatic lipoprotein synthesis in the liver microsomes. These observations have thus far been carried out only in animals, and we now hope to extend them to patients in order to determine whether the same phenomena obtain in the patient with alcoholism.

One of the problems frequently encountered on our wards is that of cirrhosis. We see both Laennec's cirrhosis, in which alcoholism appears to be a significant etiologic agent, and also many cases of postnecrotic cirrhosis, which may follow clinical or subclinical episodes of viral hepatitis. Dr. Robert Schapiro and Dr. Gerald R. Plotkin of our Unit, and Dr. Wallace A. Jones of the Pathology Department are currently conducting a controlled study to determine whether corticosteroid therapy may have beneficial effects in influencing the course of chronic liver disease, and, more specifically, to ascertain whether such treatment may prevent the development of cirrhosis in patients with so-called "subacute hepatic necrosis"—a severe form of viral hepatitis. While this study is a long-range one, we are hopeful that the results will provide us with a sounder basis for the use of corticosteroids in acute and chronic liver disease.

One other metabolic consequence of alcohol ingestion in man and in animals is the inhibition of galactose utilization by the liver. This problem has been investigated together with Dr. Stephen M. Krane of the Arthritis Unit. It was observed that alcohol ingestion strikingly alters the levels and the ratios of oxidized and reduced diphosphopyridine nucleotides (DPN and DPNH) in the liver cell. The increased level of DPNH markedly inhibits a specific enzymatic step in the metabolism of galactose, and accounts for the impairment of galactose utilization following alcohol ingestion, even in otherwise normal human subjects.

Our interest in disorders of galactose metabolism stems from our previous studies on the enzymatic defect in the congenital disease, galactosemia. These earlier studies (reviewed in THE NEWS in 1956) were initiated at the National Institutes of Health in association with Dr. Herman M. Kalckar, who, during the past year, has come to the M.G.H. as Chief of the Biochemical Research Laboratory. Although the nature of the enzymatic lesion in this disease has been elucidated, many important problems remain—such as the manner by which these patients develop cataracts, mental retardation, and liver disease. There is much to suggest that the clinical manifestations are due to the accumulation of galactose-1-phosphate in the tissue, but just how this phosphorylated sugar interferes with cellular metabolism is one of the problems under active investigation. Although patients with galactosemia have a complete absence of galactose-1-phosphate uridyl transferase activity, one of the questions we are trying to answer is whether this is due to an actual *lack* of the specific enzyme protein, or whether these individuals perhaps possess an *altered protein,* which, because of a subtle difference in structure or amino acid composition, lacks the transferase activity. We hope that by means of enzymatic purification and immunologic techniques it may be possible to find the answer to this genetically important question.

From the foregoing review of the research activities of the Gastrointestinal Unit, it is quite apparent that we could not be successful in these efforts and still meet our two other major objectives—namely, better patient care and teaching—without the support and participation of a strong clinical staff. We are most fortunate in having not only a clinically superior but also a dedicated group of internists who form the core of our clinical and teaching activities. I wish to take this opportunity to express my indebtedness and appreciation to Drs. Perry J. Culver, Daniel S. Ellis, Walter W. Point, and Edwin P. Maynard, III, for their enthusiastic support and their devoted participation in all the activities of the Gastrointestinal Unit.

Kurt J. Isselbacher, M.D.,
Assistant Physician
and *Chief of the Gastrointestinal Unit*

The Board of Trustees, at their meetings on December 22, 1961, and January 5 and 19, 1962, voted:

That the Surgical Service be granted an additional Intern, to be assigned to Gynecology, making a total of eleven Interns in Surgery to be supported by the Hospital;

To accept with regret the resignation of Dr. Noel H. Aldridge from the position of Assistant Radiologist, effective January 15;

To accept the resignation of Dr. John F. Bertles from the position of Assistant in Medicine, effective as of December 19, 1961.

To appoint:

Dr. Rodolfo A. Arellana as Out-Patient Resident on the Children's Service, for the period January 1 through June 30;

Dr. John M. Bennett as Clinical Fellow in Dermatology, for the months of January and February;

Dr. Jane M. Berman as Clinical Fellow in Psychiatry, effective July 1;

Dr. Caesar Briefer, Jr. as Resident in Medicine for one year, beginning July 1;

Dr. Stanley E. H. Brooks as Clinical Fellow in Pathology for one year, beginning February 1;

Dr. Martha A. Carpenter as Exchange Assistant Resident on the Children's Service, for the period January 16 through February 26;

Dr. William D. Cochran as Assistant Pediatrician, beginning January 1;

Dr. James E. Drorbaugh as Assistant Pediatrician, beginning January 1;

Dr. Homayoun Kazemi as Resident in Medicine for one year, beginning January 1, 1963;

Dr. John B. Little as Clinical Assistant in Radiology, beginning January 1;

Dr. S. Bert Litwin as Third Assistant Resident in Surgery, beginning January 1;

Dr. Edward Los as Assistant in Anesthesia, beginning January 15;

Dr. William McDonald as Assistant Resident

in Anesthesia, beginning July 1;
Dr. Luis F. de Q. Mattoso as Second Assistant Resident in Radiology, beginning February 1;
Dr. Egbert H. J. Mueller as Assistant Psychiatrist at McLean Hospital, beginning September 22, 1961;
Dr. Nancy T. P. Nichols as Clinical and Research Fellow in Psychiatry for one year, beginning January 1;
Dr. Philip I. Salib as Assistant Resident in Orthopedic Surgery for one year, beginning January 1;
Dr. Robert H. Schapiro as Resident in Medicine for one year, beginning January 1;
Dr. Donald D. Sheffel as Clinical and Research Fellow in Neurosurgery for one year, beginning January 1;
Dr. William E. Strole, Jr. as Resident in Medicine for one year, beginning October 1;
Prof. George P. Wadsworth as Consultant in Mathematics to the Physics Research Laboratory;
Dr. Hibbard E. Williams as Resident in Medicine, for the period July 1, 1962 through December 31, 1962, and as Chief Resident in Medicine for one year, beginning January 1, 1963;
Dr. Nicholas T. Zervas as Clinical Assistant in Neurosurgery, beginning January 1;
Dr. Leonard Zinman as Assistant Resident in Urology, for a period of six months, beginning December 1, 1961;
Dr. Klaus A. Zuppinger as Clinical and Research Fellow in Medicine for one year, beginning July 1.

The Trustees also voted to appoint the following as Residents in Psychiatry at McLean Hospital, beginning July 1:

Dr. John Bachman
Dr. Guido Belsasso
Dr. Randolph Catlin, Jr.
Dr. Robert M. Chalfin
Dr. Jack Ellenberg
Dr. Robert W. Farkas
Dr. William H. Goodson, Jr.
Dr. Albert E. Herman
Dr. John B. Livingstone
Dr. Michael T. McGuire
Dr. Judith G. Ronat
Dr. Christopher Van A. Rowland, Jr.
Dr. Melvyn B. Schupack
Dr. Richard Sens
Dr. John S. Strauss
Dr. Olga S. Wermer
Dr. Emmett Wilson, Jr.
Dr. Jacob C. Wolterbeek

At their meetings on December 27, 1961, and January 3, 10, and 24, 1962, the General Executive Committee voted:

To promote:

Dr. Stanley P. Bohrer to the position of Resident in Radiology, beginning March 1;
Dr. A. Erik Gundersen to the position of First Assistant Resident in Surgery, beginning January 1;
Dr. James J. Pollard to the position of First Assistant Resident in Radiology, beginning January 1.

To reappoint:

Dr. Frederick W. Ackroyd as Second Assistant Resident in Surgery, beginning January 1;
Annemarie Closse, Ph.D. as Research Fellow in Biochemistry (Medicine), for the period February 1 through September 1;
Dr. Cesare G. Coletta as Clinical Fellow in Anesthesia, for the period November 1, 1961 through April 10, 1962.

To appoint:

Mr. John A. Stout as Research Fellow in Psychology in the Department of Psychiatry for one year, beginning December 1, 1961;
Dr. Ronald B. Wilcox as Research Fellow in Medicine for one year, beginning January 1.

At their May 10, 1961 meeting, the General Executive Committee voted to promote Albert H. Solway, Ph.D. from Assistant Chemist to Associate Chemist (Neurosurgery), for the three-year period beginning July 1, 1961. This vote was delayed in reaching the office of The News until the last week in January.

Seventy years ago the Vincent Club presented its first show for the benefit of the Vincent Memorial Hospital. The curtain was barely down on the final performance of last year's political spoof, "Winning Ways", before the Vincent Club was hard at work worrying about this year's Show. The location—New England Life Hall (formerly New England Mutual Hall)—and the dates—April 3 through 7—had already been decided upon. It had also been decided to keep the same producer, director, and orchestra.

During the past summer, various Vincent members worked on scripts. By November, one was settled upon, and the Show Committee moved into second speed, meeting with the director to discuss the book, music, scenery, and costumes, while the Script and Music Committees met weekly.

At the time of this writing, the advertising campaign is almost over, and the back office is beginning to pile up with proof from the advertisers. The Front of the House Committee is now being organized. "Front of the House" is our term for activity taking place in front of the footlights. The traditional lavender and yellow uniforms are being refreshed, and the chairmen of flowers, programs, and waitresses are meeting to discuss their mutual problems.

Once a week, during January and February, there were practice sessions in singing, dancing, and dialogue at the Club House. The membership patroness lists have been brought up to date and the envelopes have been hand-addressed, stuffed, sealed, stamped, and mailed, as has also the Show letter. The response to this mailing gives the Show Committee and the Front of the House a clue as to how many assistant or potential actresses are planning to help on this year's Show.

Rehearsals for the Show are now going on. "Hold Your Hats" will be a lighthearted satire on the Roaring '20's, complete with financial tycoons, speakeasies, cruises on luxury liners, adventures in Paris, a circus, and a football hero from Princeton. The original script was written by three talented and experienced Vincent members—Mrs. Samuel S. Drury, Mrs. Wallace Lincoln Pierce, and Mrs. Joseph T. Ryerson, Jr., with some provocative ideas contributed by Mrs. Charles B. Barnes.

The Ticket Committee is busy at the box office at New England Life Hall, 225 Clarendon Street, Boston. Tickets ranging in price from $1.25 to $6.00 will be available at the box office from March 19 through the date of the final performance of the Show on April 7. The box office will be open from 9:30 A.M. until 5:30 P.M. This year's box office telephone number is COmmonwealth 6-1740.

Dr. Howard Ulfelder, who has been identified since 1942 with teaching, research, and clinical activities concerned with gynecology at the Harvard Medical School, the Vincent Memorial Hospital, and the Massachusetts General Hospital, has been named the first Joe Vincent Meigs Professor of Gynecology at Harvard.

The Meigs Professorship, established by Harvard in 1955, was recently activated, following the successful completion of a campaign for $500,000. Funds were contributed by the friends, associates, and former patients of Dr. Meigs, who retired from Harvard in 1955 to become Clinical Professor of Gynecology, Emeritus.

Since 1955, Dr. Ulfelder has been Clinical Professor of Gynecology at the Harvard Medical School, Chief of Staff at the Vincent Memorial Hospital, and Chief of Gynecology at the Massachusetts General Hospital. He is Senior Surgeon at the Pondville Hospital.

Dr. Ulfelder's teaching responsibilities for the Harvard Medical School involve medical students in the second, third, and fourth years. Included is a course in gynecological diagnosis for second-year students, clinics and ambulatory clinic assignments for third-year students, and elective clerkships for fourth-year students. In addition, Dr. Ulfelder, with Dr. Francis M. Ingersoll, Assistant Clinical Professor of Gynecology at Harvard and Associate Visiting Surgeon at the Massachusetts General Hospital, is responsible, at the Vincent Memorial Hospital, for the annual organization of a postdoctoral course in gynecology under the Harvard Medical School's Courses for Graduates.

The Gynecology Service, under Dr. Ulfelder, is responsible for the care of patients with diseases in this area admitted to the Massachusetts General Hospital. Major emphasis is placed on the treatment of malignant disease of the uterus. An active research program is carried on at the Vincent Memorial Hospital in the field of pituitary and ovarian endocrine physiology. Dr. Ulfelder has contributed numerous articles to the scientific press.

Among the many scientific and professional organizations in which Dr. Ulfelder holds membership are the American Gynecological Society, American Surgical Association, and the Obstetrical Society of Boston (president, 1961).

Dr. Ulfelder was born of American parents in Mexico City, Mexico, on August 15, 1911. He received the A.B. degree in 1932 and the M.D. degree in 1936 from Harvard. During World War II he served from 1942 through 1945 in the U.S. Army Medical Corps as Chief of Surgical Service at the 55th General Hospital.

SOME FACTS ABOUT HONG KONG

Hong Kong is a British crown colony. It was ceded to Britain by China in 1841, and later, in 1860, when it included the Kowloon Peninsula. In 1898, an additional substantial stretch of the mainland, called New Territory, was leased to Great Britain by China for 99 years.

Hong Kong is situated on the southeast coast of China, at and near the mouth of the Pearl River—one of the three largest rivers in China. It is just inside the Torrid Zone, being less than 100 miles south of the Tropic of Cancer.

The city of Victoria, on Hong Kong Island, covers about 30 square miles, the peninsula of Kowloon is about 3 square miles, and the New Territory is roughly 365 square miles. Thus, the total area of Hong Kong is less than 400 square miles. The land is of low fertility, and granitic rocks practically cover the mountains and hills. The farm produce, composed mainly of rice and vegetables, is limited and is far from being sufficient.

According to the latest census, there are no less than 3 million people in Hong Kong. If all the land were available for habitation, there would be 7,500 people per square mile. Since most of Hong Kong is either rocky or hilly, one can well imagine how dense the population is along the coast and on the flatlands. Along the water fronts and among the foothills, thousands and thousands live together in small quarters. With the influx of refugees, some live even way up on the hilltops in a section called "squatters".

Of the three million or more in Hong Kong, about 99 percent are Chinese. Among the non-Chinese are the British, the Europeans, the Americans, and others. There are less than 3,000 Americans, most of whom are engaged in business, some in education, and others in the diplomatic service.

The Chinese in Hong Kong have come from all over China, plus quite a number from over seas. A most trying problem of language exists, as one can see; but, by and large, Cantonese is the predominant tongue. Thus, Cantonese is the spoken dialect in Hong Kong, while English is the official language in business transactions, etc.

The population in Hong Kong has not been stable, and I believe it will never be. There is the inherent problem of uncontrolled birthrate, as well as that of the influx of refugees. Roughly, we have about 120,000 babies born annually. This figure, minus the number of deaths each year (about 20,000), leaves us with an annual increase in population of 100,000. In addition, there is the continuous immigration of refugees from nearby countries—notably from the Chinese mainland. It is difficult, and probably never will be possible, to give an exact figure on these refugees, for most of them are smuggled into Hong Kong. The proximity of the Chinese mainland to the New Territory of Hong Kong is such that one can easily *swim* across the dividing line, which is a one-mile-wide stream.

Hong Kong has not produced enough rice and vegetables for her consumption because of the geographical limitations, therefore she has relied very much on imports from over seas. Most of the rice has come from southeast Asia and the Indochina area, most of the poultry and beef from all over the world—Australia, Japan, the U.S.A., and Europe. Our vegetable supply has been imported largely from the neighboring Chinese mainland. Fish, however, is one of the few foods that we have in plenty for most of the year—so much fish, in fact, that we are able to export it. The annual income from fishing alone is valued at round 60 million Hong Kong dollars, or 10 million U.S. dollars.

With regard to industry—Hong Kong has occupied a very important position in southeast Asia. In 1939 she had less than 1,000 factories, but in 1960 she had over 5,000 of many kinds. Besides shipping, textile, clothing, rubber, and plastic industries are the notable ones. There are also lighter industries, such as those for light metal products, electrical appliances, and electronic supplies. This growth in industrial activities is a very important stabilizing factor, for without it there would have been chaos, with thousands and thousands of unemployed.

With economic conditions as they are in Hong Kong, one cannot pass on without pointing out the importance of "tourism". Hong Kong is a very attractive spot, and is a "must" in your itinerary if you wish to see the world. We have had thousands and thousands of visitors in Hong Kong every year. The effect of this is both immediate and far-reaching; for, materially, the amount of money Hong Kong has made from the tourist business is enormous (so much so, there is no actual way of estimating it); and the morale of the local populace has thus been much enhanced with a sense of security because of the continuous presence of these visitors. Americans have done their very best in this respect. We have more American tourists than all the rest combined.

There are less than 1,000 western-trained registered medical doctors in Hong Kong, 400 dentists, 2,000 nurses, and 2,000 midwives. At first glance it would seem that the medical profession in Hong Kong would be taxed to its fullest possible ability to handle such a vast population. But this has not always proved to be the case, for there are many doctors who could have been more fortunate than they have been. Some have had to find jobs as ship surgeons. And there are many, many healthy people in Hong Kong who do not need western medicine.

In addition, the paradoxical situation is that not all the people there believe in western medicine, let alone surgery. The memory that the knife only cut, and rarely cured, still remains in the depths of many minds. Thus, there has been in effect for many, many years a most lucrative business for the local herbalist "physicians", the acupuncturists, the bone setters, and the so-called orthopedic specialists. How much damage this form of medical practice has done to the public will probably never be known. I have seen death from typhoid perforation, internal hemorrhages, and acute abdominal catastrophies so treated. On the other hand, it does alleviate the problem of shortage of doctors—though, I must admit, at a terrific price!

We have a number of large hospitals —some run by the government, others of private ownership. There is rarely the problem of securing a hospital bed and of admitting patients to the private hospitals, although the government hospitals are always filled. The total number of hospital beds is a little over 8,000, or 1.7 to each thousand of the estimated population.

We have about 1,700 schools for secondary education and one university, with about 20,000 teachers. Over half a million students are enrolled each year, yet not everyone can afford to go to a private school or be able to enter a public school because space is so limited. As a result, many children will not have the opportunity to secure an education. With the rapid population increase every year, there seems always to be a lag behind, no matter how many new schools are put up each year.

The university is a small but a fine one. It is staffed by an excellent faculty. Many of them are Chinese who have returned from abroad—chiefly from Great Britain. The entire pattern of teaching is British. The main problems lie, I believe, in money and manpower, both of which the schools badly need.

Chiu-an Wang, M.D.,
(*W.S.* 1944)

[At our request, Dr. Wang has given us a short addendum to the above article. It describes more fully the medical situation in Hong Kong. It will appear in our next issue.——*Editor*]

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

Arthritis

Ward, J., Cohen, A. S., and Bauer, W.
Acute suppurative arthritis.
Bull. Rheumat. Dis. 12:259, 1961.

General Medicine

Hardy, H. L.
Case 40-1961. Case records of the Massachusetts General Hospital. (Discussion)
New England J. Med. 264:1154, 1961.
Hardy, H. L.
Farmer's lung. (Editorial)
New England J. Med. 264:1313, 1961.

General Surgery

Grillo, H. C., and Gross, J.
Thermal reconstitution of collagen from solution and the response to its heterologous implantation.
J. Surg. Res. 2:69, 1962.
McDermott, W. V., Jr.
Upper gastrointestinal hemorrhage, the liver, the spleen, the gall bladder and biliary tract.
In Surgery—A concise guide to clinical practice, Nardi, G. L., and Zuidema, G. D., Editors, Boston, Mass., Little, Brown & Co., 1961, chap. 17.
McDermott, W. V., Jr., Henneman, D. H., and Laumont, C.
Biochemical changes associated with the administration of glutamic acid and arginine to patients with hyperammoniemia.
J. Surg. Res. 1:307, 1961.
Phillips, A. W., and Cope, O.
Burn therapy. II. The revelation of respiratory tract damage as a principal killer of the burned patient.
Ann. Surg. 155:1, 1962.

Neurology

Brown, M. R.
Prosper Menière.
J.A.M.A. 179:62, 1962.

Orthopedic Surgery

Florence, D. W., and Caplan, M. A.
Orthopaedic stroller chair: An aid in the treatment of congenital dislocation of the hip.
J. Bone & Joint Surg. 43-A:1243, 1961.

This is the last issue of The News in which 1961 titles will appear.

* * *

Dr. Richard P. Stetson, President of the Medical Foundation, has announced a three-year fellowship for basic research to Dr. Robert G. Ojemann. Dr. Ojemann is an Assistant in Neurosurgery at the Massachusetts General Hospital and an Assistant in Surgery at the Harvard Medical School. The Medical Foundation, a United Fund Agency, supports young investigators in basic research through fellowships.

Dr. Ojemann is particularly concerned with two areas of investigation. The first is the study of some aspects of cerebral vascular disease—a disease of the blood vessels of the brain. His investigation of this problem will include the measurement of blood flow in the arteries of the neck which supply the brain. A new electromagnetic instrument will be used for this purpose. This should help to improve the treatment of certain diseases where hardening of the arteries causes obstruction of these vessels, and in other instances where the arteries in the neck are deliberately closed off to reduce the pressure after bleeding from a weak artery in the brain.

His second area of investigation is in exploring the possible use of special forms of radiation treatment for brain tumors. By using the giant nuclear reactor at Massachusetts Institute of Technology, radioactive isotopes with a very short half life (less than three hours) can be produced. The possibility of injecting the isotope into a separate circulation involving the vessels of the neck and head with a pump oxygenator may allow a high concentration of the isotope to be maintained in the area of a brain tumor. Because of the short half life, most of the radiation effect will take place during the circulation and the isotope which does escape into the general body will rapidly decay. Dr. Ojemann is also assisting Dr. William H. Sweet, Chief of the Neurosurgery Service at Massachusetts General Hospital and Associate Professor of Surgery at the Harvard Medical School, in developing other applications for the M.I.T. reactor in its use of the neutron beam for destroying tumor cells in the brain.

Dr. Ojemann graduated from the State University of Iowa in 1951, and from the College of Medicine, State University of Iowa in 1955, where he ranked first in his class.

VOLUNTEER GROUPS

MGH Service League

On February 7, the Massachusetts General Hospital Service League (formerly the MGH Staff Wives) gave a luncheon at the Harvard Club. Guest speaker at the luncheon was Mrs. Isabella Halsted, Executive Director of the Boston Council for International Visitors. Her subject was "Boston's international opportunities".

The Boston Council for International Visitors was incorporated last spring as a result of the experience of a number of educational, industrial, and civic organizations in this area which were concerned with the large numbers of our international visitors. Finding that the interests of these visitors frequently extended beyond the facilities of any one member organization, they established an office at 55 Mount Vernon Street, Boston, to serve as a clearing house for visitors' affairs. The Massachusetts General Hospital is one of 23 sponsoring organizations of the Boston Council for International Visitors.

Chairman for the luncheon was Mrs. Farahe Maloof of Milton. Serving on her committee were Mrs. Stephen M. Krane, Mrs. Lewis W. Kane, and Mrs. Walter S. Kerr, Jr. of Milton, Mrs. Alfred L. Weber of Quincy, Mrs. Francis G. Barnum, Jr. of Brookline, Mrs. George L. Nardi and Mrs. Richard H. Wohl of Belmont, Mrs. Stuart Fell of Boston, and Mrs. Alexander Leaf of Winchester.

Distaff Club

On Valentine's Day the Club gave a party for the children in Burnham, which included refreshments, motion pictures, and other entertainment.

Husbands, as well as Club members, were invited recently to a lecture on "The fakes in art", given at the Boston Museum of Fine Arts.

We look forward to a joint meeting with other Boston hospital Wives Associations some time in March.

Fabian Bachrach

DR. KURT J. ISSELBACHER, ASSISTANT PHYSICIAN—CHIEF OF THE GASTROINTESTINAL UNIT

BIOGLETS

Dr. Hugh P. Chandler, Assistant Resident in Orthopedic Surgery — born in Boston, Massachusetts, June 15, 1931; A.B., Harvard College, 1954; M.D., Harvard Medical School, 1958; Intern in Surgery, University of California at Los Angeles Medical Center, Los Angeles, California, 1958-59; Assistant Resident in General Surgery, U.C.L.A., 1959-60; Assistant Resident in Orthopedic Surgery, Children's Medical Center, Boston, Massachusetts, 1960-61.

Dr. Thomas R. Hakala, Intern in Surgery — born in Sault Sainte Marie, Michigan, June 15, 1936; A.B., Stanford University, 1958; M.D., Harvard Medical School, 1961; home address: 1003 North I Street, Aberdeen, Wash.

Dr. Newton E. Hyslop, Jr., Intern in Medicine — born in Newton, Massachusetts, October 14, 1935; Dummer Academy, 1953; A.B., Harvard College, 1957; M.D., Harvard Medical School, 1961; married; one child.

Dr. John N. Loeb, Intern in Medicine — born in New York City, December 17, 1935; Phillips Exeter Academy, 1953; A.B., Harvard College, 1957; M.D., Harvard Medical School, 1961.

Dr. S. Michael Marcy, Intern on the Children's Service — born in Berlin, Germany, October 25, 1936; B.A., Pomona College, Claremont, California, 1957; M.D., University of Pennsylvania Medical School, 1961; single.

Dr. Roger H. Morris, Assistant Resident in Anesthesia — born in Albuquerque, New Mexico, August 9, 1931; A.B., Harvard College, 1953; M.D., Harvard Medical School, 1957; Intern in Medicine, Stanford University Hospitals, San Francisco, California, 1957-58; military service: Lieutenant, Medical Corps, U.S. Navy, 1 year in Japan, 2 years at the Philadelphia Naval Shipyard, 1958-61; married; two daughters.

* * *

Brief bits:

In late November 1961, Dr. and Mrs. William V. McDermott, Jr. traveled to Buenos Aires, where Dr. McDermott was an invited guest speaker at the Sixth Argentine Congress of Gastroenterology, together with Professor Marion, from France, and Dr. Lester Dragstedt. Following the conclusion of the Congress at Mar del Plata, Dr. McDermott spent a week at the University and various hospitals in Buenos Aires, where the activities consisted of the usual succession of lectures, rounds, conferences, etc.

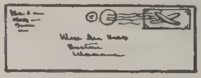
Dr. Peter Schuntermann has informed us that his promotion to the position of Assistant Resident on the Children's Service was rescinded because of his decision to accept an appointment as Assistant Resident in Child Psychiatry at Duke University.

Dr. Byron H. Waksman was invited to give an address on "Experimental aspects of the autoimmune mechanism" before the 20th Annual Meeting of the American Academy of Dermatology and Syphilology. He was also invited to participate in a discussion of "Mechanisms of hypersensitivity in CNS" at the Conference on "Underlying mechanisms of demyelination", held at the UCLA Medical Center, January 30 through February 1.

Dr. Edward W. Webster of our Department of Radiology has been appointed a special consultant to the Division of Radiological Health of the U.S. Public Health Service.

New addresses:

Dr. M. Henry Clifford (a.r.p. 1935), Veterans Administration Hospital, Rutland Heights, Mass.
Dr. John L. Fromer (clin. assoc. *D.*), 66 Arnold Rd., Wellesley, Mass.
Dr. John W. Josse (*M.* 1957), Johns Hopkins University School of Medicine, Baltimore 9, Md.
Dr. David M. Klein (r.s. *N.S.* 1961), Edward J. Meyer Memorial Hospital, Buffalo, N. Y.
Dr. Alfred E. Miller (*S.* 1957), University Health Service, Harvard College, Cambridge, Mass.
Dr. William A. Perkins (*E.S.* 1917), 3001 Benvenue Ave., Berkeley 5, Calif.
Dr. Harold N. Segall (a. *M.* 1924), 5845 Cote des Neiges Rd., Montreal, Canada
Dr. William E. Wilson (sr. r.s. *Or.* 1961), 4460 Sherbrooke St., West, Montreal, Canada



This letter has come from Mr. John B. Rideout, R.N., who resigned his position as Administrative Assistant to Mr. Joseph W. Degen on July 31 to become Director of Nurses at Danvers State Hospital:

The latest issue of THE NEWS arrived today and I am pleased that you thought to send it.

I never fully realized the amount of work that goes into the publication of this periodical, nor the amount of material that is in it. . . .

I have had one visitor from Massachusetts General already. Mr. Gladwin stopped in a few weeks ago and brought me up to date on some of the happenings there since I left.

I thoroughly enjoy my work and have a good staff of supervisory personnel to help me. In all, there are approximately 500 nursing personnel and 40 ward areas. We have a modern operating suite of 2 rooms and central supply unit, in a new Medical Building.

Recently, Dr. Peter Sifneos and Dr. John Lamont, from your Psychiatry Department, gave the first lectures of a series to our nursing and medical staffs. We are looking forward to a continuing relationship with the Massachusetts General Hospital in this regard.

We provide a 12-week affiliation in Psychiatric Nursing for 6 hospitals and we average from 30 to 40 students in each group. Our nursing education staff is very active in conducting the various programs necessary to keep our personnel up to date.

Please extend my best regards to all at M.G.H., and tell them to stop in when they are in this area. Danvers State Hospital is located at the junction of Routes 1 and 62.

The News

No. 212 Boston, Mass. April 1962

To all members
of the M.G.H. family:

It is easy to greet one's friends and acquaintances, and certainly we are no strangers. As I sat and pondered the form of my greeting, I thought to myself, how can I best convey what I feel and what I know the Staff and employees of the M.G.H. feel as they come to work each day. Is it pride in the age of the Hospital and its now almost traditional pre-eminence? Is it the spirit and environment of *caring* that makes us feel that we perhaps are *giving* something to humanity and to each other as well as receiving something? Is it that we are all united in a common goal, the best possible care of and care for the sick, that makes us feel the strength and support we derive from each other? Is it that each one of us as individuals feels he is directly contributing to the care of the patient and the excellence of the Hospital, be he housekeeper, messenger, photographer, administrator, accountant, practicing physician, research worker, nurse, pharmacist, dietician, or librarian? It is all these things and more. The strength of any institution is determined by the character of the people within its walls. The M.G.H. is 151 years old and has a vigorous look about it — because all its employees and Staff feel that they individually play a crucial role and do a crucial job which only they can do — and what they do contributes directly to the most humane of all human pursuits, the care of the sick. I salute you all for the part you play — you are the institution.

All of us value our roles in the Hospital and the part we may play in maintaining its excellence and pre-eminence as one of the oldest institutions in the country devoted to the preservation and restoration of human life and the relief of suffering. Is there a better way to spend one's life or a better place to spend it?

My best wishes to you all.

John H. Knowles, M.D.,
General Director
and *Associate Physician*

* * *

THE CARDIAC CLINICS AND LABORATORY ✓

In an earlier report to The News (1950), the origin and evolution of cardiology and of the Cardiac Unit at the Massachusetts General Hospital were reviewed in some detail. This is one of the oldest of the special groups at the Hospital, dating back to the establishment of the Cardiac Laboratory by Dr. Paul D. White more than forty years ago. In the ensuing decades this laboratory has served as a focal point, not only for electrocardiography but also for clinical research and for the training of physicians from this country and abroad. The chief function of the unit and its strongest forte remain in the field of clinical cardiology, with emphasis on the long-term study of patients, on the application of new methods and techniques, and on the development with our surgical colleagues of a conservative program for the relief of cardiovascular deformities.

The special clinics (Adult, Children's, and Rheumatic Fever), as well as private patients, have served through the years as a reservoir of material of great value in teaching and research. From studies conducted therein there has accrued a wealth of information now available to present-day investigators as a legacy from their medical predecessors. Of special note are the long-term series of Robert S. Palmer (hypertension), of Paul D. White (coronary disease), and of Edward F. Bland and the late T. Duckett Jones (rheumatic fever) conducted both at the House of the Good Samaritan and at the M.G.H. This last study now encompasses a thirty-year follow-up of 1,000 children and is approaching its conclusion and final report.

During the decade since our previous report on this unit the number of new units which have been established at the Hospital for the study of special aspects of cardiovascular disease attests to the mounting complexity of cardiac research and the need for special disciplines to acquire more precise information concerning the basic factors which contribute to the Number 1 health hazard of our age — cardiovascular disease.

In contemplating the future and the formidable challenge of the present-day problems of atherosclerosis and of hypertension, one may take heart from the truly remarkable progress of the past two decades, both in the prevention and in the control of other types of heart disease. For example, as recently as 1941 rheumatic fever was still a very prevalent and an often-fatal illness in children and adolescents by injury to the heart. Bacterial endocarditis was a frequent and a uniformly fatal complication of scarred valves and congenital defects. Furthermore, at that time only a few operations were available for the simpler congenital defects, and no surgical relief could be offered those with acquired valvular disease. Electrocardiography and X-ray were the only special methods of study commonly employed.

In 1942 the introduction of penicillin (and subsequently of other antibiotics) changed dramatically the rheumatic fever picture from a violent and frequently fatal disease to one of a milder nature, shorter duration, and with consequently much less risk of serious injury to the heart. A recent report from this Hospital and the House of the Good Samaritan (1959) pointed out that an eight-fold reduction in mortality has occurred. Likewise, bacterial endocarditis can now be cured in 75 to 80 percent of instances.

In the single decade since 1950 operations on the heart have become commonplace procedures and new techniques are being developed each year. The extraordinary advances in blood replacement, in electrolyte control, in anesthesia techniques, in monitoring and maintaining by electrical stimulation faltering hearts, and, in particular, in the development of pump oxygenators now permit open-heart operations of one or more hours' duration. Thus, the majority of congenital defects are now amenable to surgery, and even the badly scarred and often calcified valves of adults, a heritage of childhood rheumatism, are being successfully repaired and in some instances actually replaced. Our oldest patient to date who has undergone an open-heart procedure is a lady of seventy-five with a severely calcified aortic valve, who, six months ago, was successfully relieved of her near-fatal symptoms of pain (angina pectoris), fainting, and heart failure.

This brief reference to recent progress in clinical cardiology leads to a consideration of the current activities of the Cardiac Unit and future plans.

The Cardiac Laboratory

The chief function of the laboratory, from the point of view of the Hospital, is its responsibility for the taking and the interpretation of electrocardiograms for all divisions of the institution and for members of the staff who request this service. Actually, however, the laboratory has played a far more significant role in the life of the Hospital than its day-to-day responsibility implies. It has served as the spiritual and functional headquarters for a nucleus of staff physicians, beginning with Dr. Paul D. White and followed by a host of his associates and disciples, who, in this country and abroad, have achieved for cardiology a top priority as one of the chief specialties of our time.

Along with its broader role in research and teaching, the laboratory continues to operate for the Hospital as a service unit, to an extent clearly indicated by the phenomenal increase in the number of electrocardiograms in recent years, as shown by the following tabulation:

Number of electrocardiograms

1921 — 1,406
1931 — 2,220
1941 — 6,120
1951 — 7,041
1961 — 18,257

This increase in the past ten years has been at a steady rate of about 1,000 tracings per year, of which 60 percent are from the general services and 40 percent from the private floors. Eight technicians perform the taking and processing of these records, and five members of the professional staff and the clinical trainees are responsible for the interpretations. Thus, the daily load ranges from 70 to 100 tracings, all of which are processed, photostated, interpreted, and made available for the staff by 7 P.M. or earlier on the day they are taken. Our top record to date is 122 tracings on February 12, 1962.

Since 1955 vectorcardiography has been employed at the Hospital as a research tool and teaching aid. Dr. Conger Williams has been our specialist in this field and, with the help of graduate students and trainees, he has studied certain atypical patterns of myocardial infarction which he and Dr. Donald McCaughan reported at the meeting of the American Heart Association last fall. Under the special circumstances of "atypical" infarction, and also in the determination of ventricular hypertrophy, vectors, in addition to the usual electrocardiogram, are of considerable value. Hence, they are made available in limited numbers to the staff as an aid in difficult cases.

Cardiac catheterization

In 1928, Forssmann in Germany first catheterized the human heart (his own) and for this feat he shared, somewhat belatedly, the Nobel prize with Richards and Cournand in 1956. His description of the event follows:

> Following the successful investigations in the cadaver I undertook the first study in living man in the form of a *research on myself.* Next I arranged in a preliminary test to have my right elbow punctured with a thick needle by a colleague who kindly placed himself at my disposition for this purpose. I introduced then, as in the case of the researches on the cadaver, a well-oiled ureteral catheter of 4 Charrières thickness through a cannula into the vein. The catheter allowed itself to be introduced very easily to a length of 35 cm. Since going further seemed too dangerous to the colleague we stopped the investigation at that point even though I myself felt quite well. After a week I undertook a further investigation alone. Since a puncture of the vein with a thick needle on my own body was technically too difficult, I made under local anesthesia a venesection in my left elbow and introduced the catheter without any resistance in its whole extent of 65 cm. This length appeared to me, after measuring the surface of the body, to agree with the distance from the left elbow to the heart. On introduction of the catheter I had, during the procedure, merely a feeling of slight warmth in the wall of the vein similar to the sensation after intravenous injection of calcium chloride. On backward movement the catheter touched the upper and lower wall of the subclavian vein. I then felt an especially intensive warmth behind the collarbone under the insertion of the sternocleidomastoid. Simultaneously, doubtless through the stimulation of the vagus branches, I felt a slight tendency to cough.
>
> *The position of the catheter* I confirmed *in a Röntgen photograph* and observed the shadow of the catheter itself by means of a mirror held by a sister before the fluoroscopic screen.

(Translation by P. D. White in *Heart disease,* 4th edition, page 227, New York, The Macmillan Company, 1951.)

For a number of years this was considered too bold and dangerous a procedure for clinical use and actually it was not employed at the M.G.H. until 1945. Certain circumstances of World War II were significant in its introduction here and, lest the details be forgotten, I have asked Dr. William C. Bridges (now of Seattle, Washington) to relate for the record his remembrance of this event. Dr. Bridges writes as follows:

> I shall do my best to recall my early experiences with cardiac catheterization at the M.G.H.
>
> In 1945, I was privileged to work with Drs. White and Mandel Cohen on the O.S.R.D. project studying neurocirculatory asthenia. Dr. White had a few soldiers suffering from "combat fatigue" flown back from the Battle of the Bulge for us to investigate. In carrying out this study, the question arose as to the best method of computing their cardiac output. Dr. Cohen felt the best way to clarify this would be to combine the Fick principle with right heart catheterization. In the previous year, I had been a guinea pig in New York, before my sympathectomy, when I had my own cardiac output estimated. Perhaps on this account I was elected to help on the project. I made a trip down to Bellevue where Drs. Richards and Cournand most graciously permitted me to observe a catheterization. Dr. Cournand was good enough to give me a large cannula through which the catheter was threaded in those days, and a Lindamen needle for the arterial sample. The room next to Ed Wheeler's office downstairs was outfitted for the procedure. Dr. Robbins supplied the necessary x-ray equipment which consisted of a portable machine with which we could watch the course of the catheter and take pictures to verify its location. Although there were many problems, Dr. White was always anxious to help and without his wonderfully kind, enthusiastic way, I am sure it would not have succeeded.
>
> In those days, pressures were measured by a Hamilton manometer, such a temperamental instrument that we confined our observations to the cardiac output alone. I believe Dr. Cohen and I catheterized about three soldiers with this equipment. The catheter was threaded only to the right atrium and that is probably why we did not encounter any worrisome arrhythmias.
>
> After the project was finished, we lacked a technician to perform the gas analyses. Dr. Carl Josephson from Denver worked hard trying to master the Van Slyke technique for doing this and was very helpful in keeping the team together. Dr. Lewis Dexter also frequently lent his valuable ear to our problems. Altogether we catheterized about six patients and without any complications, I am happy to report. At about this time, 1947, Dr. Gordon Myers was back from the war and was chosen to continue the catheterization work. I need not mention the many improvements he achieved but it was very satisfying to me to see the work continued by one as competent as he.

Thus was instituted at the M.G.H. a technique which has now become an essential tool to cardiologists and their surgical colleagues. It has been responsible for a better understanding of the mechanics of the circulation, especially through the lungs, and is a necessary adjunct in the selection of the majority of patients for cardiac surgery.

Dr. Myers was soon joined by Dr. Allan L. Friedlich, and, in collaboration with Dr. J. Gordon Scannell (Surgery) and Dr. Stanley M. Wyman (Radiology), they have constituted the catheterization team. A special laboratory was constructed in 1949 through the efforts of Dr. White and the generosity of the late Mrs. Theodore E. Brown for this and related research. However, during the past few years the laboratory facilities have become outmoded and the program has been increasingly hampered by lack of space and of personnel to keep abreast of the mounting demands for this special service. Currently there is often a backlog of patients of two or more months awaiting study. This has become even more pressing this past year with the return of Dr. W. Hardy Hendren (Pediatric Surgery) and the consequent number of infants and children with congenital defects often requiring early and sometimes emergency study (catheterization) and operation.

Fortunately, relief is in sight as to space and also a respite is in store for Drs. Myers and Friedlich, who have carried the brunt of this load voluntarily and as their contribution to the Hospital and its cardiac-surgical program. In July 1962, Dr. Charles A. Sanders, who shared in this work in 1958-1960, will return from his service with the Air Force to become the full-time director of this activity and head a new, to-be-constructed catheter laboratory.

The training program

The activity of the unit continues to place special emphasis on the research and clinical fellows who function as cardiac "residents". In this role currently are Dr. Andrew Huvos, Dr. Daniel Allensworth, and Dr. William Bush. Dr. Roman DeSanctis continues as our senior (second-year) fellow, and Dr. Donald McCaughan for a second year is assisting with the vector program.

During the sixteen years of its existence, 231 physicians from the following countries have trained here in the eight months' graduate course, in recent years under the supervision of Dr. Edwin O. Wheeler:

UNITED STATES (113)
CANADA (21)
CENTRAL AMERICA and WEST INDIES (17)
    Costa Rica
    Cuba
    El Salvador
    Guatemala
    Haiti
    Jamaica
    Mexico
    Panama
    Puerto Rico
SOUTH AMERICA (10)
    Argentina
    Bolivia
    Brazil
    Chile
    Colombia
    Venezuela
EUROPE (25)
    Austria
    Belgium
    England
    France
    Germany
    Greece
    Iceland
    Ireland
    Italy
    Poland
    Turkey
MIDDLE EAST (5)
    Iraq
    Jordan
    Lebanon
    Syria
    (Turkey)
AFRICA (5)
    Egypt
    South Africa
FAR EAST (35)
    China
    India
    Indonesia
    Japan
    Korea
    Malaya
    New Zealand
    Pakistan
    Philippines
    Taiwan
    Thailand

In many respects this program has been a unique and a notable contribution to cardiology and, perhaps even more important, to the furtherance of international good will.

Related activities

The creation by an act of Congress in 1948 of the National Heart Institute has led to a succession of significant consequences to the M.G.H. Unhappily, however, it deprived the Cardiac Unit of the services, although not the inspiration, of Dr. Paul D. White, who felt obliged to relinquish his duties here in order to accept the responsibilities of Executive Director of the National Advisory Heart Council and Chief Consultant of the National Heart Institute through its formative years. The wisdom of his decision has been borne out by the impetus and the support which this program has provided cardiovascular research at national and international levels.

As a direct result of this new interest of the Federal Government in heart disease the Hospital received in 1949 a construction grant of nearly a half million dollars to assist with the new Research Building, and also with it acquired an obligation to promote and extend basic research in cardiovascular diseases. This led to the establishment of the Atherosclerosis Unit, under Dr. Ivan D. Frantz, Jr. until his acceptance of a full-time post at the University of Minnesota. This unit is now under the direction of Dr. Frederick T. Hatch, where he and his collaborators are studying the formation and breakdown of lipoproteins — substances suspected of playing a role in atherosclerosis.

Likewise, another special unit directly related to circulatory disorders was established as the Cardiorenal Unit under Dr. Alexander Leaf, where he and Dr. Howard S. Frazier are studying the mechanisms involved in the transport of fluids and electrolytes across cell membranes.

Finally, a third special unit under Dr. Lot B. Page in hypertension is carrying on the clinical studies initiated by Dr. Palmer in 1928, as well as an investigative program of unilateral renal disease in the causation of high blood pressure and of the role of the catechol amines in hypertension.

Thus, the stake of the M.G.H. in the total field of cardiovascular disease has mounted sharply during the past ten years. It is of impressive proportions and its importance is further emphasized by the creation at the Hospital last year of a Cardiovascular Research Center through a grant from the U.S.P.H.S. for the furtherance of research, for the training of investigators, and for the welfare of patients.

These exciting events augur well for the future, but new techniques and multiple disciplines will be required if the enigmas of atherosclerosis and hypertension are to be solved and if the nation's Number 1 health hazard is to be curbed for the next generation.

Edward F. Bland, M.D.,
Consulting Visiting Physician

The Board of Trustees, at their meetings on February 2 and 16, voted:

To change the title of Dr. Bruce W. Fischberg from Resident in Psychiatry to Clinical Fellow in Psychiatry at McLean Hospital, effective January 1;

To grant leave of absence to Dr. Leo T. Kelly, Assistant in Anesthesia, because of service in the Armed Forces.

To promote:

Dr. Paul R. Dinsmore from Clinical Fellow in Psychiatry to Assistant Psychiatrist at McLean Hospital, effective July 1;
Dr. Suzanne R. van Amerongen from Assistant Attending Psychiatrist to Associate Attending Psychiatrist at McLean Hospital, effective February 16.

To appoint:

Dr. George E. Battit as Assistant in Anesthesia, beginning February 16;
Dr. Jack Braunwald as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Edward D. Churchill to the Board of Consultation, effective July 1;
Dr. Roman W. DeSanctis as Clinical Assistant in Medicine at McLean Hospital, effective January 1;
Dr. Larry J. Embree as Assistant Resident in Neurology, for the period February 1 through June 30;
Dr. David S. Feingold as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Sumner Frank as Clinical Fellow in Medicine, beginning January 1;
Dr. Andrew G. Frantz as Assistant in Medicine, beginning February 1;
Dr. John W. Harthorne as Clinical and Research Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1:
Dr. Peter B. Jenney as Assistant Psychiatrist at McLean Hospital, effective August 15;
Dr. Mark M. Kartchner as Second Assistant Resident in Surgery, beginning February 1;
Dr. Gabriel T. Koroxenidis as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;
Dr. Arthur S. Kunin as Clinical and Research Fellow in Medicine, beginning March 1;
Dr. Ruth M. Landolt as Research Fellow in Neuropathology at McLean Hospital, effective January 1;
Dr. Norman D. Levine as Clinical and Research Fellow in Radiology, beginning September 1;
Dr. John G. Morgan as Clinical Fellow in Anesthesia, beginning May 1;
Dr. Paul A. Rudnick as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Theodore Sack as Assistant Attending Psychiatrist at McLean Hospital, effective February 1;
Dr. Roberto F. Santos as Visiting Fellow in Medicine for one year, beginning November 1, 1961;
Dr. Eugen Schmid as Clinical Fellow in Medicine for one year, beginning July 1;
Dr. William E. Strole, Jr. as Clinical and Research Fellow in Medicine and to grant him a Dalton Scholarship of $1250 for a period of three months, beginning July 1;
Dr. Louis Weinstein as Associate Physician for one year, beginning January 1.

At their meetings on January 31 and February 14, the General Executive Committee voted:

To extend the appointment of:

Dr. Yuji Miyazaki as Clinical and Research Fellow in Neurosurgery from September 1, 1961 through November 30, 1962.

To reappoint:

Arthur B. Callahan, Ph.D. as Research Fellow in Physics (Medicine) for one year, beginning March 1;
Dr. Anne Wight Phillips as Clinical and Research Fellow in Surgery for one year, beginning January 1.

To appoint:

Mr. Stephen Lorch as Assistant in Mathematic (Psychiatry), effective December 1, 1961;
Dr. Michio Sakanoue as Research Fellow in Neurosurgery for one year, beginning February 1;
Olga Sears, M.A. as Research Fellow in Psychology, beginning February 1.

* * *

THE NEUROLOGY RESEARCH LABORATORY

The Neurology Research Laboratory, now located on the third floor of the Warren Building, has grown up about the study of a single disease, experimental auto-allergic encephalomyelitis — a demyelinative process produced by sensitizing experimental animals against their own nervous tissue and apparently comparable to post-rabies vaccination encephalomyelitis in man. Because this laboratory disease shows certain resemblances to multiple sclerosis and to post-infectious encephalomyelitis, it is of great interest to neuropathologists. It is of equal interest to immunologists because it was the first of the experimental "auto-allergies" to be carefully studied.

The late Dr. L. Raymond Morrison, working in the department of Dr. Stanley Cobb, in 1947 described the production of allergic encephalomyelitis in rabbits. In 1949 he asked Dr. Byron H. Waksman, who had been trained as an immunologist under Heidelberger at Columbia, to join him in the study of this disease. After Dr. Morrison's untimely death in 1950, the study was continued by Waksman under the aegis of Dr. Cobb. When Dr. Raymond D. Adams became the head of the Neuropathology group, he gave this work strong support and has been a major participant in many of the studies carried on over the past twelve years.

From our early investigation of allergic encephalomyelitis, several major lines of research developed. First is the deeper study of the disease itself as an immunologic process. Evidence has been gathered to show that it is a "delayed" hypersensitive reaction comparable to a tuberculin reaction occurring in the nervous system. Investigation of its pathogenetic mechanism (by techniques discussed below) has shown that the lesion is produced by "sensitized" lymphoid cells coming from the circulation and begins with accumulation and proliferation of these cells around veins. Myelin destruction appears to be produced by direct action of the invading cells and not to involve humoral antibody. A collaborative study with Dr. Jordi Folch-Pi and his co-workers at the McLean Hospital, directed at isolating and characterizing the antigenic substance of nervous tissue responsible for the production of allergic encephalomyelitis, has shown that the antigen is probably proteolipid — a lipid-protein complex of the type first described by Folch-Pi and his collaborators. It is only recently, within the last two or three years, that medical scientists have begun to accept the possibility that inflammatory lesions of the auto-immune type may be produced by a cellular mechanism. It was our study of allergic encephalomyelitis, more than ten years ago, which gave the first impetus to this line of investigation in relation to the experimental auto-allergies and to the human diseases which they appear to resemble.

Secondly, the laboratory has concerned

itself with the investigation of related neuropathological problems, especially those concerned with myelin and processes in which myelin is destroyed. One of these is diphtheritic polyneuritis. Our first study showed that this disease is not an allergic process, as many people believed, but a primary toxic effect of diphtheria toxin on myelin-forming cells. In later investigations, the effect of toxin on Schwann cell metabolism (a joint study with Guido Majno and Manfred Karnovsky of the Departments of Pathology and Biochemistry at Harvard Medical School) and the ultrastructural changes in involved nerve (with Dr. Henry deF. Webster of our own department) were examined in detail. Another study was concerned with the blood-nerve barrier, which we described for the first time and were able to relate to the distribution of veins in the peripheral nervous system. A careful histologic investigation of primary white matter lesions produced by viruses showed these to be quite distinct from the allergic encephalomyelitis lesion and from the lesions of human demyelinative disease, but rather to be comparable to subacute sclerosing leukoencephalitis and progressive multifocal leukoencephalopathy in man. Similarly, neurotropic measles virus was shown to produce primary disease of grey matter and ependyma, quite unlike allergic encephalomyelitis on the one hand and post-measles encephalitis in man on the other. This group of studies has been of particular value in correcting the widely-held view that demyelinative lesions in multiple sclerosis, post-infectious and post-vaccinal encephalomyelitis and neuritis, and acute hemorrhagic necrotizing encephalitis must be the result of a direct attack of some agent on myelin. We have shown that viral or toxic processes in which there is such a direct attack are non-inflammatory and that conversely, in experimental inflammatory disease resembling these human processes, demyelination occurs as a secondary effect following the invasion of nervous tissue by sensitized mononuclear cells.

A third major line of investigation involved the study of other auto-allergies comparable to allergic encephalomyelitis. Needless to say, this has become a very popular field in the last few years. By now, experimental auto-allergic processes have been described which affect the CNS, PNS, lens, uvea, thyroid, testis, adrenal, kidney, skin, and gastric mucosa. In 1955 Waksman and Adams described the disease now known as experimental allergic neuritis, which provides the only available animal model for the Guillain-Barré type of polyneuritis in man. These authors also carried out a detailed histologic study of experimental allergic orchitis. At present several members of our group, in collaboration with Dr. Martin H. Flax of the Pathology Service, are engaged in active study of experimental allergic thyroiditis. One of our principal concerns has been to show that the various experimental auto-allergies described hitherto, when examined from the histologic and immunologic standpoint, represent the same basic lesion occurring in different tissues. We have reported successful passive transfer experiments of allergic encephalomyelitis and neuritis, and more recently, with the collaboration of Dr. Derrick Felix-Davies, from the Department of Medicine, of allergic thyroiditis. We have demonstrated that the vascular bed and blood-tissue barriers play a role in other auto-allergies comparable to that described in the central and peripheral nervous systems, and have shown that both allergic encephalomyelitis and thyroiditis can be prevented by appropriate pretreatment with the tissue antigen, perhaps on the basis of some type of "immunologic tolerance". While our major purpose has been to seek underlying principles of lesion formation in different disease states, a major effect of our studies has been to counteract the fragmentation of knowledge resulting from study of one experimental disease entity by neuropathologists, a second by thyroid specialists, and a third by ophthalmologists. We have, with the use of histologic, immunologic, and radioautographic methods, succeeded in establishing not only the probable unity of mechanism in different experimental auto-allergies, but also their essential identity with other delayed hypersensitive reactions.

A fourth line of investigation has been concerned with the arthritis produced in rats following a single injection of mycobacterial adjuvant. This disease is one of the best models described hitherto for rheumatoid arthritis and its congeners, and it seemed possible at first that it might be auto-allergic in character. The evidence obtained suggests that it is, in fact, an immunologic process, probably of the "delayed" type, but that the antigen is derived from the injected mycobacteria rather than from a tissue constituent. In addition to the arthritis, diseased animals were found to have nodular lesions on bare skin surfaces (i.e., ears and tail), exanthematous rashes, dermatitis comparable to keratodermia blennorrhagica, iridocyclitis, balanitis and urethritis, and diarrhea. The process was felt to resemble Reiter's syndrome more than rheumatoid arthritis. Much of the work with this disease was carried on in collaboration with Dr. Carl M. Pearson (a.r.p. *Path.* 1948) of U.C.L.A., who first described it, later with Dr. S. J. Bullington of the Retina Foundation, and still more recently with Dr. Flax.

A final major line of investigation has been a more profound study of "delayed" allergies in general. The basic histologic lesion of various delayed reactions (among them the tuberculin reaction, the delayed reaction to purified protein, the reaction of contact allergy, the rejection of solid vascularized skin homografts, and the various auto-allergies) was shown to be essentially constant: the perivenous accumulation of mononuclear cells. Suppression of the level of circulating lymphocytes by injection of an anti-lymphocyte antiserum was found to abolish various types of delayed response. More recently, with the use of tritiated thymidine and radioautography, it has been possible to show, in both allergic encephalomyelitis and thyroiditis, as well as in simpler delayed reactions such as tuberculin reaction, that the infiltrating cells are largely or entirely hematogenous and that they proliferate actively at the site of the lesions. The work with thymidine has been carried on largely by Dr. Timo U. Kosunen (our Finnish collaborator), together with various members of our research group. It was shown in an earlier study with Mrs. Matoltsy that mononuclear cells from tuberculin-sensitized animals, when exposed under suitable test conditions to tuberculin in a tissue culture system, show signs of stimulation and proliferation which correspond to the cell proliferation found by application of the thymidine method in the developing tuberculin reaction *in vivo.* Most recently, Drs. Barry G. Arnason (a.r.p. *N.* 1959), Branislav D. Jankovic, and Waksman have demonstrated that, in rats thymectomized at birth and allowed to mature, all reactions of the delayed hypersensitive type are abolished or markedly reduced and there is an almost complete absence of small lymphocytes from the major lymphoid tissues.

Throughout the period covered by the present report we have collaborated effectively with other scientists in the Boston area who were interested in subjects which we were investigating. Our work with Dr. Folch-Pi's group has already been mentioned. A metabolic study of diphtheritic polyneuritis was carried out in collaboration with Drs. Majno and Karnovsky, and a subsequent electron microscopic examination of this disease process with Dr. Webster of the Neurology Service. We have collaborated with Dr. Sidney Leskowitz of the Allergy Service in a comparative investigation of antibody formation and delayed sensitization in rabbits immunized by different techniques, and with Dr. Bullington of the Retina Foundation on a series of immunologic problems involving the eye. More recently we have collaborated with Dr. John T. Sharp of the Medical Service and with Dr. J. Peter Kulka (a.r.p. *Path.* 1947) of the Robert Breck Brigham Hospital in our investigations of the arthritis lesions. Dr. Flax of the Pathology Service has been an active co-worker in several of the more recent projects. The subject of Immunopathology has attracted a number of young medical men to our laboratory, where they worked for periods of one or more years as fellows on the problems described above. The first of these was Dr. N. Joel Ehrenkranz (*M.* 1950), who, as a National Polio Foundation Fellow, spent the year of 1955 in the study of the tissue culture phenomenon in tuberculin sensitivity. The second was Dr. Arnason, a Fellow of the Multiple Sclerosis Society from 1959 to 1961. Fellows at present in the laboratory include Drs. Kosunen, a Fulbright scholar and Foreign Fellow on the NIH, 1960-62, Jankovic of the Faculty of Pharmacy in Belgrade, 1961-62, Joseph N. Blau, a Nuffield Fellow for the current year, and I. Karin Samuelsson, who is spending a few months with us. An early collaborator was Dr. Douglas Bocking, then a Fellow in the Arthritis Service. Dr. Herbert Mansmann of the Allergy

Service participated in our first study of diphtheritic polyneuritis. More recently Dr. Felix-Davies, also of the Arthritis Service, worked with us on allergic thyroiditis. At various times fellows in the Neurology Service or in Neuropathology have joined us for brief periods to work on experiments related to experimental allergic encephalomyelitis and neuritis, among them Drs. Ruth E. Stauffer, Karl Åström, and Francoise Robert. Finally, many medical students have been moved to investigate Immunology more deeply with us, either as summer fellows or during their third and fourth years. These have included at various times Don Pearl, Arnold Weinberg, Michael Frank, Karl Wegner, Stuart Danovitch, Jim Stephans, Polly Cogan (a college student at the time), and John Mendelsohn. Hal Dvorak worked during 1960-61 as a post-sophomore fellow on problems related to homograft rejection.

The technical staff of the laboratory has grown to meet the demands of the increasing professional personnel and the increasing diversity of problems being studied. Our first technician was Donald Gaulitz. When the laboratory moved to its present quarters in the Warren Building, Don accepted a position as head of the Warren Animal Farm but continued to work part time with us. Now he has moved to higher things by becoming head of the Research Building Animal Farm and of other animal farms within the Hospital. Mrs. Matoltsy was our second technician and devoted most of her time with us to study of the tissue culture phenomenon and passive transfer in tuberculin sensitivity. She was followed by Christine Wennersten. For briefer periods, Simone Arbouys and Nicole Briquelet joined us as exchange technicians from France. The present laboratory staff includes Christine, Anne Newton (who carries out many of the functions formerly performed by Don), and Edna Scott. The histology laboratory, on which we depend heavily, is under the direction of Margaret Carroll. The physical plant occupied by all these people has also expanded to meet growing needs. A small laboratory under the Bulfinch roof, in the area now occupied by the Hematology offices, was the scene of Morrison's and Waksman's first immunologic studies of allergic encephalomyelitis. We subsequently took over Dr. Fritz Lipmann's laboratory, immediately next door, when he moved to roomier quarters in the Research Building, and four years ago we moved to the present space on the third floor of the Warren Building.

The last decade has seen the development of Immunopathology into a full-fledged area of investigation concerned with the production of different types of lesions by various immune mechanisms. The best known laboratories in this field have been those of Dixon at the University of Pittsburgh (now at the Scripps Institute in La Jolla), Good at the University of Minnesota, and Stetson, Benacerraf, and others at New York University, as well as a small number of laboratories in England and France. Our own laboratory has been a major participant in this field of activity since its inception, and is recognized as one of the leading experimental groups concerned with auto-immunity and its pathological consequences. The Neurology Service, in the person of Dr. Adams, has adopted the view that any advance in knowledge of pathogenetic mechanism, no matter what disease process is being studied, will be reflected in an increased understanding of mechanisms of lesion formation in the nervous system. We have thus far been slow to apply information gained in the laboratory to patients with diseases of unknown origin, such as multiple sclerosis, first, because there is as yet no satisfactory *in vitro* method for identifying the delayed hypersensitivity mechanism and, second, because skin testing of patients with tissue suspensions is a relatively unsatisfactory procedure, fraught with dangers to the patient. In collaboration with Dr. Stauffer, we carried out a program of skin testing of patients with multiple sclerosis and other demyelinative diseases with white matter suspensions, and more recently Dr. Arnason has extended these studies; but they have not thus far proved fruitful. However, *in vitro* methods for identifying cytopathogenic effects of sensitized lymphoid cells on target cells (e.g., colon epithelium, thyroid epithelium, synovial cells) have been described within the last year or two. These may make possible a new attack on a whole series of human diseases of unknown origin.

Byron H. Waksman, M.D.,
Associate Bacteriologist
and *Chief of the Neurology Research Laboratory*

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

Endocrinology

Benedict, P. H.
Endocrine features in Albright's syndrome (fibrous dysplasia of bone).
Metabolism 11:30.

General Surgery

Mixter, C. G., Jr., Keynes, W. M., and Cope, O.
Further experience with pancreatitis as a diagnostic clue to hyperparathyroidism.
New England J. Med. 266:265.

Miscellaneous

Garland, J.
A voice in the wilderness: *The New England Journal of Medicine* since 1812.
Brit. M. J. 1:105.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

Adams, R. D., and others.
Diseases of muscle, ed. 2.
New York, Paul B. Hoeber, Inc., 1962.
(18D)
American Association for the Advancement of Science, Publication No. 64.
Calcification in biological systems, edited by R. F. Sognnaes.
Washington, D.C., American Association for the Advancement of Science, 1960.
(8K)

VOLUNTEER GROUPS

MGH Service League

On March 6, the Massachusetts General Hospital Service League (formerly the Staff Wives Association) gave their spring tea in honor of our professional visitors from many lands who are studying and working at the Hospital. Because of the inclement weather, not as many guests came as had been expected; but the smaller gathering made it possible to carry on more deliberate conversations than would otherwise have been possible, with the result that many of our guests from other countries felt much better acquainted with us by the time the party was over.

Mrs. George L. Nardi, Chairman of the tea, was assisted by many members of the League, who received the guests, acted as hostesses, and poured at the tea and coffee tables.

Distaff Club

On April 24, Mrs. Mary I. Bunting, President of Radcliffe College, will discuss with members of the Club the education of women — particularly the education of those who have both children and jobs.

Brief bits:

Dr. Joseph C. Aub has left for Europe, and he plans to visit Israel, where he will lecture on the research work being done in his laboratory in the Warren Building.

Dr. Clemens E. Benda, who has been elected an Affiliate of the Royal Society of Medicine, London, England, has been invited to act as a Visiting Professor of Psychiatry at the Psychiatric University Clinic in Munich for the summer and possibly for the following winter semester of 1962. In July, the Instituto Experimental del Mongolico in Buenos Aires, Argentina, will hold a meeting on mongolism from July 7 to 15. Dr. Benda, as guest of honor, will preside at the meeting and will attend the dedication of the Institute's new library, which will be named for him. Dr. Benda, who is an honorary member of the Pediatric Society of Uruguay, will then go on a lecture tour through Uruguay, Brazil, and Venezuela, on the invitation of their respective Ministers.

Dr. Arthur B. Callahan of Dr. Gordon L. Brownell's laboratory attended the Fifth International Symposium on Radioactive Isotopes in Clinical Medicine and Research, held in Bad Gastein, Austria, from January 9 to 12.

Dr. Bradford Cannon attended the regional meeting of the American College of Surgeons in San Juan, Puerto Rico, and spoke on "Reconstructive surgery of the extremities and facial injuries".

In addition to his office in Providence, Rhode Island, Dr. Hannibal Hamlin has recently taken office space on the 9th floor of the Warren Building at M.G.H. for the practice of neurosurgery.

Dr. Alexander Leaf served as Consulting Scientist at the meeting of the Medical Research Council of the Tropical Metabolism Research Unit, held at the University College of the West Indies, in Jamaica, W.I., on February 10 through 26.

Dr. J. Roger Newstedt (r.s. 1950) of Cincinnati paid us a nice visit on March 12. We had a most interesting talk about many facets of medical practice and associated subjects.

Dr. Richard L. Rovit (r.s. *N.S.* 1958), informs us that he has been appointed Professor in Neurosurgery at Jefferson Medical College Hospital in Philadelphia.

This letter has come from Dr. Jack J. Greenberg (*S.* 1957), written from the United Leeds Hospitals in England:

> Many thanks for sending along The News to me. It is really my only contact with the General. During the past year it has been very pleasant to read the reports about the doings in the Hospital.
>
> My year in England has been very useful and professionally rewarding. The Leeds General Infirmary has 700 beds, of which 90 are thoracic and I am kept quite busy. I recently presented a paper to the Thoracic Society of Great Britain and Ireland at their Grand Annual Meeting. My subject was "Myocardial metabolism and function".
>
> I shall be returning to the General on July 1 to complete my surgical residency, and shall look forward to thanking you personally for sending me The News.

As a result of our note of thanks to Dr. Elbert L. Persons (*E.M.* 1929) for his usual contribution to The News, over and above the regular subscription fee, a very nice letter has come from him. Among other comments which we appreciate very much, Dr. Persons has this to say which will be of general interest:

> . . . I was a grateful recipient of The News when it was revived at the time of World War II and I decided that my own subscription, because of the excellent . . . treatment of activities at the M.G.H., was worth $5.00 per year.
>
> I should like to congratulate you on the continued high level of interest which has been maintained in every issue of The News, and the fact that it seems to be actually *read* by those who receive it. I have frequently referred issues to individuals on the Duke staff, with the result that I had a special invitation to witness one of the four-way cardiac catheterizations where tubes are pushed in from every direction.
>
> I am writing to congratulate you on . . . the fact that The News is now approaching its twentieth birthday as an interesting publication.

The News

No. 213 Boston, Mass. May 1962

MASSACHUSETTS EYE & EAR INFIRMARY

THE DEPARTMENT OF OTOLARYNGOLOGY

Scientific thought and methodology have finally applied themselves to otology—that discipline of medicine which deals with the ear and its disorders. It is not surprising that the surge of interest in the hearing organ should occur later than similar revolutions in related medical specialties. After all, the inner ear is hidden deep in the skull in a casing of hard bone. Thus, while it is protected from environmental and physical abuses, it also becomes more difficult to study.

Not until recently has the impact of deafness been fully appreciated in terms of its social, occupational, and economic effects. The public still is not fully aware of the communicative disability which results from deafness. The blind individual is pitied, but the deaf one is often "kidded". Why is this? It may be that blindness has a greater pull on the heart strings because everyone experiences the effects of loss of vision at sundown or by merely closing the eyes. On the other hand, it is not possible to divorce one's self from auditory stimulation. Placing plugs in the ear canals is comparable to only slight diminution of vision. Even in an elaborate soundproof room, the sounds of breathing, chewing, and the circulation of blood in the head provide constant awareness of auditory function.

One of the most exciting developments in otology is the stapedectomy operation for otosclerosis. Otosclerosis is a bony disorder of the otic capsule which causes ankylosis of the stapes bone and varying degrees of inner ear degeneration. Much of the credit for developing the stapedectomy operation belongs to Dr. John J. Shea of Memphis, Tennessee, a former Resident in Otolaryngology at the Massachusetts Eye and Ear Infirmary. He replaces the stapes with a vein graft and plastic prosthesis. This operation was first performed successfully by him about five years ago. I adopted the principle of total stapedectomy soon afterward and developed a modification, using earlobe fatty connective tissue and a steel wire prosthesis, believing this method had certain technical advantages. Today both methods are in common use and are equally successful, with hearing being restored in over 90 percent of patients. More important than the choice of method is that of surgical skill. The operation is performed through the ear canal, under local anesthesia, with the aid of an operating microscope. It is very gratifying to teach this operative technique to residents, for they learn these microsurgical techniques quickly.

Another attractive field of ear surgery is reconstruction of the middle ear following partial destruction by infection or trauma. These procedures, termed tympanoplasty, are sometimes highly successful in restoring hearing but, in general, the surgical principles are less well defined and the results are less predictable.

Two of four research laboratories in the Department of Otolaryngology are concerned solely with otological problems. The Neurophysiology Laboratory, under the direction of Nelson Kiang, Ph.D., is studying stimulus coding in the auditory nerve. The key to success has been the collection of data on magnetic tape, followed by computer analysis at the Massachusetts Institute of Technology, thanks to the help of Walter Rosenblith, Ph.D. It takes little imagination to realize the significance of this work. When the coding mechanism is known, it is entirely possible that electronic devices can be built to stimulate the neural centers directly and, in this way, restore hearing to an individual with deafness due to cochlear degeneration. A knowledge of neural coding for auditory stimuli might apply in principle to all sensory systems.

The experimental histopathology and surgery laboratory, under my direction, is concerned with the morphology, neuroanatomy, pathology, and physiology of hearing, as well as the development of therapeutic procedures for auditory and vestibular disorders.

Human ears for histological study from patients with deafness and/or dizziness are received by bequests and are acquired by permission from the diener of the Massachusetts General Hospital. Histological preparation requires six months. Because frequency has a spacial orientation in the cochlea, it is necessary to record pathological changes as a function of distance along the cochlear partition. About 600 sections are made of each ear and the pathological changes are recorded quantitatively on graphic reconstructions. Dr. Makoto Igarashi, our Research Fellow in Temporal Bone Pathology, has acquired about 30 valuable specimens in the past nine months. Recent new observations have been made which help define the pathogenesis of Ménière's disease, deafness due to kanamycin, positional vertigo, acoustic tumor, and sudden deafness.

Stapedectomies are being performed on cats to determine the fate of tissue autografts, tolerance to plastic and metal prostheses, and inner ear reactions to surgical trauma. Dr. George H. Williams is studying in animals the nature of the high-tone, inner ear type of deafness which occasionally follows stapedectomy.

Drs. Heinrich H. Spoendlin and Richard R. Gacek are studying the distribution of efferent nerve fibers to the ear. This fascinating nerve bundle arises in a retro-olivary cell group, crosses the midline, and innervates the auditory sense organ on the opposite side. We know it ends in the organ of Corti and *not* in blood vessels or secretory cells. What is its function? It probably modifies the afferent neural pattern, and one attractive theory is that it inhibits unwanted or unattended auditory stimuli. A very important and exciting new discovery in our laboratory has been the finding in the cochlea of a new system of fluid channels which probably carry perilymph to the organ of Corti. These channels may have a significance equal to that of the canals of Schlemm in the eye.

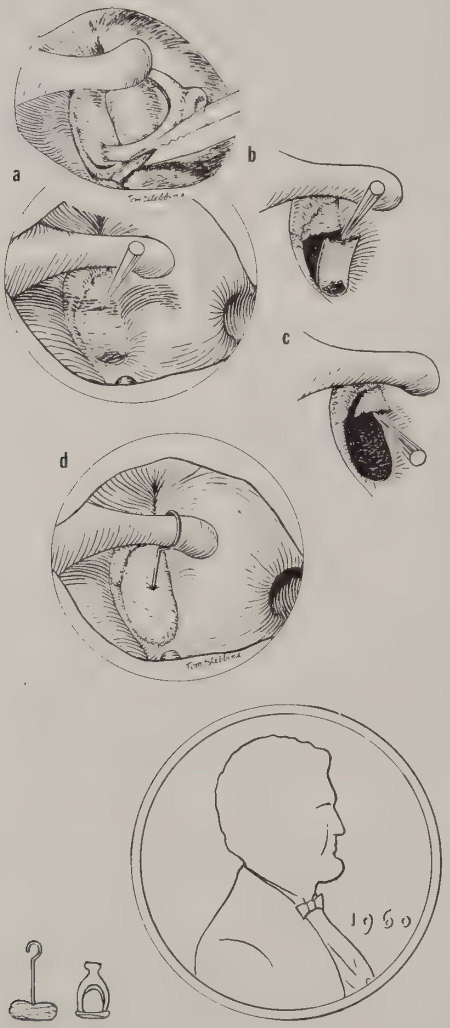
Among the newly planned activities in the Histopathology Laboratory will be electron microscopy performed by Robert S. Kimura, who is currently spending a year at the Wenner-Gren and Karolinska Institutes in Stockholm, and histochemical research under the direction of Dr. Károly Balogh of the Department of Pathology at the Massachusetts General Hospital, who has been appointed Pathologist in Otolaryngology at the Massachusetts Eye and Ear Infirmary, effective July 1, 1962, following the retirement of Dr. Werner Mueller.

I personally believe that nerve deafness is not at all a hopeless problem, for a recent experiment suggests that atrophic changes in the endolymphatic sac may lead to nerve deafness. This problem needs more study immediately and only time will tell whether this exciting finding will pay off.

Other laboratories working on equally important problems are the Biochemistry Laboratory, under the direction of S. Peter Marfey, Ph.D., and the Microcirculatory Laboratory, under the direction of Dr. John W. Irwin. Dr. David L. Pierce, a research fellow, and Dr. William W. Montgomery are studying in animals the histopathology of free graft obliteration of the frontal sinus. This research relates to chronic frontal sinusitis and the obliteration operation as practised by Dr. Robert L. Goodale of our staff.

In conclusion, may I state that I have found the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary a stimulating environment in which to practise medicine and to perform research.

Harold F. Schuknecht, M.D.,
Chief of the
Department of Otolaryngology



SURGICAL STEPS IN THE STAPEDECTOMY OPERATION FOR OTOSCLEROSIS

a. *In the top view the superstructure of the stapes is being removed with an alligator forceps.*
In the lower view a small opening is created with a pick.

b. *The posterior segment of the footplate is removed with a hook.*

c. *The anterior segment of the footplate is removed. Notice the thick ridge of otosclerotic bone at the anterior-superior margin of the footplate.*

d. *The stainless steel wire prosthesis with attached earlobe graft has been introduced and the wire has been locked onto the incus.*

Comparative sizes of a penny, a stapes, and a wire prosthesis with fatty connective tissue graft.

The Board of Trustees, at their meetings on March 2, 16, and 30 voted:

To accept the resignation of Francis W. Hatch as a Trustee of the Massachusetts General Hospital with great regret and with sincere gratitude for his constructive contributions during his fifteen years of service in this capacity. It was thereupon voted to elect Francis W. Hatch as an Associate Trustee to serve for one year, it being noted that he would become the first person to hold this title;

Unanimously to elect Francis H. Burr as a Trustee of the Massachusetts General Hospital on the part of the Corporation to fill the vacancy created by Mr. Hatch's resignation;

To accept with regret the resignation of Dr. Albert S. Murphy from the position of Clinical Assistant in Surgery.

To promote:

Robert D. Schnitzer, Ph.D. from Assistant Psychologist to Associate Psychologist at McLean Hospital, effective March 19.

To appoint:

Saul Aronow, Ph.D. as Associate Applied Physicist (Medicine), for a three-year period, beginning July 1;

Dr. Sheldon S. Baddock as Intern in Pathology for one year, beginning July 1;

Dr. Ann R. Brace as Intern in Surgery, assigned to Gynecology, for one year, beginning July 1;

Dr. George W. Brumley as Exchange Assistant Resident on the Children's Service, for the term February 27 through April 9;

Dr. Marianne Dierks as Clinical Fellow in Anesthesia, beginning July 1;

Dr. Ronald W. Dunbar as Assistant Resident in Anesthesia, beginning July 16;

Dr. Reinhard Fricke as Clinical and Research Fellow in Medicine, beginning May 1;

Dr. Robert P. Germanos as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Kenichiro Higashi as Clinical and Research Fellow in Neurosurgery for one year, beginning September 1;

Dr. Michael E. Jabaley as Third Assistant Resident in Surgery for one year, beginning July 1;

Dr. Edwin J. Madden as Clinical Assistant in Orthopedic Surgery for one year, beginning April 1;

Dr. Arthur M. Pappas as Assistant Resident in Orthopedic Surgery for one year, beginning April 1;

Dr. Edward F. Rabe as Assistant Pediatrician, beginning March 1;

Dr. William E. Reeves as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Charles A. Rodman, II, as Assistant Resident in Anesthesia, beginning August 1;

Dr. Jose A. Rodrigues as Clinical and Research Fellow in Neurosurgery for one year, beginning July 1;

Dr. James A. Rourke as Assistant in Radiology, beginning July 1;

Dr. William Sharpe, Jr. as Assistant in Psychiatry, beginning April 1;

Dr. William G. Stewart, Jr. as Assistant Resident in Orthopedic Surgery for one year, beginning April 1;

Pierre J. Stoffyn, Ph.D. as Associate Biochemist, for a three-year period, beginning July 1;

Dr. Jon B. Tingelstad as Exchange Assistant Resident on the Children's Service, for the term April 10 through May 21;

Dr. Kanji Torizuka as Clinical and Research Fellow in Medicine, beginning September 1;

Dr. Dorothy B. Villee as Assistant Pediatrician, beginning July 1;

Dr. Roland G. Ware, Jr. as Second Assistant Resident in Radiology, beginning July 1.

To appoint the following Interns for one year, beginning July 1:

Medicine

Dr. J. Michael Bishop
Dr. Verne S. Caviness, Jr.
Dr. David T. Harper, Jr.
Dr. Edward D. Harris, Jr.
Dr. Brian E. Henderson
Dr. James R. Lehrich

Surgery

Dr. Alfred J. Defalco
Dr. Dexter W. Lawson
Dr. Ralph A. W. Lehman
Dr. Peter B. Mansfield
Dr. Michael N. Margolies
Dr. George A. May, Jr.
Dr. William R. Moore
Dr. Dennis D. O'Keefe
Dr. Robert L. Waldron, II
Dr. LeRoy S. Wirthlin

At their meetings on March 7, 21, and 28, and April 4, the General Executive Committee voted:

To accept the resignation of James L. Pinter from the position of Research Fellow in Physics (Medicine), effective as of March 23;

To change the title of Dr. Prafulchandra M. Dalal from that of Clinical and Research Fellow in Neuropathology to that of Clinical and Research Fellow in Neurology, to act as Resident in Neurology, for a period of six months, beginning March 1.

To reappoint:

Dr. Jorgen G. Jacobsen as Clinical and Research Fellow in Medicine, beginning April 1;

Elton P. Katz, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning April 28;

Gerald L. Mechanic, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning March 1;

Dr. Isadore Starr as Clinical Fellow in Medicine, beginning April 15.

To appoint:

Dr. Yoichi Saito as Research Fellow in Psychiatry for one year, beginning June 1;

Mrs. Judith Sharir as Research Fellow in the Department of Psychiatry for one year, beginning January 15;

Neil R. Williams, Ph.D. as Research Fellow in Biochemistry (Medicine) for one year, beginning September 1.

Mr. Francis H. Burr, partner in the Boston law firm of Ropes and Gray, was unanimously elected a Trustee of the Massachusetts General Hospital, at a meeting of the Trustees held on March 30.

Mr. Burr is a Director of American Airlines, Inc., State Street Investment Corporation, Fiduciary Trust Company (N. Y.), Federal Street Fund, Old Colony Trust Company, and the Radio Shack Corporation. He is a Fellow of Harvard College and a Trustee of the Humane Society of the Commonwealth of Massachusetts, Employers Group Associates, Massachusetts Foundation, Industrial School for Crippled Children, and the Massachusetts Savings Bank. He is a member of the Board of Managers-Adams House (Adams Nervin) and a Vice President and Director of the United Fund.

ERRATUM

In the article on "The Cardiac Clinics and Laboratory", which appeared in the April issue of THE NEWS, the date of the construction of the catheterization laboratory was erroneously given to us. This date, which appears in next to the last line of the middle column on page 2, should read 1949.

* * *

OFFICIAL NOTICE

Over the past few months two Massachusetts General Hospital projects have been discussed with various committees and individuals in the Hospital. These groups include: the Board of Trustees, the Hospital Committee of the Board of Trustees, the General Executive Committee, the Staff Associates' Executive Committee, and a subcommittee of the Associates' Executive Committee. Both of these projects have the approval of the above-mentioned groups.

The projects are:

Project I

To set up a suite of offices at the Massachusetts General Hospital in the present Clinics Building, in which a group of internists and one or more general surgeons would combine private practice on a fee-for-service basis with a medical care program in which care would be given to a significant number of individuals who have purchased diagnostic and critical care services on a prepayment plan.

Project II

To establish in conjunction with the Massachusetts Port Authority a Massachusetts General Hospital connected medical facility at Logan International Airport. This unit will provide on-the-scene medical direction for employees of various Airport facilities, visitors to the Airport, and passengers of airlines using the Airport. It will be involved with disaster planning for the Airport and it is expected to collaborate with the Harvard School of Public Health on a study program.

John H. Knowles, M.D.,
General Director

MASSACHUSETTS GENERAL STAFF ASSOCIATES

This is the first of what is hoped will be a series of reports from the Executive Board of the Massachusetts General Staff Associates on the activities of this body. The Associates is recognized by the Trustees as a staff organization advisory to the Trustees.

During the autumn of 1961, a subcommittee of the Associates' Board studied with an administrative committee the complex problems of the Baker system for the setting and collecting of fees—problems created by the increasing number of patients for whom there is third-party payment. Following a meeting of the membership of the Associates in December, a recommendation that the Baker system be changed was forwarded to the Trustees for their consideration. This action of the Associates stimulated a great deal of interest on the part of the staff, which is reflected in further study of this matter by the Director of the Hospital, by the Baker Fee Committee, and by the Associates.

In light of the staff interest generated by this report and the recommendation which came from it, the Executive Board of the Associates is encouraged to go ahead with other plans for informing the staff of the problems of the Hospital and of practice within the Hospital, in order to keep abreast of the rapidly changing picture of medical care in our present world.

Bradford Cannon, M.D.,
Chairman

ENDOSCOPY—1933-1962

Twenty-nine years ago the first flexible gastroscope ever used in the United States was passed at the Massachusetts General Hospital. The instrument used was the Wolf-Schindler flexible gastroscope, and its passage marked the beginning of the Endoscopy Service at this Hospital. At that time the other peroral endoscopic procedures, namely bronchoscopy and esophagoscopy, were performed by the Ear, Nose and Throat Service at the Massachusetts Eye and Ear Infirmary. This was a very cumbersome arrangement, necessitating temporary transfer to the Infirmary of many General Hospital patients just for bronchoscopy or esophagoscopy. As Thoracic Surgery developed, it became obvious to Dr. Edward D. Churchill that we should have our own facilities for endoscopy in our own Hospital. At the same time, the late Dr. Arthur W. Allen felt that it would be worth while to do peritoneoscopies in suitable cases. Accordingly, instruments were obtained, and space and assistants were found for peroral endoscopy in the Out-Patient Department. Arrangements were made for overnight stay in the Emergency Ward.

For several years thereafter endoscopies were also performed in the Baker and Phillips House operating rooms, and in the temporary Quonset hut operating room used for ward cases during construction of the White Building. When the White Building was completed in 1940, Room 4 on White 3 was set aside for endoscopic work on Monday, Wednesday, and Friday afternoons. Expensive endoscopic instruments began to accumulate rather rapidly and could not be satisfactorily taken care of when they had to be moved from one operating room to another. They became damaged in transit and the nurses in the three operating rooms could not become familiar with sterilizing them, cleaning them after the procedures, and setting up the operating room in the special manner required. Furthermore, it could not be anticipated what instruments might be needed in a given case. One might plan an esophagoscopy and then find it necessary to do a gastroscopy or a bronchoscopy in addition. The only answer was to have one operating room for all peroral endoscopic procedures. Several years after the completion of the White Building, permission was granted to take care of Baker and Phillips House patients for endoscopy, as well as all endoscopy instruments, on White 3.

At the present time we have the following instruments, very ably inventoried and cared for in the White 3 operating room, under the direction of Mrs. Frances Chase: 8 laryngoscopes, 22 bronchoscopes, 17 esophagoscopes, 7 gastroscopes, 8 telescopes, 1 peritoneoscope, 24 biopsy and foreign body forceps, besides bougies, sponge carriers, aspirators, etc. Instruments of different sizes and shapes are needed to take care of babies and children of all ages, and of various anatomical and pathological situations.

During the early years of endoscopy the House Staff did not participate. Graduate students from all over the world were taken for a few months or up to one year. Beginning in 1941, they enrolled at the Harvard Medical School Courses for Graduates. They came from all parts of the United States and many from foreign countries, including Chile, Cuba, Venezuela, Paraguay, Canada, Lebanon, Brazil, Luxembourg, Portugal, Guatemala, China, South Africa, Turkey, Mexico, the Philippines, Taiwan, Italy, and Cyprus. In 1952, in reply to a questionnaire sent out by Dr. Churchill, the surgical resident staff expressed interest in learning to do the various endoscopies. Therefore, graduate students were no longer accepted, and attention was directed to the teaching of our own surgical resident staff. Ear, Nose and Throat residents and anesthesia residents continued to take part in the M.G.H. Endoscopic Teaching Program. For many years third year clinics in endoscopy have been given to Harvard Medical students. During the past twenty-nine years, endoscopic teaching has been given to 366 doctors, including 72 graduate students, 73 surgical residents, 119 ENT residents, and 102 anesthesia residents. Over 16,000 endoscopies have been done, including 9697 bronchoscopies, 2214 esophagoscopies, 3106 gastroscopies, and 1023 peritoneoscopies. Almost all of these procedures have been diagnostic. Many additional therapeutic bronchoscopies have been done on the wards by the Anesthesia Service.

The Anesthesia Service has become so expert in intravenous anesthesia for procedures of short duration that there has been a recent tendency toward using general anesthesia more frequently, especially for esophagoscopy and sometimes for gastroscopy. This, of course, makes endoscopic procedures easier for the patient, and increases the safety of the patient in the hands of trainees.

Since the beginning of the Endoscopy Service, over one hundred articles by members of the MGH staff have been written on endoscopy and allied subjects. In addition, two books have been published, one on endoscopy (1) and the other on the esophagus (2). The most important recent studies in endoscopy have been concerned with the value of bronchoscopy in determining the inoperability of carcinoma of the lung (3), the role of benign esophageal obstruction in the development of carcinoma of the esophagus (4), and benign inflammatory postoperative esophageal stenosis (5).

At the present time we are evaluating the use of esophagoscopy in the diagnosis of gastric reflux and its symptomatology in the absence of hiatus hernia. We also are working on the value of esophagogastroscopy in the diagnosis and localization of acute upper gastrointestinal hemorrhage (6). The importance of the Hirschowitz gastroduodenoscope (7, 8) is being studied, and efforts are being made through Flexi-Optics, Inc. to incorporate a directional mechanism and biopsy forceps in a similar type of fiberglass instrument.

Edward B. Benedict, M.D.,
Endoscopist

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

Biochemistry

Eylar, E. H., and Jeanloz, R. W.
Oligosaccharides from the $\alpha_1$acid glycoprotein of human plasma.
J. Biol. Chem. 237:622.

Houston, C., Adams, L. C., McDermott, W. V., Jr., and Field, R. A.
Effect of insulin on glucose uptake by the isolated perfused canine liver.
Lancet 1:357.

Jeanloz, R. W.
2-amino-2-deoxy-α-D-allose hydrochloride.
From D-glucosamine by interconversion.
In Methods in carbohydrate chemistry, R. L. Whistler and M. L. Wolfrom, Editors, New York, Academic Press, Inc., vol. 1, p. 212.

Jeanloz, R. W.
2-amino-2-deoxy-α-D-gulose hydrochloride.
In Methods in carbohydrate chemistry, R. L. Whistler and M. L. Wolfrom, Editors, New York, Academic Press, Inc., vol. 1, p. 231.

Jeanloz, R. W.
2-amino-2-deoxy-α-D-talose hydrochloride.
In Methods in carbohydrate chemistry, R. L. Whistler and M. L. Wolfrom, Editors, New York, Academic Press, Inc., vol. 1, p. 238.

Jeanloz, R. W., and Stoffyn, P. J.
2-amino-2-deoxy-α-D-galactose hydrochloride.
In Methods in carbohydrate chemistry, R. L. Whistler and M. L. Wolfrom, Editors, New York, Academic Press, Inc., vol. 1, p. 221.

Jeanloz, R. W., and Stoffyn, P. J.
Chemical structure of hyaluronic acid.
Federation Proc., vol. 21, p. 81, 46th Annual Meeting, Atlantic City, N. J.

Stoffyn, P. J., and Jeanloz, R. W.
Chemical structure of dermatan sulfate (β-heparin, chondroitin sulfate B).
Federation Proc., vol. 21, p. 81, 46th Annual Meeting, Atlantic City, N. J.

Endoscopy

Benedict, E. B.
Esophagoscopy, gastroscopy, and peritoneoscopy.
Gastroenterology 42:171.

General Surgery

Malt, R. A., and Mullinax, P. F.
Carbon dioxide generator for stimulating respiration.
Anesthesiology 23:132.

Mixter, C. G., Keynes, W. M., and Cope, O.
Further experience with pancreatitis as a diagnostic clue to hyperparathyroidism.
New England J. Med. 266:265.

Raker, J. W., Henneman, P. H., and Graf, W. S.
Coexisting primary hyperparathyroidism and Cushing's syndrome.
J. Clin. Endocrinol. 22:273.

Neurology

Waksman, B. H., Burnstein, T., and Adams, R. D.
Histologic study of the encephalomyelitis produced in hamsters by a neurotropic strain of measles.
J. Neuropath. & Exper. Neurol. 21:25.

Orthopedic Surgery

Sakellarides, H.
A follow-up study of 172 peripheral nerve injuries in the upper extremity in civilians.
J. Bone & Joint Surg. 44-A:140.

Pathology

Weinberger, H. W., Ropes, M. W., Kulka, J. P., and Bauer, W.
Reiter's syndrome, clinical and pathologic observations: A long term study of 16 cases.
Medicine 41:35.

Pediatrics

Brazelton, T. B.
A child oriented approach to toilet training.
Pediatrics 29:121.

Psychology

Whiskin, F. E., Dibner, A. S., and Rhudick, P. J.
Psychological, cultural, and health characteristics of aging smokers and nonsmokers.
J. Gerontol. 17:69.

Surgical Research

Monaco, A. P., Buckley, M., and Raker, J. W.
Carcinoma of the oral cavity. I. Carcinoma of the anterior two thirds of the tongue: Results of surgical treatment.
New England J. Med. 266:575.

Thyroidism

Chapman, E. M.
Action of antithyroid drugs associated with the treatment of hyperthyroidism with radioactive iodine.
Medicine et Hygiene, Geneva, Jan. 31:64.

THE SOUTH SURGICAL SERVICE

Dr. Faxon has written a most interesting and informative 47-page book about the South Surgical Service—a department of the Hospital where he received his training as a house pupil. One copy has been deposited in Dr. Knowles's office, another in Treadwell Library, and a third in the Archives Department.

An epitome of Dr. Faxon's book is given in his preface, which reads:

> This story of the South Surgical Service has been written mostly for my own enjoyment but also with the thought of recording for posterity an episode in the history of the Massachusetts General Hospital and a way of life at the Hospital that will soon be forgotten.
>
> While reliving my days as a House Pupil at the Massachusetts General Hospital and refreshing my memory from the official records, it occurred to me that a rather detailed account of the physical arrangement of the Hospital during that period, of its organization and how it operated, would be worth while. Also I have enumerated and have tried to explain some of the forces which, working within and without the Hospital, led to the establishment of and then to the demise of the South Surgical and the formation of a new Staff organization.
>
> The information here set down has been collected from the Minutes of the Board of Trustees, the Annual Reports, the Surgical Staff Secretary's Records, the Records of the Medical Board, the Medical Records of the South Surgical Service, and Dr. F. A. Washburn's History of the Massachusetts General Hospital. The period covered is from 1894 to 1911 but mostly it is the Massachusetts General Hospital of 1905 as I remember it.

Seven appendixes give such information as the names of the South Surgical staff and house pupils and their years of service, the number of beds and their location in the Hospital, names of the directors and members of the Corporation during this period, and complete lists of the names of the MGH staff in 1894 and 1912, which show the growth of the Hospital round the period of the existence of the South Surgical Service.

This book will be appreciated equally by present-day readers and future historians of the Massachusetts General Hospital.

♣ ♣ ♣

VOLUNTEER GROUPS

On May 19, the Massachusetts General Hospital holds its Annual Spring Dance, sponsored by the Trustees, the MGH Service League, and the Distaff Club. It will be held in the Crystal Ballroom of the Hotel Continental in Cambridge. We will dance to the music of Marshard's Orchestra.

DISTAFF CLUB

The *Hints for housing*, compiled by Mrs. George P. Canellos, is now complete. It lists, among other things, names of real estate agents, desirable locations, information about schools, and other helpful and pertinent data for Boston newcomers or residents.

We look forward to our annual family picnic in June.

It was nothing short of an inspiration that led me one day to the Massachusetts General Hospital. I knew it to be one of the best of all hospitals, and I hoped that I might find something of interest to do there—something which was in line with my professional training and experience. Luckily for me, I was referred to Miss Mary Ruth Wolf, Director of Volunteers, who was just about to launch a new program. As I listened to her unfold her plans, I comprehended the scope of her ideas, admired her progressive thinking, and caught her enthusiasm.

Over a period of years, there have been increasing requests from hospital administrators across the country and from such far-away places as Nigeria, asking Miss Wolf to give of her experience to newly appointed directors of volunteers. Appreciation of the importance of this post is growing, and a director of volunteers is coming to be recognized as a really professional member of hospital staffs.

After World War II, an expanded program for hospital volunteers started and has been growing ever since—but growing more or less like Topsy. As yet there is no national association to stabilize and guide the directors of this service, and there has been no nationally accepted type of training, though the American Hospital Association has offered each year a two-day basic and a two-day advanced institute in various sections of the country. A few years ago, the Committee of Directors of Volunteers of Metropolitan Boston, under the chairmanship of Miss Wolf, was instrumental in obtaining the interest and cooperation of Boston University, which offered a workshop —the first of its kind in New England— for the training of directors of hospital volunteers. But Miss Wolf's fertile imagination and sincere concern for her profession have led her to further thinking. Since M.G.H. is a pioneering hospital, why not pioneer in this relatively new field? Why not offer a course for directors of volunteers at the Hospital, including in-service training, observation, and experience? Miss Wolf presented her plans to the administration and they gave their approval for this pioneering postgraduate course.

The course was first given in the month of October. Four carefully selected students were accepted on the basis of receipt of a college degree, professional training or experience, and personal qualifications. Attendance was daily from 10 A.M. to 4 P.M., with a few evening sessions, from October 2 through 27.

The aim of the course was to offer education and training in the complexities of hospital organization and management, and the understanding of the role of the volunteer department in the total hospital structure. Special emphasis was placed on the executive responsibilities of the director of volunteers and on her relationship to the administration, the hospital staff, and other hospital auxiliary groups. Massachusetts General provides unique opportunities for students to receive practical on-the-job experience and the acquisition of technical knowledge of the manner in which the volunteer department functions on the administrative level and how it is integrated with its own advisory committee, under the able leadership of its chairman, Dr. Chester M. Jones, and with other committees both within and without the Hospital. We were privileged, also, to attend weekly administrative meetings. Because of the advantageous location of M.G.H., students have the added opportunity of visiting other hospitals and attending such meetings as those of the Greater Boston Council for Directors of Hospital Volunteers.

Lectures were given by Miss Wolf and others of the professional personnel at the Hospital. We had the opportunity to visit many departments and to confer with their directors. Also of value was our attendance at the orientation sessions for new volunteers and at the volunteer training sessions for such services as child recreation, adult recreation, and patient care. Under the guidance of volunteers we observed admitting areas, clinics, communication centers, etc. We viewed unusual programs, such as that offered by the Institute of Contemporary Art. We learned in what way volunteers could or could not be used by Pharmacy or Central Supply. Our understanding of the Hospital service was enhanced by conferences with the chairmen of the Ladies' Visiting Committee, the M.G.H. Service League, and the Metropolitan Boston Chapter of the American Red Cross. It was not only possible to study techniques of selecting and training volunteers, but to examine records of office procedures, public relations, and recruiting, and to delve into the history of the volunteer movement and the current literature—books, pamphlets, articles, and records. The course was so thorough and of such breadth that we also had the opportunity to evaluate our own interests, aptitudes, and abilities.

Our visits to other hospitals (which differed in locale, size, and service) were helpful, as was our contact with other directors of volunteers. In these outside visits we seemed to feel at home, for our training in a hospital made possible our understanding of what we saw and heard.

To whatever kind or size or location of hospital the students may go as directors of volunteers, this course has not only provided exceptional administrative and technical training, but inspiration as well. The example set by M.G.H. in its dedication to the care of the sick, the mutual respect between departments and the cooperation of each with the others—all of this should engender such high aspirations that each of us will be an asset in her new post. I cannot but think that this course is a big step in the right direction toward sound and thorough training.

The four of us who took the first course are proud of our certificates, are staunch admirers of the Massachusetts General Hospital, and are grateful to Miss Wolf for her outstanding leadership.

Acile Harrison

BIOGLETS

Dr. Guido Belsasso-Prister, Assistant Resident in Psychiatry—born in Trieste, Italy, December 8, 1935; B.S., Centro Universitario, Mexico, 1952; M.D., National University of Mexico, Medical School, 1959; Assistant, First Seminar for Medical Students, University of Michigan, Ann Arbor, 1959; military service: Captain in the Medical Corps, Mexican Army, 1959-60; Intern (straight in Medicine), Instituto Nacional de Enfermedades de la Nutrición, Mexico, 1959-60; Assistant Resident in Medicine, Instituto Nacional de Enfermedades de la Nutrición, 1960-61; single.

Dr. Randolph Catlin, Jr., Assistant Resident in Psychiatry—born in New York City, November 17, 1925; lived in Tuxedo Park, N. Y., for several years, then moved to Charlottesville, Virginia; educated at St. Paul's School, Concord, New Hampshire and at the University of Virginia; M.D., University of Virginia Medical School, 1952; Intern, New York Hospital, 1952-53; military service: Flight Surgeon, USAF, Korea, 1953-55; Resident in Neurosurgery, University of Virginia, 1955-56; further military service: special work in aviation medicine, Harvard School of Public Health and USAF School of Aviation Medicine, 1957-58; assigned as Flight Surgeon and Hospital Commander with the Strategic Air Command at a base near Oxford, England, 1958-61; married to the former Marian Woolston (HMS 1956); 2 children.

Dr. Albert E. Herman, Resident in Psychiatry, McLean Hospital—born in Edgemont, South Dakota, August 28, 1928; B.A., University of Nebraska, 1950; M.D., University of Nebraska, 1953; military service: Captain, U.S. Army Medical Corps, 1953-56; Resident, University of Colorado, 1957-58.

Dr. Axel Hoffer, Intern in Medicine—born in Gablonz, Czechoslovakia, July 23, 1936; University of Munich, 1955-56; B.A. Harvard College, 1957; M.D., Harvard Medical School, 1961; married.

Dr. John B. Livingstone, Resident in Psychiatry, McLean Hospital—born in Boston, December 26, 1932; graduate of Moses Brown School, Providence, Rhode Island; A.B., Brown University, Providence, 1954; M.D., Harvard Medical School, 1958; Intern in Surgery, University of Minnesota, Minneapolis, 1958-59; Resident in Surgery, Beth Israel Hospital, Boston, Massachusetts, 1959-60.

Dr. Gordon K. MacLeod, Assistant Resident in Medicine—born in Boston, Massachusetts, January 30, 1929; A.B., Blackburn College, Carlinville, Illinois, 1954; Engineer, Procter and Gamble Company, Cincinnati, Ohio, 1954-56; M.D., University of Cincinnati Medical School, Cincinnati, Ohio, 1960; Intern, I and III Medical Service, Boston City Hospital, 1960-61; married; one son.

Dr. Dale E. Wenlund, Intern in Surgery—born in Cokoto, Minnesota, May 17, 1931; military service: USAF, Middle and Far East 1950-54; B.A., University of Minnesota, Minneapolis, Minnesota, 1958 and B.S., 1959; University of Minnesota Medical School, 1958-59; M.D., Harvard Medical School, 1961; single.

New addresses:

- Dr. William T. Butler (*M.* 1959), 5903 Greenlawn Drive, Bethesda 14, Md.
- Dr. Frank F. Davidoff (*M.* 1960), 5823 Greenlawn Drive, Bethesda 14, Md.
- Dr. Norris B. Finlayson (a.r.p. *Path.* 1960). San Francisco General Hospital, San Francisco, Calif.
- Dr. Edward A. Gall (r.p. *Path.* 1937), Cincinnati General Hospital, Cincinnati 29, Ohio
- Dr. Gilbert Hermann (*S.* 1955), 1320 Garfield St., Denver 6, Colo.
- Dr. Gerald Kenner (a.r.s. *Or.* 1961), 540 Parker St., Newton 59, Mass.
- Dr. Edward J. Ottenheimer (*E.S.* 1924), 3707 Stanford Drive, Phoenix 18, Ariz.
- Dr. James A. Pittman, Jr. (*M.* 1953), Veterans Administration Hospital, Birmingham 3 Ala.
- Mr. Elliot L. Richardson (Trustee), 73 Tremont St., Boston 8, Mass.

* * *

Brief bits:

- Dr. Edward B. Benedict delivered the Fried Lecture at Newton-Wellesley Hospital last February 15. His subject was "Peroral endoscopy, special considerations".
- At its annual meeting on April 6, held at the Rhode Island Hospital in Providence, the New England Society of Plastic and Reconstructive Surgery elected Dr. Bradford Cannon as President.
- On March 21, Dr. Earle M. Chapman gave a talk on "The medical aspects of thyroid disease". The occasion was the observation of Mercy Hospital Clinical Day, in Rockville Centre, N. Y.
- Dr. Oliver Cope was the Sommer Memorial Lecturer in Portland, Oregon, April 4 through 6. He spoke on "Non-toxic nodular goitre: Uses and limitations of medical and surgical therapies"; "Hyperthyroidism: Considerations of the choice of therapy"; and "Hyperparathyroidism: Experiences in diagnosis and management of 300 cases".
- Dr. Richard A. Field was invited to speak to the Alabama Diabetes Association in Point Clear, Alabama, on February 25, concerning "Hypophyseal stalk section in the treatment of advancing diabetic retinopathy".
- Dr. Hannibal Hamlin presented a paper before the Eastern Association of Electroencephalographers, at their meeting in Ste. Adele, Quebec, on March 9. His subject was "Therapeutic effect of brain stem electrostimulation in traumatic suppression of the recticular activating system".
- Dr. Harilaos Sakellarides addressed the New England Surgical Society meeting at the Massachusetts General Hospital on March 28. He spoke on "Surgical correction on rheumatoid hands".
- Dr. Edward W. Webster acted as moderator for one of the panels in the Symposium on Technological Needs for the Reduction of Diagnostic X-ray Exposure, held by the U.S. Public Health Service, Division of Radiological Health, in Washington, D.C., on March 5 and 6. Dr. Webster also contributed an introductory paper entitled "Dose and information in diagnostic radiography".

* * *

When we published Dr. Chiu-an Wang's article on Hong Kong in our March issue, we said that a short addendum would follow. More recently we secured a copy of a talk Dr Wang gave here in the Hospital, and we feel that it should be made available to all our readers. Dr. Wang, who practises surgery in Hong Kong, is spending a year at the General.

MEDICAL PRACTICE IN HONG KONG

√

A PERSONAL EXPERIENCE

Medical practice in Hong Kong is intricately involved in her many social and economic problems. Over-population and over-crowding, illiteracy and poverty play an important role in our health problems. Geographically, Hong Kong is a small colony with an area less than 400 square miles, in which over 3,000,000 people live — 99% of them Chinese. Over 80% live along the coastal fringes of the harbour — some on boats. They represent the middle and lower classes. Some are of moderate means, others are indeed very poor.

In Hong Kong, as in other parts of China, the families are often large, and traditionally a man has to support not only his wife and his children (usually four or more), but also his parents who live with him. This large family system creates a serious financial problem, for the average income for this kind of family is low.

A skilled workman receives about $2 or $3 per day, and an office worker or a school teacher from $3 to $5 per day. Out of this meager income rent must be paid, which, of course, varies with the location. In general, for decent living quarters for a family today one must pay at least $50 or more per month. This would be a financial drain, and the only way to a reasonable solution is to sublet a quarter. This has been the general practice. One rents a living quarter, then sublets it to the next family, and the next will sublet to the next, and so on until there is no longer any room for subletting. All these families will now live under a single roof, and many in a family will sleep in one bed within a tiny cubicle. Over-crowding conditions thus account for the spread of many contagious diseases. Besides rent, there are also other expenses to meet — clothing, food, and education. By the time all these bills are paid, there isn't really very much left for saving. Many of these people literally live from hand to mouth. Should illness strike, as it often does, the entire family would feel the pinch and would suffer severe hardship.

Two kinds of medicine are being practised in Hong Kong — the Western and the traditional Chinese herbal medicine, commonly known as Chung Yee. The herbal medicine costs comparatively little, so most laymen are ready to accept it. It is aimed primarily at the symptomatic relief of fever, pain, constipation, etc. It consists mainly of medicinal plants, leaves, seeds, or roots, from which a liquid extract is prepared with boiling water for oral consumption. Snake bile has been claimed to be effective for rheumatism, and snails of certain species have been employed for the treatment of incurable cancers. The results are often questionable, yet this traditional herbal medicine has often been in demand, for it serves to provide symptomatic relief, which is just what most patients want. The cost is little, and the patient can afford it. Then, there is the bone-setter who sets fractures by wrapping the injured part in a dense mass of herbs, presumably to reduce swelling and improve healing. The patient will also be given a tonic, usually containing liquor, for the subcutaneous hemorrhage. There have been some acceptable results, but for many others there is frequently permanent deformity.

Another popular form of treatment is acupuncture. It is said to be effective for neuralgia, rheumatic pain, fibrositis, etc. Some cases of polio are also treated in this manner. The procedure is simple. A long non-sterile needle is inserted, without anesthesia, into the painful site or a selected area somewhere remote from the lesion. After a few artistic motions, the needle is withdrawn. The effect of the treatment is chiefly psychological. Not infrequently infection is introduced, followed by abscess formation.

Western medicine, on the other hand, has taken root very slowly since it was introduced into China some hundred years ago. As a rule it is more costly than the traditional herbal medicine, and there is still much reluctance to accept Western medicine — especially surgery.

According to the 1960 statistics of the Hong Kong government, there were 1001 registered medical practitioners, 393 dentists, 1740 nurses, and 1705 midwives. There were also many non-registered nurses and some doctors who are refugees from the Chinese mainland. While many of these nurses have been taken into practice, the refugee doctors are employed only to attend patients in certain clinics.

We have a limited number of hospital beds in Hong Kong. The latest figures show about 8000 altogether. There are two large government general hospitals — one on the Kowloon side, the other on the island. A new one is about to be completed on the Kowloon side. There are government-assisted hospitals which are jointly run by the local charitable organizations and the government. We have some very well equipped private hospitals, maternity homes, and nursing homes, which accommodate mostly the paid cases.

We have a medical school on the island. The teaching follows a British pattern — that is, a 6-year course leading to a M.B.B.S. Most of our graduates are general practitioners; some of them went abroad for postgraduate training; many returned to work in hospitals. Until very recently there were very few specialists in the Colony.

In our daily practice we have encountered some rather unusual problems. We have many cases of nutritional diseases and avitaminosis. Many of our patients suffer beriberi, with polyneuritis or beriberi heart. Nutritional edema, profound anemia, and hypoproteinemia are common findings. In some of our surgical patients we had to be satisfied if a hemoglobin level reached 10 grams percent or so. Obesity has been an exception, for most of our subjects are under-weight.

We have a high incidence of infectious and parasitic diseases, with some of the most unusual complications. Tuberculosis is very common. There are many acute and chronic pulmonary cases. Tuberculosis of bones and joints, meninges, the intestines and urinary tract is also common. A cold abscess in the right lower quadrant of the abdomen has often led to mistaken diagnosis of appendiceal abscess. Thus, in the differential diagnosis of any illness, tuberculosis is customarily included.

Because of water shortage and restricted supplies during the summer months, typhoid epidemics have been common for years. Typhoid perforation had been a serious problem and had cost many lives prior to Chloromycetin therapy. It is possible now to salvage a certain percentage with better surgical management of the cases and better understanding of the disease.

Small bowel obstruction caused by the roundworm, Ascaris lumbricoides, has been encountered occasionally among children. This is usually precipitated by strong anthelmintics. Symptoms usually will subside with the passage of the parasites by rectum, but in some obstinate cases obstruction will be relieved only by surgery with evacuation of the parasites.

One of our most perplexing problems in biliary surgery is recurrent cholangitis secondary to cholelithiasis, choledocholithiasis associated with the liver flukes (Clonorchis sinensis). No drugs have been found effective, given either orally or locally, for the treatment of this disease, consequently recurrent cholangitis, with or without obstruction, is a common occurrence.

Malaria splenomegaly has been frequently seen. Most of the patients were usually quite ill, with profound anemia. There have been a few cases of malaria in the Colony. One still sees occasionally a comatose patient with a positive blood smear for Plasmodium falciparum.

While we have had much the same kind of malignancy in Hong Kong as in the West, neoplasms that we have seen were almost always in a very advanced stage, and surgery could offer little hope for cure. Most cancer cases had had a trial with herbal medicines before they came to us for treatment. Colostomy has not been generally acceptable in the treatment of cancer of the bowel. It is often rejected.

We have had a number of neoplastic diseases commonly found in Hong Kong, namely, the nasopharyngeal cancer, locally known as Canton tumor because most of the cases were Cantonese. Primary hepatoma and chorionepithelioma were also common. Hepatoma has been found frequently associated with the liver flukes.

Degenerative disease did not seem to pose a very serious health problem, for the incidence has been relatively low. It occurred mostly in the upper classes, such as executives, bankers, lawyers, etc. There have been and still are cases of hypertension and various forms of heart diseases. Recently there seems to be an increase in the number of psychosomatic disorders. Schizophrenia, manic depression, and psychosis have been reported.

In Hong Kong we now have most of the up-to-date medical supplies, antibiotics, chemotherapeutic agents, and parenteral fluids at our disposal. These are costly, naturally, and they have been used very judiciously. Blood transfusions have always been our problem. For one thing, most willing donors were anemic to begin with, and others were reluctant. Traditionally, the people believe that blood, being a vital fluid, must not be given away indiscriminately. There has been a constant shortage of supply of blood. Major operations involving the unlimited use of blood were automatically curtailed to the minimum.

Because of the difficulty involved in blood transfusions and expenses incurred in the use of medical supplies, many of the operative procedures had to be done with discretion. We would delay closure for any contaminated abdominal wounds and drain any cavity being potentially a site of sepsis. We have frequently instituted feeding jejunostomies for cases requiring surgery for protracted gastrointestinal ailment. We would perform staged operations whenever there was the slightest question regarding the risk and the bodily reserve of the patient. Perhaps many of these considerations were over-cautious, but they have been done with gratifying

Dr. Harold F. Schuknecht—Chief of the Department of Otolaryngology, Massachusetts Eye and Ear Infirmary

results.

It seems to me that medical practice in Hong Kong presents a dual challenge. First, there is the disease to cure, which is not easy, but which can be done with care and experience. Then, there is the population to educate and convince that Western medicine can offer more for better health. This requires patience and tact. The basic problem, however, still lies in the solution to the many social and economical difficulties.

Chiu-an Wang, M.D.,
(*W.S.* 1944)

Dr. Khalil Abi-Torbey, Chief Resident in Urology, has been in the United States for six years, four of which have been spent at M.G.H. He returned recently to his native country—Lebanon. Just before his departure, we had a most interesting talk with him, during which he told us of his plans and hopes for the future. Dr. Abi-Torbey and eleven members of his family (two brothers, two nephews, and seven cousins—all American-trained here in university hospitals) will constitute the nucleus of a new diagnostic clinic to be located in Beirut. He proposes to create a center in the Middle East where the techniques and philosophy of the American type of medicine will be practised. Dr. Abi-Torbey expressed no interest in his own personal aggrandizement—in fact, quite the contrary. His one desire is that his country may be the beneficiary of his training over here.

During 1961, Dr. Abi-Torbey published three papers: "Function of the colon after removal of anal sphincters and replacement by denervated ileal segments", which appeared in *Annals of Surgery;* "Replacement of the right renal artery with the hypogastric artery", which came out in the *Argentina Urological Journal;* and "Urethral sphincter substitution with a specially prepared ileal segment providing urinary continence in male and female dogs", which appeared in the *Journal of Urology.* This last paper was a prize-winning essay of the A.U.A. In addition to these papers, a motion picture was made of Dr. Abi-Torbey in action, entitled "Technique and result of right renal artery replacement", and an exhibit on "Use of sero muscular layers of ileum in reconstructive urological surgery — Steps in regenerating of urothelium", prepared by him, was on exhibition at the Chicago meeting of the American College of Surgeons in November 1961. Nine more papers and another motion picture are awaiting publication.

Before ending the interview, Dr. Abi-Torbey said he wished to express his deepest appreciation to Dr. Wyland F. Leadbetter, the Directors of the Hospital, and members of all the services who have so kindly cooperated with him in his work here and thereby contributed to his education. As he rose to leave, he said, "And please include my gratitude for what your country has meant to me during my time here. The International Exchange Visitor Program has been a wonderful means for people to get the proper first-hand knowledge regarding their particular fields of interest. Also, it acquaints the members with the different ways of life and of thinking in various parts of the world. The members are equipped to carry back home information regarding the kind of culture and education they have been exposed to during their time of exchange. It is the very best way to convey messages of good will between all nations."

We wish more of our visitors from other lands would come in and tell us about their plans for the future.

* * *

IMPORTANT NOTICE

It is one of the duties of the Archives Department to revise the Directory section of the Hospital's *Annual Report* each year. A very simple request has appeared in The News many times, asking all our alumni and members of our professional staff, of all categories, to inform the Hospital promptly of any change of address. These appeals have been disregarded by a discouraging number of individuals. Unless each one of you cooperates in this respect, much extra work is entailed to keep our Directory up to date.

Members of the House Staff who are about to finish their services at the Hospital on June 30 are especially urged to comply immediately with this request. If you are planning to travel about for a while, or have not made definite arrangements for the opening of your office or your future association with an institution, please give us an address from which mail may be forwarded to you until your plans for the future are determined. Send your new address to either the Archives Department or the Secretaries' Office, after which it will appear in The News and in the following year's Directory. And please keep us up to date on any subsequent changes.

The News

No. 214 Boston, Mass. June 1962

ORTHOPEDIC RESEARCH LABORATORIES

The new Orthopedic Research Laboratories, which were dedicated September 11, 1960, were the culmination of many years of effort by the Department of Orthopedic Surgery. This event, in the words of Dr. Joseph S. Barr, Chief of the Orthopedic Service, marked the beginning of a new era in orthopedic surgery at the Massachusetts General Hospital and the Harvard Medical School and represented a major shift in the emphasis placed on the role of research, especially in the basic sciences, to orthopedic surgery and to the future training of orthopedic surgeons.

In this report from the laboratories, it would be well, I think, to review the background and philosophy which led to the creation of the laboratories, and which represented a reorientation of the Department of Orthopedic Surgery at the Massachusetts General Hospital and the Harvard Medical School.

Boston and the Department of Orthopedic Surgery of the Harvard Medical School with its two affiliated hospitals—the Massachusetts General Hospital and the Children's Medical Center—are often referred to as the "Cradle of American Orthopedic Surgery". For many years these institutions played important roles in the training of almost every professor of orthopedic surgery in the country. The faculty and the staffs of the two hospitals boasted of some of the most distinguished names in orthopedics—Goldthwait, Brackett, Osgood, Lovett, Allison, Smith-Petersen, Ober, Klein, and others.

These men played major roles in the rapid development of orthopedics that occurred during and after the First World War, when orthopedic surgeons were charged with the care of the tremendous numbers of skeletal injuries resulting from this conflict. Stimulated by these problems, these men and orthopedic surgeons the world over initiated the era of rapid technical development in reconstructive surgery that has characterized orthopedic surgery during the last forty years. During this period orthopedic surgeons made use of the basic research being carried out by other medical and surgical disciplines on shock, infection, anesthesia, bone metabolism, joint physiology, and the like, but contributed little in these areas themselves. The mechanical problems of fracture fixation, muscle transfers, joint reconstruction and the like consumed their energies.

Inevitably, the limits of such an approach to the diseases and deformities of the musculoskeletal system were reached. In recent years the need for a basic understanding of the biology of skeletal tissues and their response to injury and disease has become increasingly clear. Rapid advances in the biological, biophysical, and biochemical sciences had provided the tools and the know-how to investigate skeletal biology but, unfortunately, there was little or no communication between the scientific laboratory and the orthopedic surgeon. For further major advances in the specialty to occur, this iron curtain between basic research and orthopedic surgery had to be set aside, but the task was formidable indeed. The urgency of the reorientation was apparent to the leaders in the field of orthopedic surgery and was the subject of a series of presidential addresses of the American Academy of Orthopaedic Surgeons and the American Orthopaedic Association.

The need to bridge this gap was evident to no one more clearly than to Dr. Barr in 1947, when he became the John B. and Buckminster Brown Professor of Orthopedic Surgery at the Harvard Medical School and Chief of the Orthopedic Service at this Hospital. Starting with a purely clinical service at the M.G.H., with no more space than one of the small rooms on White 3A as an office, he began the hard task of finding personnel and providing space for administrative offices and laboratories. The first accomplishment was the remodeling of White 5 to provide an administrative office, a library, and a conference room now known as "Pete's Joint" in loving memory of Dr. Marius N. Smith-Petersen, Dr. Barr's predecessor.

Next was the research program. Was this to be established with short-term goals, such as the study of one specific disease, or was it to be a broad program designed to investigate normal and abnormal skeletal physiology? The best course for the M.G.H. was not clear at first, but after some preliminary false starts the course was laid out. The major research efforts of the Orthopedic Service were to be aimed at a long-term and continuing study of skeletal metabolism at a very basic level.

The skeletal structures, including bone, cartilage, and teeth, are unique. In these tissues, hard inorganic crystals of calcium phosphate in the form of apatite are deposited, giving them the structural properties necessary for their mechanical functions in the organism. In addition, the large quantity of calcium phosphate and other ions thus stored in the skeleton serves as a vast storehouse of those mineral ions which are available to maintain the constant chemical composition of the body fluids so essential to the maintenance of life.

Under normal conditions the deposition and resorption of these minerals is carefully controlled. They are deposited only when they are needed, and the amount deposited varies with the mechanical requirements of the body. On the other hand, in certain diseases and after some fractures, the deposition of these crystals in bone is impaired, with resultant failure of skeletal growth, deformity, or failure of fractures to unite and heal. Conversely, the situation may be reversed, with calcification occurring in tissues not normally mineralized. Tissues with such abnormal calcification are not confined to the skeleton and are well known to most of us in one form or another: tendons in bursitis, arteries in arteriosclerosis, the heart valves in heart disease, tartar on the enamel of teeth, and many other less well known sites, such as the skin and ligaments.

Clearly, accurate diagnosis, preventive and specific treatment of many diseases of the skeletal system and the many diseases of other tissues which calcify pathologically, must await an understanding of, first, the normal mechanism of calcification and its biological control, and the specific aberrations of these fundamental processes that are responsible for aberrant calcification. There is need to learn how to both prevent calcification (bursitis, arteriosclerosis, and the like) and encourage mineralization (fractures, bone fusion procedures and so forth).

Tissue mineralization is a universal biological process not confined to the calcification of bones, teeth, and cartilage in vertebrates. The process of the hardening of living tissue by the deposition of inorganic crystals occurs in some plants and in most animals from minute unicellular organisms to the most highly organized form of life—man. The shells of oysters, clams, lobsters, sponges, and sea urchins are a few examples. To be sure, the minerals differ in the various species—calcium carbonate, silica, strontium sulfate and the like replacing calcium phosphate—and the composition of the tissue in which the minerals are deposited also differs, but the same basic phenomenon appears to underlie all forms of biological mineralization, as shown by investigators in these laboratories and in many others.

With such a ubiquitous process occurring in all forms of animal life, the investigator has the opportunity to study the mechanisms involved in the simpler animal systems before progressing to the more complex systems of bone, teeth, and calcified cartilage. It is hoped that the knowledge gained from the more simple systems can be applied to the solution of the more complex problems involved in the vertebrates.

Because of this favorable circumstance, the Orthopedic Research Laboratories were organized to investigate basic mechanisms in biological mineralization, not only in bone. Our objective was a long-term, coordinated and integrated, multidisciplinary study of the structure, organization, and physiological function of mineralized tissue at all levels of the anatomical hierarchy—molecule, tissue, and organ. With such an approach, the lines which divide the clinical specialties of medicine, surgery, and dentistry disappear. The mechanisms involved are relevant to bone disease, arteriosclerosis, kidney stones, dental caries and so on.

Such a program required biochemists, electron microscopists, biophysicists, and other highly-trained personnel, not to mention laboratory space and the equipment and supplies necessary for the research. When this program was envisioned, the Orthopedic Service had no basic research in progress. There was no space, no funds, and certainly no trained personnel. The problems confronting the program were large indeed, but in the space of less than three years the funds were raised, an addition to the White Building was finished and the laboratories designed and completed, equipment and supplies were purchased, and a first-rate scientific staff was assembled and engaged in productive research.

That this idea became a reality was due to the dedicated efforts of a great many members of the MGH family. The orthopedic staff, headed by Dr. Barr, worked endlessly. Dr. Edward D. Churchill, Chief of the Surgical Services, Dr. Walter Bauer, Chief of the Medical Services, and Dr. William H. Sweet, Chief of the Neurosurgical Service, contributed advice and essential support. Mr. David C. Crockett, Associate Director for Resources and Development, by his ingenuity, resourcefulness, energy, and unshakable optimism, guided us along the difficult and often discouraging course that led to the successful raising of funds and the completion of the construction.

Financial support for this project came from the United States Public Health Service, from many private foundations, notably the John A. Hartford Foundation, Inc., the Liberty Mutual Insurance Company, the Easter Seal Society, the Green and Stranahan Foundations, and many private individuals, including the friends and family of Drs. Armin Klein, Robert B. Osgood, Joel E. Goldthwait, and Marius N. Smith-Petersen, for whom individual laboratories have been named. We shall be eternally grateful to these agencies and individuals for their confidence and support.

However, as often happens in such large undertakings, the major responsibility for coordinating everyone's efforts fell on one man's shoulders. In this case, it was Dr. Thornton Brown. Dr. Brown devoted more than his full working time to the organization of the laboratories, the building plans, the raising of funds, and the preparation of scores of applications, brochures, and numerous important details, with vigor and enthusiasm and with great personal sacrifice to himself. There is no question that, without his dedicated effort, the laboratories would never have come into being. Not only the Orthopedic Service, but both the Harvard Medical School and the M.G.H. owe him a vote of thanks for his tireless efforts on their behalf.

Our present research program has been in full swing for about two years. It now includes a wide variety of projects ranging from a comparative study of the structure and organization of the mineralized tissues of certain invertebrates, to the study of the structure and organization of dental enamel, to the incorporation of tetracycline into the bone structure of patients with hyperparathyroidism.

Members of the research unit and their fields of interest include Dr. Dorothy F. Travis, Marine Biology; Dr. Ulf A. Friberg, Biophysics (visiting from the Karolinska Institutet, Stockholm); Dr. Murray Vernon King, Crystallography; Dr. Samuel R. Kamhi, Mineralogy and Crystal Chemistry; Dr. Laurence C. Bonar, Crystallography; Dr. Anthony L. Andrikides and Dr. Leighton B. Richards, Organic Chemistry; Dr. Gerald L. Mechanic, Biochemistry; Dr. Elton P. Katz, Physical Chemistry; and Dr. William H. Harris, Bone Metabolism and Physiology. In addition we have had two visiting fellows in Orthopedic Surgery: Dr. Robert W. Jackson, from Toronto, and Dr. Richard L. Jacobs, from University Hospitals of the State University of Iowa, both spending one year with Dr. Harris, studying tetracycline *in vitro* and into bone *in vivo*.

Perhaps Professor Franklin C. McLean of the University of Chicago, in his address at the dedication of the laboratories, has best summarized the previous history of the M.G.H. in relation to our goals and plans. With Dr. McLean's kind permission, his address is reprinted herewith:

THE HOSPITAL AND RESEARCH

I would like to take for my text today a sentence attributed by Dr. Edward D. Churchill to Dr. J. Collins Warren, as follows:

"Suddenly a time arrived when it seemed as though medical science had reached a point where new activities were in order."

While this was written with reference to a new outlook and period of activity in Boston Medicine in the 1840's, it applies equally well to the event we are celebrating today.

To set the stage further for what I have to say, I will quote from a statement made in an Instructional Course of the American Academy of Orthopaedic Surgeons in 1947, by a speaker whom I shall not identify:

> Who is to accept the challenge of the non-traumatic disorders of the skeleton? And my answer is that you will. And you will for the simple reason that in the long run no one will know more about the bones and their idiosyncrasies than you will. Wherever you are in practice you will find that these problems will be laid on your doorsteps, and that your success in practice will be measured not only in terms of your ability to deal with injury and deformity, but equally in terms of your grasp of the metabolic and systemic problems that come to you.

That this challenge is being accepted by orthopedic surgeons is now made manifest by the provision of the Orthopedic Research Laboratories at the Massachusetts General Hospital, which are being dedicated by these ceremonies. This is a noteworthy example of a time when medical science has reached a point where new activities are in order, and I am happy to participate in these exercises. I am also happy that this occasion has been brought about mainly by the efforts of the Massachusetts General Hospital, which has a long and distinguished record of contributions to medical research.

The Harvard Medical School, whose participation in this enterprise is also being celebrated today, has had, in its long history, a number of points where new activities were in order. A few of these may be mentioned briefly. For our present purposes, one of the most important was the establishment of two small physiological laboratories in the North Grove Street buildings of the Harvard Medical School, in 1871. Here Henry Pickering Bowditch, recently returned from study with Karl Ludwig and with Claude Bernard, became the first professional medical scientist in the faculty; the first to devote his full working day to investigation and teaching; and the first teacher in the Medical School who did not choose to practice medicine. With him began a period of devotion to medical research, which continues to characterize the Harvard Medical School to this day.

Marking another point of new activities was the dedication of the new buildings of the Harvard Medical School, in 1906. But if I point to this as the culmination of an era of effort in medical science, I must also say that these magnificent marble buildings included no provision for observation of a patient, or even for the temporary housing of a volunteer subject. To quote from your own Dr. Churchill, "it was thought that, if investigations were contemplated by clinicians, either the work could be carried on for them (or even by them) in the departmental institutes of medical science, or else their efforts would find more congenial surroundings in the pathological laboratories of the associated hospitals." Events moved rapidly after 1906, both in Boston and elsewhere, but I have recorded, in another place, that plans were made for a teaching hospital as late as 1923, with absolutely no provision for research laboratories in the clinical departments. There was provision for pathological laboratories, and the assumption was that any clinicians who might feel the urge to carry out research could find a place to do so in the Department of Pathology. The event of today shows how far medicine has progressed since 1906 and 1923.

My theme today is implied by my title—"The hospital and research". By this I mean not only the hospital as a locus for research, but, more importantly, as an instrument for research. I need go no further than the Massachusetts General Hospital to show how successfully a hospital can perform this function. The story of Ward 4, as told in a delightful and informative manner by James Howard Means, is a case in point, although Dr. Faxon's tabulation of the research accomplishments of the M.G.H. makes it clear that Ward 4 is responsible for only a fraction of these. Ward 4 does illustrate, however, how the hospital can contribute to the advancement of orthopedic science; some of the important pioneer work on the relation of the parathyroid glands to disorders of the skeleton was done in these surroundings.

That research has not always been a recognized function of the hospital, even though practitioners making use of hospital facilities have from time to time made discoveries therein, is self-evident. Medical research was a well-recognized activity by the end of the nineteenth century, but it did not take place in any organized fashion in hospitals. It may be of interest, on this occasion, to determine when research did move into the hospital, and it is possible to do so with considerable precision. Let me first make the statement that the bridgehead over which research advanced into the hospitals of the United States was established early in the decade beginning in 1910; I shall then bring forward some of the evidence which permits us to pinpoint this advance with some degree of accuracy.

The period surrounding the year 1910 was critical for American medical education and research. The American Society for the Advancement of Clinical Investigation held its first meeting in 1909, and S. J. Meltzer, in his presidential address, set forth the need for "a differentiation of clinical medicine into a science and a practice". In 1910 the report of Abraham Flexner on *Medical education in the United States and Canada* was published, and this was destined to revolutionize American medical education. In the same year the Hospital of the Rockefeller Institute for Medical Research was opened in New York, with Dr. Rufus Cole as Director, and with a staff of full-time investigators. Also in 1910 the University of Pennsylvania, in Philadelphia, established a chair of research medicine. The breakthrough at the Massachusetts General Hospital occurred two years later, when in 1912 David Linn Edsall came as Chief of a medical service, and established research in the Hospital in a continuing and professional way. His first concern on taking up his duties was the development of a teaching and investigative clinic. He needed young men, trained both in clinical medicine and in research, but the supply was scant. He picked promising young men and sent them off to acquire the needed training in research methods; they subsequently returned to the M.G.H. These men, together with others selected and given additional on-the-job opportunities, formed the nucleus of Edsall's clinic. The roster of their names is impressive: Walter W. Palmer, James L. Gamble, Louis H. Newburgh, Paul D. White, James H. Means, Joseph C. Aub, George R. Minot—every one of these, together with many who joined the ranks later, has had a profound influence on academic medicine and on the establishment of research in the Hospital. The bridgehead of medical research at the Massachusetts General Hospital was secured in 1912.

Since 1912 research in and under the auspices of the Massachusetts General Hospital has become firmly established. In fact, on April 7, 1919, Dr. Edsall himself, in his first statement of policy as Dean of the Medical Faculty at Harvard Medical School, deplored the fact that a career in clinical investigation was attracting so many of the young men of scientific training and interest away from medical science as a profession; this he attributed to a disparity in financial rewards.

Note the emphasis on the term clinical investigation. I take it that no one will now question the desirability and, under modern conditions, even the necessity of carrying on, in the hospital, research having to do directly with the study of patients. But even here there are differences of opinion concerning the objectives and even the motivation of such research. On the one hand there is the view, as expressed by a former President of Harvard University, that the clinical investigator is a man who is "treating patients or studying by pathological methods the effect of disease on the human organism." Clinical investigators as a group, he said, "may be considered the medical equivalent of what are called development engineers in industry." In their laboratories, "projects are to be reworked and if promising are handed on to the manufacturer for production."

On the other hand is the view, so ably represented by your own James Howard Means, that the terms "clinical" and "basic", so often applied to research as though they were antithetical, are by no means mutually exclusive. "Basic research in medicine may be clinical, and clinical research may be basic. . . . The term 'basic' research implies research designed to discover fundamental truth without any intent of immediate or direct practical application. It is sometimes inaccurately thought of as research conducted only in laboratories by means of planned experiments on animals or otherwise, but equally basic research can be done on patients, and, conversely, laboratory experiments can have very practical objectives."

Over the years there has been a sort of hierarchy in research. Research in the natural and biological sciences, having long become firmly entrenched in our universities, has been referred to as pure or basic research; medical science, as exemplified in the departmental institutes of the Harvard Medical School, dedicated in 1906, occupied a middle ground, somewhere in between basic and applied science; clinical investigation, formally inaugurated at the Massachusetts General Hospital by Dr. Edsall in 1912, was expected to deal with the patient, and certainly began as an applied science; the investigators were called the medical equivalent of development engineers in industry. It may now be shown that there is no essential difference between these three categories, as was in fact done by Dr. Means.

The change in the attitude toward medical research, be it basic or clinical, can be traced through the records of the *Journal of Clinical Investigation,* the pioneer in the field. When the American Society for the Advancement of Clinical Investigation was under organization, in 1909, clinical investigation was defined as "medical research . . . by men actively engaged in the practice of medicine", and the emphasis was on the study of the patient "by the methods of the natural sciences." By 1949 the editors of the Journal found it necessary to publish a letter, in an effort to define "what is and what is not clinical investigation", and arrived at the conclusion that: "Essentially, clinical investigation is the study of the sick person, his past experiences and adaptations, and their relation to his present plight as it is manifest by deviations in structure, function, and behavior, and the internal and external processes upon which they depend." Now, only a decade later, the statement of policy in each issue of the Journal reads: "The *Journal of Clinical Investigation* is designed for the publication of original investigations dealing with *or bearing on* [emphasis supplied] the problems of disease in man, and it is the policy of the editors that the Journal should cover the field of clinical investigation in its broadest sense." While the emphasis is still on disease as it occurs in man, the least common denominator of those engaged in clinical investigation appears to be concern with the diseased state, whether it is observed in man or produced in animals, or even whether knowledge fundamental to an understanding of the disease process is being sought. On perusing the *Journal of Clinical Investigation,* one may at times find it difficult to differentiate its subject matter from that of the *American Journal of Physiology.*

A similar transition is under way in the field with which we are concerned today—that of orthopedics. An important journal in this field is the *Journal of Bone and Joint Surgery,* and orthopedics is still commonly referred to as Orthopedic Surgery. Both of these began with a connotation of concern with operative intervention in diseased or abnormal states. Over the years the term surgery has itself lost some of this connotation; the surgeon is first of all a physician, who has acquired special skills in the treatment of patients. Likewise, the orthopedist is now, as was predicted some years ago, a physician interested in the metabolic and systemic problems posed by the skeleton, as well as in injury or deformity. For this reason, perhaps, we frequently see the word surgeon dropped from his title. Similarly, such publications as the *Journal of Bone and Joint Surgery* and *Clinical Orthopaedics* are now finding it desirable, as a matter of policy, to devote a fair proportion of their pages to the physiology and biochemistry of bone—subjects that would have seemed strange to them only a few years ago. I have even heard suggestions that the term surgeon or surgery be dropped from the titles of organizations or orthopedists and of their publications.

Now the Massachusetts General Hospital has elected to go all the way in this transition. The Orthopedic Research Laboratories, by deliberate policy, will engage in basic or fundamental research, in the extreme sense in which these terms are applied. This does not say that the patient is to be lost sight of; it does say that any research bearing on the musculoskeletal system is a proper field for inquiry, to be carried out in a hospital and under hospital auspices. We may expect to see publications originating from these laboratories, reporting on research carried on by all the methods available in the physical and biological sciences. In a sense, this is a return to the 1909 definition of clinical investigation, which I have quoted, as "medical research . . . by men actively engaged in the practice of medicine", since it is their interest in medicine that brings them together.

I do not mean to imply by this that all of those who work in these laboratories will be physicians; this will by no means be true. As long ago as 1914 physicists were brought into the problem of cancer in the Collis P. Huntington Memorial Hospital for Cancer Research. This tradition has been carried on in the Massachusetts General Hospital up to the present time; the contributions of the Massachusetts Institute of Technology in research at the M.G.H. have been many and important; there is no doubt that this collaboration will continue, as well as collaboration with the "departmental institutes of medical science" at the Harvard Medical School. We may expect every tool available to the investigator in the biological sciences to be brought to bear on the problems to be studied in these new laboratories, and we may expect to have, in a paraphrase of the words of S. J. Meltzer, "a differentiation of orthopedics into a science and a practice."

I would like to close by quoting again from my unidentified source, this time from words written in 1958, referring specifically to the proposed creation of the Orthopedic Research Laboratories that we are now dedicating:

> I know of no place where research on the physiology and biochemistry of bone, as well as on the many clinical problems of orthopedic surgery, can flourish to better advantage than at the Massachusetts General Hospital. The close relationships with the Massachusetts Institute of Technology and with the Harvard Medical School, already in existence, will continue to nourish the Orthopedic Research Laboratory to be established. In addition to the research output of such a laboratory, an important feature will be its stimulus to physicians and students at all levels, including the undergraduate and graduate students at M.I.T., the preclinical and clinical students at Harvard, and the staff of the M.G.H. The impact upon the residents in training at the M.G.H. will be especially great; the research unit will produce investigators of the future, and will have a beneficial effect upon the practice of orthopedics—both medical and surgical.

* * * * *

I am very pleased to have Dr. McLean's words published in conjunction with this brief story of the "birth" of our laboratories, especially since his careful appraisal reflects the growing understanding that research on any level can and should be carried out in the setting of a university hospital such as ours.

Melvin J. Glimcher, M.D.,
Assistant in Orthopedic Surgery
and *Director of the*
Orthopedic Research Laboratories

* * *

Dr. Richard H. Sweet, who for many years (until his retirement on 1 July 1961) was Visiting Surgeon at the Massachusetts General Hospital and Associate Clinical Professor of Surgery at the Harvard Medical School, died on 11 January 1962.

This year was Dr. Sweet's Presidential Year in the American Association for Thoracic Surgery. The meeting was conducted by the Vice President, but at the scheduled time for the Presidential Address by Dr. Sweet a memorial to him was read. This was followed by a paper read by his associate, Dr. Earle W. Wilkins, Jr., entitled "Experience with 500 cases of hiatus hernia".

The memorial presented to the Association for Thoracic Surgery was selected and prepared by Dr. Churchill. It is reprinted here so that it may be read by the Staff and many graduates of the Hospital who had come to know and admire Dr. Sweet during the long years of his service to the Massachusetts General Hospital.

RICHARD HARWOOD SWEET

(1901-1962)

I shall read to you an ancient Hindu legend as retold by Rudyard Kipling. It is a legend which has been transmitted to us from the remotest ages. It is this: Once upon a time, or rather, at the very birth of Time, when the Gods were so new that they had no names, and Man was still damp from the clay of the pit whence he had been digged, Man claimed that he, too, was in some sort a deity. The Gods were as just in those days as they are now. They weighed his evidence and decided that Man's claim was good—that he was, in effect, a divinity, and, as such, entitled to be freed from the trammels of mere brute instinct, and to enjoy the consequence of his own acts. But the Gods sell everything at a price. Having conceded Man's claim, the legend goes that they came by stealth and stole away his godhead, with the intent to hide it where Man should never find it again. But that was none so easy. If they hid it anywhere on Earth, the Gods foresaw that Man, the inveterate hunter—the father, you might say, of all hunters—would leave no stone unturned nor wave unplumbed till he had recovered it. If they concealed it among themselves, they feared that Man might in the end batter his way up even to the skies. And, while they were all thus at a stand, the wisest of the Gods, who afterwards became the God Brahm, said, "I know. Give it to me!" And he closed his hand upon the tiny unstable light of Man's stolen godhead, and when that great Hand opened again, the light was gone. "All is well," said Brahm. "I have hidden it where Man will never dream of looking for it. I have hidden it inside Man himself." "Yes, but whereabouts inside Man have you hidden it?" all the other Gods asked. "Ah," said Brahm, "that is my secret, and always will be; unless and until Man discovers it for himself."

Thus, then, gentlemen, does the case stand with Man up to the present. Consider, for a moment, the pathos of the poor brute's position! You all know the common formula for him. "Born of Woman, on Woman designed to beget his like—the natural quarry of the Seven Deadly Sins, *but* the Altar of an inextinguishable Hope."

And it is just this search for this unlocated spiritual area, which has preoccupied Man from that day to this. The Priest and the Lawgiver have probed and fished for it all through the ages; but, more than any other, through all the ages, the Leech, the Medicine-Man, the Healer, has been hottest on its track. He has searched wherever he dared—openly or furtively—in safety or at the risk of his life. In the early days the Astrologer-Physician, as he called himself, dreamed that the secret of Man's eternal unrest was laid up in the sun, moon, and stars; and consequently, that an universal medicament for Man's eternal woes could be discovered upon earth. So he searched the earth and the heavens for those twin secrets, and sacrificed himself in the search as a matter of course. Later, when the embargoes on the healing art were lifted—when, at last, he was permitted to look openly into the bodies of mankind—the nature of his dreams changed for a while. He had found more wonders beneath his knife than earth or the planets had theretofore shown him. Once again, the Surgeon, as he had become, renewed his search, and once again sacrificed himself in the search as his passion drove him. There is no anaesthesia so complete as man's absorption in his own job.

In the teeth of the outrageous, the absurd disabilities imposed on him, Man—the imperfectly denatured animal, who cannot trust the evidence of his own senses in the simplest matter of fact; whose evidence on the simplest matter is coloured by his own iniquities—Man, always the hunter, went up against the darkness that cloaked him and every act of his being, to find out what order of created being he might be. He called it scientific research. It was the old quest under a new name. But, this time, the seekers who headed it, unlike the Priest and the Lawyer, admitted that they knew very little. Experience had taught them to be humble. For that reason their knowledge was increased. They moved forward into areas of the body, which, till then, had denied themselves to man's hand. They were turned back, without explanation, from other areas which, as yet, would tolerate no spying. They were bewildered by mysteries which some new marriage of observation and accident, some predestined slip of the knife resolved into—mysteries profounder still! Is it any wonder that the old dreams came back? The dream of the essential unity of all created things—the dream that some day that which men called Life might be led into matter which men called dead—the boldest dream of all, that eventually Man might surprise the ultimate secret of his being where Brahm had hidden it, in the body of Man. And, meanwhile, their days were filled, as yours are filled, with the piteous procession of men and women begging them, as men and women beg of you daily, for leave to be allowed to live a little longer, upon whatever terms.

Is it any wonder, gentlemen, that your calling should exact the utmost that man can give—full knowledge, exquisite judgement, and skill in the highest, to be put forth, not at any self-chosen moment, but daily at the need of others? More than this. Your dread art demands that instant, impersonal vision which in one breath, one beat of the pulse, can automatically dismiss every preconceived idea and impression, and as automatically recognise, accept, and overcome whatever of new and unsuspected menace may have slid into the light beneath your steadfast hands.

But such virtue is not reached or maintained except by a life's labour, a life's single-minded devotion. Its reward is not only the knowledge of mastery and the gratitude of the layman, which may or may not bring content. Its true reward is the dearly prized, because unpurchasable, acknowledgement of one's fellow-craftsmen.

This brief pause in your search is to honor the name of a man by no means the least in your long line of seekers who follow the quest Brahm set them—a fellow-craftsman whom you yourself acknowledged by electing him to be your President, Richard H. Sweet—a Master among Masters.

A fine tribute was paid to Dr. Richard H. Sweet by Dr. Robert Soupault, President of the Académie de Chirurgie, Paris, France. It appeared as an article in the March issue of *Académie de Chirurgie*.

The Board of Trustees, at their meetings on April 13 and 27, voted:

To accept the resignation of Dr. Monroe Cole, Clinical and Research Fellow in Neurology, as of March 30, because of his call to duty in the Armed Forces;

To accept with regret the resignation of Dr. Leonard W. Cronkhite, Jr. from the position of Assistant in Medicine, and that he be extended our best wishes and congratulations on his appointment as General Director of the Children's Medical Center;

To change the title of Dr. Chiu-an Wang from Clinical Fellow in Surgery to that of Clinical Assistant in Surgery, for the period April 1 through July 31.

To appoint:

Dr. Barry J. Agranat as Intern in Dental Medicine for one year, beginning July 1;

Dr. Wallace H. Clark, Jr. as Associate Pathologist for one year, beginning June 1;

Dr. Milton H. Clifford as Assistant Physician, effective as of April 1;

Dr. Leonard W. Cronkhite, Jr. to the Board of Consultation, effective April 15;

Dr. Theodore Dreier, Jr. as Assistant Resident in Psychiatry for one year, beginning July 1;

Dr. Matthew P. Dumont as Assistant Resident in Psychiatry for one year, beginning July 1;

Dr. Ruben F. Gittes as Assistant Resident in Urology for one year, beginning July 1;

Theodore A. Kalin, Sc.B. as Consultant in Biomathematics (Psychiatry) for one year, beginning April 1;

Dr. Peter G. Kimball as Resident in Dental Medicine for one year, beginning July 1;

Dr. Donald L. Leake as Intern in Dental Medicine for one year, beginning July 1;

Dr. Regina C. McCormack as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Beale H. Ong as Exchange Assistant Resident on the Children's Service, for the period May 22 through June 30;

Dr. Pietro Paoletti as Clinical and Research Fellow in Neurosurgery, for a period of six months, beginning August 1;

Dr. Larry H. Strasburger as Assistant Resident in Psychiatry for one year, beginning July 1.

At their meetings on January 3, February 21, April 11, 18, and 25, and May 2, the General Executive Committee voted:

To promote:

Dr. A. Colin Markland to the position of Resident in Urology, retroactive to January 1, and through June 30.

To reappoint:

Dr. John H. Bowker as Clinical and Research Fellow on the Orthopedic Service for one year, beginning July 1;

Edna M. Follensby, Ph.D., for one year, effective July 1, with a change of title from Assistant Immunologist (Medicine) to Consulting Assistant Immunologist;

Dr. Abdollah Gashgai to the position of Second Assistant Resident in Surgery, from May 15 through June 30, and to promote him to the position of First Assistant Resident in Surgery, beginning July 1;

Dr. Jacobus M. Greep as Clinical and Research Fellow in Surgery for one year, beginning June 15;

Dr. Richard L. Jacobs as Research Fellow in Orthopedic Surgery for one year, beginning July 1;

Leighton B. Richards, Ph.D. as Research Fellow in Orthopedic Surgery, for the period December 1, 1961 through August 31, 1962;

Dr. Edward J. Riseborough as Clinical Fellow in Orthopedic Surgery and Orthopedist-in-Charge of the Orthopedic Ambulatory Clinic for one year, beginning May 1.

To appoint:

Dr. Babatunde K. Adadevoh as Research Fellow in Medicine for one year, beginning June 1;

Miss Valerie E. Jones as Research Fellow in Medicine for one year, beginning January 1, 1963;

Toshiaki Osawa, Ph.D. as Research Fellow in Biochemistry (Medicine) for one year, beginning September 1;

Bronnetta L. Scott, Ph.D. as Research Fellow in Electron Microscopy in the Department of Orthopedic Surgery for one year, beginning May 1.

A General Executive Committee vote on January 3 and one on February 21 did not reach the office of The News in time to appear in any previous issue of this paper.

* * *

RADIOLOGY DEPARTMENT

A few weeks ago, three members of the Department of Radiology were elected to membership in the Association of University Radiologists. This group exists for the purposes of encouraging laboratory and clinical investigation in Radiology, stimulating an interest in academic Radiology as a medical career, and advancing Radiology as a medical science. There are about 100 members of the Association in the United States, all of whom hold staff appointments at medical schools.

The members recently elected from the M.G.H. were Dr. Jack R. Dreyfuss, Dr. Henry P. Pendergrass, and Dr. Majic S. Potsaid. Dr. Chiu-chen Wang is also a member.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material*, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter, and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

Biological Chemistry

Eylar, E. H., and Jeanloz, R. W.
Periodate oxidation of the α_1 acid glycoprotein of human plasma.
J. Biol. Chem. 237:1021.

Spiro, R. G.
Studies on fetuin, a glycoprotein of fetal serum. II. Nature of the carbohydrate units.
J. Biol. Chem. 237:382.

Spiro, R. G.
Studies on the monosaccharide sequence of the serum glycoprotein fetuin.
J. Biol. Chem. 237:646.

General Medicine

Friedman, A. P., Finley, K. H., Graham, J. R., Kunkle, E. C., Ostfeld, A. M., and Wolff, H. G.
Classification of headache.
J.A.M.A. 179:717.

Laboratory Science

Schmid, K., Polis, A., and Takahashi, S.
Electrophoresis of human serum albumin at PH 4.0. III. Interpretation of the electrophoretic behavior of different albumin preparations.
Biochim. et biophys. acta 57:48.

Radiology

McCoy, W. T., and Donnelly, E. W.
Congenital heart lesion.
J.A.M.A. 179:131.

Robbins, L. L.
Education of the radiologist: Thence and whence. Annual oration in memory of Donald Smythe Childs, 1888-1960.
Radiology 78:343.

Simon, H., and McCoy, W. T.
Chronic renal disease.
J.A.M.A. 179:119.

Simon, H., and McCoy, W. T.
Osteolytic lesion of the skull.
J.A.M.A. 179:181.

Orthopedic Surgery

Rowe, C. R.
Management of osteomyelitis following fractures of extremities.
New York J. M. 62:1200.

Otolaryngology

Kelemen, G.
Mimetic musculature and animal language.
Logos 5:18.

Psychiatry

Beecher, H. K.
Nonspecific forces surrounding disease and the treatment of disease.
J.A.M.A. 179:437.

Beecher, H. K.
The placebo effect and sound planning in surgery.
Surg. Gynec. & Obst. 114:507.

Benda, C. E.
Bereavement and grief work.
J. Pastoral Care 16:1.

Stoeckle, J. D., and Davidson, G. E.
Bodily complaints and other symptoms of depressive reaction: Diagnosis and significance in a medical clinic.
J.A.M.A. 180:134.

Miscellaneous

Beecher, H. K.
Some fallacies and errors in the application of the principle of consent in human experimentation.
Clin. Pharmacol. & Ther. 3:141.

BIOGLETS

Dr. James J. Pollard, Assistant Resident in Radiology — born in Lynn, Massachusetts, December 5, 1934; A.B., Providence College, Providence, Rhode Island, 1955; M.D., Boston University School of Medicine, 1959; Intern in Surgery, Barnes Hospital, St. Louis, Missouri, 1959-60; married.

Dr. John S. Strauss, Resident in Psychiatry, McLean Hospital — born in Cleveland, Ohio, August 18, 1932; B.A., Swarthmore College, Swarthmore, Pennsylvania, 1954; research in psychology with Prof. Jean Piaget, Geneva, Switzerland, 1956-57; M.D., Yale Medical School, 1959; Intern in Medicine, New England Medical Center, Boston, Massachusetts, 1959-60; Assistant Resident in Medicine, Boston City Hospital, 1960-61.

Dr. Richard A. Weinberg, Assistant Resident in Dermatology — born in Brooklyn, N. Y., August 3, 1932; B.S., Brooklyn College, Brooklyn, N. Y., 1954; M.D., University of Chicago School of Medicine, 1958; Intern, Philadelphia General Hospital, 1959; military service: USAF, Tokyo, Japan, 1959-61; married; one child.

MASSACHUSETTS GENERAL STAFF ASSOCIATES

The Executive Board of the Massachusetts General Staff Associates has had semi-monthly meetings throughout the spring. Many of the topics discussed at these meetings are of local interest only, and have been summarized in reports distributed to the membership. These include the establishment of an Education Committee, whose purpose is to inform the staff by symposia or in other ways of problems posed by third-party payment, fees for service (ward) patients, activities of the Massachusetts Medical Society which are important to all practising physicians, etc. Also discussed has been membership in the Associates. The Executive Board, acting as the spokesman for the staff, has consistently tried to encourage a broader representation from the active staff to strengthen, influence, and fulfill the stated purpose of the Associates: "To provide for the effective discussion of problems of the Medical Staff of the Massachusetts General Hospital and to transmit to the Board of Trustees of the M.G.H. the opinions, suggestions, and recommendations of the members of the Association relative to matters directly concerned with the affairs of the members of the Associates."

In keeping with a forward-looking attitude by the Hospital and a willingness to try new ideas, a pilot experiment to provide all health services to a defined community by the M.G.H. has been projected for the Logan International Airport area. This has been discussed in the Associates' Executive Committee and has the approval of a sub-committee of the Associates.

Those of you who have not visited the M.G.H. recently will be astonished by changes in the West End. A redevelopment project has leveled practically all the buildings that were within the triangle formed by the M.G.H., Bowdoin Square, and the North Station. In their place 15- to 23-story buildings are being erected, two of which are completed and occupied. This is not tenement housing and therefore it poses problems in providing adequate care either in private offices or possibly in a private clinic organization. In addition, the buildings in Scollay Square are being demolished to make way for a Government Center, which will draw large numbers of employees to this area and thus place additional responsibilities upon the M.G.H.

The solution of these problems is very much in the minds of the administration and is among the immediate concerns of the Associates' Executive Board repre-

♣ ♣ ♣

An article by Dr. Samuel Proger, Physician-in-Chief and Chairman of the Department of Medicine at Tufts University School of Medicine, which appears in a recent annual report of the Pratt Clinic—New England Center Hospital, has been called to our attention. In one section of the article, Dr. Proger has this to say about academic medicine:

> We hear much about academic medicine and it seems to be variously defined depending upon one's basis of comparison. It is well to remember that a chief goal of all academic medical activities is the highest possible standard of medical practice. If academic medicine is not a means to this goal, it loses a large reason for its existence. It may be that academic clinical medicine is nothing more than the model practice of medicine in an environment that prizes and encourages creative achievement and scholarship along with a concern for patients as people. Students, house officers, and staff then learn to practice good medicine in an academic environment. They do not learn to practice academic medicine. University affiliated hospitals are becoming increasingly aware of the fact that in order to survive, they will have to compete for patients. How fortunate for the patient that there exists this built-in mechanism for his benefit, a mechanism, incidentally, that may do much to insure a proper environment for the proper teaching of medicine. As I have previously indicated, the patient in such an environment assumes new status as a person. The basic concept emerges of *the patient* as a frame of reference for all of the institution's activities rather than the faculty or the student.
>
> Instead of adapting our clinical material to the teaching needs of the institution, . . . we have been attempting . . . to adapt the teaching activities to the patient's needs. Students and house officers come to recognize that they are in the hospital to participate in a program for the care of the patients instead of patients being in the hospital to provide training material for them. . . .

Brief bits:

Dr. Otto E. Aufranc was invited to attend the Congress of the Society of Latin America of Orthopedics and Traumatology, and to participate in their program. The meetings were held in Bogotá, Colombia, during the week of January 13 to 19. During the week of March 26 to 30, Dr. Aufranc was Visiting Professor in Orthopedics at the Columbia-Presbyterian Hospital and on March 30 he delivered the Allan De Forest Smith Lecture. On April 25, he conducted two courses at the Post Graduate Course in Trauma, given by the American College of Surgeons, in Chicago.

Dr. Oliver Cope was the Adolf Gundersen Visiting Professor of Surgery pro tempore at Marquette University School of Medicine from May 14 to 17.

Dr. Humberto Fernández-Morán leaves the M.G.H. in August or September to become Professor of Biophysics in the Division of Biological Sciences at the University of Chicago. He has thoughtfully contributed to our Archives Department a file containing information regarding his family history, his educational background, his postdoctoral studies in this country and in Europe, his professional and governmental appointments in Venezuela, Sweden, Norway, Denmark, and the United States, a list of honors conferred upon him, titles of 82 of his publications, and reprints of articles about him that have appeared in newspapers and journals.

Dr. George L. Nardi was the guest speaker at the Harris County Medical Society meeting in Houston, Texas, on March 14. His subject was "Effects of trauma on surgery".

Mr. Joseph T. Prekup resigned from his position as Administrator of McLean Hospital to become Associate Director of the Maricopa County General Hospital at Phoenix, Arizona. His resignation became effective on May 12.

The News

No. 215 Boston, Mass. October 1962

ARMS AND THE M.G.H.

Last May a twelve-year-old boy whose right arm had been amputated just below the shoulder in a railroad accident, was brought to our Emergency Ward and the arm was successfully reattached. From a surgical point of view, this was not a particularly astounding accomplishment, involving as it did nothing but well-honed principles and practices in the treatment of major extremity trauma. However, the fact that repair had seldom been attempted in so complete an injury, combined with the patient's being a successful twelve-year-old Little League baseball pitcher, resulted in a press coverage similar to that afforded the birth of sextuplets or a major Hollywood scandal—and to the M.G.H. this was an astounding phenomenon.

The case has been so well documented in the daily press, *Time, Look,* etc., that it would be redundant to present it here except briefly. The article in *Look* of August 14 was particularly detailed. Their reporter had apparently made contact with all people and places concerned, and was impressed by the "usual state of disciplined turmoil" of the Emergency Ward where "white clad doctors strode about, sometimes colliding."

The youngster arrived in the EW on a Wednesday afternoon, with his arm, and was swept into the usual competent and expeditious processing applied here to the seriously injured. From the very first, reattachment seemed the natural thing to do, especially with the precedent of repairing all major vascular injuries having been firmly established several years ago. The patient himself fully expected this to be accomplished and would have been aghast had it not been. In the Operating Room, vascular anastomoses and intramedullary bone fixation were performed and the wound was debrided. Delayed wound closure with skin grafting was planned in a few days, delayed nerve suture being left to follow wound healing. The comment was made in the Operating Room, "Wait till the newspapers get a-hold of this one", but the magnitude of the public splash to come was not yet anticipated.

The next morning the house staff had enjoyed the gratification of passing the patient through Surgical Grand Rounds as he was being transferred from Recovery Room to Ward. The sober presentation of the history, concluded by the usual "an operation was performed", was climaxed by offering warm pink fingers and a pulsatile radial artery to the palpating front row in the Bigelow Amphitheatre, and was almost too easy a triumph in roundsmanship.

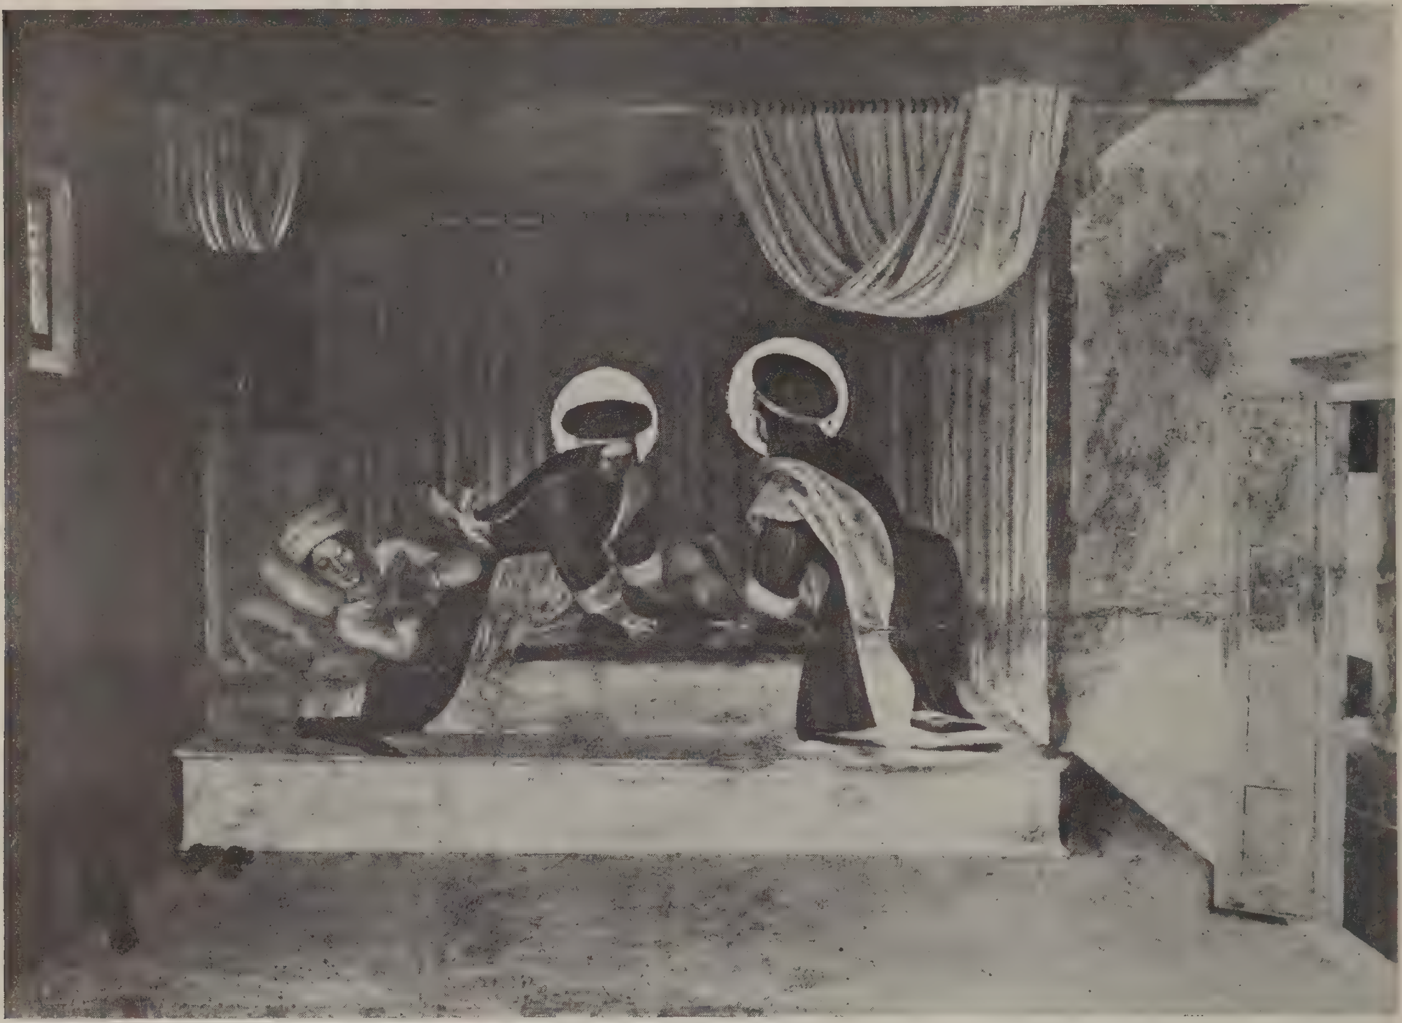
The daily newspapers and the national news services had caught the case by then and the real avalanche of inquiry began. It soon became obvious that if the Hospital were going to continue in operation, some policy and methodology had to be formulated to satisfy these people. Consequently, all reporters were referred to the Administrative Group, who took on the job of extracting a daily medical bulletin from the surgical staff to pass on to them. At the height of things Mrs. Reardon, Mr. Henry J. Murphy's secretary, processed more than fifty calls a day from the press; and in the evening our wives had their lives brightened a little when they answered telephone calls and encountered the Associated Press instead of the usual surgical requirement for their husbands' immediate disappearance. The countless requests for personal interviews were deflected by the promise that a press conference would be arranged for June 13, when all the Hospital staff concerned would be captured and set up as targets which could be interviewed to exhaustion. All of us were keenly conscious of the dreadful anticlimax that failure and reamputation would be after such a hullabaloo; and for this reason, as well as for the feeling that all this was not quite in keeping with the dignity of the institution, we made a determined effort to soft-pedal the whole affair and be very guarded in our comments. I'm afraid all we accomplished was to add the spicy ingredient of suspense to the press reports. The reporters seemed to want to find a single surgical hero whom they could use in their stories, and our failure to produce one underlined for them and for us the unique nature of the conglomerate organism that serves our patients.

The youngster himself did well, had an uneventful and uncomplicated secondary closure of his wound with skin grafts, and was discharged in plaster with a healed wound the morning of the press conference. He had been isolated on wound precautions until healing occurred, and had been protected from other than family visitors until the time of discharge. One enterprising photographer from a Boston daily secured a scoop by disguising himself as a janitor, breaking precautions, securing the boy's picture, and fleeing down the stairs from the twelfth floor of the White Building, pursued by a train of indignant nurses. The youngster's face, as it appeared in that evening's newspaper, wore the most wonderful "Who the hell are you?" expression you can imagine. The Hospital diluted this newsman's triumph by promptly autoclaving our own photographer, having him then secure a large number of appropriately posed pictures, and distributing them to all comers with the compliments of the management.

The great press conference was held in the Nurses' Cafeteria, which had been so transformed that those who were interviewed were made to feel a little like the President of the United States. The staff was protected from the press by a long conference table, and all were appropriately labelled. In addition to representatives of the local press and radio, there were people from the national news services, from New York and Chicago and other newspapers, from some of the national and foreign periodicals, and representatives from the British and European press. This array was backed by the heavy machinery of three television stations, and reinforced by eight or nine cameramen.

Doctor Churchill was superb and a real professor in his introductory briefing. When the question of priority for the first performance of such surgery was brought up, he was quick to point out that we did not claim priority and yielded it to the Syrian surgical team of St. Cosmas and St. Damian who, in 400 A.D., amputated a man's cancerous leg and successfully replaced it with a leg from a recently deceased but otherwise intact blackamoor. He referred us to the documentation of this miracle in early Christian art.

It was inevitable with all this that we should receive a flood of mail, and this was an astonishing demonstration of the effectiveness of modern communications and the degree to which our world has shrunk thereby. Letters have arrived from all over Europe, including Yugoslavia, and from North Africa and Asia. For the most part, this mail has come from humble people in hopeless trouble and it has indeed been touching. Most commonly, these people are searching for some way to replace a missing extremity. Many have old traumatic amputations, usually the result of World War II. Many have children with congenital amputations. Many have some unrelated insoluble deformity or disability and are looking for a miracle. Several of these letters were simply expressions of good will from informed and realistic people who had been touched by tragedy. Common in the mail from the States, but absent in foreign mail, were accounts describing people of the past generation who, in their youth, had suffered trau-



(Ed. Alinari) N. 1527. FIRENZE R. Museo di S. Marco. Un Miracolo dei Santi Cosimo e Damiano. (Beato Angelico)

Copy of an artist's conception of the transplantation of a leg in 400 A.D.

matic amputation of a digit or a foot which had been successfully replaced by the old family doctor, unsung and unhonored. There were some charming letters of congratulations and admiration from children. "Was it hard?" "Do you like your job?" There were, of course, a certain number of crank letters, most often urging us not to be so preoccupied with the body but to make our major effort at saving our patient's and our own souls. Most of these people read ugly things into the newspaper photographs, from the patient's expression, from the way he was holding his dog. The Parents' League for Good Bite was distressed that we spent so much time on his arm and neglected orthodontia.

On a day in mid-September, when the soft tissue wounds and fracture were healed, the patient returned to the Hospital for a second operation. The four major nerves of the upper arm were found and joined, and now will begin the wait of a year or two to see if sufficient nervous regeneration will occur to make the whole effort worth while.

This case was unique in MGH history —not that it represented a surgical accomplishment, but that it had such wide publicity. This was unsought, uncensored, and not a little bit worrisome to conservative New Englanders here. There are some things, however, that we are proud of and hope that we have conveyed to the public. The first is that our paramount concern is for the individual patient; and beside this, individual or institutional glory, or even research efforts, are nothing. The second is a byproduct of the first—namely, that a patient entering this Hospital is not the jealously guarded property of any one physician but, rather, the patient's physician is the instrument for bringing to bear on his case all the minds, the techniques, and the special skills that could be of benefit. This is the reason that the press could not find a hero—a Doctor Kildare—in this case.

Robert S. Shaw, M.D.,
Associate Visiting Surgeon

VARAZTAD H. KAZANJIAN, M.D.

One of the extraordinary and unique senior surgeons of the Massachusetts General Hospital is Dr. Varaztad H. Kazanjian. Dr. Kazanjian has been an outstanding figure in New England plastic surgery for sixty years and has held world recognition for nearly five decades. He has been honored by many organizations and governments. Recently, under the leadership of his colleague, co-author, and student, Dr. John M. Converse, there was established a Visiting Professorship in Plastic Surgery bearing Dr. Kazanjian's name, at the New York University Medical Center Institute of Reconstructive and Plastic Surgery. The inaugural lecture in this series was given by Dr. Kazanjian himself on May 28, 1962, in the auditorium of the recently completed Alumni Hall of the New York University Medical Center. His title was, appropriately, "A lifetime experience in plastic surgery".

Dr. Kazanjian was introduced by the Dean of the New York University Medical School, Dr. S. Bernard Wortis. Before the introduction, Dr. Converse reviewed Dr. Kazanjian's boyhood in Armenia, his arrival in the United States, his pursuit of further education, the opportunities and challenges of World War II, and finally his many contributions to plastic surgery in the years since. Dr. Converse's familiarity with the many personal facets of Dr. Kazanjian's life made a fascinating story.

The funds for the establishment of the Visiting Professorship were contributed by many of Dr. Kazanjian's patients, friends, and school classmates from the Northeast as well as from remote parts of the world. One of them wrote: "As there has never been any way in which to show my appreciation for a facial operation performed thirty-five years ago, I was, naturally, thrilled and delighted to hear of these plans."

The meeting was attended by members of Dr. Kazanjian's family and by his many devoted professional colleagues. Scattered through the hall were former patients, many of whom showed the evidence of severe trauma or extensive congenital anomalies which had been very effectively and skilfully improved by Dr. Kazanjian's surgical ministrations. It was a most successful occasion and one which should make all of us proud to claim Dr. Kazanjian—a member of the staff of the M.G.H. for four decades.

Bradford Cannon, M.D.,
Visiting Surgeon

On May 31, Dr. Edward D. Churchill was admitted to the Honorary Fellowship (sodalis honorarius) of the Royal College of University Surgeons of Denmark (Collegium Regium Chirurgorum Universitatum Daniae).

* * *

Three letters from Dr. John H. Knowles, our General Director, were sent to all members of the MGH Staff since our last issue. In order that our subscribers who are away from the Hospital may read these letters, THE NEWS gives them to you now.

On July 1st, a distinguished surgical career that has brought honor and distinction to this Hospital culminated in the retirement of Dr. Edward Delos Churchill who becomes John Homans Professor of Surgery, Emeritus, at Harvard Medical School. Dean Berry said, "Dr. Churchill's professional tenure was one of the longest and most important in the history of Harvard Medical School." One of his former pupils wrote in the dedication of a scientific monograph, "To Edward D. Churchill, M.D. who, more than any other, brought the standards of the university into the hospital."

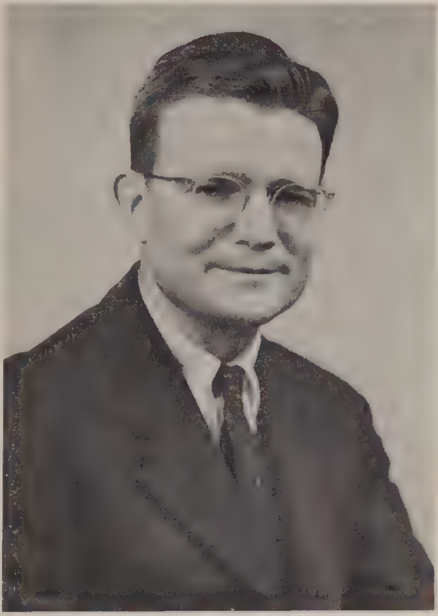
I shall not attempt to eulogize a man of Dr. Churchill's stature nor am I able to express adequately the deep feeling of a venerable institution for one of its most valued Chiefs.

The character of his service to hospital, university, community, and country has been tinctured with sensitivity, scholarship, wisdom, and eloquence.

The M.G.H. wishes Dr. Churchill well and expresses its gratitude as it views with pleasure his contributions in the vineyards of the M.G.H. and the H.M.S. His interest and counsel in the years to come have been assured us—be he in Baghdad or Belmont. A felicitous and warm salute!

It gives me great pleasure to announce that, effective July 1st of this year, Dr. Paul S. Russell succeeded Dr. Edward Delos Churchill as Chief of the General Surgical Services at the Massachusetts General Hospital and John Homans Professor of Surgery at Harvard Medical School.

Paul Russell is an old friend to many of us here at the M.G.H. He came here first as a surgical intern in 1948 after graduation from the University of Chicago Medical School in 1947. He completed his assistant residency here in 1951. Service in the United States Air Force from 1951 through 1953 was followed by his return to the Hospital to start his senior residency. The latter was interrupted for a year of study abroad as a postdoctoral research fellow of the United States Public Health Service under the guidance of Professor Medawar in London. Dr. Russell became Chief Resident in Surgery at the M.G.H. in 1956. Thereafter, until joining the faculty of medicine at Columbia in 1960, he was Instructor, Clinical Associate in Surgery, and Tutor in Medical Sciences at Harvard.



DR. PAUL S. RUSSELL,
CHIEF OF SURGICAL SERVICES

Since 1960 Dr. Russell has been Associate Professor of Surgery at the Columbia University College of Physicians and Surgeons and Associate Attending Surgeon at the Presbyterian and Francis Delafield Hospitals in New York City.

Dr. Russell is a Fellow of the Royal Society of Medicine, London, and a member of the American Association for the Advancement of Science, the Society of University Surgeons, and the Society for Experimental Biology and Medicine.

The M.G.H. welcomes back one of its most distinguished young alumni to one of its most important posts and looks confidently to the future. The Hospital is fortunate in having a man of such vigor, accomplishment, and dedication, and stands ready to provide the best possible environment for his successful launching.

DR. NATHAN B. TALBOT,
CHIEF OF CHILDREN'S SERVICE

It gives me great pleasure to announce that, effective July 1st of this year, the acting Chief of our Children's Service, Dr. Nathan B. Talbot, became the Chief of this service and Professor of Pediatrics at Harvard Medical School.

Dr. Talbot is a Pediatrician who has brought to the medical treatment of the young the skill of the clinician and the concern of the social scientist.

Dean Berry states, "The impact of Dr. Talbot upon American pediatrics has been significant. At the Massachusetts General Hospital he has improved the clinical care of children, particularly through his recognition of the manner in which such other services as neurology, orthopedics, psychiatry, and surgery can contribute to pediatrics."

Dr. Talbot succeeds Dr. Allan M. Butler, who retired in 1960 to become Professor of Pediatrics, Emeritus.

We look forward to the continued advance and success of the Children's Service under Dr. Talbot's guidance, and consider ourselves fortunate in having a man of his stature and accomplishments at the helm.

* * *

The Board of Trustees, at their meetings on May 11 and 25, June 8 and 22, and July 20, voted:

That Dr. Leonard Atkins, Assistant Pathologist, be granted leave of absence for one year, beginning July 1;

That the appointment of Dr. Sumner Frank, Clinical Fellow in Medicine, be concluded as of June 30.

To accept the resignations of:

Dr. Paul J. Catinella from the position of Assistant Dermatologist, effective June 30;

Dr. Virginia L. Clower from the position of Assistant Attending Psychiatrist at McLean Hospital, effective July 31;

Dr. Paul M. G. St. Aubin from the position of Associate Radiologist, effective June 30.

To rescind the appointments of:

Dr. Marianne Dierks as Clinical Fellow in Anesthesia, as of June 30;

Dr. John T. Dunn, recently reappointed a Clinical and Research Fellow in Medicine for the period July 1, 1962 through June 30, 1963;

Dr. Jack Ellenberg as Resident in Psychiatry at McLean Hospital, effective June 30;

Dr. Jose A. Rodrigues as Clinical and Research Fellow in Neurosurgery, as of June 30;

Dr. Robert G. Townley, recently appointed Clinical and Research Fellow in Medicine for the period July 1, 1962 through June 30, 1963.

To change the appointments of:

Dr. Matthew P. Dumont from Assistant Resident to that of Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Mr. Henry J. Langevin from Associate Administrator to Acting Administrator at McLean Hospital, effective April 27;

Dr. Larry H. Strasburger from Assistant Resident in Psychiatry to that of Clinical and Research Fellow in Psychiatry for one year, beginning July 1.

To appoint:

Dr. Harold Abramowitz as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. A. Scott Anderson, Jr. as Clinical Assistant in Psychiatry, beginning June 22;

Dr. John F. Bacon as Assistant Radiologist for one year, beginning September 1;

Dr. George P. Baker, Jr. as Assistant in Medicine, beginning July 1;

Dr. Karoly Balogh, Jr. as Assistant in Pathology for one year, beginning July 1;

Dr. Peter H. Berman as Clinical Fellow in Neurology, to act as Assistant Resident, for one year, beginning July 1;

Dr. William C. Bostic, III, as Assistant Resident in Orthopedic Surgery for one year, beginning July 1;

Dr. Stanley E. Bradley to serve as the James H. Means Visiting Physician, for the week of June 11;

Dr. Jerald S. Brodkey as Clinical and Research Fellow in Neurosurgery, for the period July 1, 1962 through April 30, 1963, and as Assistant Resident in Neurosurgery, beginning May 1, 1963;

Dr. Douglas Buchanan as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Peter T. Choras as Assistant Resident in Psychiatry, beginning July 1;

Dr. Cesare G. Coletta as Clinical Fellow in Anesthesia, beginning July 2;

Dr. Hiram B. Curry as Clinical and Research Fellow in Neurology for one year, beginning July 1;

Dr. Giulio J. D'Angio as Consultant in Radiology, beginning July 1;

Dr. Roman W. DeSanctis as Assistant in Medicine, beginning July 1;

Dr. Robert E. Dinsmore as Assistant Radiologist, beginning October 1;

Dr. John P. Donohue as Assistant Resident in Urology, beginning July 1;

Dr. William A. K. Dwyer as Clinical Fellow on the Children's Service, for the period June 1 through August 31;

Dr. Larry J. Embree as Assistant Resident in Pathology, assigned to Neuropathology, beginning July 1;

Dr. Bruce Foster (for Senior Staff) as Fellow in Anesthesia, beginning November 1;

Dr. A. Erik Gundersen as Assistant in Surgery, for the period June 25 through September 6, with the privilege of seeing private patients in Dr. Hendren's office;

Dr. Richard P. Harbord as Visiting Anesthetist, for a period of six months, beginning June 1;

Dr. Stephen E. Hedberg as Assistant in Surgery, beginning July 1;

Dr. Thomas D. R. Hockaday as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. Gwendolyn R. Hogan as Clinical Fellow in Neurology, to act as Resident in Pediatric Neurology, beginning July 1;

Dr. Joshua Hollander as Assistant Resident in Neurology for one year, beginning July 1;

Dr. Lore G. Hopff as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;

Dr. Motokazu Hori as Clinical and Research Fellow in Surgery for one year, beginning September 1;

Dr. Douglass H. Howry as Clinical Fellow in Radiology, beginning August 1, with the understanding that when he obtains his permanent Massachusetts license he is to be an Assistant Radiologist;

Dr. John B. Isom as Clinical Fellow in Neurology and Research Fellow in Neurosurgery for one year, beginning July 1;

Dr. George A. Jacoby, Jr. as Clinical and Research Fellow in Medicine, for the period July 5 through September 8;

Dr. Hershel Jick as Clinical Assistant in Medicine at McLean Hospital, beginning July 1;

Dr. Eda M. Kahana as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Paul K. Katrinakis as Clinical and Research Fellow in Neurology, assigned to Electroencephalography, for a period of six months, beginning July 1;

Dr. Bernard Kliman as Assistant in Medicine for one year, beginning July 1;

Dr. George F. Kwass as Assistant in Pathology for one year, beginning July 1;

Dr. Miguel A. Leibovich as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Carl M. Leventhal as Clinical Fellow in Neuropathology for one year, beginning July 1;

Dr. Norman S. Lichtenstein as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Ronald A. Malt as Assistant in Surgery, beginning July 1;

Dr. Aleksander Mathé as Assistant Resident in Psychiatry for one year, beginning July 1;

Dr. Bucknam McPeek as Assistant in Anesthesia, beginning July 15;

Dr. Alexander M. McPhedran as Clinical and Research Fellow in Neurology for one year, beginning July 1;

Dr. Edward Messner as Assistant Psychiatrist, beginning July 1;

Dr. Eugene J. Morrissey as Assistant Resident in Orthopedic Surgery, for a period of two months, beginning August 1;

Dr. Norman C. Nelson as Clinical and Research Fellow in Surgery, beginning July 1;

Dr. Shyam S. Pant as Clinical Fellow in Neurology, to act as Assistant Resident, for one year, beginning July 1;

Dr. Ernest H. Picard as Assistant in Neurology, beginning July 1;

Dr. Rudolph W. Pierce as Clinical Assistant in Surgery, with the privilege of assisting Drs. Meigs, Ingersoll, and Green in the care of their private patients, for one year, beginning July 1;

Dr. Aldo Pinchera as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Jack R. Rishikof as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Robert J. Robl as Clinical Fellow in Radiology for one year, beginning July 1;

Dr. Peter B.-B. Rosenberger as Clinical Fellow in Neurology, to act as Assistant Resident, for one year, beginning July 1;

Dr. Murray K. Rosenthal as Assistant in Pediatrics, beginning July 1;

Dr. Sanford I. Roth as Assistant in Pathology, beginning July 1;

Dr. Byron N. Rudolph as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Charles A. Sanders as Assistant in Medicine, beginning July 1, subject to his having permanent Massachusetts license;

Dr. Allan I. Sandler as Assistant in Medicine, beginning July 1;

Dr. Lewis Sasse as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Evelyne Schwaber as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Robert B. Scoggins as Clinical and Research Fellow in Dermatology, beginning July 1;

Dr. T. David Seigne as Assistant in Anesthesia, beginning June 1;

Dr. Shyam P. Singh as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. Clement B. Sledge as Clinical Assistant in Orthopedic Surgery, for the period of one month, beginning July 1, then be promoted to Senior Resident in Orthopedic Surgery, for the period August 1 through December 31;

Dr. Menno E. Sluijter as Clinical Fellow in Anesthesia, for one year, beginning February 1, 1963;

Dr. Edward L. Socolow as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Sergio Stipa as Clinical and Research Fellow in Surgery for one year, beginning June 1;

Dr. Edgar B. Thompson, III, as Assistant Resident in Orthopedic Surgery for one year, beginning July 1;

Dr. Robert G. Townley as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Robert Tym as Clinical and Research Fellow in Neurosurgery for one year, beginning September 1;

Dr. Peter H. van der Walde as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Arnold N. Weinberg as Assistant in Medicine, beginning October 1;

Dr. Harold A. Wilkinson as Assistant Resident in Neurosurgery, beginning September 1;

Dr. Dorothy Wilson as Exchange Assistant Resident on the Children's Service, for the period July 1 through August 10;

Dr. Jack Wittenberg as Second Assistant Resident in Radiology, beginning July 1, 1963;

Dr. Livingston M. F. Wong as Second Assistant Resident in Surgery, beginning July 1;

Dr. Robert R. Young as Assistant Resident in Neurology for one year, beginning July 1;

Dr. George F. Zinninger as Second Assistant Resident in Radiology, beginning July 1, 1963.

The Trustees also voted unanimously:

To elect Mr. Edwin W. Hiam as an Associate Trustee, to serve a two-year term;

To appoint Dr. Paul S. Russell as Chief of Surgical Services, to succeed Dr. Churchill on his retirement;

To appoint Dr. Nathan B. Talbot as Chief of the Children's Service.

At their meetings on May 16, 23, and 29, during June and July, and on August 1, the General Executive Committee voted:

To extend the appointment of Dr. Sheldon Cooperman as Clinical Fellow and Acting Resident in Pathology, for the period July 1 through October 31;

To rescind the reappointment of Dr. Richard L. Jacobs as Research Fellow in Orthopedic Surgery, beginning July 1;

To assign Dr. R. Lewis Wright to the V.A. Hospital as Senior Resident in Neurosurgery, for a period of eight months beginning September 1.

To promote:

Dr. William M. Abbott to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. Arthur K. Asbury to the position of Resident in Neurology for one year, beginning July 1;

Dr. John F. Barlow to the position of Resident in Pathology for one year, beginning July 1;

Dr. Joseph R. Barrie to the position of Second Assistant Resident in Surgery, beginning July 1;

Dr. John D. Burrington to the position of Second Assistant Resident in Surgery, beginning July 1;

Dr. William B. DeLong to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. Louis H. Edmunds, Jr. to the position of First Assistant Resident in Surgery, beginning July 1;

Dr. Josef E. Fischer to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. F. Daniel Foley to the position of First Assistant Resident in Pathology for one year, beginning July 1;

Dr. Elwin E. Fraley to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. James M. Gibson to the position of Third Assistant Resident in Pathology for one year, beginning July 1;

Dr. Jack J. Greenberg to the position of First Assistant Resident in Surgery, beginning July 1;

Dr. Nathan T. Griscom to the position of Resident in Radiology, beginning July 1;

Dr. Thomas R. Hakala to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. Richard C. Hirschhorn to the position of Senior Assistant Resident in Urology for one year, beginning July 1;

Dr. Lewis P. James, Jr. to the position of Resident in Pathology for one year, beginning July 1;

Dr. Herbert I. Krickstein to the position of Resident in Pathology for one year, beginning July 1;

Dr. Burnham E. Lamkins to the position of Resident in Dermatology, beginning July 1;

Dr. Edward Lowenstein to the position of Chief Resident in Anesthesia, beginning July 1;

Dr. Donald M. McKee to the position of First Assistant Resident in Surgery, beginning July 1;

Dr. Abbott R. Miller to the position of First Assistant Resident in Radiology for one year, beginning July 1;

Dr. Gerald S. Moss to the position of Second Assistant Resident in Surgery, beginning July 1;

Dr. Leslie W. Ottinger to the position of Second Assistant Resident in Surgery, beginning July 1;

Dr. Anthony S. Patton to the position of First Assistant Resident in Surgery, beginning July 1;

Dr. Don C. Pearl, Jr. to the position of Second Assistant Resident in Surgery, beginning

July 1;

Dr. William L. Strickler to the position of Resident in Urology for one year, beginning July 1;

Dr. Dale E. Wenlund to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. Bruce E. Zawacki to the position of Third Assistant Resident in Surgery, beginning July 1.

To continue the appointments of:

Dr. Edward P. Baker, Jr. as Assistant Resident in Neurosurgery, assigned to the private service, for eight months, beginning September 1;

Dr. Earl F. Jordan as Assistant Resident in Neurosurgery, assigned to the Neurology Service, for eight months, beginning September 1.

To reappoint:

Dr. David W. Allen as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Edward F. Balius as Assistant Resident in Anesthesia for one year, beginning August 1;

Dr. Károly Balogh as Clinical and Research Fellow in Pathology, retroactive to May 1, 1961, through June 30, 1962;

Dr. William H. Batchelor as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Peter L. Bergquist, Ph.D. as Research Fellow in Medicine for one year, beginning September 12;

Dr. John A. Bolzan as Clinical Fellow in Medicine for one year, beginning July 1;

Dr. Philip R. Boyd as Clinical and Research Fellow in Psychiatry, retroactive to January 9;

Dr. Bob Bullwinkel as Assistant Resident in Anesthesia for one year, beginning May 15;

Dr. James R. Callison as Third Assistant Resident in Surgery, beginning June 1, and to promote him to the position of Second Assistant Resident in Surgery, beginning July 1,

Dr. Robert W. Carey as Clinical Fellow in Medicine for one year, beginning July 1;

Dr. Ock S. Choi as Clinical Fellow in Medicine for one year, beginning July 1;

Dr. George H. Collins as Clinical and Research Fellow in Neurology, retroactive to July 1, 1961, through June 30, 1962;

Dr. Paul A. Crabbé as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. Albert Damon as Clinical Fellow in Medicine for one year, beginning September 1;

Dr. Peter A. Del Giudice as Assistant Resident in Anesthesia for one year, beginning July 1;

Dr. Gerhart A. Duda as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. John T. Dunn as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Eric Engel as Clinical and Research Fellow in Medicine for one year, beginning October 1;

Dr. T. Corwin Fleming, with a change of title to that of Clinical Fellow and Acting Resident in Neurology, for one year, beginning July 1;

Harold M. Flowers, Ph.D. as Research Fellow in Biochemistry (Medicine) for one year, beginning October 1;

Dr. Nicoll F. Galbraith, Jr. as Second Assistant Resident in Surgery, beginning July 1;

Dr. Herbert A. Haessler as Research Fellow in Medicine for one year, beginning July 1;

Anund A. Hallen, M. K. as Research Fellow in Biochemistry (Medicine) for one year, beginning October 15;

Dr. Jónas Hallgrímsson as Clinical Fellow in Pathology for one year, beginning July 1;

Dr. Robert E. Hayes, III, with a change of title from Clinical Fellow in Neurology to that of Clinical Fellow in Neuropathology, for one year, beginning July 1;

Dr. John Hedley-Whyte as Clinical Fellow in Anesthesia for one year, beginning July 1;

Dr. Peter R. Huttenlocher, with a change of title to that of Clinical Fellow in Neurology, to act as Resident in Pediatric Neurology, for one year, beginning July 1;

Dr. Andrew Huvos as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;

Dr. Murray L. Janower as First Assistant Resident in Radiology for one year, beginning September 1;

Dr. Martin Kantor as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Shelby Kashket, Ph.D. as Research Fellow in Medicine for one year, beginning July 1;

Dr. Bruce W. Konigsmark as Research and Clinical Fellow in Neuropathology for one year, beginning July 1;

Dr. George Küry, with a change of title to that of Clinical and Research Fellow in Pathology, for one year, beginning July 1;

Dr. Nelson R. Lampert as Second Assistant Resident in Surgery, beginning July 1;

Dr. Charles M. Lapiere as Research Fellow in Medicine for one year, beginning October 1;

Dr. Austra Likais as Clinical Fellow in Medicine, beginning June 1;

Dr. S. Bert Litwin as Third Assistant Resident in Surgery, for a period of six months, beginning July 1;

Dr. Tecla O. Lovina as Clinical Fellow in Medicine for one year, beginning July 1;

Dr. Donald McCaughan as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. William F. McCourt as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Guy M. McKhann, with a change of title to that of Clinical Fellow in Neuropathology, for one year, beginning July 1;

Dr. Rita A. Manzi as Assistant Resident in Anesthesia for one year, beginning August 1;

Dr. West T. Moore as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Leonard A. Moroz as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Roger H. Morris as Assistant Resident in Anesthesia for one year, beginning July 8;

Dr. Gustave C. E. Mueller as Second Assistant Resident in Surgery, beginning July 1;

Dr. John D. Murphy as Assistant Resident in Anesthesia for one year, beginning July 1;

Yutaka Nagai, Ph.D. as Research Fellow in Medicine for one year, beginning October 23;

Dr. Charles A. Nagant de Deuxchaisnes as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. Hans B. Nevinny-Stickel as Clinical Fellow in Medicine for one year, beginning July 1;

Dr. Richard A. Norton as Clinical Fellow in Medicine for one year, beginning November 1;

Dr. Harry S. Olin as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Robert S. Pinals as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Gerald R. Plotkin as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Arthur L. Prensky, with a change of title to that of Clinical Fellow and Acting Resident in Neurology, for one year, beginning July 1;

Dr. M. Ramakrishna Raju as Research Fellow in Physics (Medicine) for one year, beginning September 1;

Dr. John P. Remensnyder, Jr. as Second Assistant Resident in Surgery, beginning July 1;

Dr. George W. Rever as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Jack O. Rice as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Victor J. Rosen, Jr., with a change of title to that of Clinical Fellow in Pathology, for one year, beginning July 1;

Dr. Hugues Ryser as Clinical Fellow in Medicine for one year, beginning September 15;

Dr. Harilaos T. Sakellarides as Clinical and Research Fellow in Orthopedic Surgery for one year, beginning July 1;

Dr. John E. Salvaggio as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Lawrence C. Salvesen as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Mei Satake as Research Fellow in Medicine for one year, beginning September 1;

Dr. David G. Satin as Clinical and Research Fellow in Psychiatry, for the period July 1 through September 30;

Dr. Robert H. Schapiro as Clinical and Research Fellow in Medicine, for the period July 1 through December 31;

Dr. Jeremiah E. Silbert as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. David B. Skinner as Second Assistant Resident in Surgery, beginning July 1;

Dr. Charles Sorbie as Clinical Fellow in Orthopedic Surgery for one year, beginning July 1, with the privilege of assisting Dr. Edwin F. Cave in the care of his private patients;

Mary J. Spiro, Ph.D. as Research Fellow in Medicine for one year, beginning July 1;

Dr. Danuta M. Stachiewicz as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Judith A. Tassie as Clinical Fellow in Anesthesia for one year, beginning July 1;

Dr. Captane P. Thomson as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Katuhiko Tokita as Research Fellow in Medicine for one year, beginning September 1;

Dr. Howard A. Trachtenberg as Assistant Resident in Anesthesia for one year, beginning July 1;

Dr. Alfred D. Weiss as Clinical Fellow in Neuropathology, retroactively for one year, beginning July 1, 1961; it was further voted that he be reappointed, with a change of title to that of Clinical and Research Fellow in Neurology, for one year, beginning July 1;

Dr. G. Melville Williams as Second Assistant Resident in Surgery, beginning June 1;

Dr. Gerald F. Winkler as Clinical and Research Fellow in Neurology for one year, beginning July 1;

Dr. Richard H. Wohl as Second Assistant Resident in Surgery, beginning July 1;

Dr. Hubert J. Wolfe as Clinical and Research Fellow and Acting Assistant Resident in Pathology for one year, beginning July 1;

Dr. Jacob C. Wolterbeek as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Gilbert F. Young, with a change of title to that of Clinical Fellow in Neuropathology, for one year, beginning July 1.

To appoint:

Dr. Ram M. Behki as Research Fellow in Pathology for one year, beginning July 15;

Dr. Joseph H. Brenner as Clinical Assistant in Psychiatry, beginning July 1;

Robert A. Darrow, Ph.D. as Research Fellow in Biological Chemistry, retroactive to November 15, 1961. It is understood that this appointment will terminate on October 31;

Dr. Donald J. Fern as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Murray H. Helfant as Assistant Resident in Neurosurgery, assigned to Neuroradiology, for eight months, beginning September 1;

Lee V. Leak, Ph.D. as Research Fellow in Surgery for one year, beginning September 1;

Dr. Kilmer S. McCully as Research Fellow in Medicine for one year, beginning July 1;

Dr. Gordon K. MacLeod as Clinical Fellow in Medicine for one year, beginning July 1;

Mr. David A. MacSweeney as Research Fellow in Anesthesia, for the period July 15 through October 15;

George D. Maier, Ph.D. as Research Fellow in Pathology for one year, beginning July 1;

Hubert L. Mayer, Ph.D as Research Fellow in Biological Chemistry for one year, beginning September 1;

Mr. John A. Myhill as Research Fellow in Medicine for one year, beginning October 1;

Dr. Hiroshi Nikaido as Research Fellow in Biological Chemistry for one year, beginning

January 1;

Dr. Patrick F. Noone as Assistant Resident in Anesthesia for one year, beginning May 1;

Dr. Suraj Prakash as Research Fellow in Pathology for one year, beginning July 1;

Dr. Eric L. Radin as Research Fellow in Orthopedic Surgery, for a period of three months, beginning July 1;

Nathan Sharon, Ph.D. as Research Fellow in Biochemistry (Medicine) for one year, beginning September 1;

Dr. Geoffrey W. G. Sharp as Research Fellow in Medicine for one year, beginning September 1;

Dr. Haruo Sugano as Research Fellow in Pathology for one year, beginning September 1;

Dr. Julius W. Taylor as Graduate Student Assistant in Surgery, for the period June 23 to July 23;

Dr. Edward D. Williams as Research Fellow in Pathology for one year, beginning November 1;

Dr. Harold W. Williams, Jr. as Clinical and Research Fellow in Psychiatry for one year, beginning July 1.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter, and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

Biochemistry

Bergmann, F. H., Levine, L., and Spiro, R. G.
Fetuin: Immunochemistry and quantitative estimation in serum.
Biochim. et biophys. acta 58:41.

Drabikowski, W., Maruyama, K., Kuehl, W. M., and Gergely, J.
Studies on the depolymerization of F-actin.
J. Gen. Physiol. 45:595A.

Kamiyama, S., and Schmid, K.
Studies on the structure of α_1-acid glycoprotein: II. Preparation and characterization of a glycopeptide fraction.
Biochim. et biophys. acta 58:80.

Martonosi, A.
Intermediate polymers of actin.
J. Gen. Physiol. 45:610A.

Martonosi, A.
The specificity of the interaction of adenosine triphosphate with G-actin.
Biochim. et biophys. acta 57:163.

Maruyama, K., and Gergely, J.
Interaction of actomyosin with adenosine triphosphate at low ionic strength: I. Dissociation of actomyosin during the clear phase.
J. Biol. Chem. 237: 1095.

Maruyama, K., and Gergely, J.
Interaction of actomyosin with adenosine triphosphate at low ionic strength: II. Factors influencing clearing and superprecipitation: Adenosine triphosphatase and birefringence of flow studies.
J. Biol. Chem. 237:1100.

Noda, H., Maruyama, K., and Gergely, J.
End-to-end aggregation of myosin.
Biochim. et biophys. acta 58:598.

Schmid, K., Kamiyama, S., Binette, J. P., and Pfister, V.
Resolution and characterization of the α_1-acid glycoprotein variants.
Fed. Proc. 21: 407E.

Spiro, M. J., and Spiro, R. G.
Composition of the peptide portion of fetuin.
J. Biol. Chem. 237:1507.

Endocrinology

Benedict, P. H.
Use of small doses of the newer oral progestogens.
J. Am. M. Women's A. 17:332.

Endoscopy

Benedict, E. B.
Benign stenoses of the esophagus.
In Current gastroenterology, G. McHardy, Editor, New York, Hoeber-Harper, chap. 2.

Benedict, E. B.
Review of recent literature on bronchoscopy.
Current Med. Practice 6:51.

General Surgery

Herbst, A. L., Skinner, D. B., Anderson, L., Raker, J. W., and Austen, W. G.
Factors influencing the disappearance of nitrogen mustard from blood.
Ann. Surg. 156:307.

Skinner, D. B., Herbst, A. L., Austen, W. G., and Raker, J. W.
A simplified technique of intra-arterial infusion for regional chemotherapy.
Surg. Gynec. & Obst. 115:242.

Laboratory Science

Arnason, B. G., Jankovic, B. D., and Waksman, B. H.
Effect of thymectomy on 'delayed' hypersensitive reactions.
Nature 194:99.

Dvorak, H. F., and Waksman, B. H.
Primary immunization of lymph node cells in millipore chambers by exposure to homograft antigen.
J. Exper. Med. 116:1.

Morgan, W. S., Perlmann, P., and Hultin, T.
Characterization of the pattern of amino acid incorporation in cell-free liver systems by autoradiography of precipitin reactions.
J. Cell Biol. 12:628.

Senior, J. R., and Isselbacher, K. J.
Direct esterification of monoglycerides with palmityl coenzyme A by intestinal epithelial subcellular fraction.
J. Biol. Chem. 237:1454.

Waksman, B. H.
Auto-immunization and the lesions of autoimmunity.
Medicine 41:93.

Waksman, B. H., and Adams, R. D.
A histologic study of the early lesion in experimental allergic encephalomyelitis in the guinea pig and rabbit.
Am. J. Path. 41:135.

Medical Research

Lotz, M., and Smith, L. H., Jr.
The effect of reticulocytosis in the rabbit on the activities of enzymes in pyrimidine biosynthesis.
Blood 19:593.

Rabkin, M. T., Frederick, E. W., Lotz, M., and Smith, L. H., Jr.
Pyrimidine metabolism in man. V. The measurement *in vivo* of the biochemical effect of antineoplastic agents in animal and human subjects.
J. Clin. Invest. 41:871.

Neurology

Aström, K.-E., and Waksman, B. H.
The passive transfer of experimental allergic encephalomyelitis and neuritis with living lymphoid cells.
J. Path. & Bact. 83:89.

Orthopedic Surgery

Little, J. B.
Destructive bone lesion following injury.
J.A.M.A. 181:248.

MacAusland, W. R., Jr.
Fracture of the medial epicondylar epiphysis of the humerus.
Am. J. Surg. 104:77.

Millard, D. G., and Lee, T. H.
"The-twist" fracture dislocation of the patella.
New England J. Med. 267: 246.

Otolaryngology

Kelemen, G.
Histology of the nasal and paranasal cavities of germfree-reared and ex-germfree rats.
Acta Anat. 48:108.

Kelemen, G.
Osso temporale e tumori: Rapporti reciproci.
Arch. ital. di otol. 73:1.

Physical Medicine

Watkins, A. L.
Ability not disability—The key to rehabilitation.
J.A.M.A. 180:495.

Physiology

Downing, S. E., Remensnyder, J. P., and Mitchell, J. H.
Cardiovascular responses to hypoxic stimulation of the carotid bodies.
Circulation Res. 10:676.

Psychiatry

Chafetz, M. E., Demone, H. W., Jr., and Solomon, H. C.
Alcoholism: Its cause and prevention.
New York J. M. 62:1614.

Sifneos, P. E.
Tutorial: A useful way to teach psychiatry to senior medical students.
Am. J. Psychiat. 118:832.

Stoeckle, J. D., and Davidson, G. E.
The use of "crisis" as an orientation for the study of patients in a medical clinic.
J. M. Educ. 37:604.

Radiology

Griscom, N. T., and Wang, C. C.
Radiation therapy of inoperable breast carcinoma.
Radiology 79:18.

Little, J. B.
Large solitary pulmonary nodule.
J.A.M.A. 180:234.

Little, J. B.
Pain and abdominal mass following appendectomy.
J.A.M.A. 180:544.

Pendergrass, H. P., Tristan, T. A., Blakemore, W. S., Sellers, A. M., Jannetta, P. J., and Murphy, J. J.
Roentgen technics in the diagnosis and localization of pheochromocytoma.
Radiology 78:725.

Skinner, D. B., Dreyfuss, J. R., and Nardi, G. L.
Azygography in the evaluation of operability of pulmonary carcinoma.
New England J. Med. 267:232.

Wang, C. C., and Schulz, M. D.
The role of radiation therapy in the management of carcinoma of the sigmoid, rectosigmoid, and rectum.
Radiology 79:1.

Webster, E. W., and Wipfelder, R.
Limitations of combined image amplifier-television systems for medical fluoroscopy.
IRE Tr. Bio-Med. Electron. BME-9:150.

Books

Watkins, A. L.
Manual of electrotherapy, ed. 2.
Philadelphia, Lea & Febiger.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

Abramson, D. I. (Editor)
Blood vessels and lymphatics.
New York, Academic Press, Inc., 1962.
(15B)

Academy of Sciences of the USSR. Institute of Cytology.
Problems of cytology and protistology.
Moskova-Leningrad, Izdatel'stovo Akademii Nauk SSSR, 1960.
(2Am)

Academy of Sciences of the USSR. Institute of Higher Nervous Activity.
Works. Physiological series, vol. 3, 1962.
Washington, D.C., National Science Foundation, 1962.
(19A)

Adams, R. (Editor)
Organic reactions, vol. 12.
New York, John Wiley & Sons, Inc., 1962.
(5P)

Adams, W. R., and Veith, I. (Editors)
Pulmonary circulation.
New York, Grune & Stratton, 1959.
(15C)

Aronson, S. M., and Volk, B. W. (Editors)
Symposium on the cerebral sphingolipidoses.
New York, Academic Press, Inc., 1962.
(19R)

Artz, C. P. (Editor)
International Congress on research in burns.
Washington, D.C., American Institute of Biological Sciences, 1962.
(23Z)

Association of Clinical Pathologists.
The adrenal cortex, edited by G. K. McGowan and M. Sandler.
Philadelphia, J. B. Lippincott Company, 1961.
(14T)

Austin, R. B.
Early American medical imprints, 1668-1820.
Washington, D.C., U.S. Government Printing Office, 1961.
(1Mu)

Bakwin, H., and Bakwin, R. M.
Clinical management of behavior disorders in children, ed. 2.
Philadelphia, W. B. Saunders Company, 1960.
(19O)

Ballou, H. W. (Editor)
Guide to microphotographic equipment, ed. 2.
New York, National Microfilm Association, 1962.
(1B)

Barker, W. F. (Editor)
Surgical treatment of peripheral vascular disease.
New York, McGraw-Hill Book Company, Inc., 1962.
(15D)

Bender, G. A.
Great moments in medicine.
Detroit, Parke-Davis, 1961.
(1F)

Billingham, R. E. (Editor)
Transplantation of tissues and cells.
Philadelphia, The Wistar Institute Press, 1961.
(23N)

Bloomfield, A. L.
A bibliography of internal medicine: Selected diseases.
Chicago, University of Chicago Press, 1960.
(1Ah)

Bock, K. D. (Editor)
Shock: Pathogenesis and therapy.
Berlin, Springer-Verlag, 1962.
(8H)

Bowditch, H. T.
On paracentesis thoracis with an analysis of cases.
Philadelphia, T. K. and G. P. Collins, Printers, 1852.
(23Q)

Brocher, J. E. W.
Die Wirbeisäulenleiden und ihre Differentialdiagnose, 3. Ehweiterte Aufl.
Stuttgart, George Thieme, 1962.
(7R)

Buck, R. C. (Editor)
Studies in modern analysis.
Englewood Cliffs, N. J., Prentice-Hall, Inc., 1962.
(36L)

Burchfield, H. P., and Storrs, E. N.
Biochemical applications of gas chromatography.
New York, Academic Press, Inc., 1962.
(5A)

Butler, J. A. V. (Editor)
Progress in biophysics and biophysical chemistry, vol. 12.
New York, Pergamon Press, 1962.
(2Am)

Chafetz, M. E., and Demone, H.
Alcoholism and society.
New York, Oxford University Press, 1962.
(13Y)

Chepinoga, O. P.
The biological role of nucleic acids.
Washington, D.C., U.S. Department of Commerce, 1961.
(5B)

Coon, M. J. (Editor)
Biochemical preparations, vol. 9.
New York, John Wiley & Sons, Inc., 1962.
(5A)

Danowski, T. S.
Clinical endocrinology, 4 vols.
Baltimore, The Williams & Wilkins Company, 1962.
(14L)

Dock, W. (Editor)
Advances in internal medicine, vol. 11.
Chicago, The Year Book Publishers, Inc., 1962.
(6G)

Fein, R.
Economics of mental illness.
New York, Basic Books, Inc., 1958.
(19S) In Sarah Potter Evarts Memorial Library

Feingold, S. N.
Scholarships, fellowships and loans, vol. 4.
Cambridge, Mass., Bellman Publishing Company, 1962.
(1Af)

Ferguson, F. C., Jr.
Drug therapy.
Philadelphia, Lea & Febiger, 1962.
(22D)

Figgins, L.
Repeated blood transfusion in the treatment of bone and joint infections.
New York, Cambridge University Press, 1962.
(18E)

Fraenkel-Conrat, H.
Design and function at the threshold of life: The viruses.
New York, Academic Press, Inc., 1962.
(8G)

Glass, B. (Editor)
Survey of biological progress, vols. 3 and 4.
New York, Academic Press, Inc., 1962.
(2As)

Goepp, R. M.
State board questions and answers, ed. 10.
Philadelphia, W. B. Saunders Company, 1962.
(1N)

Grant, R. P.
Clinical electrocardiography: The spatial vector approach.
New York, The Blakiston Company, 1957.
(15E)

Grenell, R. G. (Editor)
Progress in neurobiology, vol. 5. Neural physiopathology.
New York, Harper & Row, 1962.
(19Ab)

Hamilton, W. F. (Editor)
Circulation, sec. 2, vol. 1 of Handbook of physiology.
Washington, D.C., American Physiological Society, 1962.
(15C)

Harrison, T. R., and others. (Editors)
Principles of internal medicine, ed. 4.
New York, McGraw-Hill Book Company, Inc., 1962.
(6G)

Joint Commission on Mental Illness and Health.
Action for mental health.
New York, Basic Books, Inc., 1961.
(19S) In Sarah Potter Evarts Memorial Library

Keele, C. A., and Neil, H. (Editors)
Applied physiology by Samson Wright, ed. 10.
New York, Oxford University Press, 1961.
(4A)

Kilgour, F. G.
Library of the medical institution of Yale College and its catalogue of 1865.
New Haven, Yale University Press, 1961.
(1Ca)

Klein, A., and others.
Slipped capital femoral epiphysis.
Springfield, Ill., Charles C. Thomas, 1953.
(18E)

Lankenau Hospital, Philadelphia.
Muscle as a tissue, edited by K. Rodahl and S. Horvath.
New York, McGraw-Hill Book Company, Inc., 1962.
(4E)

Lederer, M. (Editor)
Chromatographic reviews, vol. 4.
Amsterdam, Elsevier Publishing Company, 1962.
(5A)

Luck, J. M. (Editor)
Annual review of biochemistry, vol. 31.
Palo Alto, Annual Reviews, Inc., 1962.
(5A)

Maxwell, M., and Kleeman, C. R.
Clinical disorders of fluid and electrolyte metabolism.
New York, McGraw-Hill Book Company, Inc., 1962.
(5M)

Menninger, K.
A psychiatrist's world. The selected papers of Karl Menninger.
New York, The Viking Press, 1959.
(19S) In Sarah Potter Evarts Memorial Library

Miale, J. B.
Laboratory medicine-hematology, ed. 2.
St. Louis, The C. V. Mosby Company, 1962.
(14B)

Montagna, W. (Editor)
Advances in biology of skin, vol. 2.
New York, Pergamon Press, 1961.
(27B)

Neurath, H., and Bailey, K.
The proteins, vol. 1A, 2A and 2B.
New York, Academic Press, Inc., 1953-54.
(5B)

Pack, G. T., and Ariel, I. M. (Editors)
Treatment of cancer and allied diseases, ed. 2, vol. 7.
New York, Paul B. Hoeber, Inc., 1962.
(13V)

Parsons, L.
Gynecology.
Philadelphia, W. B. Saunders Company, 1962.
(24A)

Raven, C. P.
Oogenesis: The storage of developmental information.
New York, Pergamon Press, 1961.
(3G)

Revici, E.
Research in physiopathology as basis of guided chemotherapy with special application to cancer.
New York, American Foundation for Cancer Research, 1961.
(22Yc)

Roberts, E. (Editor)
U. S. Air Force symposium on inhibition in the nervous system and gamma-aminobutyric acid.
New York, Pergamon Press, 1960.
(19C)

Rosebury, T.
Microorganisms indigenous to man.
New York, The Blakiston Company, 1962.
(9B)

Rytand, D. A. (Editor)
Annual review of medicine, vol. 18.
Palo Alto, Annual Reviews, Inc., 1962.
(IJ)

TeLinde, R. W.
Operative gynecology, ed. 3.
Philadelphia, J. B. Lippincott Company, 1962.
(24A)

United States Government Organization Manual.
Washington, D.C., U.S. Government Printing Office, 1962.
(1A)

U. S. National Cancer Institute.
Monograph No. 7.
Washington, D.C., U.S. Government Printing Office, 1962.
(13V)

U. S. National Library of Medicine.
Bibliography of medical reviews, vol. 6.
Washington, D.C., U.S. Government Printing Office, 1961.
(1B)

Wallis, H.
Masked epilepsy.
Baltimore, The Williams & Wilkins Company, 1956.
(19Fe)

Watkins, A. L.
A manual of electrotherapy, ed. 2.

Philadelphia, Lea & Febiger, 1962.
(220)

World medical periodical, ed. 3.
London, British Medical Association, 1961.
(41B)

Zuckerman, S. (Editor)
The ovary, 2 vols.
New York, Academic Press, Inc., 1962.

MASSACHUSETTS GENERAL STAFF ASSOCIATES

The Executive Board of the Massachusetts General Staff Associates has received a number of communications in recent months, with comments about its activities. Fortunately, most have been favorable and thus, naturally, welcome; but more important have been the evidences of staff interest and the constructive suggestions which have been helpful in directing the deliberations and plans of the Executive Board. We would urge that you continue to needle us with suggestions and comments about the manner in which we are fulfilling our duties, since we represent a large body of the staff.

Earlier in the summer, each member of the active staff received a letter from the Director indicating a continued concern by the administration regarding future planning in the Hospital. The renovation of Bulfinch 3 and the addition of an X-ray unit in the Emergency Ward were cited as examples of plans already under way or contemplated. Others are in the planning stage or are merely part of the contemplated program for improving the facilities of the Hospital.

A joint meeting called by the Director and the Executive Board of the Staff Associates was held on October 2, at which time there was an up-to-date report by the Director on present and future plans for the Hospital. These plans, of vital concern to the active staff, have been discussed by the Executive Board on several occasions. It is felt desirable and appropriate that this information should be transmitted to the active staff, after which there will be opportunities for free discussion and questions.

Any further comments or suggestions from staff members concerning the several topics indicated in earlier communications to the Associates will be welcomed.

Bradford Cannon, M.D.,
Chairman

HARVARD MEDICAL CHORUS

The Harvard Medical Chorus began its fifth season on October 2, but it will be open to new members for the next two rehearsals—October 9 and 16.

Rehearsals are held weekly from 6 to 7:15 P.M. in the Boston Lying-in Auditorium. Concerts are given in December and early May.

The chorus is composed of students, doctors, nurses, technicians, secretaries, dietitians, and wives from the Harvard Medical School and its affiliated hospitals. We welcome new members who would enjoy the opportunity to sing good music under an experienced conductor.

VOLUNTEER GROUPS

A new course for Directors of Hospital Volunteers is being given here at the Hospital from October 1 through 26, under the supervision of Miss Mary Ruth Wolf, Director of our Volunteer Unit. The course includes lectures from hospital administrators and community leaders. Information, including a detailed description of the course, entrance requirements, and expenses involved may be procured from Miss Wolf's office in the Moseley Building here at the Hospital.

DISTAFF CLUB

A delightful party was given by Dr. and Mrs. John H. Knowles and the Distaff Club on the afternoon of July 12. The purpose of the party was to make it possible for all the invited guests to meet the members of the House Staff and their wives—particularly our new members from other countries.

An accordion player furnished the background music, and delicious refreshments were served.

Judge Jenny Loitman Barron spoke at the first meeting of our 1962-63 season, held in the Walcott House on September 25. Judge Barron is the first woman judge to be selected for the Superior Court of Massachusetts.

On October 23, the Club and Don Leake (a dental resident) and his musical group will entertain the visitors to M.G.H. from other countries.

The Distaff Club will give a Halloween party for some of the M.G.H. patients toward the end of October.

* * *

Dr. Alfred L. Frechette, President of the Medical Foundation, has announced the award of a grant of $22,695 for a two-year research project to Dr. Francis L. A. de Marneffe, Associate Psychiatrist at McLean Hospital, and Dr. Helen J. Kenney, Consultant in Education at McLean. The title of the project is "Adapting instruction to the learning needs of emotionally disturbed adolescents". The Medical Foundation is a United Fund Agency.

According to Dr. de Marneffe, "The problem is to now provide the necessary number of adequately trained teachers to handle the situation." McLean Hospital has already gained some experience. Its school for emotionally disturbed adolescents, ages 13-21, has just completed its first year. Seven teachers (4 full time) have taught 16 students such subjects as English, History, Algebra, Latin, French, German, and Physiology.

During the next two years Drs. de Marneffe and Kenney, through various tests, observations, and discussions with the teachers involved, hope to learn "what teacher attitudes, techniques of instruction and control, and what classroom, social, and emotional climates promote the most effective learning in a group of emotionally disturbed adolescents".

When completed, the findings of the study will be published.

Dr. Frechette has also announced the award of a one-year project grant to Dr. Thomas B. Fitzpatrick, Chief of our Dermatology Service, and Dr. Hitoshi Takahashi, a Research Fellow in Dermatology at the Hospital.

Their project will concern itself with the study of the formulation of red and yellow pigments in man and other mammals—the formation of brown and black pigments being well understood already, according to Dr. Fitzpatrick.

New addresses:

Dr. Homer L. Ash (*Dn.* 1960), 29 Lincoln St., Framingham, Mass.
Dr. James B. Ayer (hon. p.), 1350 Canton Ave., Milton, Mass.
Dr. Daniel M. Bachman (clin. & res. fel. *M.* 1956), Dept. of Medicine, University of Oregon Medical School, Portland 1, Oreg.
Dr. Dudley M. Baker (sr. r.s. *Or.* 1962), U.S. Naval Hospital, San Diego, Calif.
Dr. Peter Van D. Barrett (*M.* 1961), National Cancer Institute, National Institutes of Health, Bethesda 14, Md.
Dr. Arthur E. Baue (*S.* 1955), University of Missouri Medical Center, Columbia, Mo.
Dr. Richard F. Bedell (*C.M.* 1958), 3300 Eastman Ave., Boulder, Colo.
Dr. Edward B. Benedict (*W.S.* 1926), Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.
Dr. Arthur E. Brown (clin. a. *M.*), 501 Boylston St., Boston 17, Mass.
Dr. Robert N. Buchanan, Jr. (r.p. *D.* 1941), 1905 Hayes St., Nashville 3, Tenn.
Dr. Charles E. Burden (a.r.p. *C.* 1961), 1 North St., Bath, Maine
Dr. Charles R. Campbell (r.p. *Path.* 1955), 100 S. San Mateo Drive, San Mateo, Calif.
Dr. Fernando A. Cardenal (a.r.s. *Or.* 1959), Organisation mondiale de la Santé, W.H.O., B.P. 1899, Leopoldville, République du Congo
Dr. David L. Collins (*S.* 1955), Cabarrus Medical Bldg., Ardsley Rd., Concord, N.C.
Dr. Eubert J. Daniel (res. fel. *Or.* 1961), Dept. of Pathology, Duke University School of Medicine, Durham, N.C.
Dr. Jack Ellenberg (r.p. *Psychiat.* (*McL.*) 1962), Albert Einstein College of Medicine, Bronx, N.Y.
Dr. Francis F. Foldes (r.p. *An.* 1943), Montefiore Hospital, New York 67, N.Y.
Dr. Stanford B. Friedman (*C.M.* 1958), University of Rochester School of Medicine and Dentistry, Rochester, N.Y.
Dr. Robert G. Frost (a.r.p. *An.* 1961), 56 Cuesta Vista Drive, Monterey, Calif.
Dr. Stephen E. Goldfinger (*M.* 1961), National Institutes of Health NIAMD, Bethesda 14, Md.
Dr. John W. Grover (*S.* 1957), Free Hospital for Women, Brookline, Mass.
Dr. Trygve Gundersen (S. *Oph.*), 520 Commonwealth Ave., Boston, Mass.
Dr. E. Parker Hayden (h.s. *E.S.* 1923), 249 Commonwealth Ave., Boston 16, Mass.
Dr. Gilbert Hermann (*S.* 1955), 1245 E. Colfax Ave., Denver 18, Colo.
Dr. John B. Herrmann (*S.* 1958), Div. of Basic Surgical Research, Walter Reed Army Institute of Research, Washington 12, D.C.
Dr. Myron A. Hofer (*M.* 1959), National Institutes of Health, Bethesda, Md.
Dr. George A. Jacoby, Jr. (*M.* 1959), 36 Fortismere Ave., Muswell Hill, London N. 10, England
Dr. Samuel Kaplan (a. psychiat.), 38 Hyde St., Newton Highlands, Mass.
Dr Hanna Klaus (a.r.p. *Path.* 1953), Holy Family Hospital, Rawalpindi, West Pakistan
Dr. Howard M. Kravetz (clin. & res. fel. *M.* 1962), Phoenix Medical Bldg., 909 E. Brill St., Phoenix 6, Ariz.
Dr. Robert S. Lees (*S.* 1960), Institute of

Cardiology, 35 Wimpole St., London W. 1, England (through June 30, 1963)

Dr. Carl M. Leventhal (a.r.p. *N.* 1962), Massachusetts General Hospital, Boston 14, Mass.

Dr. Gordon K. MacLeod (a.r.p. 1962), Dept. of Pharmacology, Harvard Medical School, 25 Shattuck St., Boston, Mass.

Dr. Alexander M. McPhedran (r.p. *N.* 1962), Dept. of Neurology, Massachusetts General Hospital, Boston 14, Mass.

Dr. Frank A. Mantz (res. fel. *Path.* 1950), Kansas University Medical Center, Kansas City, Kan.

Dr. Harold I. Meyer (r.s. *W.S.* 1925), 104 S. Michigan Ave., Chicago 3, Ill.

Dr. D. Glyn Millard (r.p. *R.* 1960), Box 503, Jaffrey Center, N. H.

Dr. Frances D. Milligan (clin. & res. fel. *M.* 1962), Virginia Mason Clinic, 1118 9th Ave., Seattle 1, Wash.

Dr. Walid A. Mnaymneh (sr. r.s. *Or.* 1962), American University Hospital, Beirut, Lebanon

Dr. Robert K. Osborne (*M.* 1957), Dedham Medical Associates, 743 High St., Dedham, Mass.

Dr. E. William Rosenberg (r.p. *D.* 1959), 899 Madison Ave., Memphis, Tenn.

Dr. Paul M. G. St. Aubin (*M.* 1948), 300 Palos Verdes Blvd., Redondo Beach, Calif.

Dr. Nobuaki Sasano (res. fel. *Path.* 1962), Dept. of Pathology, Tohoku University School of Medicine, Kitayobancho, Sendai, Japan

Dr. David G. Satin (r.p. *Psychiat.* (McL.) 1961), Ellsworth Air Force Base, S. Dak.

Dr. Ronald A. Seltzer (a.r.p. *R.* 1962), Radioisotope Laboratory, Cincinnati General Hospital, Cincinnati, Ohio

Dr. John R. Senior (clin. & res. fel. *M.* 1962), Medical Bldg., Philadelphia General Hospital, Philadelphia, Pa.

Dr. Claire M. Stiles (a.r.p. *An.* 1962), 11523 Adco St., Downey, Calif.

Dr. Samuel J. Sunnenblick (gr. stud. a. *S.* 1956), 19 Pleasant St., Portsmouth, N. H.

Dr. Richard C. Talamo (*C.* 1962), National Institute of Arthritic and Metabolic Diseases, Pediatric Metab. Group, 8N - 250 Clinical Center, National Institutes of Health, Bethesda 14, Md.

Dr. Richard A. Weinberg (a.r.p. *D.* 1962), 18 - 7 Valley Rd., Drexel Hill, Pa.

Dr. C. Gene Wheeler (*S.* 1956), Swiss Ave., Dallas 4, Tex.

Brief bits:

Dr. Daniel M. Bachman was a Clinical and Research Fellow in Dr. Bauer's Arthritis Group from 1954 to 1956. Since he left the Hospital, Dr. Bachman has been on the full-time faculty of the University of Oregon Medical School, in Portland, Oregon, where he has worked to develop a Division of Rheumatology. There had been no such Division in the University of Oregon Medical School in the past. On July 1, Dr. Bachman assumed the duties of Head of the Division of Rheumatology and was promoted from Assistant Professor to Associate Professor of Medicine at the University.

Dr. Henry H. Brewster (*W.M.* 1940) left the University of Colorado Medical School in July and returned to join our Psychiatry Staff. Dr. Brewster's office is in the Charles River Park Office Building, 1 Emerson Place.

Dr. Earle M. Chapman was moderator at a Panel on Thyroid Disease at Mercy Hospital, Long Island, N.Y., on March 21. On March 29, he gave a talk on "Physiologic consideration in therapy of disease of the thyroid" at Emerson Hospital in Concord, Mass.

Dr. Cope was elected president of the American Surgical Association at the meeting of the Association held in Washington, D.C., on May 11.

Dr. Oscar S. DePriest, III (*S.* 1955) has assumed the duties of Chief of the General Surgical Services at Kimbrough Army Hospital at Fort George G. Meade, Md.

Dr. Ernesto R. Lima has recently been appointed the Minister of Health in El Salvador. Dr. Lima was a Graduate Student Assistant in Cardiology at M.G.H. in 1953-1954 and again in 1959-1960.

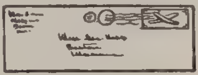
In addition to his office at 18 Moore Street in Belmont, Dr. Edward A. Nalebuff maintains a second office at 1180 Beacon Street in Brookline, Mass.

Dr. Joseph L. Shugar (a.r.s. *Or.* 1950) has been appointed Chief of the Orthopedic Service of the Jewish General Hospital in Montreal, Canada.

Dr. Arthur S. Spangler gave a lecture on "Papular dermatitis of pregnancy" at the Hospital of San Juan de los Dios in Madrid, Spain, last March. While there, he also conducted clinics at the hospital and at the Research Institute. Dr. Spangler made this comment in connection with his visit to Spain: "We hear so much about socialized medicine, that it was very interesting to study the practice of medicine under a dictator. I am more than ever grateful for the American way of life."

Rev. Paul R. Swanson, Administrative Protestant Chaplain and Director of the Institute of Pastoral Care at M.G.H., resigned as of August 31 to become Professor of Pastoral Care at the Lutheran School of Theology in Rock Island, Ill.

With the recent appointment of Dr. Renato Tagiuri (clin. fel. *An.* 1951) as Professor of Social Science at Harvard University, he becomes the 40th member of the Anesthesia Laboratory to have achieved a professorship or its equivalent. Twenty-two are in the field of anesthesia, and 18 are in other fields: 2 in anatomy, 2 in pharmacology, 1 in physiology, 3 in neurophysiology, 1 in biophysics, 2 in chemistry, 1 in mathematics, 1 in medicine, 4 in surgery, and 1 in sociology.



We were very glad to receive this letter from Dr. Dean A. Clark, our General Director from 1949 to 1961:

Thank you for your letter of July 4 and for your good wishes.

I am now Visiting Professor of Medical and Hospital Administration at the University of Pittsburgh, where I am an associate of Dr. Cecil G. Sheps, who was formerly Executive Director of Beth Israel Hospital in Boston.

My principal work at present is assisting in the conduct of a study of the nature of the affiliation between the medical schools of this country and their associated teaching hospitals. This is a nation-wide study and many interesting and complicated findings are already apparent. It is the hope of the study that it may provide some assistance to medical schools and hospitals in perfecting their arrangements for affiliation.

There may be other studies later which might interest the readers of The News. If so, I will let you know.

Best wishes.

This letter has come to us from Dr. Rodney F. Atsatt (*Or.* 1926), our "singleton" in Ojai, California:

After two years in Boston, I began practice in the Santa Barbara Clinic as the orthopedic surgeon (1927). I remained in this capacity for fifteen years.

On December 22, 1941, I was ordered to active military service and was assigned to the Naval Hospital at San Diego. While there I was retired on account of a mild Parkinson's stemming from an encephalitis which I had in WW1 at Yale Army Laboratory School.

Immediately after a token retirement, I was ordered to Section Base, Santa Barbara. My next duty was as Senior Medical Officer at Midway Islands (my rank had always been Comdr., MC, USNR). After nine months there, I was sent to USNBH 18 at Guam, where I was Chief of a very active Orthopedic Service.

With nine months out there and with accumulated leave, I was separated from the Naval Service in January 1946, having served more than four years. The little WAVE at San Francisco asked me if I didn't want to take a Refresher Course in Orthopedics!

I resumed practice in my own office and, after a few years, I brought in Dr. Leonard Burgess as a partner. I retired in 1959 on account of my Parkinson's, moved to Ojai, California, and am enjoying life here.

Dr. Robert H. Vaughan (*E.S.* 1944), our "singleton" in Columbus, Georgia, has sent us this nice letter:

I finished at the M.G.H. in 1944 and subsequently finished general and thoracic surgical training in Boston and New York, as well as serving for two years in the Service. I began private practice here in 1953. I have been certified by both specialty boards—general and thoracic.

I married the former Mary Percy of Chestnut Hill, Massachusetts, and have four children—two daughters (ages 16 and 15) and two sons (ages 12 and 7). We still have several mortgages to pay off besides getting additional ones, but private practice is challenging and most enjoyable. We like it here in Georgia, and particularly enjoy the golfing all year round, with the fishing sandwiched in between.

I well remember my year at the M.G.H., and some of the most enjoyable times I spent were on Sunday evenings with Mrs. Cushing playing the organ in the Baker Memorial Chapel while a group of us sang the old hymns that I love—some of which I still sing now in the choir at the St. Paul Methodist Church.

My regards to all those who remember me.

Dr. Frank B. Norbury (*M.* 1949), another MGH "singleton", has sent us this letter:

Thank you for your letter asking for something about me and Jacksonville, Illinois.

It seems a long time since I visited Boston and the M.G.H. I regretted that I was unable to be there for the 150th Anniversary in 1961.

For the past eight years I have been practising internal medicine and neurology here in Jacksonville—a city of 25,000 located near Springfield, Illinois. This is a college town. Illinois College and MacMurray College have been located here for over a hundred years. There is also a State Hospital and a State School for the Blind and a School for the Deaf. Practice in this community is interesting, and professionally and personally rewarding.

My chief outside interests are gardening, community activities, and, of course, my family which now numbers four children.

I was temporarily out of duty last winter and spring due to illness but have fully recovered, and am now busier than ever before.

This exciting letter has come from Dr. Harvey F. Zartman (*C.M.* 1954), our "singleton" in the entire State of Alaska:

I am indeed flattered that someone noticed there is an MGH-er this far up in the north woods.

Mine is an extremely busy practice of pediatrics in this town which has the distinction of having the highest birth rate per capita of any city in the country, and that is easy to believe every time one walks down any one of the main streets. The town swarms with children, most of them healthy and happy in this rather cold climate. I am associated with two other pediatricians and, together with one other man in solo practice in this town, we compose the entire supply of pediatricians for the entire State of Alaska, except for the government services. As a result, we do get a fair number of referrals from the outlying districts. In addition, my colleagues and I serve as consultants in pediatrics to the very large Native Health Service Hospital here in

Dr. Robert S. Shaw, Associate Visiting Surgeon

Anchorage, which cares for the Eskimo and Indian children (as well as adults) for the State of Alaska.

We currently are about to enter a lovely new general hospital which has just been completed for the city of Anchorage by the Sisters of Providence and can ultimately be enlarged to almost a 600-bed capacity. It is built along the lines of the White Building, and most of us have fond aspirations that in the far distant future it will be the center of a medical school in the State of Alaska. Currently, the University of Alaska is located several hundred miles to the north, in Fairbanks, but the Methodist Church has opened a lovely new university adjacent to our new hospital—the Alaska Methodist University, and it may become the focus for professional medical activities at some time in the future.

I have found my practice of pediatrics to be so time-consuming that I have had very little time for outside activities other than occasional picnics and hiking trips with my wife and my own children into some of our beautiful countryside. However, a large number of the doctors here own their own light planes, and flying is a major interest. Our winter season is long and our hills are high, and several of them are now equipped with lovely ski tows and other services to attract the best skiers in this and other areas. We hope to be the seat of Olympic skiing in the not too distant future.

Anchorage is not, as may sometimes be supposed, a small town far in the north land. We are now a sizable city of upwards of 60,000 people within the corporate city limits and several large suburbs immediately adjacent; and we extend from the edge of Cook Inlet all the way back to the Chugach Range (which may limit the ultimate expansion of this metropolis). We have recently completed a seaport which is now used by barges and by a number of the Japanese trading vessels, as well as by the military in transporting men and equipment to and from Alaska. We are the location for the large Elmendorf Air Force Base and for the very large Army installation at Fort Richardson, and are currently becoming the center for the gas and oil activities by the large oil companies as they move their branch offices up north in order to tap the apparently extensive resources of the Kenai Peninsula.

One visiting this town is not very likely to run into Eskimos and Indians any more, or even really true "old sourdoughs" of the gold mining era. The town has taken on quite an international flavor because of the large airport which services the jets of SAS, KLM, Northwest, PNA, and Alaska Airlines, to name but a few; and it is a poor day in any week when one or more dignitaries of world renown do not stop at least for a cup of coffee in the International Airport.

Any MGH-ers who are in this area should feel free to give me a ring and I will be happy to show them as much of the town as they have time for. I don't happen to own a light plane myself, which is a moderate handicap in this part of the world, but many doctors here do, and they delight in taking "outsiders" round to show them the gorgeous glaciers and the mountains.

Dr. William M. Shedden (*E.S.* 1920 and *W.S.* 1922) has sent us a letter, written in his usual delightful style. His new address—290 John Anderson Drive, Ormond Beach, Florida—means that he still retains his "singletonship" in his new location. He writes:

In response to your letter requesting "local color", I am at a loss as to what material you would like—material which would interest your readers.

After resigning as Chief Surgeon of the V.A. Hospital in Lake City, Florida, I fully intended to retire, but little did I know the penalties of such an attempt. It is assumed that one must, in such a situation, have plenty of time, so: (a) after running the American Cancer Society campaign for Florida, (b) I was tackled to run the Orthopedic Centre here as Medical Director "till someone could be found". That was two years ago!

I'm flying several times a week in a Cessna 140. I love it!

My daughter, a Ph.D. psychologist, lives in Daytona with her family. My oldest son has successfully weathered the Eastern Airlines strike and went back as a senior pilot in New Orleans on September 13. He flies N.O. to New York.

The *New England Journal of Medicine* is avidly read in this area. My copy finds eager hands.

I had a good visit with Dr. Parker Hayden (h.s. *E.S.* 1923) at the American Proctological in Miami.

I've done a bit of oil painting. A recent one-man show here exhibited 24 of my meager efforts—landscapes and portraits and seascapes.

Finally, *how does one retire?* I haven't been able to yet.

For six years we have tried unsuccessfully to locate Dr. Haukur Kristjansson (a.r.s. *Or.* 1946). We traced him to Iceland, but even a letter to a director of a hospital in Reykjavik received no reply. Recently, when Dr. Snorri P. Snorrason (gr. stud. a. *M.* 1955) renewed his subscription to The News and gave his address as Iceland, we appealed to him for help and, thankfully, received the information we needed. Dr. Snorrason says:

As I have been away from home for a while I have just received your letter dated July 12. I feel sorry for my countrymen who are known for replying to letters late or not at all!

The address of Dr. Haukur Kristjansson is Grettisgata 94, Reykjavik, Iceland. This is his home address. He works at the City Hospital, Baronsstig 47, Reykjavik, where he is in charge of the Emergency Service. I might add that a few years ago he became seriously ill and paralyzed from polio, but is now working efficiently, although much handicapped.

I would like to use this opportunity to express my thanks for The News, which I appreciate greatly and which keeps me in constant touch with the great M.G.H. and the fine people there.

I hope that I can later send you some Icelandic postage stamps for your collection.

⁂

Contributions to The News in the amount of $640.50, over and above the subscription fees, were received during the fiscal year 1961-1962.

A note of appreciation is always sent to each contributor, but The News takes this opportunity to express publicly its thanks for such generosity from so many of its readers.

The News

No. 216 Boston, Mass. November 1962

HEPATIC REGENERATION

A PROBLEM OF GROWTH REGULATION

In the early 1930's the absorbing problem of how growth is regulated in normal tissues began to engage the attention of members of the J. Collins Warren Laboratories of the Collis P. Huntington Memorial Hospital, now located at the Massachusetts General Hospital. Since their inception these laboratories have been dedicated to the study of cancer. Dr. Joseph C. Aub, writing some years later in the MGH NEWS, remarked that during this early period the investigation of normal growth was severely criticized on the grounds that it was not a study of the cancer problem. (Readers of this paper need hardly be reminded that Dr. Aub's association with the Huntington Hospital began in 1928 and that he was director of its medical laboratories from 1943-1956.) The thinking at the Huntington was in advance of the times; within a decade it was generally agreed that this approach was essential to an understanding of malignant disease. Now, thirty years later, it continues to engross the attention of cancer investigators here and throughout the world. Within the Huntington Laboratories—to cite a few examples—Dr. Paul C. M. Zamecnik, the present director, and his group are studying how cells build proteins; Dr. Lewis L. Engel and associates are exploring the intricacies of action of steroid hormones, which are potent regulators of growth in specific tissues; Dr. Jesse F. Scott and co-workers are investigating the nucleic acids—the substances that transmit genetic information; Dr. John W. Littlefield is examining the production of these latter substances by cells in rapid phases of growth in tissue culture; other members of the department are engaged with other substances and other biological materials. All are working on aspects of the same broad problem, although the approaches are varied.

That a diversified approach is inherent in the programs and personnel of the Huntington Laboratories is explained by Dr. Zamecnik in the MGH *World* of December 1953. "This is not 'programatic' research where everyone works on one small part of a master plan. We share equipment and ideas among ourselves and with other groups in the Hospital, but the research workers here, coming from different scientific disciplines, rely on their own inspiration in devising approaches to the problem of growth regulation."

The remainder of this article will describe the approach used in the author's laboratory within the framework of the Huntington. Since about 1947 we have been attracted by the mechanism that controls the restorative growth (usually called regeneration) that rat liver undergoes after part of it has been removed surgically. Classical studies in this area were carried out here by Dr. Austin M. Brues in the middle 30's and early 40's, setting a standard of performance that continues to challenge us. (Dr. Brues is now Director of the Biology Division at the Argonne National Laboratory.)

Under normal conditions, adult rat liver is relatively static and its cells rarely divide. When the two main lobes are excised (about two-thirds of the total), the remnant begins to enlarge within a few hours and extremely rapid growth ensues. It gradually tapers off as the original number of cells is restored (within about two weeks), after which growth ceases. Dr. Brues studied these changes in detail, and pointed out that during the first three days, when the growth rate is very rapid, it far exceeds that of the most malignant neoplasms, yet remains perfectly controlled. The core of the problem is the means by which this control is effected.

Round 1949, in collaboration with Drs. Scott and Aub, we began to study rats surgically joined in parabiotic union so that cross-circulation of blood occurred between them. Partial removal of the liver in one partner increased the rate of cell division in the liver of the other. This finding, also obtained in laboratories elsewhere, suggested that the regenerative response was initiated by changes in the chemical composition of the blood. When 80% of the liver was excised from two of the partners of parabiotic triplets, the effect on the liver of the remaining intact partner was greatly augmented. This promising beginning led to the optimistic notion that we had only to inject or infuse blood or plasma from partially hepatectomized rats into normal animals to demonstrate a stimulatory type of control mechanism; or, conversely, we could inject normal plasma into animals with regenerating livers to show that a circulating inhibitor might be the primary regulator of liver growth. Unfortunately, neither here nor elsewhere have such experiments been consistently successful, and the main result of a great deal of work is an impressive accumulation of contradictory observations, more negative than positive.

This discouraging state of affairs called for new tactics. One such effort led us into an unpremeditated but productive bypath, through an interest, stimulated by Dr. Aub, in changes that might occur in the surface of cells when they divide. Liver cells had previously been isolated in our laboratory for morphological studies by Dr. Paul M. G. St. Aubin (who subsequently joined the Radiology Department). They looked beautiful under the microscope, but were functionally deficient. During the course of seemingly endless attempts to restore their viability, we investigated their capacity to synthesize cholesterol. This had been proposed to us as a useful indication that the cells might be intact. Surprisingly, we found that cell parts could synthesize cholesterol as effectively as whole cells if the conditions for breaking up the cells were carefully controlled. This fortuitous discovery provided exciting opportunities to probe into the capabilities of these various cell parts to synthesize important compounds, and to explore possible regulatory mechanisms. Thus, from this time on we discarded the formerly treasured whole cells and salvaged the previously ignored debris which could now be separated by centrifugation into structural entities such as nuclei, mitochondrial and microsomal fractions, capable by themselves of functioning to form new molecules. We are indebted to Dr. Ivan D. Frantz, Jr. (at that time in charge of the Cardiovascular Research Laboratory and now Clark Research Professor at the College of Medicine of the University of Minnesota) for valuable technical advice and collaboration in a study to show that the substance formed by the cell fractions we were studying really was cholesterol. In addition to launching us upon an interesting study, the technique for gentle disruption of liver cells gave a boost to our colleagues in Dr. Zamecnik's group who were studying protein synthesis in cellular particles by greatly enhancing the activity of their preparations. Further, it opened the way for investigators here and elsewhere to piece together the chemistry of how cholesterol is formed step by step in living cells—a puzzle that was then quickly solved once the barrier of the cell membrane could be dispensed with.

Cholesterol is an essential constituent of cells of all higher animals. It contains twenty-seven carbon atoms formed by joining together two carbon units (acetate) in a complicated process involving at least twenty-four steps. We found that all of these could be carried out by the soluble components in combination with the small granule (microsomal) fraction of disrupted cells.

The arrival of Dr. Alden V. Loud, who stayed with us for several years before becoming an Assistant Professor of Biophysics at Wayne State University College of Medicine, provided an impetus to study squalene, a long thirty-carbon molecule that coils up (cyclizes) to yield the steroid configuration ultimately leading to cholesterol. Dr. Loud had been studying the rate of turnover of this substance in Dr. Frantz's laboratory, and with us went on to measure the size of its metabolic pool. Working together, we later showed that in the absence of molecular oxygen, liver preparations did not convert acetate into cholesterol because squalene could not cyclize without oxygen; instead, the acetate got only as far as squalene, which accumulated because the reaction could go no further. Using this mode of blockage as a tool to bisect the biosynthetic pathway between acetate and cholesterol, coupled with techniques developed elsewhere for measuring earlier segments of the reaction sequence, we obtained evidence for a major rate-limiting step—roughly analogous to a bottleneck in an assembly line—at an early stage in the pathway. Later on, while the author was on leave of absence to work in Professor Feodor Lynen's laboratory in Munich, it became possible to localize the bottleneck more precisely at the point where a six-carbon compound (β-hydroxy-β-methyl glutaryl CoA) is importantly altered (reduced) by a microsomal enzyme. It is probable that at this point most physiological controls operate on the production of cholesterol by the liver. An end product inhibition involving the level of cholesterol itself is probably one of the mechanisms concerned (higher concentrations of cholesterol are reported to prevent the reduction of the above CoA compound).

Our initial hope was that a system such as the above would guide us in seeking ways that the mechanism for physiological control might operate in regenerating liver. However, it is obvious that far more precise knowledge of the systems in regenerating liver would be required before any such mode of operation could be investigated, and we are now working in this direction.

Taking a different tack, in other kinds of experiments we began exploring at the biochemical level the early events leading to cell division. While visiting Dr. Daniel Mazia's laboratory in Berkeley, the author, in collaboration with Dr. Mazia, examined the first and second known events leading to mitosis and cleavage in fertilized sea urchin eggs—the duplication of the cell centers and the synthesis of DNA. These two major reproductive events, although normally occurring in sequence, could be dissociated experimentally and shown to occur independently. This finding is in agreement with the idea of some biologists that mitosis is not triggered by a single event, but rather that a number of separate preliminary steps have to take place before the final co-ordinated mitotic division can occur.

An interest in X-irradiation as a possible tool in the study of liver regeneration was stimulated by Dr. Mary D. Albert, who spent several years with us in the late 1950's before leaving to teach at Northeastern University. Moderate doses of X-irradiation have little apparent effect upon normal adult liver unless it is induced to regenerate. The latent damage then manifests itself as a delay in starting DNA synthesis and mitosis. As longer times (weeks) elapse between irradiation and partial hepatectomy, the delay becomes less and gradually disappears. However, other forms of damage, involving the distribution of the genetic material between the daughter cells, seems to persist indefinitely. It seems that certain functions relating to early steps in the process of cell reproduction are impaired by X-irradiation, even when the cells are in a non-dividing state. The fact that steps at the beginning of the process are affected makes this kind of study worthy of continued effort, since it may provide another way of looking into what starts regeneration.

The rate of incorporation of radioactively-labeled precursors into DNA has provided a useful index of regenerative activity. Twenty years ago Dr. Brues showed that DNA synthesis is very low in normal liver and rises to high levels during regeneration, as the cells duplicate their genetic material before dividing. The subject is still being intensively studied in many laboratories. Recently we have shown that the response is rapid in baby rats, but becomes slower with increasing age. It also varies, as one might expect, with the size of the stimulus, but only down to a point. If 30% of the liver is removed instead of the usual 68%, the response is small; but if 40% is excised, the rise in DNA synthesis is much larger. There seems to be a relatively sharp threshold that must be exceeded before a really active growth response is achieved. Having established a number of points such as these, in order to have a firm base line from which to operate, we are now beginning to study events that occur before the start of DNA synthesis, seeking sources of prior activities that hopefully may some day disclose what sets the whole process in motion. The mainstay of these studies is Miss Miriam Swaffield who joined us several years ago and has developed a flair for rat surgery, in addition to her skill in biochemical manipulations.

The above paragraphs represent a selected sampling of our activities, intended to convey the general directions in which we are proceeding. We have benefited from and enjoyed the transitory participation of a succession of students, premedical or medical—many now advanced to higher status, including Mitchell T. Rabkin, Ellen Cary, John W. Grover, Robert W. Colman, Julian Wallace, James P. Keating, Joseph F. Di Troia, and Martha Webb. We are grateful to a long list of interested and hard-working research assistants from whose labors and words of wit and wisdom we have greatly profited. Miss Gladys Friedler has recently joined us in this category, cheerfully exerting her capabilities on problems relating to cholesterol and regeneration sequentially. In addition to the professional collaborators mentioned above, Dr. Andre D. Glinos (now at the Walter Reed Army Institute of Research) was here for two years in the late 1940's, during our early acquaintance with regenerating liver; and Dr. Michael C. Schotz was here briefly in the early 1950's while awaiting a tour of duty in the Armed Forces.

During all of this time we have had the very real pleasure of exchanging assistance and advice with friends and associates at the M.G.H. Its congenial atmosphere is a continuing joy. Although our contact with the main stream of the Hospital's functioning is tenuous in the extreme, we like to think that we provide a reservoir for certain kinds of information and skills, available for service whenever the need arises.

Nancy L. R. Bucher, M.D.,
Associate Biologist (Medicine)

The Board of Trustees, at their meetings on August 17 and September 14, voted:

That Dr. Walter Bauer be granted a medical leave of absence with pay, effective as of June 25;

To accept the resignation of Dr. Edward Los, Assistant in Anesthesia, effective August 5;

That the appointment of Dr. Shyam S. Pant as Clinical Fellow in Neurology be changed to Assistant Resident in Neurology, as of September 1;

To change the title of Miss Willa F. Pasho from Executive Assistant to Administrative Assistant at McLean Hospital, as of August 1;

That the appointment of Dr. Richard W. Sagebiel be changed from that of Third Assistant Resident in Pathology to that of Clinical and Research Fellow and Acting Third Assistant Resident in Pathology, effective as of August 13;

To accept the resignation of Irving Weliky, Ph.D., Assistant Biochemist (Medicine), effective August 31.

To appoint:

Dr. Gerald Adler as Clinical and Research Fellow in Psychiatry, effective as of July 1;

Dr. Lynn L. Ault as Assistant Resident in Orthopedic Surgery for one year, beginning October 1;

Dr. W. Gerald Austen as Assistant in Surgery, beginning January 1, 1963;

Dr. Howard P. Baden as Clinical Associate in Dermatology, effective as of August 1;

Dr. Michael H. Bell as Assistant Resident in Orthopedic Surgery for one year, beginning January 1, 1963;

Dr. Ernest W. Bergel as Clinical and Research Fellow in Psychiatry, effective as of July 1;

Dr. Samuel J. Braun as Clinical and Research Fellow in Psychiatry, effective as of July 1;

Dr. Henry H. Brewster as Associate Psychiatrist, effective as of August 1;

Dr. Richard E. Conway as Assistant Resident in Orthopedic Surgery for one year, beginning October 1;

Dr. Lyall S. Crary, Jr. as Third Assistant Resident in Surgery, beginning September 1;

Dr. Frederick M. Ehrlich as Clinical and Research Fellow in Psychiatry, effective as of July 1;

Dr. Brendan M. Fox as Assistant Resident in Urology, effective as of September 10;

Dr. Antonio Gomez as Graduate Assistant and Clinical Fellow in Pathology, effective as of July 1;

Mr. Henry H. Harvey as Assistant Administrator at McLean Hospital, effective as of

August 1;
Dr. Sprague W. Hazard as Associate Pediatrician, effective as of September 14;
Dr. Gerald M. Kolodny as Second Assistant Resident in Radiology, beginning July 1, 1963;
Dr. Alfred Kranes as Acting Chief of Medical Services, effective as of June 25;
Dr. Ian F. Macrae as Clinical and Research Fellow in Medicine for one year, beginning August 1;
Dr. Spyros G. Macris as Visiting Anesthetist, for a period of six months, beginning January 1, 1963;
Dr. William A. Miller as Assistant Resident in Anesthesia, beginning July 15, 1963;
Dr. Arnold H. Modell as Associate Attending Psychiatrist at McLean Hospital, effective as of July 20;
Dr. Harry H. Shawdon as Clinical Fellow in Radiology for one year, beginning March 1, 1963;
Dr. C. Norman Shealy as Clinical Assistant in Neurosurgery, for a period of eight months, beginning September 1;
Marvin Snider, Ph.D. as Assistant Psychologist on the Children's Service, effective as of July 1;
Lawrence T. Stoddard, Ph.D. as Assistant Psychologist on the Neurology Service, beginning September 1;
Dr. Glenda R. E. Wacker as Clinical and Research Fellow and Acting Second Assistant Resident in Pathology for one year, beginning January 1, 1963;
Dr. William J. Yount as Clinical Fellow in Medicine, effective as of August 1.

At their meetings during September and on October 3, the General Executive Committee voted:

To rescind the reappointment of Dr. Richard A. Norton as Clinical Fellow in Medicine as of November 1; Dr. Norton has accepted a position at the Lahey Clinic;
That Dr. Harold C. Urschel's term of service as First Assistant Resident in Surgery be considered to have been from January 1, 1961 (rather than July 1, 1961) through December 31, 1961;
That the appointment of Dr. Martin J. Wohl as Resident in Medicine be extended for the period January 1, 1963 through June 30, 1963.

To promote:

Dr. Hibbard E. Williams to the position of Chief Resident in Medicine for one year, beginning January 1, 1963.

To promote the following Interns to the position of Assistant Resident in Medicine for one year, beginning July 1, 1963:

Dr. J. Michael Bishop
Dr. Verne S. Caviness, Jr.
Dr. Edward D. Harris, Jr.
Dr. Brian E. Henderson
Dr. James R. Lehrich
Dr. Robert C. Moellering, Jr.
Dr. William A. Robinson
Dr. George N. Rogentine, Jr.
Dr. John N. Sheagren
Dr. Philip F. Sparling
Dr. Herbert S. Waxman

To reappoint:

Anthony L. Andrikides, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning November 1;
Dr. Joseph W. Burnett as Clinical Fellow in Dermatology for one year, retroactive to July 1;
Hilda Dickoff, Ph.D. as Research Fellow in Psychology, in the Department of Psychiatry, beginning September 21;
Kaney Ebisuzaki, Ph.D. as Research Fellow in Biochemistry for one year, beginning September 1;
Dr. Joan W. Flacke as Assistant Resident in Anesthesia for one year, beginning October 1;
Dr. M. Judah Folkman as Second Assistant Resident in Surgery, beginning August 1;
Dr. Ulf A. Friberg as Research Fellow in Orthopedic Surgery for one year, beginning November 1;
Samuel R. Kamhi, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning October 1;
Dr. Richard Masters as Clinical and Research Fellow in Dermatology, beginning September 1;
Annette M. C. Rapin, Ph.D. as Research Fellow in Biochemistry for one year, beginning September 1;
Dr. Alberto Salama as Clinical and Research Fellow in Neurology for one year, retroactive to July 24;
Dr. Vincent W. Steward, with a change of title from Clinical Fellow to Clinical and Research Fellow in Neurology, for an additional period of six months, beginning July 1;
Dr. Shizuko Takahashi as Research Fellow in Medicine for one year, beginning September 15;
Dorothy F. Travis, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning October 1.

To appoint:

Cyrus R. Creveling, Ph.D. as Research Fellow in Biological Chemistry, effective as of September 1;
Dr. Camille J. Francois as Research Fellow in Orthopedic Surgery for one year, beginning August 30;
Dr. Alistair G. C. Renwick as Research Fellow in Medicine for one year, beginning September 26.

Mr. Ralph Lowell, Chairman of the McLean Hospital Committee, officiated on October 15 at the cornerstone laying ceremony for McLean's new Rehabilitation Center.

Several items were deposited in the cornerstone, including the McLean Hospital's Annual Report, a list of the names of the members of the Architectural and Building Committees, and other documents dealing with various aspects of patient care and research.

A detailed description of the proposed Rehabilitation Center appeared in the November 1961 issue of THE NEWS.

VOLUNTEER GROUPS

THE M.G.H. SERVICE LEAGUE

The Service League gave a tea in Bartlett Hall on October 2, in honor of our professional visitors from other countries. More of these doctors and their wives than ever before attended the tea—many of the ladies appearing in their attractive native costumes.

Mrs. Glenn E. Behringer was chairman of the tea. She was assisted by twelve hostesses, five ladies in the receiving line, and eight others who poured.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter, and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

Biochemistry

Jeanloz, R. W., and Flowers, H. M.
The isolation and synthesis of the methyl ester-methyl α-glycoside of 3-*O*-*β*-D-glucuronosyl-*N*-acetyl-D-glucosamine (hyalobiuronic acid).
J. Am. Chem. Soc. 84:3030.

Biology

Gross, J., and Lapiere, C. M.
Collagenolytic activity in amphibian tissues: A tissue culture assay.
Proc. Nat. Acad. Sc. 48:1014.

Dermatology

Spangler, A. S., Reddy, W., Bardawil, W. A., Roby, C. C., and Emerson, K.
Papular dermatitis of pregnancy.
J.A.M.A. 181:577.

Endocrinology

Benedict, P. H., Cohen, R. B., Cope, O., and Scully, R. E.
Ovarian and adrenal morphology in cases of hirsutism or virilism and Stein-Leventhal syndrome.
Fertil. & Steril. 13:380.

Orthopedic Surgery

Cave, E. F.
Causes and management of delayed union and nonunion of fractures of long bones.
Manitoba Med. Rev. 42:419.

Psychiatry

de Marneffe, F., and Prekup, J. T.
The McLean Hospital Rehabilitation Center.
Ment. Hosp., Aug. 1962:410.

Radiology

Little, J. B.
Partial obstructions of small and large bowel.
J.A.M.A. 181:627.

Millard, D. G.
Renal siderosis.
Radiology 79:290.

ADVANCES IN THE STUDY OF CERTAIN HEMORRHAGIC DISORDERS

Since my last report in THE NEWS of September 1954, I, in collaboration with Drs. Edward S. Rendall, Joseph J. McGovern, Louis Kunian, John R. Graham, and Harold S. Anstall, have pursued the study of a bleeding disorder that I had previously termed Idiopathic Bleeding Time Defect (IBTD). As the years have gone on, the records of more patients studied have been added to the series and more time has elapsed for long-term follow-up. In September 1961, I had the opportunity to present a summary of these studies at the 8th Congress of the European Society of Haematology, held in Vienna. The following brief notice summarizes our findings to date:

Since my previous publications (1, 2), observations of a large number of individuals have been continued and during the last decade there have been studied a total of 135 patients. As will be elaborated below, these patients appear to possess a hemostatic defect involving only the bleeding time. Inasmuch as the etiology of this condition is unknown and inasmuch as this syndrome appears to differ from other hemorrhagic syndromes, we prefer the term Idiopathic Bleeding Time Defect (IBTD). This term is quite analogous to the term "Idiopathic Thrombocytopenic Purpura", embodying the fact that the etiology is unknown and stating the major defect in hemostasis.

At the outset it should be emphasized that IBTD is not synonymous with "pseudohemophilia" or with "von Willebrand's disease" or with "von Willebrand's syndrome" or with the "inherited autosomal hemorrhagic diathesis with antihemophilic globulin deficiency and prolonged bleeding time" of Nilsson, et al.

Clinical material

One hundred thirty-five cases were studied; 23 percent were males and 77 percent were females. Seventeen patients were studied over a period of one to three weeks, 46 patients from one to ten months, and 72 patients from one to ten years. The ages of patients at the time of establishment of the diagnosis ranged from the first through the eighth decade, but the bulk of the patients fell between the second and fifth decades. In the majority of individuals the disorder had been manifest approximately one decade before the diagnosis was established. None of the patients had any organic disease that might include symptoms of an hemorrhagic disorder.

A completely negative family history was obtained in 70 percent of the patients, both males and females. In the families of only 3 patients was there definite evidence of IBTD.

Functional disease was strikingly prominent in these patients. Twenty-one percent of all the females suffered from migraine. Thirty-five percent of all the males and 71 percent of all the females manifested symptoms of a severe emotional disturbance and in a few instances of a frank psychosis.

Clinical manifestations of abnormal bleeding

Eighty percent of all the individuals furnished a history of ease of bruising: 42 percent of all the males and 88 percent of all the females. Abnormal bleeding from cuts was noted in 30 percent of all the patients: 29 percent of all the males and 31 percent of all the females. Epistaxis was prominent in the history of 42 percent of all the patients: 49 percent of all the males and 40 percent of all the females. Eighteen percent of all the patients complained of bleeding gums: all were females. Menometrorrhagia was a prominent symptom in 76 percent of all the menstruating women; among 32 postmenopausal women a past history of menometrorrhagia was obtained in 50 percent of the cases; but in 28 percent of these postmenopausal women the previous menstrual history was uncertain. In conclusion, menometrorrhagia was prominent in the history of 72 percent of all the women.

Spontaneous bleeding from other sources was very infrequent. In 3 patients retinal hemorrhage and in 1 patient vitreous hemorrhage led to serious defects. Only 1 patient manifested gastrointestinal bleeding, and in this individual the diagnosis of a small gastric or duodenal ulcer was not entirely eliminated. Non-lacerating trauma was followed in one boy by a subgaleal hematoma, in another boy by a retroperitoneal hemorrhage, and in 1 man by a subdural hematoma. There were no instances whatever of hemarthroses or of bleeding into the muscles after trauma.

Abnormal bleeding following a variety of surgical procedures was very prominent in the past history of these patients. The commonest operations included tonsillectomy among 70 patients; 40 instances of abnormal bleeding were related by these patients, 30 probably had no abnormal bleeding. Among 42 patients who had undergone appendectomy, 32 operations were uneventful and 10 were followed by probable abnormal bleeding. Dilatation and curettage in 32 women was uneventful in 26 cases, and was followed by abnormal bleeding in 6 cases. Among 22 women who had undergone hysterectomy, abnormal bleeding was certain in 15 cases. Other surgical procedures carried out in far fewer patients resulted in varying degrees of bleeding. The largest incidence of abnormal bleeding followed extraction of cataract, submucous resection, rhinoplasty, radical sinus surgery, breast biopsy, all types of bone surgery, muscle and tendon surgery, and excision of skin lesions. On the other hand, circumcision in 7 infants was uneventful in all cases.

Multiple dental extractions, with or without alveolarplasty, were accompanied by a very high incidence of abnormal bleeding. Among 96 individuals, 60 bled abnormally and many of these hemorrhages were observed by us. It is of interest that females bled more frequently than males: among 36 males, 26 bled; and among 60 females, 52 bled.

Pregnancy in women with IBTD was accompanied by no apparent greater incidence of bleeding than in women without IBTD.

Methods

The bleeding time in these individuals was carried out by the previously described method. This method is simple, involves an area of skin surface large enough for multiple serial determinations, and enables mechanical hemostasis by means of a "Band-Aid" type of dressing. A large number of determinations in normal individuals have established 6½ minutes as the upper border of normal. This method is far more sensitive than the conventional needle puncture of an ear lobe.

Other determinations mentioned below were carried out by conventional methods.

Laboratory findings

In every case platelets were normal or increased in number in relation to bleeding episodes. Clot retraction, prothrombin time, and coagulation time were normal. In 115 individuals tested, prothrombin consumption was normal. In 32 individuals studied, the thromboplastin generation test yielded normal results. Platelet function in the thromboplastin generation test was normal in 5 individuals studied.

Among 135 individuals not under the influence of corticosteroids, the bleeding time was determined on 454 occasions. It is evident that with the exception of periods of pregnancy, values of less than 7½ minutes are very few in number, and these low values were found in patients who at other times manifested very high values. Analysis of these data by means of the Chi square test demonstrated no significant difference in the bleeding time levels between males and non-menstruating females, a longer bleeding time in the 7-11 day group during the menstrual cycle, and a shorter bleeding time during pregnancy.

Treatment

Among the 135 cases were 25 individuals with postoperative bleeding prior to evaluation of the disorder. These patients had been treated with multiple transfusions of bank blood and fresh blood, vitamin K, Premarin intravenously, Adrenosem both orally and intramuscularly, and ascorbic acid. Neither the clinical bleeding manifestations nor the bleeding time were influenced by these forms of treatment. The use of corticosteroids in the treatment of IBTD originated in previous observations first reported in 1953 (1). Since that time, treatment with corticosteroids has been used in 103 individuals on 141 occasions. The indications for treatment included preoperative preparation, postoperative bleeding, and in the presence of various types of spontaneous bleeding. On 96 occasions in 82 patients the bleeding time was measured the day of beginning treatment and during the following seven successive days. These observations demonstrate that within twenty-four hours after beginning treatment, the average bleeding time reached 8 minutes, remained close to 7 minutes through the fourth day, and then fell further during the remaining three days of observation. In most preoperative instances, treatment was begun forty-eight to seventy-two hours prior to surgery. Gradual daily reduction in dosage of the medication was instituted most commonly two to four days postoperatively, and in most instances the medication was omitted by the tenth postoperative day. Among the large variety of surgical procedures, preoperative and postoperative treatment was very effective in reduction of the degree of postoperative bleeding.

The vast majority of the treated individuals were given Cortisone Acetate orally or intramuscularly, or Prednisone or Prednisolone orally or intramuscularly. For the most part, the dosage used in adults of Cortisone Acetate has been 300 to 400 mg. daily, and of Prednisone or Prednisolone 60 to 120 mg. daily. Proportionately smaller doses were used in children. Other corticosteroids were used in a smaller number of individuals. All of the corticosteroids appeared equally effective in controlling the bleeding manifestations and the bleeding time. In no instance was any attempt made to maintain a patient on continuous daily dosage of corticosteroids.

Discussion

IBTD appears to be largely an acquired defect and is seen predominantly in females. In these respects and in the clinical bleeding manifestations, IBTD appears distinct from other hemorrhagic disorders previously reported. The pathogenesis of IBTD is obscure. Abnormal capillary permeability appears likely. The possible role of the autonomic nervous system is a problem for further study. It is to be noted that there are certain similarities between IBTD and idiopathic thrombocytepenic purpura. In both conditions heredity appears to play no significant role, both disorders appear predominantly in females, both are characterized by a chronic course with occasional remissions, and, in both disorders, the respective defects are sensitive to corticosteroids.

Bernard M. Jacobson, M.D.,
Physician

REFLECTIONS

On the eve, so to speak, of finishing a surgical residency, one quite naturally begins to contemplate the future with a serious air. There is a certain vague question which remains in the background, but which warrants some speculation. The question is: What is the formula for success in work such as ours? What makes the difference between being busy and improving, and just making a living? Some of the answer lies in the effectiveness of the training which has gone before and the skill which has developed, for a poor surgeon will never be successful. Some of the answer is yet to be learned, though, because resident training can go only so far in preparing one for his solo flight. This facet yet to be learned is not the *science* of surgery; it is more accurately the *business* of surgery. It might well be covered in a business school course, and even if not, every good executive seems to have this talent instinctively. It seems to me that the skill one achieves in this respect may very well determine the complete success of his surgical venture.

We have had the opportunity to look at some of these principles in action, even if with but a passing glance. Who could see a well-conducted Grand Rounds, a Medical Society Meeting, or a Clinical Symposium, and not recognize this to be an excellent way for the medical community to see one's work, to evaluate one's professional acumen, and thereby to promote the appreciation of one's skill? Who has heard a smooth, clear presentation of a subject, complete with colored slides, at one of these meetings and has not recognized what good public relations this is? This type of activity could well separate two men of equal surgical ability, one of whom would inevitably increase his following. When the element of time is so great a problem, one might need help in planning the approach. Those of us who have seen a good secretary in action know that here lies the most valuable help in organizing and carrying out this side of a professional life. Letters well typed on good stationery will do wonders toward keeping interested colleagues informed about one's activities and the care of one's patients.

In the effort to gain success, consistent community effort may be an integral part. To find time for this extra-surgical endeavor will be difficult, but time must be budgeted rather than forgotten. In this field, a wife who is interested and active may take on some of the responsibility and be a tremendous help.

As for the innumerable fine points and remaining general principles which I am as yet ignorant of, experience will be an effective, though perhaps a harsh, teacher. If one can learn these lessons well in the beginning and coordinate them into definite action, the road to success must certainly lie ahead.

A. Erik Gundersen, M.D.,
First Assistant Resident in Surgery

New addresses:

Dr. Neil Baggett (res. fel. *Biochem.* (*M.*) 1962), Chemistry Dept., University of Birmingham, Edgbaston, Birmingham, England

Dr. Mervyn F. Burke (a.r.s. 1961), 712 D St., San Rafael, Calif.

Dr. Carl N Brownsberger (a.r.p. 1957), 4535 46th St., N.E., Seattle 5, Wash.

Dr. Walter C. Cotter (r.s. *N.S.* 1957), 110 Lockwood St., Providence 2, R. I.

Dr. Richard F. Gibbs (a.r.p. *An.* 1962), Union Hospital, Lynn, Mass.

Dr. Arnold H. Modell (assoc. psychiat. (*McL.*)), 1419 Beacon St., Brookline 46, Mass.

Dr. Stuart Ragland, Jr. (*M.* 1951), Aviation Medical Acceleration Laboratory, Naval Air Development Center, Johnsville, Pa.

Capt. R. Wyman Sanders, MC, USA (*C.M.* 1959), U.S. Army Hospital, U.S. Forces, Augsberg, APO New York, N. Y.

Dr. C. Gene Wheeler (*S.* 1956), 1008 N. Washington St., Dallas 4, Tex.

Brief bits:

Dr. John Gillies of Edinburgh, Scotland, father of Dr. Alastair J. Gillies (a.r.p. *An.* 1952) of Strong Memorial Hospital, Rochester, N. Y., assumed his duties as Visiting Anesthetist on October 1, for a period of two months.

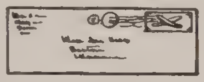
Dr. Roger W. Jeanloz delivered eight lectures in seven countries of Europe during June and July. A list of the titles of these lectures and papers has been filed in the Archives Department.

Dr. George Kelemen (res. cons. *Otolar.*) has been elected a correspondent member of the Hellenic Oto-neuro-ophtalmologic Society.

Dr. Edward Los (a.r.p. *An.* 1961), who resigned from his position as Assistant in Anesthesia last August, has gone to the Monmouth Hospital, Monmouth, N. J.

Dr. Arthur S. Spangler delivered a paper entitled "Papular dermatitis of pregnancy—a systemic disease" before the International Congress of Dermatology, held in Washington, D.C. on September 11. The following scientific exhibit, prepared by Drs. Spangler and Charles S. Keuper, was also presented: "Fibrin foam treatment of depressed scars, plus dermabrasion: 8 years' experience". Dr. Spangler says there were over 40 countries represented, but that relatively few of the papers were from the United States.

Dr. Samuel B. Thompson (a.r.s. *Or.* 1947), in addition to his many other professional activities, has served for twelve years as Medical Advisor to the Claims Department of Liberty Mutual Insurance Company in Little Rock, Ark.



Dr. Donald B. Steenburg (*E.S.* 1915), our "singleton" in Aurora, Nebraska, has sent us this interesting account of his busy life, together with a new address —1018 12th Street:

> In 1958, my brother Dr. Edmund K. Steenburg (*E.S.* 1919), a member of our group since 1920, moved to Washington, D.C., to be on a part-time basis with Moore-McCormick Steamship line.
>
> My two sons, Dr. E. A. and Dr. H. G. Steenburg are now carrying the greater part of the load here in our office.
>
> Our present 30-bed hospital was given by my brother and me to the foundation, which is presently building a 50-bed hospital well located across the street from Cole Park. Our group has purchased on the same tract a large lot and are now planning to erect a clinic building at this site, to be completed in the fall of 1963.
>
> Since 1947 I have been active on the Board of the Nebraska Blue Shield as their vice president. I have also been on the Executive Faculty of the University School of Medicine and have been a member of the Medical Education Committee of the Nebraska State Medical Society.
>
> We still own and operate a number of dairy farms, but my interest will soon be reduced to one farm with the transfer of title to my three children and fourteen grandchildren.
>
> Mrs. Steenburg and I are leaving for our annual trip to the Colorado Rockies soon.

Dr. Nancy L. R. Bucher, Associate Biologist (Medicine)

This brief but welcome letter has come from Dr. Rafe Banks, Jr. (*E.S.* 1943), our MGH "singleton" in Gainesville, Georgia.

I have practised the specialty of urology here in Gainesville for eleven years.

I married Jane Wood of Decatur, Georgia, in 1949 and we now have four children—three boys and a girl.

I am fortunate in having a very good associate, Dr. J. R. Johnson, whose presence gives me the opportunity of enjoying not only my family but also the excellent fishing in these North Georgia mountains.

Dr. H. Irving Bixby (*W.S.* 1924), our "singleton" in Falmouth, Massachusetts, has sent us this interesting letter:

I know I should have been more "vocal" all these years, but I have been very busy. It is only recently that I gave up my office in Attleboro, where I am still Consulting Surgeon at the Sturdy Memorial Hospital and where I was Chief of Surgery for fifteen years.

I look back on my Navy duty at Pearl Harbor in 1942 with fond memories of visiting with Dr. Paul E. Spangler [*W.S.* 1925] and another classmate, Dr. Mon-Fah Chung. The latter had the most beautiful collection of orchids that I have ever seen, and he was doing a splendid job of carrying on the fine traditions of the Harvard Medical School in that area.

This interesting and very informative letter has come from Dr. Harold F. Bosco (*Dn.* 1946), our "singleton" in New Britain, Connecticut:

Thank you for your letter which reminded me that I am an MGH singleton in this area. It has been 16 years since I physically left the grounds of the M.G.H. and the able instructions of Dr. Kurt Thoma. However, the "magic" of the letters M.G.H. will never leave me. I feel that I will never be able to repay the M.G.H. for the opportunity afforded me to learn and train under Dr. Thoma. I will be forever grateful for this experience.

I was married in 1946 to Natalie De Blois, a medical technician. We have 6 children with ages running from 14 years to 4 months (5 boys and 1 girl). Fortunately, I bought a home with enough room for expansion. My home address is 23 Ledyard Road, New Britain.

I will list my professional activities:

1) My practice is limited to Oral Surgery
2) Attending Oral Surgeon, New Britain General Hospital; Lecturer to Medical Staff and School of Nursing
3) Consultant Oral Surgeon, New Britain Memorial Hospital
4) Consultant Oral Surgeon, Bradley Memorial Hospital, Southington, Connecticut
5) Immediate past president, Medical Staff, New Britain Memorial Hospital (1st Dentist ever to hold this position)
6) Member of the Connecticut Society of Oral Surgeons
7) Member of the New England Society of Oral Surgeons
8) Member of the American Society of Oral Surgeons
9) Connecticut Society—Dental Association
10) American Dental Association
11) New Britain Dental Society—past president

My civic activities:

1) Past president of P.T.A.
2) Past president of Lions Club
3) Past president of Council of Social Agencies
4) Commissioner of Health, New Britain—since 1958
5) Member of Farmington Country Club
6) Member of the New Britain Club
7) Member of the Y.M.C.A. Health Club
8) Member of the Mountain Grove Swimming Club, Southington, Connecticut

Hobbies:

1) Golf
2) Music—play trombone
3) Chess
4) Bridge—cards
5) Reading
6) Swimming
7) Children—should be 1st on the list

I wish to thank you for your interest in me.

ARCHIVES DEPARTMENT

The Archives Department is the recipient of two very special gifts, contributed by Miss Hope A. Wheelock (*R.N.* 1916). The first is one of the old brass trays that were used in the Hospital in its early years, and which are prized so highly by those few individuals who were fortunate enough to come into possession of one. The second is a pewter whale oil lamp—an example of the kind which were in common use by our nurses and doctors from the first days of the Hospital up to about 1860. This lamp belonged to Mrs. Florence McLennan Laighton (*R.N.* 1902), who gave it to Miss Wheelock, who has given it to us.

Mr. LeRoy L. Thwing of Cambridge, author of *Flickering flames,* a book on lighting, says the two round wicks and the small size of the lamp unmistakably identify it as a whale oil lamp. Mr. Thwing says that these lamps were actually used as portable lamps after kerosene and even illuminating gas came into use in the mid-1800's, and he thinks this lamp could have been used as late as 1875. Rumor has it—whether true or not—that further use of whale oil lamps at M.G.H. was forbidden when one of the doctors at the Hospital set a bed on fire with one of them.

The initials "W.D.", scratched on the base of this lamp, have elicited the belief that it may have belonged to Walter Dodd at one time. Perhaps a more acceptable interpretation of the initials is that it was the property of Ward D, which was built in 1875. Whatever the facts may be, these initials, "W.D.", make this particular little whale oil lamp in every sense unique and we are most grateful to Miss Wheeler for contributing the lamp and the tray to our Archives Department.

The News

No. 217 Boston, Mass. December 1962

THE HISTOCHEMISTRY LABORATORY

Histochemistry and cytochemistry are two major areas of research in which histologists, cytologists, and histopathologists are engaged at the present time. As these names imply, histochemical and cytochemical methods apply chemical, and sometimes physical, techniques to cells and tissues in order to determine the location of a specific chemical substance, a related group of substances, or a specific chemical (e.g., enzymatic) reaction. These methods differ in an important way from the usual biochemical procedures which require homogenization, centrifugation, or extraction procedures that in turn destroy the architecture of the tissues and cells. It is the object of the histochemical approach to relate as closely as possible the *in situ* location of chemical substances and reactions to known histological and cellular structures. A histochemical reaction enables the morphologist to draw a step closer to his research objective of correlating structure and function, and at the same time supplements information obtained by routine biochemical procedures which disorganize cell and tissue structure.

Histochemistry is not a new discipline, and, in a general sense, dates back to the earliest staining of tissue for microscopic examination. Its burgeoning as a research tool with the incorporation of numerous reactions for the localization of enzyme activity, carbohydrates, nucleic acids, and proteins, as well as lipids and inorganic ions, has occurred in the past fifteen years.

The Histochemistry Laboratory at the Massachusetts General Hospital has existed within the Pathology Department since 1952—at first located as a neighbor of Bacteriology in the Domestic Building, and since 1956 in a group of laboratories located within the Pathology Department on the first floor of the Warren Building. While these laboratories are now equipped to utilize almost all accepted histochemical methods and many microbiochemical methods which may be applied to the study of disease, we have tended in our investigations to emphasize the localization and, in some instances, accurate quantitation of enzyme activity in tissues. In earlier studies hydrolytic enzyme systems occupied much of our time, while more recently we have been particularly interested in information which could be derived from the use of tetrazolium reduction techniques for the demonstration of the sites of activity of oxidative enzyme systems. This activity often reflects the importance of specific metabolic pathways within components of a tissue. The fact that variation in intensity or location of activity may develop in disease or in response to experimental manipulation of animals, points to the practical and theoretical potential of methods which allow for their demonstration *in situ*. Particularly interesting is the fact that those visual qualitative methods may often be quantitated by the application of microbiochemical and analytical techniques that enable us to correlate in a rather direct manner the chemical content or enzyme activity of a tissue section with the histological structure of an adjacent section.

Research in these laboratories has been under the direction of Dr. Richard B. Cohen and Dr. Edgar B. Taft, and has been conducted along three major related lines. Established histochemical methods are applied to normal and diseased human tissue as well as to experimental animals in order to obtain background information on enzyme activity and distribution. New methods for the demonstration of enzyme systems are developed which are useful in our investigations. In collaboration with Dr. Jesse F. Scott of the Huntington Laboratories, we have developed special techniques that permit accurate microquantitation of chemical constituents or of enzyme activity to correlate with distributional studies.

Perhaps because a number of the members of the Pathology Department have a particular interest in the endocrine organs, much of our work has centered on these tissues. We have been particularly interested in the pentose phosphate pathway of carbohydrate metabolism in the adrenal cortex. This alternative pathway of carbohydrate metabolism is particularly active in the fascicular zone. This observation may be integrated into certain hypotheses of ACTH action based on investigations utilizing biochemical techniques. We have been studying the effect of a variety of stimuli on the adrenal cortex, including sodium depletion and thalamic injury. These investigations are in collaboration with Dr. John D. Crawford of the Children's Service. The enzyme activity patterns of the pituitary, parathyroid, pancreas, and testes have been mapped. The basophil cells of the pituitary appear to be strikingly active in the enzymes mediating the pentose phosphate pathway, while chromophobes tend to be generally inactive. An interesting observation in the parathyroid is that the oxyphil—a cell not considered to be an active hormone producer—is the site of the most oxidative enzyme activity and is, incidentally, the cell richest in mitochondria. A technique for the demonstration of oxidative enzymes in smear specimens of sperm has been devised which may prove useful in the study of sperm metabolism and fertility problems.

A method for the study of enzyme activity in smears of white blood cells has been devised, combining histochemistry and phase microscopy. The accuracy and facility of the histochemical study of enzyme systems in bone has been vastly improved by a new technique of decalcification which preserves to a considerable extent oxidative enzyme activity. Studies have been undertaken on the effect of murine hepatitis on liver enzyme patterns, with marked changes noted at various stages of the infection. Enzyme activity characteristics of normal and neoplastic growth are being traced in regenerating limbs of amphibia and in a variety of human neoplasms.

We have been particularly interested in studying pathways of glycogen synthesis, with emphasis on the enzymes phosphorylase, uridine diphosphate glucose-glycogen transglucosylase, and amylo (1-4)-(1-6) transglycosidase. Recently we have observed that the nucleotide sugar thymidine diphosphate glucose, although a less efficient substrate, may be substituted for the uridine sugar in glycogen synthesis in human and animal striated muscle.

New histochemical techniques have been devised for a number of enzyme systems, including the following: a polyhydric alcohol dehydrogenase, of interest in certain phases of carbohydrate metabolism; L-gulonolactone oxidase which mediates an important step in the synthesis of vitamin C, and is the enzyme lacking in humans which permits that species to get scurvy; uridine diphosphate glucose dehydrogenase, an enzyme important in the synthesis of glucuronic acid; dihydroorotate dehydrogenase in the pathway of synthesis of pyrimidines from amino acids; a pyridine nucleotide transhydrogenase, a system which may be demonstrated under certain circumstances in tissues.

The study of nucleic acid content of human tumors and the relationship of these to phosphorus metabolism and to protein synthesis in these neoplasms has been a subject of collaborative investigation with the Huntington Laboratories.

Histochemical techniques must for the present be considered largely research tools, and a great deal of the time of the worker in this field is spent in expanding and improving his methods. Much, however, has already been learned from the application of these methods, and, from a large body of isolated observations, patterns are beginning to appear. An observation which has particularly interested us concerns the special metabolic organization of tissues which appear by usual methods of study to be structurally homogeneous. If one observes, for instance, a liver lobule under the light microscope, one is not impressed by any great difference in the appearance of the cells derived from the central as compared with those from the peripheral zone. Hints that metabolic differences may exist are provided by special propensities of a particular zone to respond to a specific injury. If one, however, observes enzyme patterns in the liver lobule, a striking specialization of activity for certain enzyme systems in a particular zone may be found. This characteristic is lost when liver tissue is homogenized for analysis. It is quite impressive, also, to observe that an element like smooth muscle will differ quite markedly in enzyme activity, depending on where it is located within an organ, and from organ to organ, so that while it may be fairly consistent in its anatomical characteristics, its metabolism may vary appreciably. Examples of these types are given to point out that the morphologist, provided with an additional dimension, will have to consider metabolic as well as structural organization of tissues, and this metabolic organization may provide as distinctive a stamp as does anatomic structure. In some cases it may emphasize subdivisions of a tissue already evident on structural grounds (e.g., adrenal cortex, kidney), while in others it may point up metabolic subdivisions in what appear to be homogeneous structural entities when studied by conventional methods (e.g., liver, parenchyma, smooth muscle, etc.).

Histochemical techniques of varying types have been applied extensively to the study of human disease. In our laboratory we have been able to detect rapidly in biopsy material the absence of glucose-6-phosphatase in the liver of patients with von Gierke's disease, and the absence of phosphorylase activity in the striated muscle of a patient with McArdle syndrome. Both these diseases are examples of defects in the metabolism of glycogen. Acid phosphatase activity of a tumor may be used on rare occasions to identify prostatic origin. Enzyme distribution patterns have been studied in a number of diseases, including an investigation of the small intestine in sprue and other deficiency states, in collaboration with Dr. Peter R. Holt, formerly of the Gastrointestinal Group. Histochemical methods have been used to identify characteristic inclusions in certain diseases, e.g., PAS positive inclusion in the histiocytes of Whipple's disease and the mononuclear cells of Waldenström's syndrome. The property of metachromasia, characteristic of an abnormal substance found in the brain and certain viscera, has provided the name for the entity of metachromatic leucoencephalopathy and influenced the chemical investigations into its origins. These are a few of many possible examples where histochemical techniques may be used to advantage in the study of and characterization of disease processes.

We have collaborated with a number of other groups in the Hospital on projects of mutual interest. Since ours has been until recently one of the few well-equipped histochemical laboratories in the vicinity, we have cooperated whenever feasible with investigators from other institutions who required specialized knowledge and techniques.

This review would not be complete without mention of those individuals who have contributed greatly to the accomplishments of the laboratory: Drs. Károly Balogh, Flaviu C. A. Romanul, Wallace A. Jones, Latifeh Ghandur, J. Michael Bishop, Tinrat Stitnimankarn, and, at present, Hubert J. Wolfe. Special recognition must be given to our technicians, Miss Doris Parthum and Miss Anne Jones, who have kept the laboratory functioning since its beginning.

Richard B. Cohen, M.D.,
Associate Pathologist

* * *

The American Academy of Pediatrics conferred its Borden Award upon Dr. Nathan B. Talbot at the meeting of the Academy held in Chicago on October 31. In his acceptance speech Dr. Talbot posed the question: "Has psychologic malnutrition taken the place of rickets and scurvy in modern pediatric practice?"

Dr. Paul D. White was inducted as a Fellow of the Royal College of Physicians in London on May 31.

The Board of Trustees, at their meetings on September 28, October 11 and 26, and November 2, voted:

That Dr. Edward P. Richardson be granted leave of absence for the months of October and November 1962, with pay, to serve as Neuropathologist at the University of Lausanne, Switzerland.

To accept the resignations of:

Dr. Ock Soon Choi from the position of Clinical Fellow in Medicine, effective as of October 15;
Dr. Ellis Dresner from the position of Clinical Assistant in Medicine, effective as of September 30;
Dr. Lee Jackson from the position of Clinical Assistant in Psychiatry at McLean Hospital, effective as of October 1;
Dr. Michael P. Tristan from the position of Assistant in Pediatrics.

To appoint:

Dr. E. Ramagopal Acharyulu as Clinical and Research Fellow in Medicine, beginning January 1, 1963;
Dr. H. Powell Baker as Exchange Assistant Resident on the Children's Service, for the period October 26 through December 4;
Dr. Michael H. M. Dykes as Assistant in Anesthesia, beginning January 1, 1963;
Dr. Joseph W. Fowler, III, as Clinical Fellow in Medicine for one year, beginning October 8;
Dr. Celso-Ramon Garcia as Assistant Surgeon, beginning October 11;
Dr. Gary R. Gerson as Clinical Fellow in Anesthesia, beginning June 1, 1963;
Dr. John Gillies as Visiting Anesthetist pro tempore, beginning October 1;
Dr. Thomas M. Glushien as Assistant Resident in Anesthesia, beginning July 1, 1963;
Dr. Robert S. Harper as Clinical Assistant in Pathology, beginning October 1;
Dr. Gerald W. Hazard as Assistant Resident on the Children's Service for one year, beginning July 1, 1963;
Dr. John Hedley-Whyte as Assistant in Anesthesia, beginning October 1;
Mr. John P. Hill as Assistant Psychologist, beginning November 1;
James G. Holland, Ph.D. as Associate Psychologist on the Neurology Service, effective as of September 1;
Douglas F. Hooper, Ph.D. as Assistant Psychologist in the Department of Psychiatry, beginning October 15;
Dr. Paul A. Kantrowitz as Assistant Resident in Medicine for one year, beginning July 1, 1963;
Shelby Kashket, Ph.D. as Assistant Biochemist (Medicine), beginning September 28;
Dr. M. Robert Knapp as Visiting Fellow in Anesthesia, for the period October 10 through October 24;
Dr. Hugh H. Kopald as Resident in Medicine for one year, beginning October 1, 1963;
Dr. Michael A. Kornfield as Junior Assistant Resident on the Children's Service, beginning July 1, 1963;
Dr. Pentti J. Leikkonen as Clinical Fellow in Anesthesia (Staff), beginning January 1, 1963;
Dr. Edward Lowenstein as Clinical Fellow and Acting Chief Resident in Anesthesia, beginning November 17;
Mr. James J. Muller as Clinical Fellow in Psychology, retroactive to August 1;
Dr. Charlotte G. Neumann as Assistant Pediatrician, beginning October 26;
Dr. Robert K. Osborne as Clinical Assistant in Medicine, beginning October 1;
Dr. Barry I. Pless as Clinical and Research Fellow on the Children's Service for one year, beginning January 1, 1963;
Dr. Pasko Rakic as Clinical and Research Fellow in Neurosurgery for one year, beginning November 1;
Dr. George L. Robb as Exchange Assistant Resident on the Children's Service, for the period September 19 to October 25;
Dr. John C. Robinson as Junior Assistant Resident on the Children's Service, beginning July 1, 1963;
Ralph Schwitzgebel, Ed.D. as Assistant Psychologist, beginning October 1;
Dr. Seymour M. Sabesin as Clinical and Research Fellow in Medicine for one year, beginning July 1, 1963;
Dr. David E. Tolhurst as Clinical Fellow in Anesthesia (acting Resident), beginning July 1, 1963;
Dr. Chiu-an Wang as Assistant in Surgery, effective as of September 12;
Dr. Sigurd G. Wende as Clinical Fellow in Radiology, beginning November 15;
Chuan-Tao Yu, Ph.D. as Assistant Biochemist (Medicine) for one year, beginning November 1;
Irving K. Zola, Ph.D. as Assistant Sociologist in the Department of Psychiatry, beginning November 1.

The Trustees also voted to promote the following Assistant Residents to the position of Residents in Medicine:

Dr. James R. Carter, Jr., beginning July 1, 1963;
Dr. Karl Engelman, beginning January 1, 1964;
Dr. Paul F. Griner, beginning July 1, 1963;
Dr. George A. Jacoby, Jr., beginning January 1, 1964;
Dr. Peter M. Yurchak, beginning July 1, 1963.

The following Trustees' votes of November 22 and December 22, 1961, and March 30, 1962, failed to reach the Office of THE NEWS until this past month. In order that our NEWS reporting of Trustees' votes may be complete, even though inadvertently tardy in this instance, we give them to you now:

Dr. Harvey E. Cantor appointed Intern on the Children's Service for one year, beginning July 1;

Dr. Rosemary C. Dobson appointed Intern on the Children's Service for one year, beginning July 1;

Dr. Eugene L. Klenk appointed Intern on the Children's Service for one year, beginning July 1;

Dr. Eileen M. Ouellette appointed Intern on the Children's Service for one year, beginning July 1;

Dr. Richmond Prescott promoted to the position of Resident in Medicine for one year, beginning July 1;

Dr. Donald L. Stone appointed Clinical Fellow in Radiology for one year, beginning July 1;

Dr. Michael A. Zwerdling appointed Intern on the Children's Service for one year, beginning July 1.

At their meetings on October 17, 24, and 31, the General Executive Committee voted:

To promote:

Dr. Rosemary C. Dobson to the position of Assistant Resident on the Children's Service for one year, beginning July 1, 1963;

Dr. Christopher R. Eliot to the position of Assistant Resident on the Children's Service for one year, beginning July 1, 1963;

Dr. Eileen M. Ouellette to the position of Assistant Resident on the Children's Service for one year, beginning July 1, 1963;

Dr. Michael A. Zwerdling to the position of Assistant Resident on the Children's Service, beginning July 1, 1963.

To reappoint:

Colin H. Bolton, Ph.D. as Research Fellow in Biochemistry (Medicine), for the period September 1 through November 30;

Dr. Robert E. Kahn as Clinical Fellow in Medicine for one year, beginning November 1;

Dr. Philip C. Kelleher as Clinical Fellow in Medicine for one year, beginning November 1.

To extend the appointment of:

Dr. Edward Lowenstein as Chief Resident in Anesthesia from November 6 through November 16.

To appoint:

Dr. Antero Coelho Neto as Research Fellow in Surgery, effective as of September 10;

Dr. Eugene E. Drago as Graduate Student Assistant in Medicine, assigned to Cardiology, for the period October 1, 1962 through May 31, 1963;

Dr. Harold J. Dvorak as Graduate Student Assistant in Medicine, assigned to Cardiology, for the period October 1, 1962 through May 31, 1963;

Dr. Sabri H. Ergenekon as Graduate Student Assistant in Medicine, assigned to Cardiology, for the period October 1, 1962 through May 31, 1963;

Dr. Clemente C. Gatmaitan as Graduate Student Assistant in Medicine, assigned to Cardiology, for the period October 1, 1962 through May 31, 1963;

R. Colin Hughes, Ph.D. as Research Fellow in Biochemistry (Medicine) for one year, beginning January 1, 1963;

Dr. Kazuhiko Murata as Graduate Student Assistant in Medicine, assigned to Cardiology, for the period October 1, 1962 through May 31, 1963;

Dr. Ahmad M. Nassar as Graduate Student Assistant in Medicine, assigned to Cardiology, for the period October 1, 1962 through May 31, 1963;

Dr. Rubén J. Pellanda as Graduate Student Assistant in Medicine, assigned to Cardiology, for the period October 1, 1962 through May 31, 1963;

Dr. Theodosius M. W. Poon-King as Graduate Student Assistant in Medicine, assigned to Cardiology, for the period October 1, 1962 through May 31, 1963;

Dr. Junichi Tanabe as Graduate Student Assistant in Medicine, assigned to Cardiology, for the period October 1, 1962 through May 31, 1963.

In addition to his other duties, Dr. Francis de Marneffe has been appointed Director of Hospital Affairs and Mr. Henry Langevin has been promoted to Administrator at McLean Hospital.

Mr. Ferdinand Strauss, II, Administrative Assistant in charge of our Emergency Ward since 1959 has been promoted to Assistant Director at the Hospital, effective October 1. Dr. Knowles, in making the announcement, said that Mr. Strauss would "continue to work with the Emergency Ward and will add other areas of responsibility".

THE GOLD-HEADED CANE CEREMONY

Dr. Paul D. White has sent us a copy of his introductory remarks given at the Gold-Headed Cane ceremony of the graduating exercises of the Medical School of the University of California, in San Francisco, on June 1, 1962:

Before beginning my address to you on the subject selected for this occasion, I shall take the liberty of telling you in a very few minutes of my adventures during the last 24 hours.

Yesterday afternoon and evening I was privileged to attend a meeting of the Royal College of Physicians in London at which new Fellows were received, followed by a banquet and then an exhibition in the Harveian Library where many noted manuscripts, early printed medical books, portraits, and other memorabilia were on display. Among them we were allowed to handle the silver caduceus, a wand carried by the President of the College on formal occasions such as that of yesterday evening, and presented by Caius himself to the College in 1553. Another relic of great interest, and to see which was one of the reasons for my going to London just before coming here, was the original Gold-Headed Cane carried by the Royal Physicians for about 150 years, from the late 1600s to the early 1800s, ~~and~~ finally turned over to the Library of the Royal College of Medicine by the widow of its last bearer, Matthew Baillie. The College itself was established by King Henry the Eighth in 1518, and you may be interested to hear the first few sentences of the Royal Charter.

Quote: Henry, by the Grace of God, King of England and France, and Lord of Ireland, to All to whom these present letters shall come, Greeting. WHEREAS, we consider it the duty of our Royal Office by all means to consult the happiness of the people under our rule, we have thought it to be chiefly and before all things necessary to withstand in good time the attempts of the wicked, and to curb the audacity of those wicked men who shall profess medicine more for the sake of their avarice than from the assurance of any good conscience, whereby very many inconveniences may ensue to the rude and credulous populace: Therefore, partly imitating the example of well governed cities in Italy and many other nations, and partly inclining to the petition of the grave men, Doctors John Chambers, Thomas Linacre, Fernandez de Victoria, our physicians, Nicholas Halsewell, Giovanni Franceschi, and Robert Yaxley, physicians, and especially of the most Reverend Father in Christ and Lord, the Lord Thomas, Cardinal priest of the Holy Roman Church of the title of Santa Cecilia beyond the Tiber, Archbishop of York, and our very dear Chancellor of England, We will and command to be instituted a perpetual College of learned and grave men who shall publicly exercise medicine in our City of London and the suburbs, and within seven miles from that City on every side: Whose care it will be, as we hope, both for their own honour and in the name of the public benefit, as well to discourage the unskilfulness and temerity of the knavish men whom we have mentioned, by their own example and gravity, as to punish the same by our laws lately enacted, and by the constitutions to be ordained by the same College. *End quote.*

To complete these introductory remarks may I add that this morning, which was unusually clear in London, but very cold, I walked from the heart of the City to Regents Park to see the construction of the new building of the College for which the Queen laid the Cornerstone on Crown land a few months ago. I then took the noon polar flight for California and arrived here a few minutes ago at eleven minutes before eight o'clock.

Dr. White, in a note to us, reminds us that his predecessors as lecturers at the Gold-Headed Cane ceremonies have included Dr. Roger I. Lee, 1951 (MGH 1907), Dr. Chester M. Jones, 1961 (MGH 1919), and William Kerr himself (MGH 1916) who was the originator of the ceremony when he was Professor of Medicine at the Medical School of the University of California.

Dr. White also sent us a picture of the Gold-Headed Cane, which we give you here.

GOLD HEAD OF THE ORIGINAL GOLD-HEADED CANE, IN THE LIBRARY OF THE ROYAL COLLEGE OF PHYSICIANS IN LONDON

* * *

HARVARD MEDICAL CHORUS

Through the courtesy of the Trustees of the Isabella Stewart Gardner Museum, the one-hundred-twenty-voice Harvard Medical Chorus will present a Christmas concert on Friday, December 21, at 8:30 P.M., in the Tapestry Room of the Museum. Music of Praetorius, Purcell, Clement, Bach, Schubert, and others will be presented. There is no admission charge, and a cordial invitation to attend is extended to all.

MUSIC AT M.G.H.

The October issue of THE NEWS carried a brief statement to the effect that a group of musicians, of which Dr. Donald L. Leake (*Dn. M.*) is a member, would "entertain the visitors to M.G.H. from other countries". It was not until we received a copy of the program for the concert and read the names and identifications of the musicians making up this chamber music group that we realized how fortunate the Hospital was to have the group give a concert here. We think that you, too, would be interested in knowing just who these musicians are:

Richard Jerome, Flute—Solo flute, Vermont Symphony Orchestra for 15 years; Chairman of the Board, Verne Q. Powell Flutes, Inc.

Donald Leake, Oboe—Oboist with the Robert Shaw Chorale, Columbia Records, 20th Century Fox; Graduate of Brussels Conservatory; member of our House Staff in Dental Medicine.

Henry Duckham, Clarinet—Solo clarinet with the North Carolina Symphony; Graduate of the New England Conservatory; has successfully combined a career in the business world with one in chamber music.

William Lipscomb, Clarinet—Clarinetist with the Pasadena Symphony Orchestra; chamber music performances in Minneapolis, here in New England, and in Great Britain. Professor of Chemistry and Chairman of the Department, Harvard University.

Jean Paella, Horn—French hornist with the Boston Symphony Orchestra and numerous other professional groups. Graduate of the New England Conservatory.

Roe Goodman, Bassoon—Bassoonist in many performances here in New England and in Florida. Instructor in Mathematics at M.I.T.

Their program included:

Divertimento, K. 229, No. 1, for two clarinets and bassoon, by Mozart.

Trois Pièces Brèves, for flute, oboe, clarinet, horn, and bassoon, by Ibert.

Kleine Kammermusik, for flute, oboe, clarinet, horn, and bassoon, by Hindemith.

⁂

VOLUNTEER GROUPS
MGH SERVICE LEAGUE

During the months of October and November, the ten Community Chairmen of the MGH Service League entertained at morning coffees in their individual homes for those members of the League who reside in their particular areas. Mrs. H. Dunster Howe, President of the Service League, addressed each meeting, and a discussion followed pertinent to the current activities of the organization and the plans for the ensuing year of 1962-63.

In addition to the area meetings, the fall calendar included the tea held in Bartlett Hall in October in honor of the ever-enlarging group of professional visitors to the Hospital from all parts of the world, the concerts for our patients which are given fortnightly in the Chapel, and the activities of the Reception Center and Information booth which are staffed daily by members of the League.

The 116th anniversary of Ether Day was observed in the Moseley Rotunda on October 16. Mr. Francis C. Gray, Chairman of our Board of Trustees, brought greetings from the Board to assembled guests. Dr. John H. Knowles, our General Director, gave a most interesting talk on the "Values of tradition", Dr. Ellsworth T. Neumann, Administrator of the Hospital, presented the candidates for Service Pins to Dr. Knowles, who then made the awards.

Nearly 250 members of the staff and personnel of the M.G.H. were recipients of the pins—148 for 5 years of continuous service at the Hospital, 54 for 10 years, 14 for 20 years, 11 to members of the professional staff for 25 years of unbroken service, 7 for 30 years (including 4 doctors), and 2—Mr. John Hague and Miss Mathilda Wagner—for 40 years.

Refreshments were served after the ceremony.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION.

The following new titles have been received:

Anesthesia

Beecher, H. K.
An inspection of our working hypotheses in the study of pain and other subjective responses in man.
Meth. Information Med. 1:33.

Beecher, H. K.
Pain, placebos and physicians.
Practitioner 189:141.

General Surgery

New addresses:

Dr. Francis L. Burnett (*S.S.* 1908), Proctor St., Manchester, Mass.

Dr. Allan M. Butler (past c. *C.M.*), Dept. of Public Health, Berkeley 14, Calif.

Annemarie Closse, Ph.D. (res. fel. *Biochem.* (*M.*)), Tegernsee/Bayern, Michael-Dengg-Weg 4, Germany

Dr. Daniel Deykin (*M.* 1958), Beth Israel Hospital, 330 Brookline Ave., Boston, Mass.

Dr. Edwin B. Dunphy (past c. *Oph.*), 75 Mount Auburn St., Cambridge, Mass.

Dr. David W. Florence (r.s. *Or.* 1960), 4959 Excelsior Blvd., Minneapolis 16, Minn.

Dr. Lamont W. Gaston (*M.* 1954), University Hospital, Seattle 5, Wash.

Dr. Alastair J. Gillies (a.r.p. *An.* 1952), Strong Memorial Hospital, Rochester, N.Y.

Dr. Joseph Hanelin (clin. assoc. *R.*), 27 W. Central St., Natick, Mass.

Dr. Robert S. Harper (a.r.p. *Path.* 1958), Memorial Hospital, 119 Belmont St., Worcester, Mass.

Dr. Sprague W. Hazard (assoc. pediat.), 1233 Highland Ave., Needham 92, Mass.

Dr. Edward Karian (a.r.p. *D.* 1955), 358 Commonwealth Ave., Boston 16, Mass.

Dr. Edward Los (a.r.p. *An.* 1961), Monmouth Hospital, Monmouth, N. J.

Dr. Arthur S. Lurie (a.r.p. *D.* 1959), 363 Lowell St., Peabody, Mass.

Mr. David MacSweeney (res. fel. *An.* 1962), 9 Oman Court, Oman Ave., London N.W. 2, England

Dr. William L. Morgan, Jr. (*M.* 1953), Dept. of Medicine, University of Rochester School of Medicine and Dentistry, 260 Crittenden Blvd., Rochester 20, N. Y.

Dr. Renée B. O'Sullivan (*C.M.* 1957), Medical Office, American Embassy, APO 156, San Francisco, Calif.

Dr. Murray K. Rosenthal (a.r.p. *C.* 1962), 1 Salem St., Wakefield, Mass.

Dr. Leonard B. Shulman (*Dn.M.* 1961), Georgetown University School of Dentistry, Reservoir Rd., Washington 7, D.C.

Dr. Augustus Thorndike (*W.S.* 1923), 509 Hammond St., Chestnut Hill 67, Mass.

Dr. Earle W. Wilkins, Jr. (*W.S.* 1945), Zero Emerson Place, Boston 14, Mass.

Dr. Benjamin S. Wood (*E.S.* 1933), Veterans Administration Hospital, Salem, Va.

Brief bits:

Dr. Joseph S. Barr spoke at the Georgia Orthopedic Society meeting, held at Sea Island, Georgia, September 26-30. His subjects were "Arthroplasty of the hip" and "Treatment of low-back and sciatic pain".

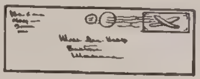
Dr. Henry K. Beecher was recently Visiting Professor of Medicine at Emory University.

Dr. Kurt J. Isselbacher has been appointed Consulting Editor to the journal *Medicine*, and has been elected to the Editorial Board of the *Journal of clinical investigation*.

Dr. Carter R. Rowe presented a paper at the American Medical Association Meeting in Chicago on June 25, entitled "A follow-up study of fractures of the os calcis". Co-authors of the paper were Drs. Harilaos T. Sakellarides, Peter A. Freeman, and Charles Sorbie. Dr. Rowe also gave a talk on "The operative treatment of fractures of the cervical spine" during a panel discussion at the American College of Surgeons Meeting in Atlantic City on October 18.

Last January 27, at the American Academy of Orthopaedic Surgeons Meeting in Chicago, Dr. Harilaos T. Sakellarides read a paper on "Delayed healing and non-union of tibial shaft fractures". Drs. Peter A. Freeman and David B. Grant were co-authors of the paper.

Dr. Kathleen Stratton and Mr. William Ellett presented papers at the Second International Congress of Radiation Research, held in Harrogate, England, August 5-10.



Dr. Robert P. Kennedy (*Thd. S.* 1924) is our "singleton" in Richmond, Indiana. In response to a request from us, Dr. Kennedy has this to say about himself:

> I am very glad to have the opportunity of writing to our memorable institution, but I am sorry that I have nothing of interest to print. My last contact with the M.G.H. was in Casablanca on my return to the "zone of interior" after a tour of duty with the Army in Africa.
>
> Not long after the war, I retired to the old homestead here. Naturally, at my age, the main interest centers about the children. None are M.D.'s and perhaps it's just as well, for I couldn't keep up with them in all the ramifications of modern medicine. I have enough trouble with a daughter who is involved in modern art. I'd let her know if a stained glass window was needed in the operating room.
>
> Best wishes to all.

Since our Archives records showed that Dr. John H. Kennedy (*S.* 1950) was our only alumnus living in La Jolla, California, we sent him a letter asking him to tell us something about his activities out there. The letter was forwarded to him at his present address—Cleveland Metropolitan General Hospital—where he is

Dr. Richard B. Cohen, Associate Pathologist

now Surgeon-in-charge of the Thoracic Surgical Service and Assistant Professor of Surgery at Western Reserve University School of Medicine. His reply reads:

On July 1, I had the good fortune to succeed Dr. George Clowes (a.r.s. 1948) in the Thoracic Unit of the Cleveland Metropolitan General Hospital, joining several MGH alumni, including Drs. Simeone, Rhinelander, and Robert W. Hopkins.

On July 20, my wife and I flew to Moscow with the Boston Charter Group to attend the VIII International Cancer Congress, where I gave a paper entitled "Pituitary Crooke cell hyperplasia in pulmonary oat cell carcinoma" in co-authorship with Drs. Sommers and Williams.

Since my return on August 14, I have been dividing my time between the laboratory, the clinical wards, the operating room, and the students, in a pattern familiar to all. I am looking forward very much to my wife's and children's return from Maine this week, as we have located a farmhouse with 25 acres in Chagrin Falls, Ohio, as our new home.

We were very pleased to receive this letter from Dr. Arturo L. Aranas (r.p. *Psychiat.* (*McL.*) 1961), written from Queen Mary Veterans Hospital, 4565 Queen Mary Road, Montreal, Canada:

This is in reply to your most welcomed letter of August 9. I must apologize for the delay in answering.

Since I left McLean Hospital in June 1961, I never had the chance to read The News, but I was hoping to get in touch with my friends at the Hospital.

I am now working as a research fellow in psychiatry at Queen Mary Veterans Hospital. Last year my work was at Ste. Anne de Bellevue, also a Veterans Hospital. My work is part of the Diploma Course in Psychiatry of McGill University. Besides my research work, I am doing undergraduate teaching.

I am very sure that through The News I shall be able to communicate with all my friends in Boston.

Many thanks again, and a wish that I might hear from everybody through The News.

Letters from our "singletons" continue to arrive—this one from Dr. Roy L. Byrnes (a.r.p. *Path.* 1954), with a new address but still a "singleton". From 31870 Coast Highway, South Laguna, California, he writes:

My wife and I have been living in the seacoast community of Laguna Beach for three years. Ilse used to work in the Huntington, under Drs. Aub and Baker, and will be remembered by many of MGH vintage 1952-55. I came to this area to organize the Pathology Department in a small new community hospital. Since that time, I have opened a private clinical pathology office and have served as consultant to several other facilities. Recently, Dr. Frank Kendrick, from the Veterans Hospital and UCLA, joined me in practice.

Ilse and I have two children—a boy and a girl. Our house is located within sound of the breakers. We are always happy to hear of the M.G.H., and we hope that any MGH-er traveling between Los Angeles and San Diego will call upon us.

This account of many and varied activities, together with a new office address, has come from our "singleton" in Norwalk, Connecticut—Dr. John Paul Gens (r.s. *U.* 1943), who felt he had nothing of importance to tell the readers of The News:

I am sorry I have not communicated with you sooner than this, but have felt that there has really been nothing of importance or of interest to others regarding me or my activities. However, since I can no longer ignore your request, I submit the following information:

I am the Chief of Staff of the Norwalk General Hospital and, in addition, am the Director of its Department of Genito-Urinary Surgery and the Director of the Renal Unit which has been performing extracorporeal hemodialysis for five years or more in this small community and has also implanted teflon cannulas for long-term dialyses according to the technique of Scribner of Seattle. I am also a Trustee of the Norwalk General Hospital and, until approximately two years ago, had been the Counselor for Fairfield County of the Connecticut Medical Society. What spare time I have is used in my capacity as a member of the Board of Education of New Canaan and for boating and sport fishing.

I am ashamed to admit that I have not attended as many professional meetings as I should have nor have I maintained contact with those from the Massachusetts General Hospital as I have wished. I sincerely miss the stimulating influence of the Hospital and the associations I had with Howard Suby, Sylvester Kelley, Wyland Leadbetter, and others. I have been interested in receiving The News and learning what is happening at M.G.H. Many times I wish I were "home".

* * *

EMERGENCY WARD

Our Emergency Ward broke an all-time 12-hour record on November 12 (a holiday this year in Massachusetts). From 12:01 Monday morning to 11:59 Monday night, 171 patients were brought or came to the Emergency Ward. While it is true that there was an E.W. census of 170 on a Saturday last February, that unusually large figure was principally due to the fact that our streets and roads were covered with a solid hard glare of ice which resulted in the influx of people with broken bones and other injuries caused by falls and by skidding automobiles.

The extraordinary thing about this large number of people who passed through the Emergency Ward on November 12 is that no particular cause was evident and no particular pattern prevailed. All ages were represented from a very young baby to a man in his 80's, and an assortment of injuries and illnesses ranged from a toothache to pneumonia.

Thirty-seven out of the 171 needed to be admitted to the Hospital as in-patients.

The News

No. 218 Boston, Mass. January 1963

LOWELL LECTURES AT M.G.H.

For the second time, a series of free public lectures under the auspices of the Lowell Institute and the Massachusetts General Hospital will be given in our Moseley Rotunda on Wednesday afternoons, beginning at 5 o'clock, from February 6 through May 15. The topic to be discussed this year is "The hospital's responsibility to the community", and seventeen men, outstanding in their various fields, will deliver the lectures.

As the plan for the series approached completion, Dr. Knowles's cogitations on the subject of a hospital's responsibility took this form:

The Lowell Institute was founded by John Lowell, Jr. in 1836 and under his will maintains annually various courses of free public lectures in the City of Boston. During the 150th Anniversary Convocation of the Massachusetts General Hospital (1961), a series of twenty lectures in the public interest were sponsored by the Lowell Institute, concerned with the stimulus provided by disease states to the advancement of basic science. Delivered by distinguished American physician-scientists, the lectures centered on the advances in scientific thought and knowledge which had their origin in the clinical observation of disease. An example was Carl F. Cori's lecture entitled "Important advances in knowledge of carbohydrate metabolism which had their origin in disease", in which the author traced the stimulus of clinical observation of diabetes and glycogen storage disease to the development of the present-day concepts and knowledge of carbohydrate biochemistry and the action of insulin. The lectures were subsequently edited by Dr. Henry K. Beecher and published by the Harvard University Press in 1960.

The last lecture of the series, delivered by Rene Dubos, was entitled "Medical utopias". The last sentence reads: "Medicine is an aspect of social technology; its ethics and its goals are the products of the interplay between scientific understanding and human aspirations." Never have human aspirations for health and the demands for fulfillment of health wants and needs been higher in this country. This has resulted largely from the massive and constantly accelerating scientific and technological advance in medicine. While its benefits are well recognized, it has also created the social problem of rising expectations in an expanding, longer-lived population, progressively less able to afford the steadily rising cost of medical care and health services.

The social technology of medicine has had considerable stimulus for its development from the consumers of health services, but organized medicine and the university hospitals have at times been slow to bring about desirable innovation. Recently I was asked to write an article for the *Boston Globe,* explaining how the M.G.H. had attained its position of pre-eminence amongst American hospitals—part of which is quoted below:

> At the time of the decision to construct the Research Building, the Trustees of the M.G.H. said:
>
> "Why have we given first priority to a Research Building when there are so many other jobs to be done and so many that we want to do? The position of science in medicine is established beyond question. There is no reason to believe that this position will not be maintained indefinitely. We want to consolidate our gains and developments and to make certain that they are established as a fundamental part of our medical and surgical structure for the next half century.
>
> "Once we are firmly anchored in what has proved sound and essential through the test of experience, then we shall be ready to undertake experimentation and pilot studies in the socio-economic aspects of medicine, the extension of medical services to the community, the maintenance of health, and the other pathways that are opening ahead. Some may be determined by society and not by us, but we are ready to play our role wherever the future may lead. Already, thinking and planning for these undertakings are under way."

What of the future? The key is contained in the last paragraph of the above quotation. The survival of the voluntary, non-profit hospital depends on its ability to relate to the wants and needs of the community on which it depends for its moral and financial support. Pre-eminence of the institution depends on its ability to *anticipate* needs and to innovate successfully in the broad field of health services, thereby leading the way and actively shaping the course of medicine, rather than following passively and responding sub-optimally to crisis induced by external *or* internal forces, where considered judgment is lacking. The present problems revolve around the steadily rising cost of medical care, an expanding population with increasing medical wants and needs, and the difficulties inherent in humanizing the many scientific and technological advances in medicine of the past several decades. Research and teaching will flourish and continue to embellish the atmosphere conducive to the best of patient care activities. The M.G.H. will maintain and strengthen its traditionally strong roots in the community in its attempt to solve the above problems.

How will the M.G.H. maintain its pre-eminence amongst the hospitals of this country? First by anticipating and viewing in proper perspective the future problems of medical science and medical care. Secondly by contributing to the solution of these problems which, in contradistinction to the past, are becoming increasingly more social, economic, and political issues.

It was with these thoughts in mind that the Lowell Institute was asked once again to sponsor a series of 17 lectures to be given at the M.G.H. and to be concerned with the social and economic problems of American medicine and the unique and central position of the hospital as a social instrument in solving these problems. It is hoped that the theme can be developed so that continuity of areas of interest will exist and, if it seems desirable, a book of these Lowell Lectures be edited and published. The format might be arranged as follows:

I. MEDICAL EDUCATION IN A CHANGING SOCIAL ORDER

Increasing wants and needs of a rapidly expanding population—all in the face of steadily rising costs of health services and increasing difficulty in supplying health personnel (including doctors) to keep pace with the needs—demand that the system of medical education and the traditional role of the hospital as an acute, curative institution be re-examined. In the case of current medical curricula, formal training stresses a scientific launching pad in the first two years, followed by emphasis on the acute curative function of the physician in both undergraduate and graduate (House Staff) activity—producing a man who, on the day he steps into practice, finds it difficult initially to provide continuity of care and to administer the necessary preventive and chronic care health services. Having been trained to take immediate action and expect immediate rewards (particularly emotional), he is poorly prepared to coordinate and administer all the necessary parts of health services and finds it difficult to work as a member of a well-coordinated group or team. More and more the physician finds himself *dependent* on other individuals, groups, and institutions where a knowledge of sociology is mandatory for effective action for himself, his patient, and his community. As Titmuss has said, ". . . progress in medical science in psychological theories and in the specialized division of medical skill has converted medicine from an individual intuitive enterprise into a social service." Yet our educational system teaches individual action and individual rewards and very little social science. The patient wants technical competence, personal care, and continuity of health services. This necessitates group activity on the part of the doctor and he must perforce become a medical administrator, interrelating with other individuals and groups to achieve the best possible care for his patient.

The *medical school curriculum* should be continuously re-examined and revised so that it will provide ongoing study during the four years of:

a) the contribution of the behavioral sciences to medicine—the sociology and psychology of the various groups involved in the provision and maintenance of health services (nurse, doctor, social worker, etc.), as well as the sociology and psychology of the various sub-cultures in the consumer groups (race, class of worker, etc.); the organizational structure of the hospital—the resultant stresses and inefficiencies; the assessment of community (and cultural) wants and needs; the administration of health services;

b) the contribution of public health and preventive medicine to the ultimate activities of the practising physician in his attempt to provide personal care, continuity of care, and technical competence—the three most pressing wants of the public.

The *function of the hospital* must be re-examined and its traditional role questioned.

a) Should the traditional division of curative and preventive medicine be removed? Professor McKeown has stated that "deficiencies of care . . . attributable to medical education . . . are due largely to traditional restrictions of the responsibilities of teaching hospitals." He has suggested that the hospital accept total responsibility for all the health services of a given area. Such a change in the traditional role of the hospital would be reflected in a more enlightened medical student and house officer as regards the total community responsibility of the physician.

b) The educational and teaching responsibility of the hospital as an institution in undergraduate and particularly graduate education should be closely scrutinized. Should the university assume major responsibility for graduate training as Russell Nelson has advocated? Certainly there has been a notable lack of ongoing scrutiny and study of this crucial phase of medical education. Recently the General Executive Committee of the M.G.H. established a Committee on Teaching and Education, to provide ongoing study of this vital Hospital function.

c) In this present era of scientific and technological advance, research in areas related to medical care (e.g., the evaluation of quality, the administration of health services, the assessment of needs) has received scant attention. Currently, only 4 to 5 million dollars (or 2/100 of 1 percent of all health expenditures) is being used to study and improve a 25 billion dollar industry (USPH).

d) The Montefiore Hospital has pioneered in certain new areas of hospital function, namely, the establishment of medical sociology in the setting of the hospital, a demonstration unit for the evaluation of newer methods in making patient care better and more efficient (electronic devices, human engineering, etc.), cooperative study with consumer groups concerning medical care and the provision of health services, medical group practices, and, recently, the plans to build an 80-bed nursing home as a demonstration unit on the grounds of the hospital. By active demonstration this hospital is contributing heavily to the solution of some of the problems besetting medicine today, and is teaching its students and staff by example rather than by lip service.

II. Rising expectations (medical wants), an expanding elderly population (medical needs), versus rising costs

Health needs demand medical care. Health wants demand medical service. The scientific and technological explosion in medicine has improved medical *care* immeasurably and an already excessively health-conscious nation looks ever more hopefully to science to conquer cancer and the degenerative diseases. In 1961, the Government spent 496 million dollars on medical research (3 million dollars in 1940), and by 1970 the figure is estimated at 1.6 billion—roughly 70% of all medical research support. We have already noted that only 5 million dollars is being spent presently to study and improve the organization, coordination, and administration of health services. While science and technology have contributed much to medicine, it has been achieved only at considerable emotional cost and financial expense. Increasing specialization has segmented the medical staff and disjointed continuity of care, necessarily and inevitably diluting the personal care element of medicine. While technical competence has increased, it has made medical care a somewhat disconnected, discontinuous, and increasingly expensive and impersonal encounter between patient and physician, and both are uneasy and concerned about it.

Important social action has occurred in the ongoing attempt to humanize scientific and technological advance, and to make health and the provision of medical care what American society now looks upon as a birthright. Attempts to provide medical care for illness and medical services for chronic care and for the prevention of illness have been hindered by three main problems:

1) the steadily rising cost of medical care and health services
2) the lack of organization and coordination of these services
3) lack of public demonstration and faulty communication between medical institutions and their communities.

All three problems are closely interrelated.

1) *The rising cost of medical care*: There have been two approaches to this phenomenon:

a) The improvement and expansion of existing hospital services and the diversion of diagnostic problems to low-cost areas of the hospital—e.g., more ambulatory care; progressive patient care and the use of ordinary business management techniques to increase efficiency and reduce cost have enjoyed a measure of success. It must be noted first, however, that acute specialized care will always be expensive and the cost will rise as the cost of living rises and as more people and more complicated and expensive apparatus are needed to combat life-threatening emergencies. Secondly, only 30% of the cost of medical care is controlled by administrative techniques and is subject to the economy and efficiency measures of business (i.e., hotel management technique), while 70% represents the direct costs of medical care—those things that the physician cannot obtain for his patient in a hotel.

b) Recognizing that the rising cost of medical care is a phenomenon and that prolonged medical illness can wreak financial disaster on most of the individuals in a now credit-minded "not saving for a rainy day" population, health insurance companies have stepped into the breach with a variety of programs based either on pre-payment for comprehensive medical care or for fixed indemnity in the event of disease, trauma, or elective surgery. While solving many problems, the plans have created many new ones, such as overutilization of hospital beds, underutilization of ambulatory services, double indemnity, and general inadequacy of plans as regards certain contingencies and exigencies.

2) *The organization of health services*: Here we can start with governmental action and take a leaf out of the book of the National Health Service in England—the factors and social pressures that led to the nationalization of the health services and the profession, and the success and failures and problems that have subsequently been encountered. One might also look closely at the organization of the health services in the Scandinavian countries, and finally review recently enacted (Kerr-Mills) and currently pending (King-Anderson) health legislation in this country, considering the field of social welfare in broad perspective.

We can then narrow the focus to consider the regionalization of health services and attempts to coordinate the efforts of regional health groups (Rochester, N.Y. and currently through Trussell's efforts in New York City). Further scrutiny of the organization, coordination, and expansion of service leads to a consideration of the group practice of medicine and the formation of comprehensive medical care plans on a pre-payment (contractual) basis.

Our vision narrows finally to a sociologic study of the organization of the hospital with its diverse groups and its paradoxical (and organizationally unsound) arrangements of responsibility and authority—all considered in the light of rising costs and increasing demands and needs and the ability of the hospital to meet them, its success depending in large measure on its organizational structure of people, energies, and resources to get the job done.

3) *Public demonstration and two-way communication*: Man will do almost anything to maintain or to regain his health. But what does *he* consider to be a healthy state of being—what are his health needs as contrasted with his health wants? Certainly the balance between physical and mental health problems has been tipped toward mental health (whatever that may be), and time, talk, and listening are what the consumer wants and is progressively less able to obtain as the consumers multiply, specialism increases, and the forces in medicine become centripetal toward the large, complex urban institution—the teaching hospital, while the demographers tell us the forces of society are centrifugal toward the small, simple suburban stronghold—the ranch house. Organized medicine—the A.M.A. and A.A.M.C.—is being subjected to increasing scrutiny by two main groups, neither of which has any formal representation within the councils of either organization: 1) the consumers, banded together by large sums of money (health insurance and Welfare funds), and 2) the experts of other disciplines—the social scientists, the economists, and the politicians. We look for a clear pattern of shots around the future target to guide the profession and the hospital, which, as the social instrument of medicine, should be shaped by social forces and respond optimally to the changing community. The hospital should also actively direct these forces by influencing the community through public demonstration.

The final format of the Lowell Institute Lectures, which will consider these problems, is as follows:

THE HOSPITAL'S RESPONSIBILITY TO THE COMMUNITY

Wed., Feb. 6 KNOWLES, JOHN H.: The Social Conscience and the Primary Function of the Hospital Viewed in Historical Perspective. (An Introduction to the Lectures.)

Wed., Feb. 13 READER, GEORGE G.: The Contribution of the Behavioural Sciences to Medicine: Some Studies in the Evaluation of Hospital Function.

Wed., Feb. 20 MCKEOWN, THOMAS: An Examination of the Traditional Concept of Medical Care.

Thurs., Feb. 21 MCKEOWN, THOMAS: Changes in Medical Education Appropriate to an Enlarged Concept of Medical Care.

Wed., Feb. 27 CHERKASKY, MARTIN: The Hospital as a Social Instrument—Recent Experiences at the Montefiore.

Wed., Mar. 6 LINDEMANN, ERICH: The Health Needs of Communities.

Wed., Mar. 13 MCKITTRICK, LELAND S.: Privileges and Responsibilities of the Physician in the Hospital.

Wed., Mar. 20 NELSON, RUSSELL A.: The Hospital in the Continuing Education of the Doctor.

Wed., Mar. 27 CHURCHILL, EDWARD D.: Pre- and Post-Doctoral Medical Education in the Hospital.

Wed., Apr. 3 PETERSON, OSLER L.: Research in Medical Care.

Wed., Apr. 10 MASUR, JACK: The Relationship of Government to Hospitals.

Wed., Apr. 17 SOMERS, HERMAN M.: Health Insurance: Programs, Pressures and Problems.

Thurs., Apr. 18 SOMERS, HERMAN M.: (Continuation of the same topic).

Wed., Apr. 24 SCHOTTLAND, CHARLES I.: The Past, Present and Future of the American Social Security System—Its Implications for Health and Medical Care Programs.

Wed., May 1 TRUSSELL, RAY E.: The Problems of Maintaining Quality in Hospitals.

Wed., May 8 POLLACK, JEROME: The Voice of the Consumer: Cost, Quality and Organization of Medical Services.

Wed., May 15 RUTSTEIN, DAVID D.: At the Turn of the Next Century.

John H. Knowles, M.D.,
General Director

The Board of Trustees, at their meeting on November 23, 1962, voted to appoint:

Stanley Bullivant, Ph.D. as Assistant Biophysicist in Neurosurgery for one year, retroactive to August 24, 1962;

Dr. Lloyd M. Caplan as Assistant Psychiatrist at McLean Hospital, beginning July 1;

Dr. Dora R. Empson as Junior Assistant Resident on the Children's Service, beginning July 1;

Dr. Delbert J. Heslin as Clinical Fellow in Radiology (Staff), beginning July 1;

Dr. Helmer W. S. Huseby as Clinical Fellow on the Orthopedic Service, for the period December 1, 1962 through January 31, 1963;

Dr. Donald D. Hutchings as Clinical Fellow in Anesthesia, beginning January 1;

Dr. Maurice E. Keenan as Assistant Resident on the Children's Service, beginning July 1.

At their meetings on October 31, and November 7, 21, and 28, 1962, the General Executive Committee voted:

That the appointment of Dr. Freddy H. Frankel as Clinical and Research Fellow in Psychiatry will become effective as of December 1, 1962, rather than December 1, 1961, as previously recorded;

That the appointment of Dr. Richard P. Harbord as Visiting Anesthetist be extended for a period of three months, from January 1 through March 31;

To promote Dr. S. Bert Litwin from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, for the period January 1 through June 30.

To reappoint:

Robert A. Darrow, Ph.D. for one year, beginning November 1, 1962, with a change of title from Research Fellow in Biological Chemistry to Research Associate in Biological Chemistry;

Lorna J. Langer Gilmore, Ph.D. as Research Fellow in Biochemistry, in the Department of Pathology, for one year, retroactive to October 1, 1962.

To change the titles of:

Dr. Joseph W. Fowler, III, to that of Clinical and Research Fellow in Medicine;

Dr. Eugen Schmid to that of Clinical and Research Fellow in Medicine.

To appoint:

Miss Erika Ehrhardt as Research Fellow in Medicine for one year, beginning January 28;

Dr. John J. Franks as Research Fellow in Medicine for one year, beginning July 1;

Mr. Nasir-ud-din as Research Fellow in Biochemistry (Medicine) for one year, beginning July 1;

Dr. Kurt Randerath as Research Fellow in Medicine for one year, beginning January 28.

THE JOSEPH P. KENNEDY, JR. MEMORIAL LABORATORIES

The dedication of the Joseph P. Kennedy, Jr. Memorial Laboratories for Research on Mental Retardation took place on November 29. The program included a luncheon at the Sheraton-Plaza, with talks by Senator Edward M. Kennedy, President of the Foundation, George W. Beadle, President of the University of Chicago, and R. Sargent Shriver, Director of the Peace Corps.

Many distinguished guests attended the luncheon, following which they, and others, were taken on a guided tour of the laboratories.

These laboratories have been made possible by a $1,133,000 donation from the Kennedy Foundation and an additional $400,000 from the National Institutes of Health. They are directed by Dr. Raymond D. Adams, Chief of the Neurology Service at the Massachusetts General Hospital and Bullard Professor of Neuropathology at Harvard Medical School. In commenting on the new laboratories, Dr. Adams said:

> This is a very happy moment for me, and I am sure that I express also the feelings of the Staff of the Massachusetts General Hospital on this pleasant occasion. Actually, our interest in the field of pediatric neurology has been slow in developing. For many years we have cherished the hope that it would be possible some day to give as much attention to the nervous diseases of infants and children as had been given to those of adults, and that we would have adequate work space and instruments by which to study these diseases. It would perhaps be more correct to say that we had been hampered not only by the lack of work space but also by the lack of trained individuals who were interested in these diseases. I regret to say that this state of neglect of pediatric neurology was almost universal some ten years ago when we began to make plans for training the necessary personnel for that type of worker. When the opportunity offered itself some years later, after Dr. [Philip R.] Dodge was already at the M.G.H. and developing a service for Children's Neurology, to obtain laboratory space, we were, of course, absolutely delighted. Today, in a way, marks the formal and public notification that the new laboratories, made possible by the generous gifts from the Kennedy Foundation, the United States Government, the Trustees of the Massachusetts General Hospital, and the Spaulding Foundation, are open and functioning. But it signifies something more—that our Staff at the Massachusetts General Hospital and a part of the Faculty at Harvard Medical School will hereafter be enabled to pursue problems relating to nervous disease in infants and children, and particularly those which result in mental and physical handicaps
>
> The Kennedy Foundation and the Neurology, Neurosurgery, and Psychiatry Staffs of the Massachusetts General Hospital appreciate that problems in this field have two sides—the one which we might speak of as the humanitarian and the other the scientific. In

> past years, I think, the entire world has been impressed by the great deeds of the Kennedy Foundation in making the frequency and gravity of mental retardation known to our citizens, in giving an air of medical legitimacy and respectability to the underlying diseases, and in making the plight of a few of their hapless victims somewhat easier. By giving this money to our Hospital they have also acknowledged the fact of their belief in the scientific approach to these problems. The Staff of the Hospital, while sensitive to the tragic state of the mentally retarded and the physically handicapped and of the necessity for providing compassionate care and educational facilities, believe that progress can be made only through the scientific study of the causes and mechanisms of the underlying diseases. These new laboratories are to be devoted to this purpose.
>
> For us this date marks the beginning of a new period, when diseases of the child's nervous system will be subjected to systematic study and all the relevant methods of medical science will be brought to bear upon them. We expect to focus the interest of scientists on these problems and to make the bright students who come to our Hospital and University for advanced study aware of this importance. Even the smallest advance in our understanding of these diseases may open the way for the prevention of their damaging effects on the nervous system.

There are approximately 5,500,000 Americans who are mentally retarded. By 1970, this figure will have been increased by 1,000,000, over half of whom will be children under nine years of age. Mental retardation is a serious personal matter to at least one out of every twelve people in this country. It disables ten times as many as does tuberculosis, and twenty-five times as many as does muscular dystrophy. Before the use of vaccines, it disabled six hundred times as many as did infantile paralysis.

The Joseph P. Kennedy, Jr. Foundation was established in 1946, in memory of Lt. Joseph P. Kennedy, Jr. who was killed while flying on a dangerous experimental mission against a German V-2 rocket base. Since that time, fourteen institutions for the care and treatment of mentally retarded children have been established by the Foundation in the East, the Middle West, and the Far West.

A portrait of Lt. Joseph P. Kennedy, Jr., on the 9th floor of the Vincent-Burnham Building at Massachusetts General Hospital, was unveiled during the dedication ceremonies.

VOLUNTEER GROUPS
MGH SERVICE LEAGUE

MRS. CHARLES B. BURBANK

In tribute to Mrs. Charles B. Burbank, a committee of the MGH Service League placed a beautiful bouquet of flowers on the desk of the White Building lobby, which remained there during a period of mourning following her death.

Mrs. Burbank was born Catherine McHugh on September 23, 1918, in Wisconsin. She was the daughter of Dr. and Mrs. Francis Thomas McHugh. She attended Mt. Mary College in Milwaukee, Wisconsin. In 1942 she joined the Chicago Chapter of the American Red Cross, and in 1944 served with the Red Cross Overseas Hospital Service in the Near East and in Italy. In 1946 Mrs. Burbank finished her research and obtained her Masters degree in 1947 from the Loyola University School of Social Work in Chicago, Illinois. On March 3, 1947, she came to the M.G.H. and served on the surgical wards as a Senior Case Worker. She left in January 1953, and was married to Dr. Charles B. Burbank on February 2, 1953.

Mrs. Burbank was Vice-President of the MGH Staff Wives Association from 1955 to 1956, and President from 1956 to 1958. She had previously served for several years as Chairman of the Volunteer Services for the Staff Wives Association (now the MGH Service League). She was also instrumental in setting up the Reception Center for Professional Visitors, and most recently had taken an active part in the early planning of a coffee shop to be opened in the future at the Hospital.

Mrs. Burbank died on October 17, 1962. Her life was largely dedicated to the service of others, and her contributions to the organizations with which she was associated will remain long in the memory and appreciation of all who knew her.

The annual tea in honor of our volunteers, sponsored by the Trustees and General Director of the Hospital, was given in Bartlett Hall on the afternoon of December 4. As always on these occasions, the affair was thoroughly enjoyed by all who attended.

But there was an added feature this year which made the party doubly appreciated. It was the presentation of the first Jessie Harding Award for Volunteer Service. Here is a bit of background information regarding this innovation:

> At the meeting of the Board of Trustees held on November 22, 1961, on recommendation of the Advisory Committee to the Volunteer Department, it was VOTED to establish an annual award to be known as the Jessie Harding Award for Volunteer Service, and the Advisory Committee was authorized to appoint such subcommittees as they deem advisable to determine the recipient of and the form of this Award.

At 4:30 on the afternoon of the tea, Dr. Chester M. Jones, Chairman of the Advisory Committee to the Volunteer Department, took the floor, greeted the assembled guests, and then proceeded to read this citation:

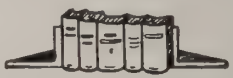
> To you, Doris Taylor Black, I have the privilege of presenting the Jessie Harding Award for Volunteer Service, in recognition of twenty years of continuous and devoted service to the many patients that you have helped at the Massachusetts General Hospital. Your work as a volunteer has been one of intense human interest in sick people, to whom you have given freely and unremittingly of your time and strength. You have made rough paths smoother; you have given hope and confidence to those who were fearful, and have provided kindly understanding to those who were doubtful. You have earned our respect and gratitude for your selfless but very tremendous contribution to the work of this Hospital.

At this point Mr. Francis C. Gray, Chairman of our Board of Trustees, presented the Award to Mrs. Black. It is a beautifully engraved, appropriately framed document, which reads, below the words "The Massachusetts General Hospital" and the Hospital seal:

> The Jessie Harding Award
> for
> Volunteer Service
> to
> Doris Taylor Black
>
> as a token of profound respect and appreciation for her many years of generous volunteer work for this hospital, and for the spirit of service that she personified.

Below are the signatures of Francis C. Gray, Chester M. Jones, and Mary Ruth Wolf (Director of our Volunteer Service Department), and the date—December 4, 1962.

Members of the Harding family who attended the tea and witnessed the presentation were her sons Mr. Edgar Harding and his son, Philip R., of Marblehead, Mr. and Mrs. Robert W. Harding of Marblehead, and Mr. Parkman D. Harding and his daughter, Inglee, of Needham.



STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter, and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

Anesthesia

Egbert, L. D., Laver, M. B., and Bendixen, H. H.
The effect of site of operation and type of anesthesia upon the ability to cough in the postoperative period.
Surg. Gynec. & Obst. 115:295.

Cardiology

Little, J. B.
Acute cardiovascular disease.
J.A.M.A. 182:289.

General Surgery

Cope, O., and Litwin, S. B.

Contribution of the lymphatic system to the replenishment of the plasma volume following a hemorrhage.
Ann. Surg. 156:655.

Miller, D., and Bjornson, D. R.
An investigation of cold injured soldiers in Alaska.
Mil. Med. 127:247.

Mundth, E. D.
Cholecystitis and diabetes mellitus.
New England J. Med. 267:642.

Internal Medicine

Hardy, H. L.
Beryllium Case Registry progress report: 1962.
Arch. Environmental Health 5:265.

Hardy, H. L.
Reaction to toxic beryllium compounds: Terminology.
J. Occupational Med. 4:532.

Laboratory Science

Isselbacher, K. J., Quinn, R. C., and Chrabas, M. F.
The solubilization and partial purification of a glucuronyl transferase from rabbit liver microsomes.
J. Biol. Chem. 237:3033.

Krane, S. M., and Glimcher, M. J.
Transphosphorylation from nucleoside di- and triphosphates by apatite crystals.
J. Biol. Chem. 237:2991.

Pinals, R. S., and Krane, S. M.
Medical aspects of renal carcinoma.
Postgrad. M. J. 38:507.

Silbert, J. E.
Incorporation of C^{14} from labeled glucuronic acid and N-acetyl glucosamine into polysaccharide by a cell free preparation from mouse mast-cell tumor.
Biochem. & Biophys. Res. Comm. 9:266.

Oral Surgery

Guralnick, W. C., and Shulman, L. B.
Tooth transplantation.
In Dental Clinics of North America, Philadelphia, W. B. Saunders Co., July, p. 499.

Orthopedic Surgery

Miller, D.
Development of a "walking cast" cover.
Mil. Med. 127:841.

Rowe, C. R.
Acute and recurrent dislocations.
J. Bone & Joint Surg. 44-A:998.

Physical Medicine

Watkins, A. L.
Rehabilitation after hemipelvectomy.
J.A.M.A. 181:793.

Watkins, A. L., and Ford, D. E.
Rehabilitation after amputation of an upper extremity: A ten year study.
Arch. Phys. Med. 43:293.

Physiology

Remensnyder, J. P., Mitchell, J. H., and Sarnoff, S. J.
Functional sympatholysis during muscular activity: Observations on influence of carotid sinus on oxygen uptake.
Circulation Res. 11:370.

Psychiatry

Blane, H. T.
Space perception among unilaterally paralyzed children and adolescents.
Exper. Psychol. 63:244.

Sifneos, P. E., and McCourt, W. F.
Wishes for life and death of some patients who attempted suicide.
Ment. Hyg. 46:543.

Radiology

Maruyama, Y., Wilkins, E. W., and Wyman, S. M.
An evaluation of angiocardiography in pulmonary carcinoma with particular emphasis on prognosis.
Radiology 79:617.

Robbins, L. L.
Problems in the education of residents in radiology. Hickey Lecture, 1962.
Am. J. Roentg. 88:393.

Wang, C. C., Little, J. B., and Schulz, M. D.
Cancer of the nasopharynx: Its clinical and radiotherapeutic considerations.
Cancer 15:921.

Miscellaneous

Cannon, B.
Editorial.
Plast. & Reconstruct. Surg. 30:103.

It has been a long time since we last heard from Dr. Arthur C. Guyton (*W.S.* 1943), our one and only "singleton" in the entire State of Mississippi, but now this most interesting letter has arrived from him:

Thank you very much for your letter.

As you perhaps recall, I had to give up my desires to be a surgeon when I contracted polio while in residency at the Massachusetts General in 1946. Almost ever since that time I have been with the University of Mississippi School of Medicine as Chairman of the Department of Physiology & Biophysics. During this time I have watched the school grow from a small two-year school to a rapidly expanding four-year school, which we believe now to be one of the outstanding medical schools of the South. Almost without exception the faculty and administration are young both in age and in energy; therefore, things move extremely rapidly here and the growth has been truly phenomenal. In research grants alone, the institution has grown over 4,000 percent in seven years, and we, like schools throughout the nation, are now finding that the research program is as important as the training program. On our faculty are many teachers who periodically bubble with excitement either from their contacts with students or with some new research finding. This is what one can find in a school that has a youthful faculty; and now, after seven years of growth in our four-year school, we are also beginning to level off into a state of stability which characterizes the older schools.

I think you can gather from my above comments that those of us at this school look forward to a very bright future. As evidence of this fact, the different departmental chairmen of the school have had an accumulative total number of offers to go elsewhere approaching the 100 mark, and yet, not a single departmental chairman has left.

Personally, I am now deeply engrained in physiology and biophysics, and I am sure that I have had as exciting a life in this field as I would have had in surgery, which, I am sure, would also have been a very rewarding life. Our school is small enough to enable me to do a few other things besides continual teaching. These include a fairly vigorous research program, some instrument design work, and the writing of a textbook of physiology for medical schools and a physiology text for colleges.

Thank you again for writing, and allowing me to respond in this way to many of my wonderful friends of the past.

Dr. Kenneth E. Liffmann (*Dn.* 1956) was our "singleton" at Loring Air Force Base when we wrote to him. Now, from

Dr. John H. Knowles, General Director

Rhode Island comes this letter:

Thank you for your kind letter.

After I left M.G.H. in 1956, I attended Tufts Medical School and obtained my M.D. degree in 1958. I spent the next two years as intern and then junior assistant resident in surgery at Rhode Island Hospital. From 1960 to 1962 I was in the Air Force, stationed at Loring Air Force Base, Maine, where I was assigned to the Surgical Service. My training in oral surgery and facial trauma, acquired at the M.G.H. under Dr.Weisberger, was a definite asset to me during my tour of duty.

Since last July I have been back at Rhode Island Hospital, Providence, as assistant resident in surgery.

The bank and I own a small home in Cranston, Rhode Island. We have stabilized at three children.

It is always good to hear from or about Dr. Donald Macomber (*S.S.* 1911), our "singleton" in Brunswick, Maine. This letter arrived from him recently:

Since it is now fifty-five years ago that I first worked at the M.G.H. as "striker", you can imagine that my professional activities have completely ceased.

I am afraid I have little of solid accomplishment to report, but I am enjoying life to the full. My time is almost equally divided between the Maine seacoast and Marathon on the Florida Keys. Sailing, fishing, and cruising are still my greatest interests. I have a twenty-six-foot auxiliary sloop on which my wife and "Teddy" Menzies (who formerly was a head nurse at Phillips House and who now makes her home with us) and I cruise and sail each summer. I have trailed this boat to Florida and lived on her winter before last and, in 1961, trailed her to the Bras d'Or Lakes, Cape Breton.

Since my last report I have travelled in South America, Europe, and round the world on a freighter. Other non-professional activities include weaving, bookbinding, and painting. The life of retirement can be both interesting and rewarding. There need never be a dull moment.

We were glad to hear from Dr. Willis H. Bower (r.p. *Psychiat.* (*McL.*) 1949), our "singleton" in Pueblo, Colorado. He writes:

Since March 15, 1961, I have been Superintendent of the Colorado State Hospital, a large mental hospital. I have had the job of presiding over the extensive reorganization of the hospital, both in its clinical services and in its administrative structure.

You might be interested to know that we called upon Mr. Larry Martin, your Comptroller, for help in the field of accounting, and we had a fine visit from him in August.

New addresses:

Dr. Irving P. Ackerman (*M.* 1951), Zero Emerson Place, Boston 14, Mass.
Dr. Allan M. Butler (past c. *C.M.*), Tashmoo Farm, Vineyard Haven, Mass.
Dr. Robert G. Frost (a.r.p. *An.* 1961), 1065 Cass St., Monterey, Calif.
Dr. John W. Josse (*M.* 1957), Dept. of Microbiology, Washington University School of Medicine, St. Louis, Mo.
Dr. Henry C. Marble (*W.S.* 1912), Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.
Dr. Eldred D. Mundth (*S.* 1960), Naval Medical Research Institute, National Naval Medical Center, Bethesda, Md. (through June 1964)
Dr. Herbert A. Newman (a.r.p. *C.M.* 1960), 10 Nosband Ave., White Plains, N. Y.
Dr. Murray E. Pendleton (assoc. pediat.), 18 Locust St., Falmouth, Mass.
Dr. Grant V. Rodkey (*W.S.* 1943), Zero Emerson Place, Boston 14, Mass.
Ralph Schwitzgebel, Ed.D. (a. psychol.), Massachusetts General Hospital, Boston 14, Mass.

Brief bits:

Dr. Edward B. Benedict gave a lecture at Salem Hospital, Salem, Massachusetts, on September 13, 1962. His subject was "Peroral endoscopy: Special considerations".

Dr. George L. Nardi was invited to Argentina last October as the guest of the municipality of Buenos Aires and the Argentine Surgical Society. During the course of the Argentine Surgical Congress he conveyed the formal greetings of the Massachusetts General Hospital to the Society and spoke on surgical residency training, coronary endarterectomy, and surgery for chronic pancreatitis. He was awarded honorary membership in the Society. On his return trip, he stopped at La Paz, Bolivia, where he made rounds and spoke on recent advances in surgery at the Medical School. He spoke to the Bolivian Surgical Society on pancreatitis, performed a demonstration esophageal operation, and was made a member of the Society. After his return to the United States, Dr. Nardi served as moderator of the Forum on Pancreatic Diseases at the American College of Surgeons Meeting in Atlantic City on October 16. On October 26, he was guest lecturer at the New Britain General Hospital, New Britain, Connecticut, and on November 27, he addressed the staff of the Tobey Hospital in Wareham, Massachusetts, on esophageal replacement. During the course of the year 1962, Dr. Nardi was elected to membership in the American Surgical Association, the New England Surgical Society, and the International Society of Surgery.

Dr. Harold F. Schuknecht, Professor of Otology and Laryngology at Harvard Medical School and Chief of the Department of Otolaryngology at the Massachusetts Eye and Ear Infirmary, has been elected to membership in the Collegium Oto-Rhino-Laryngologicum at its session in Athens last September.

Dr. Bartlett H. Stone spent a busy week recently at the Ryder Memorial Hospital on the island of Puerto Rico. This 85-bed hospital, supported by the Board of Home Missions of the Congregational Church, is located between the mountains and the forest, about 38 miles southeast of San Juan. On the first day, Dr. Stone examined patients, most of whom were in states of shocking neglect. The next four days, beginning at 7 A.M. and continuing until well into the afternoon, were spent in performing operations on these unfortunate, poverty-stricken patients. Emotionally, it was a moving experience for Dr. Stone.

The News

No. 219 Boston, Mass. February 1963

THE PHARMACY DEPARTMENT

The first rules of the Trustees (1811) provided for an Apothecary and House Surgeon, to be "elected from the class of students by the Trustees on the recommendation of the Physicians and Surgeons of the Hospital". The Apothecary was to be "ex-officio Secretary of the Corporation and of the Board of Trustees and Librarian and Cabinet Keeper of the Hospital". Then followed additional duties. He was "to care for all drugs and surgical instruments, administer the medicines, assist the Superintendent in his accounts, to care for emergencies in the absence of the Physician and Surgeon, and to keep the records". In the late 1800's he became the first Hospital Photographer and Radiologist. (Apothecaries Walter J. Dodd and Joseph Godsoe, in developing the use of X-rays at M.G.H., received extensive X-ray burns which ultimately caused their deaths.)

As each of the ancillary services matured into a new separate department, the energies of the Apothecary flowed in an amoeba-like fashion to some other area of service. During its history, the Pharmacy has been related to almost every department in the Hospital.

In 1943 John T. Murphy succeeded Joseph Godsoe as Pharmacist-in-Chief. Under his direction the department rapidly expanded, and in 1955 had a staff of forty-two (about the same number as today). In 1959 it was decided to establish two divisions of the Pharmacy. John T. Murphy became head of the Division of Pharmaceutical Research and Development, and his former assistant, John W. Webb, was appointed Director of Pharmacy. At this point of transition a number of sundry items were transferred to the Upper Store.

With the atmosphere of research permeating the Hospital, it is not surprising that various contributions to this trend have come from the Pharmacy. Among the pharmaceuticals prepared for evaluation might be mentioned injectable diphenylhydantoin sodium, parenteral glutamic acid, arginine, arginine glutamate, a highly concentrated form of intramuscular tetracycline, a stable solution of injectable phenobarbital sodium, a compatible parenteral solution of morphine and pentobarbital, and a syrup of neostigmine. Many of these formulations have become commercially available. One of the drugs currently under study is pitressin, prepared in the Pharmacy as a sublingual tablet. Should this formulation continue to prove effective, it will reduce the need for repeated injections.

Pharmacy interns and graduate students affiliated with the Hospital often select a thesis that is of direct benefit to the patient. Graduate student Vincent Bouchard is currently testing various formulations in an attempt to develop an improved cough syrup suitable for diabetics. Most of the "sugar free" syrups available contain ingredients that are neoglucogenic.

Many procedures that are practised routinely here are examples of why M.G.H. is often set apart from many other hospitals. Sterile collyria would be a long-standing illustration. For thirty years our Pharmacy has been supplying sterile collyria to the patients of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary, yet it has been only within the past few years that Industry has become interested enough to market these preparations. Even now a number of such commercial products leave a great deal to be desired. It would be impossible to determine how many eyes have been saved because John T. Murphy has insisted for three decades that collyria be sterile.

A constant stream of materials, including disposable and plastic units, not only from various departments within the Hospital but also from other hospitals and private offices throughout the city, pass through the Pharmacy's ethylene oxide gas sterilizers. This service has been supplied for the past eight years, and the Pharmacy is constantly being consulted by those who are planning to install their own gas sterilizers. It is obvious that a pharmacist's understanding of bacteriology benefits him in establishing and carrying out sterilization procedures.

In addition to the gas sterilizers, there are a number of autoclaves and various types of bacterial filters used in preparing ophthalmic and parenteral solutions. Manufacturing technique involving positive air flow through ultraviolet light is utilized in a specially designed cabinet for the aseptic filling of containers with drugs that are heat sensitive.

Injectables require special non-reactive glass containers. Ampuls demand close observation for proper sealing, while vials should be sealed with inert rubber plugs. Frequently the sulfur concentration in rubber stoppers is high and variable, requiring that special washing and rinsing be mandatory before use. Even if the medication itself were not directly affected, one must also consider the possible action on other ingredients in the formulation, such as antioxidants or preservatives.

Few people could get excited about a suppository mold unless a medication to be administered per rectum is not available. For example, suppositories containing 75 mg. of acetylsalicylic acid for pediatric use are not available commercially, but are manufactured routinely in our Pharmacy. For years all our aminophylline suppositories were made in the Pharmacy.

Physicians would be hard pressed to find such items as Congo red injection or carmine capsules available in some other hospitals, but know they may be procured routinely at M.G.H.

Mixing tanks and kettles are used for lotions, washes, and solutions. Many visitors are fascinated by the machine which fills tubes with various ointments and creams. Others enjoy watching the capsule-filling machine in action. These machines play a major role in keeping down the total cost of medication.

There are a number of other pieces of equipment that make individual contributions. The deep freezer obviously is necessary for proper storage of certain biologicals. On occasion, an injectable has to be vigorously agitated to be dissolved or properly suspended before being administered. Unless particular attention is given by the nurse or physician, part of the medication may adhere to the bottom of the vial and improper dosage will result. The Pharmacy has a machine that mechanically agitates vials in much the same way that cans of paint are shaken to assure uniform dispersion. This is appreciated by many physicians and nurses who remember the lumps of procaine penicillin in some of the early formulations and the difficulty in obtaining a homogeneous suspension.

An analytical control laboratory is maintained to assay the wide variety of items manufactured within the Pharmacy, to check selected commercial products, and to help develop new products under research. Here a chemist would recognize such things as gravimetric balances, a spectrophotometer, an automatic titrimeter, volumetric solutions, a Watkins extractor, Karl Fischer apparatus, and a polarimeter. No tableted medication is effective if it passes through the body intact, so the laboratory has an apparatus for testing the hardness of tablets and their disintegration time. A Hegman gauge allows the pharmacist to measure the particle size of ointments—another silent service to the patient.

The pharmaceutical chemist must be conversant with a wide range of incompatibilities, oxidation and reduction, pH, and all the assay techniques required for a myriad of products.

In addition to chemical or spectrophotometric assay, all sterile products manufactured in the Pharmacy must be quarantined until a bacteriological check is performed.

Packaging and labeling

The manufacturing and packaging procedures introduced during Godsoe's tenure were further developed when John T. Murphy became Pharmacist-in-Chief. Murphy introduced dark amber glass bottles so that the color of the contents could not be recognized through the deep amber glass, thereby making it necessary to read the label before using a drug. Errors obviously due to the dependence upon color and appearance of a drug, rather than a careful reading of the label, disappeared. The tightly-capped glass containers serve to protect the contents not only from dust but also from humidity which can cause hydrolytic deterioration of many drugs, including acetylsalicylic acid and the choline derivatives.

Strip packaging is now coming of age. The drug is protected from the time it is packaged by the manufacturer until it is administered to the patient. This individual protective packaging would be especially desirable for nitroglycerin and thyroid tablets, and capsules of chloral hydrate. Unit packaging of disposable syringes and needles has already been enthusiastically accepted.

The use of hypodermic tablets was discontinued at M.G.H. in 1949. Precise dilution and proper labeling of most injectables is done in the Pharmacy.

The use of the metric system exclusively was adopted in 1945.

Supplies

In 1821 the Apothecary was charged with the care of surgical instruments. This responsibility continues today. Prosthetic devices are also found in the department. A separate supply room is maintained for chemicals and laboratory supplies. The pharmaceutical needs of the Massachusetts Eye and Ear Infirmary have been supplied for years by the M.G.H. Pharmacy.

A rather extensive list of drugs is classified as floor stock for which no direct charge is made to the patient. Not all drugs, however, can be given to the patient at no cost, and it is these charge drugs that cause the greatest demands on Accounting, Nursing, and Pharmacy, since they represent individual transactions. Once a patient is admitted and a charge medication is prescribed, the nurse must requisition it from the Pharmacy. In addition to the time involved in requisitioning and obtaining the drug, practically every hospital has the problem of what to do when the Pharmacy is closed. This problem was largely solved in October 1961, when the Pharmacy hours were extended. Since most physicians have seen their patients by 8:30 P.M., the nurse has time to order and receive medications before the Pharmacy closes at 10 P.M.

A pilot study is currently being conducted on a limited number of nursing units to speed up and extend drug service by stocking both non-charge and charge drugs on the floors. Charges are recorded only *after* the drug is administered. This eliminates the need of supplying separate containers of medication for each patient and automatically eliminates the accounting procedure of issuing credit for unused medication. Drugs are *on the floor* twenty-four hours per day, readily available, irrespective of when a patient is admitted. With the logistics involved in a hospital the size of Massachusetts General, such availability is particularly desirable.

In the late 1950's, medicine stations were installed and standardized in the Baker Memorial Building. The concept gradually spread, until now only a few floors are without them. Once the medicine stations are standardized, the Pharmacy personnel assume responsibility for inventory and maintain a constant check for proper potency, packaging, and labeling.

There is a definite trend in hospitals to have Pharmacy service extend beyond the Pharmacy proper. The pharmacists' more frequent visits to the floors give a more personal service and offer greater accessibility to those who people the nursing units. Improved communications result. In this era of clinical specialization, the Pharmacy is expected to be conversant with each specialty. Information about new drugs is continually solicited from the pharmacist, but he is also expected to supply similar information about "old time" remedies to the younger generation of physicians and nurses.

In an effort to coordinate the service of items for direct patient care, the Director of Pharmacy, with his combined business and professional background, is administratively responsible for Pharmacy, Central Sterile Supply, and Upper Store. As accounting becomes more sophisticated and with computers now a reality, it is possible to establish a centralized organization of inventory control for these three major supply areas.

The pharmacist has an active interest in cotton, gauze, sutures, and adhesive plaster, since standards for these items are established by the U.S. Pharmacopeia.

Clinics Pharmacy

The Clinics Pharmacy fills prescriptions not only for Clinics patients but also dispenses reasonable quantities of drugs for inpatients who are being discharged. Prescriptions for both groups must meet the label specifications established by law.

A myriad of federal, state, and local laws, rules, and regulations govern pharmacy operations. Almost everyone is now aware of the rules and regulations recently promulgated by the Massachusetts Board of Pharmacy, whereby prescription-legend drugs may be sold to patients only. Prescriptions for employees may be filled if they originate from one of the Clinics. In instances where private patients cannot obtain medicines in the normal consumer outlets, the hospital may fill their prescriptions. State vaccines are not "sold" and are available to physicians, as in the past.

The majority of Clinics patients arrive at the Pharmacy between 10:30 A.M. and noon. Several improvements have been made in the past few years to streamline the processing of prescriptions without sacrificing accuracy. These measures have noticeably reduced the time each patient must wait for his prescription. Discharge prescriptions that are written twenty-four hours in advance are filled before the peak outpatient load occurs. This obviates the logistical time-squeeze which can develop when an ambulance or relative arrives for a patient who is being discharged.

The practice of having both the generic name and the strength of a drug on the label, which has been in effect since 1956, has dramatically reduced the number of telephone calls from physicians and pharmacists in surrounding communities.

The Clinics Pharmacy offers quality drugs at reasonable prices, price preference being given to items used for long-term illnesses, such as myasthenia, arthritis, and diabetes.

The future will undoubtedly see a change in prescription forms, since some physicians are already looking for a less time-consuming way to record the patients' needs. Third party agencies are also asking for more detailed information on each bill. This will gradually cause a paper work-load that can be broken only by some sort of standardized form suitable for machine handling. The ideal form should be satisfactory to both physician and Accounts Receivable.

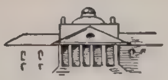
The Pharmacy maintains a library and literature file. Additional information is obtained from manufacturers' representatives or by direct communications with industrial concerns.

A *Pharmacy Newsletter* is prepared whenever there is a topic which would be of sufficient interest to the Staff. To make sure that it will be well read, the *Newsletter* is kept short and to the point. The many favorable comments received indicate that it fulfills a need.

M.G.H. pharmacists contribute to various seminars and institutes, and also serve on committees and as officers of state, regional, and national organizations. John W. Webb is currently Vice-President of the American Society of Hospital Pharmacists. In 1955 the Massachusetts College of Pharmacy recognized the many contributions of John T. Murphy by presenting him with an honorary Doctorate of Pharmacy degree—the fifth such degree to be conferred in its 125-year history.

No one can accurately prophesy, but it seems reasonable to assume that whatever the future demands, the Pharmacy at the Massachusetts General Hospital will continue to contribute its share toward superior patient care.

John W. Webb,
Director of Pharmacy



The Board of Trustees, at their meetings on December 7 and 21, 1962, voted:

To rescind the appointment of Dr. Thomas M. Glushein as Assistant Resident in Anesthesia, to have begun July 1;
To accept the resignation of Dr. Neva M. Johnson, Clinical Fellow in Radiotherapy, effective as of December 14, 1962;
That the resignation of Dr. Thomas E. Macnamara from the position of Assistant Anesthetist be accepted with regret and best wishes of the Hospital for his success at Georgetown University;
To increase the number of Interns on the Surgical Service from ten to twelve.

To appoint:

Dr. David W. Allen as Assistant in Medicine, beginning January 1;
Dr. Ernest Beroz as Clinical and Research Fellow in Psychiatry, beginning January 1;
Dr. Robert J. Boyd as Assistant Resident in Orthopedic Surgery for one year, beginning January 1;
Dr. Joan M. Brown as Clinical Fellow in Anesthesia for one year, beginning January 1;
Dr. Robert E. Burke as Assistant Resident in Neurology, beginning July 1;
Dr. John W. Cass, Jr. to the Board of Consultation, retroactive to July 1, 1962;
Dr. Thomas N. Chase as Assistant Resident in Neurology, beginning July 1;
Dr. George P. Contis as Exchange Assistant Resident on the Children's Service, for the term December 4, 1962, through January 15, 1963;
Dr. Larry J. Embree as Clinical Fellow in Neurology, to act as Resident in Neurology, for one year, beginning July 1;
Dr. John C. Fletcher as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. William H. Goodson, Jr. as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. Edward J. Guiney as Clinical and Research Fellow in Surgery for one year, beginning January 1;
Dr. Sen-itiroh Hakomori as Assistant Biochemist in the Department of Medicine, beginning July 1;
Dr. Charles Janeway as Visiting Pediatrician pro tempore;
Dr. John B. Joseph as Assistant in Pediatrics and Acting Chief Resident on the Children's Service, beginning July 1;
Dr. Carl M. Leventhal as Resident in Neurology for one year, beginning July 1;
Dr. Donald B. Martin as Assistant in Medicine, beginning January 1;
Dr. Milton Mazer as Assistant Psychiatrist, beginning January 1;
Dr. Hiroshi Nikaido as Assistant Biochemist in the Department of Research Chemistry, beginning January 1;
Dr. Elinor D. U. Powell as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Donald L. Price as Assistant Resident in Neurology, beginning July 1;
Dr. Mitchell T. Rabkin as Assistant in Medicine, beginning January 1;
Dr. Norman P. Rosman as Clinical Fellow in Neurology, to act as Resident in Neurology, for one year, beginning July 1;
Dr. Jules R. Schwaber as Clinical Fellow in Medicine, effective as of November 1, 1962;
Dr. Stephen L. Wanger as Clinical Fellow in Neurology, to act as Assistant Resident in Neurology, for one year, beginning July 1.

At their meetings on December 5 and 12, 1962, the General Executive Committee voted:

To promote:

Dr. Frederick W. Ackroyd to the position of First Assistant Resident in Surgery, beginning January 1;
Dr Melvin E. Clouse to the position of First Assistant Resident in Radiology, beginning January 1;
Dr. Louis H. Edmunds, Jr. to the position of Resident in Surgery on the East Surgical Service, beginning January 1;
Dr. Robert A. Nebesar to the position of Resident in Radiology, beginning January 1;
Dr. James J. Pollard to the position of Resident in Radiology, beginning January 1;
Dr. Lawrence C. Sack to the position of First Assistant Resident in Radiology, beginning January 1.

To reappoint:

Terence P. Abbiss, Ph.D. as Research Fellow in Neurosurgery for one year, effective as of October 15, 1962;
James E. Anliker, Ph.D. as Research Fellow in Anesthesia, retroactive to July 15, 1962;
Kerstin G. C. Gezelius, Ph.D. as Research Fellow in Medicine for one year, beginning January 15;
Dr. Mehran Goulian as Clinical and Research Fellow in Medicine for one year, beginning January 1;
Sharad G. Joshi, Ph.D. as Research Fellow in Medicine for one year, beginning January 15;
Dr. Jan Koch-Weser as Clinical Fellow in Medicine for one year, beginning January 1;
Dr. Philip I. Salib as Assistant Resident in Orthopedic Surgery for one year, beginning January 1.

To appoint:

Dr. Dennis E. Hyams as Research Fellow in Medicine for one year, beginning July 1;
Dr. Erasmo Mercado-Contreras as Graduate Student Assistant in Medicine, assigned to Cardiology, for the period November 13, 1962, through May 31, 1963;
James C. Orr, Ph.D. as Research Fellow in Medicine (Biochemistry) for one year, beginning March 1.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all recent articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material*, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter, and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

Biochemistry

Drabikowski, W., and Gergely, J.
The effect of deoxycholate on actin.
Biochim. et biophys. acta 63:225.
Drabikowski, W., and Gergely, J.
The effect of the temperature of extraction on the tropomyosin content in actin.
J. Biol. Chem. 237:3412.
Kamiyama, S., and Schmid, K.
Studies on the structure of α_1-acid glycoprotein. V. The linkage between the polypeptide and carbohydrate moiety.
Biochim. et biophys. acta 63:266.
Takahashi, S., and Schmid, K.
A low-molecular-weight γ_1-globulin derived from normal human plasma.
Biochim. et biophys. acta 63:343.

Clinical Endocrinology

Rosenberg, E. H., and Guralnick, W. C.
Hyperparathyroidism: A review of 220 proved cases, with special emphasis on findings in the jaws.
Oral Surg. 15, supp. 2:84.

General Medicine

Stoeckle, J. D., Hardy, H. L., King, W. B., Jr., and Nemiah, J. C.
Respiratory disease in U.S. soft-coal miners: Clinical and etiological considerations. A study of 30 cases.
J. Chronic Dis. 15:887.

General Surgery

Huggins, C. E.
Dimethylsulfoxide analysis to facilitate study of whole organ preservation by freezing.
Surg. Forum 13:51.
Phillips, A. W., and Cope, O.
Burn therapy: III. Beware the facial burn!
Ann. Surg. 156:759.

Laboratory Science

Arnason, B. G., Jankovic, B. D., and Waksman, B. H.
A survey of the thymus and its relation to lymphocytes and immune reactions.
Blood 20:617.
Flax, M. H., and Waksman, B. H.
Delayed cutaneous reactions in the rat.
J. Immunol. 89:496.
Jankovic, B. D., and Dvorak, H. F.
Enzymatic inactivation of immunologically competent lymph node cells in the "transfer reaction".
J. Immunol. 89:571.
Waksman, B. H.
Tissue damage in the "delayed" (cellular) type of hypersensitivity.
In Mechanism of cell and tissue damage produced by immune reactions. IInd International Symposium on Immunopathology, Brook Lodge (Mich., USA) 1961.
Basel, Switzerland Benno Schwabe & Co., 1962, pp. 146-160.
Waksman, B. H., and Adams, R. D.
Infectious leukoencephalitis: A critical comparison of certain experimental and naturally-occurring viral leukoencephalitides with experimental allergic encephalomyelitis.
J. Neuropath. & Exper. Neurol. 21:491.
Webster, H. DeF.
Schwann cell alterations in metachromatic leukodystrophy: Preliminary phase and electron microscopic observations.
J. Neuropath. & Exper. Neurol. 21:534.

Medical Research

Fallon, H. J., Lotz, M., and Smith, L. H., Jr.
Congenital orotic aciduria: Demonstration of an enzyme defect in leukocytes and comparison with drug-induced orotic aciduria.
Blood 20:700.

Otolaryngology

Kelemen, G.
The 4000-dip: Anatomic considerations.
Acta oto-laryng. 55:365.

Psychiatry

Lindemann, E.
Die Vorbeugung psychosomatischer Erkrankungen (mit Rücksicht auf den sozialen Raum).
Praxis der Psychotherapie 7:166.
Sifneos, P. E., and McCourt, W. F.
A study of mode and motive of some patients who attempted suicide.
In Proceedings of the Third World Congress of Psychiatry, Montreal, Canada, 1961.
Toronto and Montreal, Toronto Press and McGill University Press, 1962, vol. 2. pp. 1245-1249.

Talland, G. A.
Cognitive function in Parkinson's disease.
J. Nerv. Ment. Dis. 135:196.

Radiology

Lavender, J. P.
Retroperitoneal tumor.
J.A.M.A. 182:672.

Little, J. B.
Generalized collagen vascular disease.
J.A.M.A. 182:1110.

Schulz, M. D., and Wang, C. C.
A simple method of follow-up, disease indexing, and filing of radiation therapy records.
Radiology 79:842.

Next month's issue of THE NEWS will be the last in which 1962 titles will appear.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

Beckerley, J. G. (Editor)
Annual review of nuclear science, vol. 12.
Palo Alto, Annual Reviews, Inc., 1962.
(36Jn)

Garattini, S., and Shore, P. A. (Editors)
Advances in pharmacology, vol. 1.
New York, Academic Press, Inc., 1962.
(22C)

Rodd, E. H. (Editor)
Chemistry of carbon compounds, vol. 5.
New York, Elsevier Publishing Company, 1962.
(5T)

BIOGLETS

Dr. Barry J. Agranat, Intern in Dental Medicine — born in Boston, Massachusetts, June 6, 1936; A.B., Brandeis University, 1958; D.M.D., Harvard School of Dental Medicine, 1962; married.

Dr. Kenneth A. Arndt, Assistant Resident in Dermatology — born in San Francisco, California, June 3, 1936; University of California, Berkeley, 1957; M.D., Yale University School of Medicine, 1961; Intern in Medicine, Grace-New Haven Community Hospital, New Haven, Connecticut, 1961-62; married; one son.

Dr. John B. Blennerhassett, Assistant Resident in Pathology — born in Auckland, New Zealand, April 15, 1933; M.B., Ch.B., University of New Zealand, 1956; House Surgeon (Intern), Medical Registrar (Resident), Pathology Registrar (Resident), and Assistant Pathologist, Wellington Hospital, 1956-61; M.R.A.C.P. (Member of the Royal Australian College of Physicians), 1961; married; four children.

Dr. William C. Bostic, III, Assistant Resident in Orthopedic Surgery — born in Forest City, North Carolina, July 2, 1930; B.A., Chemistry, University of North Carolina, 1952; military service: Lt. (jg), U.S. Navy, Mediterranean Area, 1952-55; M.D., Harvard Medical School, 1959; Intern and Assistant Resident in Surgery, Roosevelt Hospital, New York City, 1959-61; married; three children.

Dr. Ann R. Brace, Intern in Surgery, assigned to Gynecology — born in Boston, Massachusetts, 1936; MGH-Radcliffe Coordinated Nursing Program, 1954-56; A.B., Radcliffe College, 1958; M.D., Yale University School of Medicine, 1962.

Dr. Francisco Civantos, Resident in Pathology — born in Havana, Cuba, June 25, 1935; B.S. and B.A., Champagnat College, Havana, 1952; M.D., Tulane University of Louisiana, 1961; Intern, Detroit Receiving Hospital, 1961-62; married; two children.

Dr. Melvin E. Clouse, Assistant Resident in Radiology — born in Vinita, Oklahoma, June 6, 1934; B.S., Texas Christian University, Fort Worth, Texas, 1957; M.D., University of Texas Medical Branch, Galveston, 1960; Intern, Philadelphia General Hospital, Philadelphia, Pennsylvania, 1960-61.

Dr. Richard E. Conway, Assistant Resident in Orthopedic Surgery — born in Medford, Massachusetts, January 10, 1931; A.B., Harvard College, 1952; military service: Lt., U.S. Navy, Line Officer in the Atlantic, Mediterranean, and Caribbean Areas during the Korean War; M.D., Harvard Medical School, 1959; Intern and Junior Assistant Resident on the Harvard Surgical Service at Boston City Hospital, 1959-61; Assistant Resident in Orthopedic Surgery, Children's Medical Center, 1961-62; married; one child.

Dr. Alfred J. Defalco, Intern in Surgery — born in New Haven, Connecticut, September 7, 1934; B.A., Trinity College, Hartford, Connecticut, 1956; U.S. Public Health Research Fellow in Neurophysiology, University of Rochester, Rochester, N. Y., 1956-58; M.S., University of Rochester, 1958; M.D., University of Rochester School of Medicine, 1962; married; two sons.

Dr. Khalil Germanos, Assistant Resident in Orthopedic Surgery — born in Akoura, Lebanon, September 14, 1933; B.A., Universite St. Joseph Jesuit, Beirut, Lebanon, 1952; Premedical School, Lyon, France; M.D., French Medical School, Beirut, 1958; Intern, Springfield Hospital, Springfield, Massachusetts, 1958-59; Resident for one year, Boston City Hospital, Boston, Massachusetts; six months of Orthopedics, Sacred Heart Hospital, Montreal, Canada, 1960; started Orthopedic training in the combined program of Massachusetts General and Children's Medical Center for 3½ years, Jan. 1, 1961.

Dr. David T. Harper, Jr., Intern in Medicine — born in Chicago, Illinois, May 10, 1936; A.B., Harvard College, 1958; M.D., Johns Hopkins Medical School, 1962; married; one son.

Dr. Norman G. P. Helgeson, Assistant Resident in Pathology — born in Minneapolis, Minnesota, January 6, 1931; B.A., University of Minnesota, 1952; military service: Lt. (jg), U.S. Navy, engineering on destroyers and mine sweepers in Far Eastern, European, and United States waters, 1952-55; M.S., University of Wisconsin, 1958; M.D., University of Wisconsin, 1961; Intern (rotating), Detroit Receiving Hospital, Detroit, Michigan, 1961-62; married.

Dr. Joshua Hollander, Assistant Resident in Neurology — born in New York City, December 28, 1936; A.B., Columbia University, New York City, 1956; M.D., College of Physicians and Surgeons, Columbia University, 1960; Intern in Medicine, Vanderbilt University Hospital, Nashville, Tennessee, 1960-61; Assistant Resident in Medicine, Vanderbilt University Hospital, 1961-62; married.

Dr. Donald L. Leake, Intern in Dental Medicine — born in Cleveland, Oklahoma, November 4, 1931; A.B., University of Southern California, 1953; Oboist, Columbia Records, 20th Century-Fox, 1953-56; San Diego Symphony Orchestra, 1953-58; Robert Shaw Chorale, 1954-55; Fulbright Scholar, Belgium, 1955-56; 1st Prix, Royal Conservatory of Music, Brussels, 1956; A.M., University of Southern California, 1957; D.M.D., Harvard School of Dental Medicine, 1962.

Dr. Alfred Leitner, Assistant Resident in Medicine — born in Vienna, Austria, 1932; B.S., Muhlenberg College, Allentown, Pennsylvania, 1953; M.D., University of Pennsylvania Medical School, Philadelphia, 1957; Intern, University of Michigan Hospital, Ann Arbor, 1957-58; military service: National Institutes of Health, Bethesda, Maryland, 1959-61; Research Fellow in Hematology, Oxford University, Oxford, England, 1961-62; married.

Dr. S. Bert Litwin, Assistant Resident in Surgery — born in Jasper, Alabama, February 21, 1934; B.S., University of Alabama, University, 1955; M.D., Harvard Medical School, 1959; Intern, Cincinnati General Hospital, Cincinnati, Ohio, 1959-60; Clinical and Research Fellow in Surgery, Massachusetts General Hospital, and Research Fellow in Surgery, Harvard Medical School, 1960-61; Post-Doctoral Fellow, National Heart Institute, National Institutes of Health, Bethesda, Maryland, 1960-61.

Dr. Aleksander Mathé, Resident in Psychiatry — born in Zagreb, Yugoslavia, July 31, 1934; graduate of the Gimnasium of Zagreb, 1952; M.D., Medical School, University of Zagreb, 1959; military service in Yugoslavia, 1959-60; Intern (rotating), Jewish Memorial Hospital, New York City, 1960-61; Resident in Psychiatry, Bellevue Psychiatric Hospital-New York University, 1961-62.

Dr. Luiz F. deQ. Mattoso, Assistant Resident in Radiology — born in Rio de Janeiro, Brasil, July 4, 1937; M.D., Faculdade National de Medicina, University of Brasil, 1961; six months of training in Radiology, Radiological Institute of Montevideo, Uruguay.

Dr. Gabriel B. Mirkin, Assistant Resident on the Children's Service — born in Brookline, Massachusetts, June 18, 1935; B.A., Harvard College, 1957; M.D., Baylor Medical School, Houston, Texas, 1961; Intern in Pediatrics, Michael Reese Hospital, Chicago, Illinois, 1962; married; one child.

Dr. Dennis D. O'Keefe, Intern in Surgery — born in Columbus, Ohio, July 19, 1937; A.B., Wittenberg College, Springfield, Ohio, 1958; M.D., Cornell University Medical College, New York City, 1962.

Dr. George N. Rogentine, Jr., Intern in Medicine — born in Minneapolis, Minnesota, August 29, 1936; A.B., Harvard College, 1958; M.D., University of Minnesota, 1962; married.

New addresses:

Dr. Richard F. Bedell (*C.M.* 1958), 1557 24th St., Boulder, Colo.

Dr. Irving D. Bornstein (a.r.p. *D.* 1961), 500 E. 33rd St., Chicago 16, Ill.

Dr. John M. Davis (*C.* 1961), 100 York St., New Haven 11, Conn.

Dr. Gordon S. Myers (*W.M.* 1942), Zero Emerson Place, Boston 14, Mass.

Dr. Edwin O. Wheeler (assoc. p.), Zero Emerson Place, Boston 14, Mass.

Brief bits:

Dr. Gordon L. Brownell attended the Symposium on Neutron Detection, Standardization and Dosimetry, held in Harwell, England, December 10-14, 1962. He presented a paper which will be published later. Its title is "Neutron spectroscopy and dosimetry at the Medical Therapy Facility of the M.I.T. Reactor".

Dr. Bradford Cannon has been elected to membership on the Board of Trustees of Proctor Academy, Andover, New Hampshire.

Dr. Richard B. Capps (*C.M.* 1931 and *E.M.* 1933) has been elected president of the staff of the Presbyterian-St. Luke's Hospital, Chicago, Ill. Along with his practice of internal medicine, he has established a laboratory for research in liver disease — now partially endowed. He has won distinction as president of the Society for Investigation of Liver Disease.

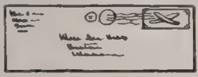
Dr. Edwin F. Cave participated in a course given by the New York and Brooklyn Regional Committee on Trauma of the American College of Surgeons, held in New York City, December 12, 13, and 14, 1962. The course was conducted by Sir Reginald Watson-Jones of London, and American orthopedic surgeons. Dr. Cave's subjects were "Fractures about the elbow" and "Fractures of the shaft of tibia". He also took part in a symposium on "Treatment of intracapsular fractures of the hip".

Dr. Earle M. Chapman gave addresses in Asheville and Morganton, North Carolina, on November 6 and 7, 1962, for the Continuing Education Program of the University of North Carolina Medical School. He spoke on "Diseases of the thyroid".

Dr. Witold Drabikowski (res. fel. *M.* 1962) is now at the Nencki Institute of Experimental Biology, Warsaw, Poland

Dr. John Gergely recently attended the Symposium on Contractile Proteins of the Japanese Biochemical Society in Tokyo, as an invited speaker. He also gave lectures on the biochemistry and biophysics of muscle contraction at the Universities of Tokyo, Sapporo, and Okayama.

Dr. Lloyd H. Smith, Jr. was visiting lecturer at the meeting of the Central American Society of Pediatrics, held in Panama on December 14, 1962. He also lectured at Roosevelt Hospital in Guatemala City on December 18.



Mr. Crockett received this letter from Mr. Joseph T. Prekup not long ago. Mr. Prekup was Administrator at McLean Hospital until his departure to assume his present duties at Maricopa County General Hospital in Phoenix, Arizona, where he is Associate Director:

> I welcome the opportunity to drop you a brief note and trust that things are well with you. Needless to say, I miss Boston and the Massachusetts General very much. As you know, it was and will always be very dear and near to my heart. However, things being as they are, the change to Arizona has been a good one so far. With the recent local elections over, the political climate continues to be excellent and Fred and I are having the opportunity of developing the kind of facility we think is necessary to meet the needs of this particular community.
>
> I know you are extremely busy, but I would like to hear from you when you can find a brief moment. I understand the Rehabilitation Building [at McLean Hospital] is now progressing nicely. Thanks for your many efforts in obtaining funds for this building. It will be something we can all be proud of.

We are especially grateful to Dr. Joseph A. Capps (*E.M.* 1896) for sending us this letter.

> I have long since retired from active practice, as I have passed my 90th birthday; but I find some occupation as an Emeritus Trustee of the Presbyterian-St. Luke's Hospital in Chicago.
>
> Longevity has its drawbacks. As I look at the picture of the 1896-1897 M.G.H. interns over my desk and reflect that they are all gone, including Dan Jones, Harvey Cushing, Elliott Joslin, and Bob Greenough, there is no satisfaction in being the last survivor.

This interesting letter has come from Dr. Howard M. Kravetz (clin. & res. fel. *M.* 1962), written from 909 East Brill Street, Phoenix 6, Arizona:

> After browsing through the last issue of THE NEWS, I am most interested to learn whether or not I am a "singleton" here in Phoenix, Arizona. I have asked that question of internists and surgeons here, but to date have found no one from the M.G.H. who is in this community.
>
> I must say that Phoenix represents the last frontier in American medicine as far as large cities are concerned. The calibre of the practitioners here, who have come from many large medical centers in the United States, certainly astounded me upon my arrival here. The phenomenal growth of this medical community has kept stride with the rapid expansion of the city itself.
>
> The vigor and enthusiasm is infectious and pervades all levels of medical practice here. The opportunity to study all phases of clinical pathology is unlimited. This city has been a "funnel" for persons with all types of illness, particularly pulmonary, and thus is a vast reservoir for patient care and treatment.

[No, Dr. Kravetz is not a "singleton" in Phoenix. He apparently made only a very hurried inquiry. MGH-ers are almost everywhere! According to our 1962 *Directory,* names of our alumni are listed as being in 46 of our States, including the District of Columbia, and in 30 foreign countries, from Australia to Wales. The names of 9 of our alumni appear as being in Arizona—4 of them in Phoenix. Perhaps even more will appear in the new 1963 *Directory,* soon to be revised and compiled.—*Editor*]

It was good to hear from Dr. Ralph Luikart, II (*M.* 1944)—our "singleton" in Santa Barbara, California. He writes:

> At long last I am replying to your request for a little news from me, as a "singleton" in this area.
>
> My wife and I came here with our small son and infant daughter in 1949 because we had fallen in love with the climate, mountains, and ocean of this area. Santa Barbara was then a relatively small town, already having a very capable dermatologist and thereby making the start a little more problematical for me than it might have been. However, my practice grew slowly but steadily until it became adequate.
>
> From the beginning I associated myself with U.S.C., where I teach and do a little research every Friday in Los Angeles.
>
> Nine years ago we had our third child, Scott, who seems to have completed our family. We live in a semi-ranch area, and have horses and sundry other animals to keep the children busy.
>
> My dabblings have included some interest in X-ray physics, cutaneous surgery, superficial chemical surgery, skiing, ham radio, real estate, and golf.
>
> Virginia and I miss our old Boston friends.

A brief note, with a promise of a longer letter in the future, has come from our "singleton" in Petah Tiqva, Israel—Dr. Zvi Laron (r.p. *C.M.* 1955). He writes:

> Thank you for your letter, and please accept my apologies for answering only now. I was abroad and returned only recently.
>
> I shall be very glad to send you a report on my activities and the facilities here. It was good to know that you had not completely forgotten me.
>
> I have heard about the wonderful changes that occurred at the M.G.H., and I hope to be able to visit you again some day.

Our "singletons" have been responding most generously to our letters of inquiry about them, for which we are very grateful. This reply has come from Dr. Gardiner Pier (*W.S.* 1943), our only alumnus in Truckee, California:

> A card from the Fruit Street Athletic Association unfortunately arrived on the day of their party in Atlantic City, but I doubt that even that invitation could move me right now.
>
> Anyone who has ever visited these parts can understand why I envy no one, despite a low income and a high cost of living. My kind of surgery, too, is fascinating (not to watch!). It is general, indeed, and fraught with unusual backwoods challenges. Fortunately, our twenty-one bed hospital is still adequate, though we're working hard to expand it.
>
> Yet there is time to take advantage of my surroundings during some part of almost any day, all year round. In summer, for instance, there are tennis courts outside my office, and in winter I often make a run down the mountain before the Ski Patrol gets busy enough to put me to work.
>
> The Squaw Valley office is frequently visited by old friends from such distant places as Boston!
>
> Several times a year I venture down to San Francisco, where I am effectively brought up to date by their excellent postgraduate courses at U. C. Hospital or the Presbyterian.
>
> But I do miss New England in October!

Another "singleton" heard from—Dr. Arnold M. Gordon (*C.M.* 1929). From 4406 Greenwood Drive, Des Moines, Iowa, he writes:

> Thank you for your interest in me.
>
> I had a pediatric internship at the M.G.H. (a long, long time ago), following a general rotating internship at St. Luke's Hospital in New Bedford, Massachusetts.
>
> I did general practice for a year in Boston, then spent a year in postgraduate study in internal medicine and gastroenterology, in Europe and in this country.
>
> I then practised internal medicine and gastroenterology in Des Moines, and I married a Des Moines girl. I took postgraduate studies in diagnostic X-ray from time to time, and did X-ray work all during my World War II service, mostly in North Africa and Italy.
>
> I had a bad heart attack (coronary thrombosis) six or seven years ago, and I subsequently gave up my office. Since then, I have been working half time as an X-ray consultant to a private medical clinic and to a U.S. Veterans' Hospital.

We were very pleased to receive this letter from Dr. Wilder Tileston (*E.M.* 1900)—our "singleton" in Carmel Valley, California:

> In March 1952 I retired from practice and, with my wife, took a trip around the world. After a year of travel, we settled down in this sunny valley in California.
>
> I have no professional activities, but I try to keep up with medicine by reading the *New England Journal of Medicine.*
>
> We have an interesting social life, largely among retired Army and Navy people. I soon found it wise, in case of doubt, to address everyone in the group as "Admiral" or "General".
>
> We keep healthy and happy by working outdoors, looking after the flowers and the shrubs, and the insect pests!
>
> The old M.G.H. still has a warm place in my heart.

Dr. Ken Hashimoto (a.r.p. *D.* 1959) wrote us a long letter shortly before he left Japan to return to Boston. Regrettably, space limitations prevented our including it in the last two issues of THE NEWS. Dr. Hashimoto is now working in Dr. Walter F. Lever's laboratory at the Boston Dispensary, 25 Bennet Street, but we give you the letter now because we think you will be interested in Dr. Hashimoto's account of conditions as he found them, in the field of medicine, in Japan.

> Thank you very much for your letter of August 20, which reached me just a few days ago. Surface mail takes a month to cross the Pacific, therefore please don't blame me for the delay in replying.
>
> I am delighted to write a short report about how I am getting along in Niigata, especially how I have survived through the all-limited practice under the National Health Insurance System as a practitioner in the town.
>
> Three years have elapsed since I left M.G.H. on one of those hot summer days of 1959. The glistening green of the trees and the lawn between the White Building and the Research Building on that day is still vivid in my memory.
>
> After a two-months' itinerary through almost all the countries in Western Europe, I sailed back home from Marseille through the Suez and around Southeast Asia.
>
> Contrary to my own desire, I had to assume

JOHN W. WEBB, DIRECTOR OF PHARMACY

my father's practice. He was suffering from a malignancy of the liver and died six months after my return. With one year's interposition of a research activity in the Kyoto University, I have been in the practice of dermatology and venereal diseases ever since.

In Japan, where forty-six medical schools produce more than three thousand M.D.'s every year for a population that is about two-thirds of that of your country, the surplus of physicians in universities and large hospitals makes it impossible for others to participate in the activities going on in those large institutions unless they get employed as full-timers with meager allowances. There is no such a system as Board of Consultants or Attending Physicians equivalent to yours—that is, the hospitals are closed to the practitioners in the town, and, accordingly, the university men maintain a much higher level of practice than the local M.D.'s. However, ninety percent of the medical cases are in the hands of the local practitioners, either general or specialty, and almost all of them are insurance doctors, under the National Health Insurance System controlled by the Government. I became one of these local M.D.'s.

Once you sign the contract with the National Insurance System, you must abide by the very ridiculous rules of the system—that is, "The Directions How to Treat Your Patients". Take a case of furunculosis, for example. The Direction tells us to use one of the sulfa drugs first, irrespective of the causative organisms (because the sensitivity tests are not recommended at this initial stage of treatment). Now that the resistant staphs are rarely sensitive to the sulfa drugs, the Direction approves the use of penicillin, which is no longer almighty, and then the use of broad spectrum antibiotics. A week or so is wasted before the right medicine can attack the resistant staphs. This step-by-step method is impractical and even dangerous. If these rules, which nobody observes, had been strictly followed, our nation would long ago have been relieved of its heavy burden of overpopulation. If any insurance practitioner honestly observed this law, no patient would come to him for a long course of rather expensive treatment. What does the doctor do to insure the health of his patients as well as his income? He uses, of course, the most effective broad spectrum antibiotics from the beginning, and makes a report (which is also a bill) for the Treasury of the National Insurance Bureau, stating that he couldn't help but use an expensive antibiotic because any one of the sulfa medicines or penicillin was not effective and his patient's general condition had rapidly been aggravated, etc. His "composition" is complete and he gets paid. The Reviewer of the Treasury, who is usually a professor of his specialty in one of the university hospitals in his locality, knows everything, including the phony contents of the report, but passes the bill if it is acceptablv composed in view of the Direction.

New modalities of treatment using new drugs are impossible, at least officially, under the National Health Insurance System, which has been so made as to check the expensive treatments and to recommend the cheaper ones. The cheaper the medicine you prepare for the patients (because of a traditional Japanese custom, we still use mortar and pestle and seldom write prescriptions for druggists) the more the profit you gain. If you give your patient aspirin pills, for example, you can get a net profit (margin) of 8 cents, while you can get only 7 cents when you give expensive tablets of steroid. There is no consideration for your cautiousness or thoughtfulness in deciding the indication of steroids. In this system, your diagnostic acumen is not duly evaluated, nor is your professional experience which has accumulated through the years, because they pay you 17 cents for ordinary diseases and 25 cents for "special diseases" as a diagnostic fee, irrespective of the length of your career. If you are an internist, the best work is to visit a patient at his home because a house call pays you 45 cents, and more if it is late or raining or the patient's house is more than a mile away.

Sometimes an internist must compete with the druggists as to how cheaply he can sell medicines, because all kinds of medicines (except narcotics) are available to everybody without prescription. Japanese newspapers are full of advertisements of new drugs and new brands, such as "Achromycine V for dysentery", "Serpasil for hypertension", "Neophylline (aminophylline) for your heart", etc. Thanks to the public health education by these advertisements, we see no fresh cases of syphilis, even in large dermatology services, but ever-increasing sero-resistant cases of late lues. Likewise, there are a lot of cases of resistant staph infections which can be controlled only by the newest antibiotics.

The insurance surgeon is no better in his business; the operation fee has no comparison with yours. For example, craniotomy pays you only $20, pulmonary lobectomy $25, gastrectomy $25, etc., including all expenses for the materials and nursing. There is no operation listed in the Directions which pays you more than $30.

Interestingly enough, this system makes a quack a millionaire and an excellent doctor poor, because it is not prohibited to treat any secondary events which ensued from the main disease and no time limit is set for the period of treatment if it is within two years. If the operation wounds get infected because of inferior sterilization techniques, you are allowed to treat the condition with "acceptable" modalities of treatment to add some more to your bill. If you neglect to give a patient tetanus to incur an unhappy event, you are not punished but are given a premium of payment for the treatment of a very difficult case of incessant seizure.

In spite of everything, my office is quite busy with an average of forty patients' visits a day. I am sure that my "medical composition" is much better than my English composition. I enjoy many American films on my TV and in the movie theaters. Among them I like Ben Casey the best. Vincent Edwards appears in a monkey suit and strolls through the hospital, which reminds me of the days I spent in the U.S. I am going to return to the Hub, but not to the Mecca, to my great regret. I'll join the research team of Dr. Walter F. Lever, who is now more active in the Boston Dispensary than in the M.G.H. It seems to me that I move once every three years to seek something new, this time with my wife and a small daughter who was born this last May. I am looking forward to seeing you all and the new developments in the Hospital, to which I couldn't contribute more than $2.

Please be assured that I shall subscribe to THE NEWS as soon as I get back to Boston, which will be before long. I couldn't pay for it when I left M.G.H. last time. I was very grateful to you when you sent me a copy, because you had reported in it that my work done with Dr. Cohen was published in the *Journal of Investigative Dermatology.*

I brought back home with me a chestnut from the horse chestnut tree in the green yard in front of your office, but it failed to bud the following spring. I imagine that huge tree has a lot of nuts this fall, too.

The News

No. 220 Boston, Mass. March 1963

MEDICAL ILLUSTRATION AND PHOTOGRAPHY

THE DEVELOPMENT OF VISUAL EDUCATION SERVICES FOR MEDICAL RESEARCH AND TEACHING AT MASSACHUSETTS GENERAL

In an academically affiliated teaching hospital, the continuous staff contributions to medical research and education, directed toward the care of the sick, have established the M.G.H. as a leader among hospitals of the world. With the rapid advance of medical and scientific knowledge and techniques during the past twenty years, has grown a continuing demand to communicate this new information. Over the past thirty years, 20 medical textbooks have been illustrated for the M.G.H. and H.M.S. staffs. In 1960, 730 papers were published on research and clinical findings based on medical and surgical cases in Massachusetts General. The design and production of 14 scientific exhibits during the past two years, utilizing the services of our medical artist and photographer, reflect the continuing demand that new medical information by visual media (drawings and photographs) be afforded. Closely linked in the medical communication chain are the picture-makers—the medical artist and the medical photographer, whose common objectives are to add visual clarity to the written and spoken word.

A review of the early common interests in medicine of the doctor, the artist, and the photographer, the growth of medical illustration as a paramedical profession, the growth of the medical art and photography departments at the M.G.H., with recent administrative changes and plans for the future, are within the scope of this report.

The role of the doctor as an investigator in scientific research and as a teacher is deep rooted in early medicine at the Universities of Salerno, Bologna, and Padua, beginning in the tenth century. During the sixteenth century in Italy, physicians and apothecaries of the day formed the Guild of St. Luke for the study and teaching of anatomy and medicine. Painters who gathered at the apothecary shops for their colors and to talk about art and artists were soon incorporated into this same guild. Common interest in anatomy by both the physician and the artist who established close contacts during this time became an important factor in the development of scientific anatomy. With the publication of the monumental *De humani corporis fabrica* in 1543, the anatomist Andreas Vesalius emerged as the "first man of modern science", and Sir William Osler called the "Fabrica" the greatest medical book ever written. Based on direct observations of the anatomical demonstrations, the illustrations by the artist Jan Stephen van Calcar have been accepted as a significant contribution to this first scientific medical book. About three hundred fifty years later, this same common interest in the broader aspects of medicine developed into the paramedical profession of medical illustration. This branch of applied art requires both a knowledge of medical subjects and artistic skills for the successful communication of medical information by visual media.

With the increased demands for books as medical knowledge expanded, printers looked for ways to produce books more quickly and more economically. Wood engravings were replaced with copper and then steel engravings and etchings. Lithography (drawing on stone) was developed in 1799 for the economical reproduction of illustrations, and to show fine details.

The discovery of photography through the experiments of Daguerre in France in 1839 and of Fox-Talbot in England in 1841 established a milestone in pictorial reproduction methods that equalled that of the first movable type and the printing press in about 1440. Manual copying of original drawings was soon replaced by the photomechanical reproduction techniques of photoengraving. An additional visual medium was added to graphic illustration in the use of the camera for recording unusual cases in medicine. Medicine, and the artist as well, gained a close associate when the photographer could help in meeting the illustration requirements for medical research and teaching.

After the Renaissance, artists continued to illustrate medical books. However, scientific accuracy by the artist, with rare exceptions, was sacrificed for decoration, and the need for artists with knowledge of and interest in the medical sciences became more evident with the development of newer methods of reproduction for book illustrations. Medical men, surgeons, and anatomists who were also capable artists prepared their own drawings for publication, to insure scientific accuracy of their careful observations. Notable among these doctor-artists during the period 1757 to 1859 were Albinus, Pieter Camper, Scarpa, Sir Charles Bell, Lord Lister, and H. V. Carter (Gray's *Anatomy*).

Staff interest in illustration was indicated at the M.G.H. in 1851 by a suggestion from the Medical Board that an artist be attached to the Hospital "who might make drawings of various morbid growths" (see Washburn's *The Massachusetts General Hospital—Its development, 1900-1935*, p. 107). Six years later the Trustees approved this suggestion and later specified the duties of the artist in the 1861 By-laws of the Medical Board, Chapter X. "He shall, under the direction and at the discretion of the Physicians and Surgeons, make accurate drawings of such anomalous and rare cases of disease as shall be useful for future reference and examination. He shall be present and assist the Physicians and Surgeons whenever his services may be desirable. All copies and drawings shall be carefully preserved in a portfolio provided for the purpose, and shall be placed in the Pathological Cabinet, under the care of the Curator; and they shall not be taken from the Hospital without the consent of the Visiting Committee." Dr. Lucius M. Sargent, Jr. and Dr. Henry P. Quincy were appointed "artists of the Hospital" and served from 1861-1864 and 1872-1892, respectively. During this period and earlier, Dr. Henry J. Bigelow utilized the services of an artist to illustrate his lectures on surgical pathology. His interest in both art and photography led to his use of photography for recording unusual tumors in some of his patients. Dr. Bigelow's drawings and photographs were later given to the Warren Anatomical Museum of the Harvard Medical School. In 1870, a drawing by Edward Waldo Emerson, a first year H.M.S. student (and son of Ralph Waldo Emerson) was included in the first recorded case history of muscular dystrophy at the M.G.H. (*New England J. Med.* *244*: January 1951).

For the next few years, unofficial artists were employed on a part-time or free-lance basis by individual surgeons, anatomists, and pathologists on the M.G.H. staff, to illustrate unusual clinical and pathological findings for teaching and for publication. Mr. H. T. Aitken and Miss Etta Piotti made outstanding contributions to both the Anatomy Department of the H.M.S. and the surgical staff of the M.G.H. from about 1900 to 1932. However, the official position of "Hospital artist", established in 1857, lapsed after 1892.

In 1894, during this lapse, the accomplished German artist, Max Brödel, came to Johns Hopkins University to illustrate a book, *Operative gynecology*, for Dr. Howard A. Kelly. The artist, with his background of illustration acquired in an anatomical laboratory of His, Braune and Spalteholz, his deep interest in research, and his artistic skills, and Dr. Kelly combined their interest and experience in communicating medical knowledge in the publication of an outstanding textbook of surgery.

The impact of Brödel's lucid illustrations based on original observation and his refusal to perpetuate the errors of other artists who only copied the works of earlier ones, led to the founding at Johns Hopkins Hospital, in 1911, of the first School of Medical Art in the world. A curriculum offered to students with artistic ability and an interest and education in the medical sciences emphasized a thorough knowledge of the anatomy and histology, as well as the disease processes, of the human body. Illustration techniques suitable for reproduction were emphasized, to develop an understanding of the most effective means of visualizing the intricate anatomical relation of the structures of the human body.

Brödel's high standards of scientific accuracy and excellent draftsmanship, as evidenced through his work and his instruction, were responsible for establishing medical illustration as a significant paramedical profession. The increasing recognition of the value of medical illustration to research and teaching is reflected in the development of schools for the formal training of medical artists in six centers of medical education in the United States. The Association of Medical Illustrators, formed in 1945, has continued to maintain these same high standards among its members, who are advancing the field of visual education in medical centers of the United States, Canada, and England.

World Wars I and II were considerable factors for focussing the attention of the medical profession on the value of the medical artist and the photographer in medical teaching and research. New emphasis on teaching methods with visual media was slowly adopted by university educators and required the services of specialists for the design, production, and use of illustrations for slides, movies, exhibits, and, later, television.

In 1930, Muriel McLatchie Miller, a pupil of Max Brödel, came to the M.G.H. to illustrate Dr. Joe V. Meigs's first book on gynecological tumors. In 1932, after completing her second book assignment and with the recommendation and financial sponsorship of Dr. Edward D. Churchill, Mrs. Miller was appointed a full-time medical artist for the M.G.H. staff. With a studio located in a corridor of Bulfinch 4 until 1939, she first illustrated surgical and pathological specimens for lectures and journal publication; but the scope of her illustration activities broadened through the years to include drawings of surgical procedures, surgical anatomy, neuroanatomy, endoscopy, orthopedic surgery, fracture service, and plastic surgery. In fact, she was responsible for all graphic illustration for the M.G.H. staff. Exhibit design and production further broadened the area of her service and, before long, her ideas on the effective presentation of statistical data for medical research and teaching were requested, and charts and graphs also became her responsibility. After moving to White 3A in 1939, part-time voluntary assistants helped her to meet the increased illustration requirements of the staff.

In 1941, the administration agreed to the establishment of a School of Medical Illustration, as it was felt desirable to offer training in the New England area. This was the third such school to be founded in the United States, the others being located in Baltimore and Chicago. A full-time assistant on a free-lance basis helped with production from 1940 to 1942, when World War II made adequate staffing a problem. With only limited space available, the School was first located in a corridor of the Domestic Building. The curriculum for the medical art student, based on the Brödel School, added new courses which were made necessary by the broader scope of medical illustration which had been developing since 1930. From a broad foundation in Anatomy, Histology, Physiology, and Embryology taught by Dr. Robert M. Green, and later by Dr. George Erikson, of the Harvard Medical School, the students were instructed in illustration techniques —pen and ink, continuous tone and color —suitable for reproduction purposes in publications and in lectures. Illustration projects during the first two years were mainly on anatomical subjects based on anatomical, surgical, or autopsy studies. Instruction in Endoscopic Illustration, Eye Anatomy, and Moulage was added to the curriculum, along with Dental Anatomy. Pathology and Neuroanatomy lectures and demonstrations were offered by the staff of the Pathology Department. Lectures and seminars in Administration, Book Illustrating, Operating Room Procedures, as well as field trips to a photoengraving plant and other art departments, added depth to the curriculum. A third year internship program in Surgery, Pathology, Medicine, and Photography for the students developed further application of art to medicine and gave an opportunity to illustrate more practical assignments related to their future work as illustrators. As the students developed technical skills and medical knowledge, they were also able to give part-time assistance in the production work in the Department of Medical Art. During the war and thereafter, this assistance was of inestimable value both to the Hospital and to the student, who gained valuable experience from close supervision of his work by the chief medical artist and the director of the School. In 1959, the School and the Medical Art Department, previously separated for lack of space, were finally brought together in their present location on the third floor of the Old Pathology Building. A large studio with laboratory, library, and lecture room, in close proximity to the production department, greatly improved the development of the teaching program. From its beginning in 1941, the School (directed by Mrs. Miller) was operated as a privately owned school, using the space made available by the Hospital.

During her thirty years as a Medical Artist for the M.G.H. and her nineteen years as Director of the School of Medical Illustration, Mrs. Miller contributed her artistic skills and her knowledge of medical subjects in a wide variety of illustrations for 18 textbooks, for lectures, exhibits, motion pictures, and for journal publications. Her contributions to the Hospital's program of research and teaching have added outstanding recognition to the value of a Visual Education Service in a teaching hospital. Graduates from her School have likewise helped to improve the standards of visual education in many medical centers in the United States. Mrs. Miller's retirement in June 1960 led to changes that were recommended to the Hospital administration after careful study of the situation. These will be discussed in a later section.

Photography, too, as a medium of illustration and of recording unusual clinical and pathological cases for teaching and research, ran a parallel course with Medical Art at the M.G.H. A review of these historic developments was written for the May 1959 issue of THE NEWS, and will be only highlighted here.

After the announcements in Europe of a new method of making pictures with a camera and photosensitized plates by Daguerre (1839) and Fox-Talbot (1841), Boston's interest in photography in the early 1850's soon stimulated investigation into its use for medical teaching. At the M.G.H., Dr. Oliver Wendell Holmes, a staff physician, soon became an enthusiastic photographer. Dr. John B. Brown, an orthopedic surgeon, used photographs to document the progress of his patients. A prompt reaction to this use appeared in an 1858 editorial in the *Boston Medical and Surgical Journal*, requesting the medical profession to make greater use of photography and urging that hospitals "have photographists attached to them as they now have microscopists and chemists". Dr. J. Homer Wright, staff pathologist, developed the techniques of photomicrography and found this "a useful method of making illustrations to accompany published results" of his research.

From 1885 to 1919, the task of clinical photography was assigned to the head apothecary, beginning with William Cameron. This additional duty was a natural and practical one because of the technical requirements for a knowledge of chemistry in the processing of photographic plates and prints. The apothecary and the physician of the nineteenth century through common interests, as with the artist in the sixteenth century, together began to apply the use of photography to medical teaching and research at M.G.H. Walter J. Dodd, head apothecary in 1895, became also the clinical photographer. His interest in Wilhelm Roentgen's new discovery led to experiments with his own X-ray machine and the study of its use as a diagnostic tool. After earning his M.D. degree in 1908, his duties as an apothecary and clinical photographer were assigned to Joseph Godsoe, and the Hospital moved Dr. Dodd to the staff of the newly formed Radiology Department as a pioneering Skiagrapher.

With the advances in pharmacology during World War I, pharmacy at the Hospital dropped its "sideline of photography", and this service, on a commission basis, became the responsibility of a local commercial photographer.

Although the Medical Board had received recommendations for the establishment of a Photography Department in 1900, action was deferred until the Trustees approved such a plan in 1927. In 1930, when the Baker Memorial was opened, the Hospital appointed Mr. Wilbour C. Lown as its first full-time staff photographer. His studio was located in the Bulfinch basement. Mr. Lown gradually built up a service to the Hospital that has continued to apply new photographic techniques for illustration and for record purposes. Surgical and pathological specimen photography, photo copying and clinical photography were the early requirements for the Photography Laboratory. Part-time assistants who volunteered their services kept budget and administrative duties at a minimum. A number of medical textbooks written by members of the M.G.H. staff during Mr. Lown's thirteen years of service here gave him credit for his outstanding work. A significant photographic record in color was made in 1942 by Bruno Micheleit to show clinical aspects of burn victims of the Cocoanut Grove fire. The entire June 1943 issue of the *Annals of Surgery* gave a full report of a new technique for the treatment of burns which had only a short time before been developed at the M.G.H. For five months after Mr. Lown's departure for military service in 1943, the Photography Laboratory was directed by Annette Conry, a graduate of the School of Medical Illustration who had studied photography with Mr. Lown in her student curriculum.

Mr. Lown and Mrs. Miller came to the Hospital at the same time and thus began a close alliance between Medical Art and Photography which was important in achieving the common objectives of the two production units of Visual Education Services which exist today.

After the succession of Richard St. Claire in 1944 and Mark McCann in 1947, Donald C. Withee was appointed head of the Department in 1952 and was responsible for much of the growth in the photographic service. Administrative responsibilities grew as a larger staff was required to meet the Hospital's increasing needs for a wide variety of photographic services. Routine work consisted of photocopying of artwork, X-rays, and book illustrations. Additional services included photography of patients, surgery, laboratory equipment, identification photographs, group pictures and others for publicity. Surgical and clinical motion pictures, and photomicrography became Don Withee's specialties. Processing of special EEG films, illustrations for medical textbooks, and many other photographic services, including a large pictorial exhibit for our 150th Anniversary, marked major photographic contributions from the Photography Laboratory under Don's direction. In 1959, Frank McCarthy, a staff photographer with 10-years' experience, transferred to the Pathology Department to assume responsibility for the continued development of their slide subscription program for the weekly C.P.C. published in the *New England Journal of Medicine*. Mr. Withee resigned in 1961 to accept a new position in California.

When Mrs. Miller retired in June 1960, the Hospital administration agreed to officially accept her gift of the School as a Hospital responsibility in its continued interest in education for the paramedical professions. Mr. Thomas A. Stebbins was appointed her successor as Director of the School of Medical Illustration and the Medical Art Department. After a careful study of other schools and medical art departments, an Administrative Committee, headed by Dr. Jack R. Dreyfuss, also recommended that the Hospital consider the benefits of administrative integration of the Medical Art Department, the Photography Laboratory, and the School into one central Visual Education Services Department. With the resignation of Mr. Withee in June 1961, Mr. Stebbins was asked to inaugurate this new program of Visual Education Services, with responsibilities for the business activities of each of the three units, to act as liaison between these units and the Hospital administration, and to solve various problems of personnel, equipment, space, and budget. With administrative approval, Mr. Stanley Bennett, a staff photographer with 8-years' experience, was appointed Chief of the Photography Unit. A staff of five assistants includes Clayton Hubbard and Peter Pierce as assistant photographers, with Ruth Carbone and Emily MacNaught as photography assistants, and Virginia Bunshaft as an office assistant.

Mrs. Edith Tagrin was appointed Chief of the Medical Art Unit, with Sidney Rosenthal as assistant medical illustrator and instructor in the School of Medical Illustration. Paul Andriesse joined the staff as full-time assistant medical illustrator a year later. Mrs. Helen Moseley continued as part-time office assistant for the Medical Art and the School units.

Among the Photography Unit's recent contributions to the Hospital's objectives in education and research are the photographic records relating to the arm surgery of Everett Knowles for public relations use, and new photographs for a revised brochure on Storrow House. Motion picture projects on animal research for Dr. John W. Irwin, and for Dr. Vernon H. Mark of the new Kennedy Laboratory, plus extensive footage to show surgery of the newborn for the Children's Service are indications of a continued need for this photographic medium. A photomicrograph showing cells of infectious mononucleosis, taken by Mr. Bennett, was used on the cover of the October 1962 issue of *Tech Engineering News*.

Recent contributions from the Medical Art Unit have been the development of illustration techniques to help visualize the three-dimensional relations of the ultrastructures of cells as seen in electron micrographs. Scientific exhibits have included research reports on an In-phantom Radiation Dosimeter, Molecular Biology of the Melanocyte, Reconstructive Urologic Surgery, Ureterovesical Reflex, Diabetic Retinopathy, Focussed Ultrasound, and the Blood Bank Reference Laboratories Program. Several of these received national awards for their contributions to medicine. Two medical textbooks, with illustrations by Edith Tagrin, were published, while three others are still in production for later publication. An increased number of individual drawings for publication has also indicated the continued need for an adequate staff of illustrators. Consultations to discuss illustration problems for publications, lectures, and conferences have also increased as the medical staff becomes more cognizant of the need for careful planning of visual material. Accelerated research activities have increased the number of complex biochemical and physiological charts and graphs that require a mutual understanding of the potentials and limitations of the use of visual media.

The School curriculum has been slightly modified after administrative study and recommendations. Pathology lectures have been doubled, and anatomy lectures and demonstrations have been concentrated in the first year to allow for increased illustrative experience in the clinics and in surgery. With continued interest of the Association of Medical Illustrators in present-day educational standards for the medical artist, accreditation, possible university affiliation, and the study of anatomy and other basic sciences on the medical school level have become prime considerations in the curricular development of the School.

The recent expansion and intensification of the whole research function of the Hospital, together with a re-evaluation of the teaching objectives of the M.G.H., have indicated a need for continued administrative and staff support for maintaining a competent group of medical illustrators and photographers. The use of television for undergraduate and postgraduate teaching is being effectively utilized in other medical centers to help communicate the advances in medicine. Such a medium may ultimately prove of value in the M.G.H. program of medical education.

Space requirements for a geographically and administratively centralized Visual Education Services Department have been evaluated and will be continually studied until a more efficient operation of these services here at the Hospital can be brought about.

The medical artist is often asked to explain why a photograph is not actually better for illustration than a drawing. The artist himself who may use photographs for reference knows the advantages of the camera in recording a fleeting instant of action and in demonstrating the actual and specific subject matter that is in front of the lens. A limitation of the camera is that it cannot interpret the subject, but when time and expense are factors in illustration, a photograph is often the medium of choice.

A drawing or painting, either realistic or schematic, can often show more than is seen by the camera. Generally only the surface relations of the subject matter are seen in a photograph. By a drawing, the artist can interpret what is visible with relation to what is known to exist even though it is not visible. From a knowledge of the purpose of the illustration and of his subject matter, he can discriminate between the important details and the trivial—he may eliminate a clutter of hands and instruments which hide structures that must be clearly visualized to be understood; and he may, by technical means, show inner structures through the outer surface as if it were transparent. He may cut away a section of the structures seen in order to reveal their hidden inner relations, combining this with an orientation view and an enlarged close-up view of the finer structural details. Often a single drawing is a synthesis of many views of the subject or many similar subjects designed to illustrate the important characteristics of size, form, and texture most clearly. By the use of light and shadow, a drawing can better show the general picture resulting from a synthesis of visual observations—the artist can focus the reader's eye on the significant parts of the illustration, while less important areas needed for orientation may be subdued or de-emphasized.

The artist is often asked to reconstruct a surgical procedure or illustrate a pathological specimen, as it existed before operation, from either a verbal description alone or from observations of X-rays or photographs when available. By his intimate knowledge of the structures of the human body and their changes in disease he is able to make a visual interpretation of what he only hears described or actually sees.

With the development of electron microscopy to reveal the ultrastructures of cells, the medical artist today faces new challenges—he must help to interpret visually what is seen in these greatly enlarged photographs. By studying many photographs of these structures, the artist must now be prepared to illustrate 3-dimentional views of these new structural relations.

Thomas A. Stebbins, A.B.,

Director, School of Medical Illustration and *Visual Education Services Department*

The Board of Trustees, at their meetings on January 4 and 18, voted:

To change Dr. Francis L. A. de Marneffe's title from Director of Hospital Affairs at McLean to Director of McLean Hospital;

To invite Dr. John H. Lawrence of the Donner Laboratory and Donner Pavilion at the University of California to give a Richardson Lecture at the Hospital on May 31.

To accept the resignations of:

Dr. Brian C. Dalton from the position of Clinical Fellow in Anesthesia, effective January 31;

Dr. Mudlagiri K. Gaitonde, Assistant Biochemist at McLean Hospital, effective retroactively to June 30, 1962;

Dr. J. Evarts Greene from the position of Clinical Associate in Medicine;

Dr. Marjorie B. Lees, Associate Biochemist at McLean Hospital, effective retroactively to September 30, 1962;

Dr. Edward Lowenstein from the position of Clinical Fellow in Anesthesia, effective January 24.

To appoint:

Dr. Donald L. Bornstein as Clinical and Research Fellow in Medicine, beginning January 1;

Dr. Lucille P. Carter as Assistant in Psychiatry, beginning January 15;

Dr. Bennett M. Derby as Clinical and Research Fellow in Neuropathology for one year, beginning July 1;

Dr. John H. Gould as Exchange Assistant Resident on the Children's Service, from January 16 through February 26;

Dr. Herbert A Haessler as Assistant in Pediatrics on the Children's Service, beginning January 1;

Dr. William C. Kvaraceus as Research Associate in Education in the Department of Psychology at McLean Hospital, beginning September 1, 1962;

Dr. Richard N. Lolley as Research Fellow in Neuropathology at McLean Hospital, beginning October 1, 1962;

Dr. Charles F. McKhann, former Second Assistant Resident in Surgery, as First Assistant Resident in Surgery, beginning January 1;

Dr. Howard S. Maker as Research Fellow in Biochemistry at McLean Hospital, beginning July 1, 1962;

Dr. Joseph M. Miller as Clinical Assistant in Medicine, beginning January 1;

Dr. Stig H. M. Nyström as Clinical and Research Fellow in Neurosurgery for one year, beginning March 1;

Dr. Emmanuel J. Perakakis as Clinical Fellow in Anesthesia, beginning June 1;

Dr. Kunio Suwa as Clinical Fellow in Anesthesia, beginning July 1;

Dr. Yasuo Takahashi as Research Fellow in Biochemistry at McLean Hospital, beginning September 25, 1962.

The Trustees also voted to appoint the following Residents in Psychiatry at McLean Hospital, beginning July 1:

Dr. Jacqueline M. Amati
Dr. Samuel H. Barondes
Dr. Douglas Buchanan
Dr. Richard D. Budson
Dr. Roy M. Coleman
Dr. Theodore Dreier, Jr.
Dr. Matthew P. Dumont
Dr. Sidney Green
Dr. Alexandra M. Kail
Dr. Stephen S. Leavitt
Dr. Bernard Levey
Dr. Harvey M. Shein
Dr. John B. Spillane
Dr. Lawrence A. Stone
Dr. Larry H. Strasburger

At their meetings on December 19, and January 15 and 23, the General Executive Committee voted:

To promote Dr. Roger H. Morris to the position of Chief Resident in Anesthesia, effective as of January 19;

To terminate the appointment of Dr. Yoshitaka Shimizu as Research Fellow in Medicine, effective as of December 22, 1962.

To reappoint:

Mrs. Olga Sears Karplus as Research Fellow in Psychology in the Department of Psychiatry for one year, beginning February 1;

Dr. Margaret H. MacGillivray as Clinical and Research Fellow on the Children's Service for one year, retroactive to September 1, 1962;

Gerald L. Mechanic, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning March 1;

Dr. Nancy T. P. Nichols as Clinical and Research Fellow in Psychiatry for one year, beginning January 1;

Gene M. Smith, Ph.D. as Research Fellow in Anesthesia, retroactive to September 1, 1962.

To appoint:

Dr. Mercedes A. Abunto as Graduate Student Assistant in Medicine, assigned to Cardiology, for the period January 1 through May 31;

Dr. Stuart J. Saunders as Research Fellow in Medicine for one year, beginning November 1.

✓ A SERVICE OF DEDICATION

A large group of friends and acquaintances of the late Miss Edith M. Terry gathered in The Chapel on January 30 in memory of her devotion as a social worker for many years in the Cardiac Clinics of the Hospital.

On the altar was a brass cross — a gift from the Committee for Home Care of Cardiac Children, who dedicated the cross in appreciation of Miss Terry's work here from 1925 to 1952. Vases of white lilies graced the altar. Soft organ music, including the hymn "When I survey the wondrous cross", preceded the prepared program which began with a few remarks by our Chaplain, Mr. Allan W. Reed. Dr. Bland then gave a résumé of Miss Terry's work. This was followed by a prayer, written by a patient for persons serving in this Hospital and read in unison by the assemblage. A benediction by the Chaplain concluded the ceremony.

The 71st annual Vincent Show, for the benefit of the Vincent Memorial Hospital, opens Tuesday evening, April 2, at 8:30, and will run through Saturday evening, April 6. There will be a matinee on Saturday afternoon at 2:30.

The script has been written by three young sisters who are members of the Vincent Club — Maria, Annie Lawrie, and Ethel Ryerson. The authoresses have taken an active part in previous Vincent Shows, and worked at the North Shore Music Circus last summer.

Mrs. Francis Keppel is again the Show Chairman and coordinator of the hundreds of Vincent members who will be working on the music, scenery, props, and behind the footlights, including the large "Front-of-the-House" Corps. The professional director will be Mr. Charles L. Tate of the Charles Blake Enterprises, Inc.

The title of this year's show is "A Bird in the Bush", in which the three authoresses take a nostalgic look at the period when the Vincent Hospital and the Club were founded. The plot, set in the Edwardian era, has scenes laid in England, France, and India, and a heroine who hails from Australia.

Tickets will go on sale March 18 at New England Life Hall, and will range in price from $1.25 to $6.00. The ticket office telephone number is KEnmore 6-4156. Members of the Ticket Committee will be on hand there to help you on Mondays through Fridays from 9:30 A.M. to 5:30 P.M.

SEVEN 150th ANNIVERSARY PROJECTS

A few of our doctors have made inquiries as to how the funds which were contributed during the 150th Anniversary Program have been and are to be used. Anticipating that others might appreciate having this information, we give you here a brief summation.

The Orthopedic Research Laboratories, dedicated in September 1960, were the first project to be completed. Under the direction of Dr. Melvin J. Glimcher, a team of scientists and doctors from the Hospital, Harvard Medical School, and M.I.T., are pooling their knowledge in histology, biochemistry, physical chemistry, and solid state physics in the study of the skeleton. Separate units are named in memory of outstanding orthopedic surgeons who served on our Staff — Drs. Joel E. Goldthwait, Armin Klein, Robert B. Osgood, and Marius N. Smith-Petersen. An article by Dr. Joseph S. Barr, describing in detail the functions of the laboratories, appeared in the February 1961 issue of THE NEWS.

The dedication of our James Howard Means Metabolic Research Laboratories, given in memory of Aimee and Winthrop Sargent, took place on June 7, 1961. Dr. C. Sidney Burwell, the principal speaker at the dedicatory ceremony, paid a well-deserved tribute to Dr. Means and spoke of the activities to be carried on in this area. Dr. Burwell's speech was published in the October 1961 NEWS. Two laboratories, two instrumentation rooms, a constant temperature room, a cold room and a dark room, a library, and a conference suite make up the space devoted to the study of metabolic research. The work is under the direction of Dr. John B. Stanbury.

In November 1961, THE NEWS published a comprehensive article, written by Dr. Francis de Marneffe, on the then-proposed McLean Hospital Rehabilitation Center. A copy of the architects' plan was included, showing the occupational therapy room, the library, the educational department, the music room, the day care center, the patio, and the village green. The "green", with its store, restaurant, beauty salon, laundromat, barber shop, bank, and post office, will offer to the patients many activities found in community life. The Center will be completed in 1963.

The Lincolnshire Hotel, located at 20 Charles Street, was purchased and is now a residence for about 150 student nurses. A library, classrooms, lounges, a snack bar, a squash court, and a laundry have been incorporated.

One of the outstanding renovations in the Hospital is the new 22-bed recovery room which has replaced the old 4-bed facility. The very latest in equipment for patient care following surgical procedures is now provided. A cardiac pacemaker, a TV monitor for visualizing heart beats, suction tubes for secretions, oxygen supply equipment, and blood pressure machines are only a few of the features of this most modern postoperative recovery room for efficient care of our patients.

THE NEWS will publish soon a report in detail on the Intensive Care Unit. Briefly, this modern Medical Service installation, with its unusual air-conditioning system designed to prevent recirculation of air from the patient areas, contains such equipment as oxygen, suction, and compressed air facilities in each patient's section of this new 18-bed unit.

The dedication of the Joseph P. Kennedy, Jr. Memorial Laboratories for Research on Mental Retardation took place on November 29, 1962. An article in THE NEWS of January 1963 reported that donations from the Kennedy Foundation, the United States Government, the Trustees of the Massachusetts General Hospital, and the Spaulding Foundation made these laboratories possible. The three major objectives to be pursued are: to improve the care of infants and children with diseases of the nervous system, to aid in the education of students and physicians in this field, and to investigate the cause, treatment, and prevention of diseases of the nervous system of infants and children. There is now adequate work space for these activities, with specially constructed laboratories for brain wave tests, research in experimental psychology, physiology, and neurochemistry, and for administration and study.

Here is a very abbreviated summary of the contributions made toward the 150th Anniversary Fund:

Total amount of money raised, as of September 17, 1962 — $12,872,214; spent or committed to date — $4,268,000; funds available for special projects — $2,058,000; 150th Anniversary expenses, including the cost of the Convocation — $595,969; bequests and gifts not available for 150th Anniversary projects — $2,674,245; building funds available for proposed new construction — $3,276,000.

Dr. Martin H. Flax, Assistant Pathologist at Massachusetts General and Instructor in Pathology at the Harvard Medical School, has been awarded a fellowship by the Medical Foundation — a United Fund agency. It will run for three years, starting on July 1.

Dr. Flax intends to do further research on the basic features of "autoimmune disease", primarily with the aid of the MGH Pathology Department's electron microscope.

In discussing his forthcoming project, Dr. Flax said, "'Autoimmune disease' results from an immune response by an individual to some of his own tissues. In contrast to inoculation with foreign materials, such as vaccines, an individual's own tissue components are generally incapable of stimulating an immune response. However, there are certain tissue constituents, often called 'autoantigens', which are in some instances treated as foreign by the body's own immune system. They then initiate a series of immunological events which lead to damage of the normal tissue from which the antigen is derived, producing an 'autoimmune disease'. These diseases, involving such organs as the brain, eye, thyroid, and the blood, occur spontaneously in man, but similar diseases can be experimentally produced in animals. Detailed analysis of these experimental conditions should clarify how these diseases are produced, and may suggest the means for their control."

Dr. George L. Nardi, Associate Visiting Surgeon at Massachusetts General Hospital and Assistant Clinical Professor of Surgery at the Harvard Medical School, has been awarded a research grant of $11,539 for the year 1963 by the Medical Foundation.

Dr. Nardi's research will involve the study of fundamental physiological and biochemical processes in the pancreas of dogs. It is expected that this basic research will result in a better understanding of the human pancreas, which is involved in such illnesses as diabetes and pancreatitis.

George A. Talland, Ph.D., Psychologist in our Stanley Cobb Laboratories for Psychiatric Research and Assistant Professor of Psychology at Harvard Medical School, has been awarded a research grant of $6,338 for the year 1963 by the Medical Foundation.

Dr. Talland's research will be concerned with the effect electric shock treatment has on memory. According to Dr. Talland, "The proposed pilot study will form an extension of the current program of the Experimental Psychology Laboratory of the Stanley Cobb Laboratories for Psychiatric Research, in which investigations of memory function occupy a central position of interest."

The Massachusetts General Hospital has received a $200,000 grant from the Hood Dairy Foundation for a new blood bank. The money will be used to increase the blood refrigeration and storage capacity from 300 to 500 units, double the donor beds, and expand the waiting room, laboratories, and research area.

Dr. Morten Grove-Rasmussen, Director of our Blood Bank, reports that 24,476 transfusions were performed at M.G.H. last year.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and

Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all recent articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter, and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

Anesthesia

Bendixen, H. H., and Laver, M. B.
Circulatory effects of thiopental sodium in dogs.
Anesth. & Analg. 41:674, 1962.

Smith, G. M., Weitzner, M., and Beecher, H. K.
Increased sensitivity of measurement of drug effects in expert swimmers.
J. Pharmacol. & Exper. Therap. 139:114, 1963.

Biochemistry

Schmid, K., Binette, J. P., Kamiyama, S., Pfister, V., and Takahashi, S.
Studies on the structure of α_1-acid glycoprotein. III. Polymorphism of α_1-acid glycoprotein and the partial resolution and characterization of its variants.
Biochem. 1:959, 1962.

General Surgery

DeGroot, L. J., Hall, R., McDermott, W. V., Jr., and Davis, A. M.
Hashimoto's thyroiditis.
New England J. Med. 267:267, 1962.

Huston, C. J. W., Adams, L. C., Field, R. A., and McDermott, W. V., Jr.
Effect of insulin on glucose uptake by the isolated perfused canine liver.
Lancet 1:357, 1962.

Kestens, P. J., McDermott, W. V., Jr., and Haxhe, J. J.
Experiences de survie apres perfusion hepatique chez le chien.
Lyon chir. 58, no. 2, 1962.

McDermott, W. V., Jr.
The diagnosis and treatment of bleeding esophageal varices.
Epatologia 8:109, 1962.

McDermott, W. V., Jr.
Doctor afield: Edward Hand, 1744-1802 — Physician and General.
New England J. Med. 266:456, 1962.

McDermott, W. V., Jr., Victor, M., and Point, W. W.
Exclusion of the colon in the treatment of hepatic encephalopathy.
New England J. Med. 267:850, 1962.

Oral Surgery

Trieger, N.
Fluothane anesthesia for ambulatory oral surgery patients.
Oral Surg. 16:31, 1963.

Orthopedic Surgery

Salib, P.
Orthopaedic and traumatic skeletal lesions in ancient Egyptians.
J. Bone & Joint Surg., Brit. Vol., 44 B: 944, 1962.

Radiology

Janower, M. L.
Mastocytosis of the gastrointestinal tract. Report of a case.
Acta radiol. 57:489, 1962.

Lavender, J. P.
Swollen painless knee.
J.A.M.A. 183:180, 1963.

Lawrence, J. H., Tobias, C. A., Born, J. L., Wang, C. C., and Linfoot, J. H.
Heavy-particle irradiation in neoplastic and neurologic disease.
J. Neurosurg. 19:717, 1962.

Maruyama, Y., and Little, J. B.
Roentgen manifestations of traumatic pulmonary fat embolism.
Radiology 79:945, 1962.

Books

Aufranc, O. E.
Constructive surgery of the hip.
St. Louis, The C. V. Mosby Company, 1962.

Fitzpatrick, T. B., and Walker, S. A.
Dermatologic differential diagnosis.
Chicago, Year Book Medical Publishers, Inc., 1962.

Janower, M. L. (Editor)
Technological needs for reduction of patient dosage from diagnostic radiology.
Springfield, Ill., Charles C. Thomas, 1963.

Miscellaneous

Viets, H. R.
Hinckley's who was who on Ether Day.
Boston Medical Library, 1962.

This is the last issue of THE NEWS in which 1962 titles will appear.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

Academy of Sciences of the USSR. Institute of Higher Nervous Activity.
Works. Pathophysiological series, vol. 4.
Washington, D.C., National Science Foundation, 1958.

BIOGLET

Dr. Robert R. Young, Assistant Resident in Neurology — born in Washington, Pennsylvania, August 26, 1934; S.B., Yale University, 1956; Fulbright Fellowship in Neurophysiology to Australia with Professor J. C. Eccles, 1956-57; M.D., Harvard Medical School, Boston, Massachusetts, 1961; Intern in Medicine, Peter Bent Brigham Hospital, Boston, 1961-62; married; one child.

New addresses:

Dr. Lawrence J. Barrows (r.p. *N.* 1952 and r.p. *N.P.* 1953), Pathology Dept., Veterans Administration Hospital, 150 S. Huntington Ave., Boston, Mass.

Dr. Colin H. Bolton (res. fel. *Biochem.* (*M.*) 1962), Dept. of Organic Chemistry, The University, Woodland Rd., Bristol 8, England

Dr. Hugh F. Folsom (*W.M.* 1931), Townshend, Vt.

Dr. Saul M. Marcus (*Bd. of Cons.*), 416 Marlborough St., Boston, Mass.

Dr. Laurence D. Trevett (a.r.p. 1933 and r.p. *N.* 1934), 412 Beacon St., Boston 16, Mass.

Dr. Chiu-an Wang (*W.S.* 1944), Zero Emerson Place, Charles River Park, Boston 14, Mass.

Brief bits:

Dr. Joseph C. Aub was invited to be present at the dedication of the new Metabolic Ward at Roswell Park Institute in Buffalo on January 29. He spoke on "Reflections on metabolic research".

Dr. Edwin F. Cave was in Montreal from February 3 to 6, serving as Visiting Professor pro tempore on the Trauma Service of the Montreal General Hospital.

Dr. Oliver Cope addressed the Academy of Surgery of Detroit on February 14. His subject was "The surgery of nodular goitre as an example of the changing emphasis in treatment of endocrine disease". On February 27 Dr. Cope gave the Lenhart Lecture at Western Reserve Medical School in conjunction with the Cleveland Surgical Society. He spoke on "Hyperparathyroidism: Experiences in diagnosis and management of 300 cases".

Dr. Thomas B. Fitzpatrick has been elected a corresponding member of the Societas Dermatologica Austriaca. Last May he was the principal speaker at the 45th Congresso Nazionale della Società Italiana di Dermatologia e Sifilografia in Rome, and also lectured to the Faculty of Medicine at the University of Frankfurt. In September, Dr. Fitzpatrick was the Chairman of a Symposium on Pigmentation, which was one of the main themes of the meeting of the International Congress of Dermatology, held in Washington, D. C. On November 20, he delivered the Eleventh Sigmund Pollitzer Lecture at the New York University School of Medicine, New York City. Also in November, Dr. Fitzpatrick discussed problems in the diagnosis of malignant melanoma, in a Symposium on Tumors of the Skin held at the University of Texas, M. D. Anderson Hospital and Tumor Institute.

Dr. William V. McDermott, Jr. returned recently from Puerto Rico, where he was a guest speaker at the annual meeting of the Puerto Rican Medical Association. He spoke on "The pathogenesis and surgical treatment of cirrhotic ascites", and again on "The management of bleeding esophageal varices". Dr. McDermott also was a member of a panel on upper gastrointestinal hemorrhage at one of the regular meetings of the New York Academy of Medicine.

The following exhibits by members of our Staff were presented at the annual meeting of the Radiological Society of North America: 1. Dr. S. P. Bohrer, "Radiology on stamps"; 2. Drs. J. R. Dreyfuss, D. B. Skinner, G. L. Nardi, and J. W. Tanner, "Azygos venography"; and 3. Drs. P. F. J. New, and E. W. Webster, "Auto-tomography". Dr. Bohrer's exhibit was awarded an honorable mention.

Dr. Byron H. Waksman lectured before the French Society of Microbiologists on the topic "The role of the thymus in immunological reactions" on December 6, 1962, at the Pasteur Institute in Paris. He was awarded the Pasteur Medal for recent studies by his laboratory in this field.

Dr. Edward W. Webster gave a refresher course for the third consecutive year at the annual meeting of the Radiological Society of North America, on November 26, 1962, entitled "Fluoroscopy: Physics, electronics, and physiology". He also delivered several lectures on instrumentation for radioactivity measurement in St. Louis on December 10 and 11, during a special course organized by Washington University, entitled "Radioactive isotopes technology in biology and medicine". Dr. Webster was elected Vice-President of the American Association of Physicists in Medicine at their annual meeting in Chicago on November 29. He was also elected to Associate Fellowship of the American College of Radiology in December.

Dr. James C. White was in Japan during the month of October 1962, at the invitation of the Japan Neurosurgical Society. This turned out to be an unusually busy and fascinating month, with lectures in Sapporo, Fukushima, Tokyo, Nagoya, Okayama, and Kyoto, in addition to the neurosurgical meeting in Ise City. In between visits to their medical schools, there was little of Japan that his hospitable hosts did not take him to see. Many of these men had trained in the United States — Dr. Teruyoshi Hashiba, now Professor of Neurosurgery in Sapporo, and Shinichiro Endo, Professor of Surgery in Fukushima, having had part of their training in neurosurgery at M.G.H. Both of these former Fellows have very active departments in their universities and a stimulating interest in research.

Dr. Stanley M. Wyman has been elected to the Board of Directors of the Radiological Society of North America.

This nice long letter has come from Dr. Sedgwick Mead (*E.M.* 1940 & *Path.* 1941), our "singleton" in Vallejo, California, written from the Kaiser Foundation Rehabilitation Center, 2600 Alameda Street:

The last time I wrote you was about eight years ago, on the occasion of our removing from Washington School of Medicine in St. Louis to our present assignment in Vallejo. Here I am Medical Director of the Kaiser Foundation Rehabilitation Center—a 74-bed, severe disability inpatient-type center. Our patients run to the catastrophic type, including, of course, many patients with strokes and paralysis agitans, but also many forms of trauma, including teen-agers with tetraplegia from diving accidents, water skiing, the ubiquitous automobile, and other causes. Traumatic encephalopathy is common, also, and usually tragic. Our center has a geriatric flavor despite the above, with the median age running about 55 and the average length of stay being just under 2 months.

Our center, unlike most rehabilitation centers throughout the country, has the important actuarial backstop of a comprehensive health plan membership numbering nearly half a million in the San Francisco Bay area. In spite of this important help, less than half of our patients are members of the Kaiser Health Plan, the remainder being private patients,

Thomas A. Stebbins, A.B., Director, School of Medical Illustration and Visual Education Services Department

workmen's compensation referrals, and patients from county, state, and federal agencies. We are one of the few rehabilitation centers in the country with a waiting list for admission. There are 4 other full-time physicians, of which 2 are psychiatrists, 1 an orthopedist, and 1 an internist/cardiologist. There are about 35 other personnel of various sorts involved in the rehabilitation part of our general hospital.

We have the feeling that in rehabilitation centers direct patient care is important, but not important enough to justify the center's existence unless it also does a consistent teaching job. To this end, teams from our center have carried out institutes of from half a day to five days' duration, both at a county level in northern California and also under sponsorship from state heart associations and the Western Branch of the American Public Health Association in Arizona, Idaho, and Wyoming. Our residency in physical medicine and rehabilitation is conducted jointly with the University of California Medical Center, San Francisco, where I hold a teaching appointment. Also, we shall soon activate a residency exchange with Letterman General Hospital. We have teaching affiliations (internships) with San Francisco State College in vocational counseling and speech.

Most gratifying of all our teaching involvements is the world-wide scope of our graduate physical therapy program in "proprioceptive neuromuscular facilitation" under the direction of Miss Margaret Knott. This program has been attracting students for 3-month or 6-month affiliations since 1948. More than 125 students from the British Commonwealth, the Scandinavian countries, northern Europe, Argentina, Uruguay, Israel, Hong Kong, and the Philippines have been trained here. In this respect, our "International House" at Vallejo quite resembles M.G.H. These courses are usually signed up for two years in advance, since only a restricted number can be accepted at any time. The program is conducted under the auspices of the International Exchange Service of our State Department.

Our hospitalization is set up on the progressive patient care principle, with patients usually being admitted to a severe disability ward, where nursing services amount to about 6 hours per patient per day. Next they go, when judged safe to do so by a self-care team, to an intermediate ward where nursing hours are about 4 hours a day. Finally, before discharge, patients spend a few weeks or days on self-care, with no nursing services. The hospital bill is drastically reduced accordingly.

I have the pleasure of acting as consulting neurologist to the Kaiser Hospitals and as physiatrist to State Crippled Children Services, Stockton State Hospital, Letterman General Hospital, San Joaquin County Institutions, and Livermore V. A. Hospital.

On the personal side, we live on a hill overlooking San Francisco Bay and out through the Golden Gate. The harbor is certainly one of the most beautiful in the world, and the constant change of cloudscapes is a never-ending marvel for us. Marge (formerly Miss Chick of the night supervisors) does the honors as chef, hostess, and gardener. Sedgwick, Jr. is a junior at Harvard this year, and the cadet, Marshall, is a third year student at Thomas Jefferson School in St. Louis. Last summer he spent some time in Florence; then we met in London for a tour of the National Spinal Injuries Center at Stoke-Mandeville Hospital, for the Paralympic Games, and for visits also to Oxford and Stratford-on-Avon.

We were very pleased to receive this letter from Dr. Lyman G. Barton, Jr., (*E.S.* 1914), our "singleton" in Plattsburgh, N. Y.:

I fear that I have had a very undistinguished career and have little of interest for the M.G.H. News. However, I will try to give you, for what it is worth, a summary of my activities over the years.

Following my service on East Surgical, I started practice in Willsboro, a small town 28 miles south of Plattsburgh, where, for about 4 years, I had a "horse and buggy" type of practice, doing minor and some major surgery in the homes.

The following spring I went overseas with the first Harvard Unit — an experience I look back to with great pleasure.

In September 1915 I married Aethel Dodge, a graduate of the M.G.H. Training School for Nurses. We have 4 children and 9 grandchildren. Neither of my sons studied medicine, but we have 2 Ph.D.'s in the family. My elder daughter is head of the Art Department at Sweet Briar College, Virginia.

In 1919 I moved to Plattsburgh, where I was on the surgical staff of our two local hospitals until three years ago, when, because of a couple of coronaries, I became largely retired.

Through the efforts and hospitality of our [Harvard Medical School] Class agent, Frank Rackemann, I had a most enjoyable time at our 50th Reunion last June and hope that most of us can make our 55th.

Sorry not to have something more interesting or startling to report.

Dr. Mariano M. Alimurung, a Graduate Student Assistant in Cardiology here at M.G.H. in 1948, is now an Associate Professor of Medicine, and Chief of Cardiology and Chief of Clinics at Santo Tomas University and the University of Santo Tomas Hospital in Manila, Philippines. This nice letter from Dr. Alimurung to Dr. Knowles arrived recently:

First of all, I wish to express my personal satisfaction in seeing that we are remembered by the MGH. Being in a very distant location now, it pleases me much to hear from my dear old MGH, more particularly when a big achievement is made. Yes, we have heard much about the drama of Everett Knowles. In my own case, I was particularly moved when I read its detailed account in a recent issue of the MGH News. In fact, through my suggestion, our Dean's Office here mimeographed the whole story contained in The News and it was then circularized to all our faculty members. This was done not only because of its unique interest as a milestone of medico-surgical achievement but, as I told our Dean here, it also typifies the way the MGH handles such big news and hands it to the lay press, protecting all interests concerned.

May I, therefore, submit here my own modest share, as solicited, for the much-needed additional construction in the Emergency Ward. It is a small share, but it carries with it profound sentiments of appreciation, felicitation, and best wishes from an MGH alumnus out in the Far East. I always take pride in the fact that it has been my good fortune to have had my graduate training under MGH tutelage, hence I keep in close contact with the MGH. The MGH News is my regular reading reference since I came home in 1950, and I never fail to visit the MGH whenever I visit Boston.

My very best wishes for continued success.

This very brief note arrived from Dr. Fernando Cardenal (a.r.s. *Or.* 1959) not long ago, in which he says, in part:

I am now leaving the Congo, after 18 months there, and shall write from my new address in the Canaries.

I will certainly send you a note about the Congo.

Please hold up the mailing of The News till I send you my new address.

The News

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 221 Boston, Mass. April 1963

MASSACHUSETTS EYE & EAR INFIRMARY

SUGAR CATARACTS

Although transparent, the lens of the eye is a dense tissue containing the highest concentration of proteins in the body. It is not simply a bag of proteins, but is an encapsulated organ made up of many modified cells — the lens fibers. A sheet of epithelium beneath the capsule covers the anterior surface of the lens, but does not extend beyond the equator. Here, at the equator, the epithelial cells undergo transformation. The cells progressively lose their nuclei along with most other formed elements, become elongated, and are gradually transformed into lens fibers. As new fibers are formed they displace the older fibers toward the center of the nucleus of the lens. Since new fibers are continually formed from the cells at the equator, the growth of the lens never ceases throughout life. A cross section of this multilayered structure has an onion-like arrangement. There are no blood vessels supplying the lens, so it must receive nutrients from, and dispose of the end products of metabolism into, the intraocular fluid bathing it. Nor can cells enter or leave the lens. In its normal habitat the lens is therefore in a state of tissue culture; consequently, it is not difficult to maintain it in a sterile culture for some period of time after removal from the eye.

Frequently in old age or in disease a loss of transparency of the lens occurs. This impairs vision and necessitates removal of the opaque lens (cataract). There are a number of different types of cataracts. One type, the sugar cataracts, have been widely studied because they are easily produced experimentally. Characteristic of a diabetic cataract are the lens changes observed in young diabetic patients which occur underneath the anterior and posterior capsule as small discrete opacities having a radiating distribution. In the more advanced stages, vacuoles and waterclefts are observed. A second clinical type of sugar cataract occurs in infants with congenital galactosemia. Lens changes develop shortly after birth, and if detected early enough are reversible by withdrawing the source of galactose from the diet. Galactosemia is a gene-linked hereditary disease in which the primary defect is a deficiency of the enzyme, galactose-1-phosphate uridyl transferase. The lack of this enzyme interferes with the utilization of galactose and results in the accumulation of galactose-1-phosphate in tissues.

The diabetic cataract encountered clinically can be reproduced in rats by alloxan injection, and the galactosemic cataract by feeding a diet rich in galactose. It may be possible that other sugars besides glucose and galactose are cataractogenic in rats if their concentrations in the blood stream could be maintained sufficiently high for long periods. Thus far, the only other cataractogenic sugar which has been studied to any extent is xylose.

A number of theories have been proposed to explain the development of sugar cataracts. A lack of insulin has been thought to depress the rate of glucose metabolism in the diabetic lens. However, no major change in the rate of glucose metabolism has been observed in these cataracts. In galactose cataract, even though the activity of galactose-1-phosphate uridyl transferase is normal, an accumulation of galactose-1-phosphate occurs. The accumulation of this substance has been suspected of altering some phase of carbohydrate metabolism, but no definite site of action has been established to account for the development of opacities. It has been shown that galactose-1-phosphate inhibits the phosphoglucomutase reaction to some extent. Whether it is a sufficiently effective inhibitor to prevent synthesis of essential polysaccharides has not been determined.

An appealing hypothesis now under consideration is that a mechanism common to all sugar cataracts is responsible for the cataractous process. Such a mechanism would eliminate insulin deficiency or the accumulation of galactose-1-phosphate as the primary factors causing cataracts. A common factor in hyperglycemia, galactosemia, or xylosemia is the availability of a high concentration of sugar in the aqueous humor. It appears that this condition sets off a sequence of events, initiating the cataractous process. The close similarities in morphology and histopathology of each kind of experimental sugar cataract lend support to the hypothesis that a common mechanism initiates the cataractous process. In these experimental sugar cataracts, opacities are first observed at the periphery or equatorial region of the lens. Moreover, the first pathological sign, which occurs very early at the onset of the disorder, is the appearance of hydropic lens fibers caused by an accumulation of fluid. In the more advanced stages the swelling continues until the fibers rupture, disintegrate, and lead to interfibrillar clefts. This histological picture is observed in each kind of sugar cataract. It suggests that differences in osmotic pressure between the intralenticular and intraocular fluids develop, and the swelling of the lens fibers is caused by movement of water into the lens fibers. Osmotic effects in sugar cataracts have been suspected for some time. In 1925, Sir Duke Elder, after reviewing reports of of a number of diabetic cases, concluded that during hyperglycemia the patients became myopic, apparently due to the swelling of the lens, while hypermetropia resulted when the blood sugar was lowered.

However, no satisfactory explanation could account for the hypertonicity developing in the lens during the cataractous process until recently, when the enzyme aldose reductase was shown to function in this ocular tissue. This enzyme is capable of reducing a number of aldoses to their sugar alcohol form. Because of this enzyme the following sequence of events may transpire in sugar cataracts. The increased concentration of sugar in the aqueous humor facilitates the uptake of sugar by the lens and this in turn accelerates the reduction of sugar to sugar alcohol. Since the lens membranes are relatively impermeable to sugar alcohols, the formation of polyol is much more rapid than its elimination. This leads to a progressive accumulation of the osmotically active sugar alcohol within the lens fibers, thus creating a hypertonic condition. Osmotic equilibrium is maintained by passage of water from the aqueous humor into the lens fibers, causing them to swell.

Evidence for this sequence of events was obtained by analyses of the lenses of rats maintained on a galactose-enriched diet. These rats relatively quickly developed opacities within 5 days after the initiation of the diet. The accumulation of both dulcitol (the sugar alcohol of galactose) and water began immediately, and by the 5th day the dulcitol concentration was 117 μmoles/kg. lens water. This represents a remarkably high concentration when it is realized that it is identical with the concentration of potassium in the lens. The water content in these lenses was elevated by 20-30% above the normal value. The increases in dulcitol and water are probably even more striking than indicated by these values, since the accumulation is not distributed uniformly but is confined principally to the superficial layers of the lens.

Differences in the rates of cataract development in the rats made diabetic by alloxan injection and in those fed galactose have been known for some time. Opacities appear much earlier in the lens of a galactose-fed rat than in that of a diabetic rat, even though the blood sugar level may be lower in the galactose-fed rat. If the osmotic theory of sugar cataract is valid, this difference in the rate of cataract development must be related to the rate of accumulation of sugar alcohol. Analyses of the lens of a diabetic rat revealed that the sugar alcohol level was much lower than that of a galactose-fed rat. Another interesting finding was that in the diabetic lens an increase in fructose was also observed, whereas no ketohexose was found in the galactose cataract. The explanation for this difference was due to the substrate specificity of another enzyme involved in the metabolism of sugar alcohol in the lens. The enzyme polyol dehydrogenase oxidizes a number of sugar alcohols to their corresponding ketohexoses in the presence of diphosphopyridine nucleotide (DPN). Thus sorbitol (the sugar alcohol of glucose) is oxidized to fructose. However, dulcitol is not a suitable substrate for polyol dehydrogenase. Therefore dulcitol, unlike sorbitol, is not further metabolized in the lens. Since fructose is utilized by the lens to some extent and is also eliminated by diffusion into the aqueous humor, the sum of sorbitol plus fructose was always much lower in the diabetic lens than the level of dulcitol accumulating in the lens of a galactose-fed rat. For these reasons the hypertonic condition arising in the diabetic lens is not as severe as that which develops in the galactose cataract.

Since opacities developed so rapidly in the lens of a galactose-fed rat, it seemed feasible to produce this type of cataract *in vitro*. This was accomplished by a sterile culture of rabbit lens in a medium containing high levels of galactose. A control lens was incubated in a medium simulating the aqueous humor, while the other lens from a rabbit was incubated in the same medium containing galactose. The control lens remained transparent for the 3-day period of incubation. The lens incubated in the galactose-containing medium developed a slight haziness at the periphery after the first day of incubation. This haziness developed into a definite ring of opacities by the end of the second day. By the third day the opacification was quite marked at the equator of the lens, while the central region remained clear. Histological examination revealed that hydropic lens fibers were numerous in the equatorial region. Thus, the early histologic changes of the cataractous process developed *in vitro* were very similar to those observed in the lens of the galactose-fed rat.

With the larger rabbit lens a much better quantitative relationship between the dulcitol accumulation and the increase in water could be established. Similar to that observed in the rat lens, a substantial accumulation of dulcitol and water occurred in the rabbit lens during the organ culture procedure. Furthermore, the increase in dulcitol was directly proportional to the increase in water. This relationship was maintained during the entire 3-day period. The ratio of the net increase in sugar alcohol to that of water appeared fairly constant, and the value approached the tonicity of the incubating medium. This means that the accumulation of osmotically-active substance was offset by a net movement of water into the lens. The lens of a young rabbit apparently responds to a difference in the tonicity of the intralenticular fluid and of the environment fluid by the loss or gain of water. This indicates that the lens acts as a delicate osmometer capable of responding to small differences in osmotic pressure.

These findings were further supported by the data on the changes in the cation content of lenses incubated in a galactose-containing medium. The total cation (Na + K) concentration, expressed on a water basis, was much lower in the lenses incubated in the galactose medium than those in the control medium. However, when these values were expressed on a dry weight basis, no difference was observed. The results indicated that in the lenses incubated in galactose only an increase in water occurred while the absolute amount of cations did not change. These findings further support the conclusion that the increase in water observed in the lens during the incubation in the galactose medium was caused by the accumulation of dulcitol.

Studies of the properties of aldose reductase revealed that the enzyme does not function to any significant extent until glucose or galactose is present in high concentrations. Under normal circumstances the concentration of glucose in the lens is sufficiently low so that only a small fraction of glucose is reduced to sorbitol, most of it being phosphorylated and metabolized through the Embden-Meyerhof pathway. When glucose is available in high concentrations, as it is in diabetes, its reduction to sorbitol is facilitated. Another important factor determining the amount of glucose reduced in the lens is the low concentration of hexokinase. Since the activity of the tricarboxylic acid cycle is so limited in the lens, the glucose metabolism proceeds essentially as far as lactic acid. Therefore the principal means of eliminating lactic acid in the lens is by diffusion into the aqueous humor. Since the lens is a dense tissue and avascular, an excessive production of lactate may become deleterious, and so it is important that the rate of glycolysis be controlled in some manner. The sluggishness of the hexokinase reaction accomplishes this by serving as the rate-limiting step in lens glycolysis. If this step were bypassed, lactate production would increase by 5- to 10-fold. Since the concentration of hexokinase is low, the enzyme is saturated by low levels of glucose, and any increase in the glucose concentration of the lens accelerates the aldose reductase reaction. Therefore the combination of the presence of an active aldose reductase and the relatively inactive hexokinase appears to render the lens peculiarly vulnerable to the effects of the high concentration of sugar in the aqueous humor.

There are other changes occurring in sugar cataracts that can be directly related to the effects of swelling of the lens or to enzymatic interactions which result during the formation of sugar alcohols. In the enzymatic reduction of aldoses to sugar alcohol the essential cofactor is reduced triphosphopyridine nucleotide (TPNH). In the lens, TPNH is primarily generated by the hexose monophosphate shunt mechanism. An interaction of the dehydrogenases of this pathway and aldose reductase is therefore possible. As the concentration of glucose was raised in the incubation medium, an increase in the rate of oxidation of C-1 of glucose, but not that of C-6, was observed. The increase in C-1 oxidation of glucose was paralleled by an increase in sorbitol production. The hexokinase reaction was saturated at the low levels of glucose employed. Further increase in glucose did not affect the rate of glycolysis but did accelerate the aldose reductase reaction which, in turn, accelerated the hexose monophosphate shunt mechanism by increasing the rate of reoxidation of TPNH.

The acceleration of the shunt mechanism by stimulation of the aldose reductase reaction was also demonstrated by incubating rabbit lens in high levels of galactose. The amount of C-1 of glucose oxidized through the shunt mechanism could be almost entirely accounted for by the quantities of dulcitol formed. Therefore, the production of dulcitol diverted TPNH away from the mechanisms which normally reoxidize it. This may account for the lowered glutathione level observed in sugar cataracts. It appears that in the lens, as in the red cell, the level of glutathione is dependent upon the glutathione reductase reaction in which oxidized glutathione is enzymatically reduced by TPNH.

One means of restricting the production of sugar alcohol is by depressing the activity of the hexose monophosphate shunt mechanism. There would then be less TPNH available, and this in turn would decrease the rate of reduction of aldose. Investigators have observed that in the lens of a galactose-fed rat, the glucose-6-phosphate dehydrogenase activity drops early in the course of the cataract. The mechanism which depresses the activity of this enzyme is not understood. One report indicated that the presence of galactose-1-phosphate markedly inhibits the activity of this enzyme, but this could not be confirmed by other investigators. It appears that the lens attempts to counteract the accumulation of sugar alcohol by suppressing the activity of the hexose monophosphate dehydrogenase.

An alteration of the amino acid transport mechanism is another secondary change manifested as a consequence of the osmotic changes in the lens during the cataractous process. The lens, because of its avascularity, must rely largely on active transport mechanism to obtain foodstuffs present in low concentrations in the aqueous humor. In the lens of a galactose-fed rat or a diabetic rat, one of the early biochemical changes to occur is a drop in the level of amino acids. In sugar cataracts the mechanism for the active transport of amino acids into the lens is markedly depressed. This can be demonstrated in an *in vitro* system by incubating the lens in a medium with or without added galactose and by following the uptake of a nonmetabolizable amino acid, α-amino isobutyric acid (AIB). In an overnight incubation, the control lens in a medium without galactose showed a marked concentration of AIB, while a strikingly lowered uptake of AIB was observed in the lens incubated in the presence of galactose. The decrease in the activity of the amino acid transport mechanism is apparently due to the osmotic changes of the lens. This appears to be the case, since a lowered uptake of AIB was observed when the lens was incubated in a slightly hypotonic medium. The more the lens swelled, the less AIB was taken up. Another approach, showing that the depressed uptake of AIB in the galactose-incubated lens was due primarily to osmotic changes, was to prevent the lens from taking up water during incubation. This was accomplished by correcting the hypertonicity in the lens by increasing proportionately the tonicity of the incubating medium by adding sugar alcohol to it during the course of the experiment. In a lens incubated in a compensated medium, an increase in water was prevented; and even though dulcitol accumulated, the AIB uptake was 80% of normal. The evidence obtained in these experiments suggests that osmotic changes may be responsible for the depressed amino acid uptake in sugar cataracts.

Although other aspects need to be explored before the accumulation of sugar alcohol can be accepted as the initiating mechanism of the cataractous process, it appears to be consistent with many of the biochemical and pathological changes observed in sugar cataracts. It is hoped that further investigations along these lines may lead to a better understanding of the pathogenesis of not only sugar cataracts but of other cataracts as well.

Jin H. Kinoshita, Ph.D.,
Biochemist in Ophthalmology

The Board of Trustees, at their meetings on February 1 and 15, and March 1, voted:

To accept the resignation of Dr. John K. Cobb, Assistant in Radiology, effective as of February 1;
To accept with regret the resignation of Karl Schmid, Ph.D., Associate Biochemist (Medicine), effective as of December 31, 1962;
To accept the resignation of Dr. Maurice Victor, Neurologist, effective as of December 1, 1962.

To appoint:

Dr. Kurt J. Bloch to the position of Assistant in Medicine, beginning July 1;
Jean B. Burnett, Ph.D. to the position of Assistant Biochemist in Dermatology;
Dr. Leonard S. Bushnell as Assistant Resident in Anesthesia, beginning August 1;
Dr. Sheldon Cooperman as Clinical Assistant in Pathology, retroactive to November 1, 1962;
Kaney Ebisuzaki, Ph.D. as Assistant Biochemist (Research Chemistry), beginning February 1;
Dr. Irwin M. Freedberg as Clinical Associate in Dermatology;
Dr. Hanne Gram as Clinical and Research Fellow in Pathology for one year, beginning July 1;
Dr. Mehran Goulian to the position of Assistant in Medicine, beginning July 1;
Dr. Hiroki Hirai as Clinical and Research Fellow in Neurosurgery, for the period April 1, 1963 through August 31, 1964;
Dr. Gary Jacobson as Clinical and Research Fellow in Psychiatry, beginning July 1;
Dr. Burnham E. Lamkins as Clinical Associate in Dermatology, beginning July 1;
Nancy Mello, Ph.D. to the position of Assistant Psychologist;
Dr. John W. L. Parry as Clinical Fellow in Anesthesia, beginning October 1;
Mr. George Putnam as Associate Trustee for two years;
Annette M. C. Rapin, Ph.D. as Assistant Biochemist (Research Chemistry) beginning February 1;
Mr. Elliot L. Richardson as Associate Trustee for two years;
Dr. Dwight R. Robinson as Clinical and Research Fellow in Medicine, beginning July 1;
Dr. Frederick J. Samaha as Clinical and Research Fellow in Neurology for one year, beginning July 1;
Robert Scheuplein, Ph.D. to the position of Assistant Biologist in the Department of Dermatology;
Mary J. Spiro, Ph.D. as Assistant Biochemist (Medicine) for one year, beginning July 1;
Dr. James L. Steele as Third Assistant Resident in Pathology for one year, beginning July 1;
Dr. Jan A. C. de Kock van Leeuwen as Visiting Psychiatrist pro tempore, for the period February 15 through March 31;
Dr. Alfred D. Weiss as Assistant in Neurology, effective as of February 1;
George F. Wilgram, Ph.D. to the position of Assistant Biochemist in the Department of Dermatology;
Dr. Edward D. Williams as Clinical and Research Fellow in Pathology, retroactive to November 1, 1962;
Dr. Gerald F. Winkler as Assistant in Neurology, beginning July 1;
Dr. R. Lewis Wright as Clinical Assistant in Neurosurgery, for an eight-month period, beginning May 1.

Governor Peabody has appointed Mr. H. Brooks Beck a Trustee of the Hospital.

At their meetings on January 9, February 13, 20, and 27, and March 6, the General Executive Committee voted:

To reappoint:

Dr. Anthony F. H. Britten as Clinical and Research Fellow in the Blood Bank for one year, beginning January 15;
Arthur B. Callahan, Ph.D. as Research Fellow in Physics (Medicine) for one year, beginning March 1;
Dr. Bruce W. Fischberg as Clinical and Research Fellow in Psychiatry for one year, beginning January 1;
Dr. Jorgen G. Jacobsen as Clinical and Research Fellow in Medicine for one year, beginning April 1;
Dr. Arthur S. Kunin as Clinical and Research Fellow in Medicine for one year, beginning March 1;
Dr. Miguel A. Leibovich as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. Aleksander Mathé as Assistant Resident in Psychiatry for one year, beginning July 1;
Dr. Byron N. Rudolph as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. Lawrence C. Salvesen as Clinical and Research Fellow in Psychiatry for one year, beginning July 1.

To appoint:

Dr. Yoshiro Aso as Visiting Fellow in Medicine for one year, beginning April 1;
Dr. Guido Belsasso-Prister as Assistant Resident in Psychiatry at the General Hospital for one year, beginning July 1;
Ora Kedem, M.Sc., Ph.D. as Research Fellow in Medicine for one year, beginning July 1;
Dr. Hitoshi Takahashi as Research Fellow in Dermatology.

* * *

Dr. Clement B. Sledge (sr. r.s. *Or.* 1962), a Teaching Fellow in Orthopedics at Harvard Medical School, has been awarded a three-year fellowship, to begin July 1, by the Medical Foundation —a United Fund agency.

Dr. Sledge will be doing research on bone. For the first two years he will be working in Cambridge, England, at the Strangeways Laboratories, to study techniques of tissue and organ culture with Dr. Honor B. Fell. Dr. Fell's particular interest is tissue and organ culture in the study of bone. For the third year of his fellowship, Dr. Sledge will do further work with Dr. Melvin J. Glimcher here in the Orthopedic Research Laboratories at the M.G.H.

MASSACHUSETTS GENERAL HOSPITAL'S CONTRIBUTION TO THE EDUCATION OF CLERGYMEN

The clergy have been associated with the Massachusetts General Hospital—sometimes happily, sometimes unhappily —since the very beginning of this institution. It was a clergyman who saw the need of a hospital here in Boston and initiated the first effective step taken toward the foundation of the Massachusetts General; Dr. John C. Warren, while not a clergyman himself, left a sum of money to be used to supply the Hospital with "religious and moral publications"; and, in more recent times, Dr. Richard C. Cabot suggested (and helped implement) a period of "internship" for ministers or seminary students within the Hospital.

This summer, another group of ministers and seminary students will submit themselves to the disciplines of the medical community and the direction of the Chaplain Supervisor. Many individuals from the various professions represented here will contribute their time and energy to this Summer School of Pastoral Care, and the students themselves will provide many hours of personal contact with patients and staff members.

Rather than describe "what happens" in the summer course, I would like to tell about some of the things that our clergy often learn through this relationship with one of the great medical centers of the world.

First of all, we learn from the patients, with whom we spend the greatest amount of our time. We learn, for one thing, that people have tremendous resources for growth and health within them. We are constantly amazed at what can happen within a given person, in spite of those so-called bad things that go to make up a disease. Clergymen need to learn that the Spirit of Healing does reside within people—that it does not have to be captured and then administered to the patient.

We also learn from patients the fact that emotions and feelings are as important to most people as rational statements and physical conditions. We witness over and over again a person enabling himself to endure disappointment, sorrow, extreme pain—and finally, death— by dealing wholesomely with his *feelings* about these events, recognizing the truth which underlies the cliché that "God does not give us more than we can bear".

Then, we learn from patients the drastic and killing results of the de-personalization of our culture. We come to know closely the heart and soul of the patients who come to the Hospital seeking, in addition to physical treatment, treatment of the whole person. And these are not patients who necessarily need referral to the Psychiatry Department. They are the everyday people of this world who find themselves lost in a technological culture, both without and within the hospital.

From the staff of the Hospital we learn many things, too. Perhaps most importantly, we learn that professional men *can* submit themselves to the scrutiny of their fellow-men. The Clinico-Pathological Conference demonstrates the need for anyone dealing with human living to recognize a source of inquiry and judgment beyond his own capabilities. Not many clergymen would normally submit their sermons, their "pastoral counseling", to such judgment, but here in the medical community we do just that—even if for only a brief time.

We also learn from the staff what it means to do *hard* work. No matter what the supposed rewards are for members of the medical profession, it still is usually *hard* work. Clergymen usually have so many tasks to perform in parish life that they may end up jabbing away at each task but not really accomplishing much except keeping busy. While the same can be true of any profession, we observe that the discipline of a medical center does demand great concentration of effort and great offerings of energy.

We also learn from the staff the results of specialization. We see how lives are prolonged and made useful, how pain is relieved, how concentration of effort within a given field has made this a more wholesome and bearable world in which to live. We usually learn to appreciate anew the advantages that have come from one person's being willing to specialize, and thus, perhaps, finding an entirely new method of dealing with disease. Also, we can see the disadvantages of specialization—how this narrowing down of the boundaries of our world tends to exclude more and more of the rest of reality from our range of vision. The Church—highly specialized—needs to recapture for itself a wider vision of reality that eventually may make unnecessary such words as "secular" and "religious".

Clinical pastoral students certainly benefit from their stay here at Massachusetts General Hospital. The welcome and cooperation we always receive make us feel at home and free us so that we can offer all that we may have for the benefit of this place. Most of the students who come feel as if they have nothing to offer (compared with the other professions here which can *do* something for the patients). However, I feel that perhaps the one thing we can offer is that for which we are trained (and paid): to ask, considerately and non-judgmentally, "What is the meaning of all this?"

The Rev. Allan W. Reed,
Chaplain Supervisor

Chaplain Allan W. Reed, in his above article, speaks of Dr. John C. Warren's gift of $1,000 for the purchase of religious publications to be distributed to patients in, or about to leave, the Hospital. From that early beginning has grown our present Warren Library. Its librarian, Mrs. Sara P. Allen, tells us there are now over 5,000 volumes available for circulation among our house patients and members of our professional and non-professional staffs. The famous bookcart, devised by Dr. Joseph B. Howland (*W.S.* 1897 and past assistant director) several years ago and widely copied in other hospitals, carries books of various types to the in-patients on a regular schedule and displays them in such a manner that individual choices as to reading matter may be made.

Dr. Warren was 63 years old when he wrote the letter to the Trustees announcing his gift. He died 15 years later. Believing that our readers might be interested in refreshing their memories as to Dr. Warren's exact wording, we give you a copy of the letter, which is in our Archives files.

"To the Trustees of the Massachusetts General Hospital

"Gentlemen,

"Having in the course of my practice had occasion to notice that patients recovering from accidents or illness, and those long confined by chronic diseases, are particularly susceptible of moral and religious impressions when judiciously conveyed, I many years since made a provision in my Will for paying to the Mass. Genl. Hospital the sum of one thousand dollars, the interest of which should, under the direction of the Trustees, be employed for the purchase of religious and moral publications to be distributed and given to the patients while in the Hospital, and also one or more of such publications to be given to each patient on leaving the Hospital, so far as the interest of the above mentioned fund may be sufficient for this purpose.

"My life having been protracted by the will of Providence beyond the period I had expected at the time the Will alluded to was made, I have now thought it best to execute the disposition myself. I have therefore caused to be deposited in the Life Insurance Company [Massachusetts Hospital Life Insurance Company] the sum of one thousand dollars, the interest of which I request you to have the goodness to cause to be employed in the purchase of publications of a religious and moral description to be distributed and given to the patients in the Hospital and those leaving the Hospital as above mentioned.

"Perhaps it may be thought that the interest of this sum might be more usefully employed in administering to the physical sufferings of patients in the Hospital, but I have been led to hope and believe that there never will be a want of benevolent persons who will be ready to contribute to this object, whereas there are few who might have an opportunity of observing the circumstances which call for moral aid, and I have therefore concluded to make the disposition above mentioned and sincerely hope it may meet with your approbation.

"I have the honor to be
Very respectfully
Yr. obdt. ser^{vt}
John C. Warren
"Boston, Nov.$^{br.}$ 6th 1841."

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all recent articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter, and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

General Medicine

Senior, J. R., and Isselbacher, K. J.
Demonstration of an intestinal monoglyceride lipase: An enzyme with a possible role in the intracellular completion of fat digestion.
J. Clin. Invest. 42:187.

General Surgery

Huggins, C. E.
Reversible agglomeration used to remove dimethylsulfoxide from large volumes of frozen blood.
Science 139:504.

Medical Science

Lotz, M., Fallon, H. J., and Smith, L. H., Jr.
Excretion of orotic acid and orotidine in heterozygotes of congenital orotic aciduria.
Nature, London 197:194.

Orthopedic Surgery

Rowe, C. R., and Sorbie, C.

Fractures of the spine in the aged.
In Clinical orthopaedics and related research, No. 26, Philadelphia, J. B. Lippincott Company, chap. 4.

Psychiatry

Sifneos, P. E.
The role of the educator and the clergyman in mental health work.
Acta neurol. et psychiat. hellen. 1:212.

Radiology

Carter, G. B., and Tanner, J. W.
Enlarging abdominal mass.
J.A.M.A. 183:588.

McCoy, W. T., and Robbins, L. L.
Emphysema: The pulmonary enigma.
Texas J. Med. 59:15.

VOLUNTEER GROUP
MGH SERVICE LEAGUE

One of the functions instituted by the MGH Service League during this past year was the establishment of the Information Booth in the Brick Corridor. The booth is now staffed by Service League members five days a week, on a 10 A.M. to 3 P.M. schedule. It takes 40 volunteer assignments per month to insure its efficient and continuous operation. Mrs. John W. Cass, Jr. is the present chairman.

This desk is supplementary to the Information Desks provided by the Hospital in the White, Warren, and Baker lobbies. It was first suggested by the Advisory Committee to the Volunteer Service. Dr. Chester M. Jones, Chairman of the Advisory Committee, appointed a group from the Ladies' Visiting Committee and the MGH Service League to make a preliminary survey. Eight volunteers, under the supervision of Miss Mary Ruth Wolf and Mrs. Floyd H. Blackman made the initial study. Six of these volunteers manned a booth in rotation from 10 A.M. to 3 P.M., April 13 through April 17, 1959. Their purpose was to evaluate the needs and classify the types of questions asked; 376 questions were asked and answered—an average of about 75 per day. The most frequent inquiries were for the location of doctors' offices, the clinics, and routes to the various buildings and other areas. Miss Lepper, Mr. Katzer, and Miss Wolf all shared in the development of this service, which was ultimately started in the spring of 1962 under the chairmanship of Mrs. Melvin J. Glimcher.

From the outset this information service met with an enthusiastic response from the staff and the public. The workers have certainly felt that they were satisfying an essential need of the Hospital —simultaneously extending warmth and friendliness to those who seek their aid.

At the present time, under the guidance of Mrs. Francis M. Ingersoll, the Service League is conducting a pilot study for a second Information Desk to be established in the Clinics Building.

This letter, expressing appreciation of the Staff Wives Association (the earlier name of the present MGH Service League) was written directly to the Editor of THE NEWS. It came from Dr. Maurice McGregor (clin. & res. fel. *M.* 1955), now a member of the staff of the Royal Victoria Hospital in Montreal, Canada:

> I would like, through your columns, to express appreciation of the wonderful job done by the Massachusetts General Hospital Staff Wives Association.
>
> I spent a year in Boston some time ago and became fully aware, for the first time, of the very great need of overseas visitors for personal contacts. Through the Association I was able to meet some Americans in their homes and form some enduring friendships. It is undoubtedly in part due to the Association that my memories of Boston, and the Massachusetts General Hospital in particular, are so pleasant.
>
> Many thanks.

New addresses:

Dr. Stanley P. Bohrer (*S.* 1959 & r.p. *R.* 1963), Hammersmith Hospital, DuCane Rd., London W. 12, England

Dr. George B. Carter (r.p. *R.* 1962), Parkland Memorial Hospital, 5201 Harry Hines Blvd., Dallas, Tex.

Dr. Efrain O. Contreras (clin. & res. fel. *M.* 1962), Hospital Latina Americano, 15 Sur 302-308, Puebla Pue, Mexico

Dr. Mary Stuart (Blakely) Fisher (*M.* 1949), Philadelphia General Hospital, Philadelphia, Pa.

Dr. William Franklin (a.p.), 100 Country Club Rd., Newton Centre; Zero Emerson Place, Boston, Mass.

Dr. John L. Fromer (clin. assoc. *D.*), 605 Commonwealth Ave., Boston, Mass.

Dr. A. Erik Gundersen (*S.* 1956), Ulleval Hospital, Oslo, Norway

Dr. Donald K. Lewis (assoc. s. *Otolar.*), 5 Emerson Place, Charles River Park, Boston, Mass.

Dr. Edward Lowenstein (c.r.p. *An.* 1962), Mount Sinai Hospital, New York 29, N. Y.

Dr. William T. McCoy (r.p. *R.* 1960), 19 Avenel Gardens Rd., Medindie, South Australia

Dr. Rhoda U. Musgrave (r.p. *Psychiat.* (*McL.*) 1937), Nevada State Hospital, Reno, Nev. (mailing address: P.O. Box 2460, Reno, Nev.)

Dr. Albert E. Parkhurst (*W.M.* 1919), Beverly Hospital, Beverly, Mass.

Dr. Thomas S. Risley (*E.S.* 1942), Beverly

Jin H. Kinoshita, Ph.D.—Biochemist in Ophthalmology, Massachusetts Eye and Ear Infirmary

Hospital, Beverly, Mass.

Dr. Charles E. Rounds (Dn. 1947), 97 Columbian St., So. Weymouth, Mass.

Dr. Beatrice E. Sleigh (clin. fel. *An.* 1959), 48 Tarnwood Park, Court Rd., Eltham, London S.E. 9, England

Dr. James W. Tanner (r.p. *R.* 1962), 2106 Hayes St., Wichita Falls, Tex.

Dr. Harold C. Urschel, Jr. (*S.* 1956), 3810 Swiss Ave., Dallas 4, Tex.

* * *

Brief bits:

Dr. Henry K. Beecher was recently Visiting Professor in Psychiatry at the University of North Carolina. Last autumn, as has already been reported in The News, he was Visiting Professor of Medicine at Emory University.

Dr. Earle M. Chapman addressed the Clark County Medical Society, Springfield, Ohio, on January 21. His subject was "The treatment of hyperthyroidism". On February 11 he spoke at the University of Kansas Postgraduate Medical Symposia in Kansas City on "The nodular goiter" and "Treatment of hyperthyroidism".

Dr. Oliver Cope was appointed Professor of Surgery at Harvard Medical School on January 1. Previously, he had been an Associate Professor of Surgery.

Dr. Richard A. Field was the principal speaker at a joint meeting of the Montreal Ophthalmological Society and the Montreal Division of the Quebec Diabetic Association, held in Montreal on February 21. In April, Dr. Field will be the guest speaker at a joint meeting of the British Diabetic Association and the Irish Ophthalmological Society, at which time he will present a paper entitled "Experiences with hypophyseal stalk section in the treatment of hemorrhagic diabetic retinopathy".

* * *

This nice long letter has come from Dr. William K. Livingston (*W.S.* 1922), our "singleton" in Camp Sherman, Oregon:

I doubt that I have ever received a more appealing form letter and I hasten to send "news" for The News from an isolated MGH-er.

When I retired a few years ago as Chief of Surgery at the University of Oregon Medical School, they were good enough to give me the Emeritus title. We were very fortunate in persuading Bert Dunphy to take over my assignments. In order to get out from under foot and give Bert a free rein, I spent a year in Australia on a Fulbright scholarship and came back to find Bert doing a grand job. He seems to be as enthusiastic about living in Oregon as we are about having him here.

Camp Sherman, where my wife and I live, is not a military post, as some people assume from its name. Actually, the post office is a part of a small country store in a resort area on the Metolius River in Eastern Oregon, about 150 miles southeast from Portland. As it is on the east side of the Cascade range of mountains, it is much drier and sunnier than on the Willamette valley side. This river and its tributary, Spring Creek (on which we have our cottage), gets its water from some unknown and never-changing source. It springs from the foot of a black mountain and within a few yards is a "river". It never changes its temperature more than four or five degrees, winter or summer, its crystal-clear water never gets muddy, never floods, and never freezes. Our cottage is close enough to Spring Creek to hear the murmur of the water, and faces Mount Jefferson, which never loses its snow fields and glaciers in summer and its pure white in winter. The winter community here is small, compact, and friendly, and people know you, your car, your bad habits, and even your thoughts—but it is a nice place to live in!

For interests, I retain intermittant contact with my research group in the Medical School, work on a book that will probably never see print, and throw pots in my ceramic shop. I search for volcanic materials to make glazes that might reproduce our "shibui" colors—red pumice roads, yellow pine, etc.

Best regards to you and all the MGH-ers who read The News.

This cordial letter has come from Dr. Walid Mnaymneh (sr. r.s. *Or.* 1962). From the American University Hospital, Beirut, Lebanon, he writes:

Since I left the M.G.H. last June and returned to my home country, Lebanon, I have had a difficult time trying to get over the idea that my stay at the General is over. I can say without hesitation that the years I spent there were among the best years of my life. I recall that my Chief, Dr. Joseph S. Barr, told me shortly after my arrival at the Hospital, "Walid, you will find the MGH environment quite a unique one." I certainly did, and in the most favorable way. The spirit of the doctor-patient relationship, the relationship between the attending staff and the resident staff, among the residents themselves and among the different hospital services were most admirable.

My wife, Dr. Latifeh Ghandur-Mnaymneh (res. fel. *Path.* 1961) and I are working at the American University Hospital in Beirut—she as an Assistant Professor in Pathology, and I as an Assistant Professor in Orthopedic Surgery. It may be quite pleasing for you to know that in this small place, several thousand miles away, we already have a small group of MGH alumni: Dr. Samuel Kirkwood, Dean of the Faculty of Medical Sciences; Dr. Craig Lichtenwalner, Dean of the School of Public Health and Assistant Dean of the Faculty of Medical Sciences; Dr. John L. Wilson, Professor and Chairman of the Department of Surgery; and Dr. Munir Shamma'a, Assistant Professor of Internal Medicine (Gastroenterology). Reminiscence of the old days at the M.G.H. is a heartening subject of conversation to all of us.

The American University Hospital is well known to some of your distinguished men, such as Drs. Edward D. Churchill, Raymond D. Adams, Grantley W. Taylor, and John F. Burke. We enjoyed the visit of Dr. and Mrs. Donald M. McKee a couple of months ago when they were on their way to the Holy Land.

If any of you happen to be traveling through the Middle East, be sure to stop in Beirut and visit us.

Massachusetts General Hospital 1811

No. 222 Boston, Mass. May 1963

ACUTE PSYCHIATRIC SERVICES IN THE EMERGENCY WARD

The changing role of the Hospital in relation to the community is receiving vigorous and widespread attention. In no area of the Massachusetts General Hospital is the demand of the community greater than in the Emergency Ward, where upwards of 44,000 patients will be admitted this year. Part of this pressure for services in the EW is caused by the increasing number of individuals with acute and chronic psychological problems, many of whom require continuing treatment that involves not only the Emergency Ward but the clinics, the Department of Psychiatry, and the Social Service Department, as well. Although enormous strides have been made and are being made in understanding and treating emotional disorders, this growing demand for psychosocial service is, for many reasons, generally unmet throughout the nation: lack of trained personnel, lack of adequate facilities, and the inflexible adherence to traditional practices and procedures. With regard to the last reason—when a patient does not fit into the particular set of therapies offered in many institutions, he is often labeled as unmotivated or otherwise unsuitable for treatment. When referral to another treatment agency is recommended, it is very often not viewed as an integral part of the first therapeutic encounter and a first step in carrying out a comprehensive treatment plan, but as a facile means of disposition. The program we have developed in the EW demonstrates the way in which this situation may be ameliorated.

As we noted, radical changes in the EW have been taking place. These reflect case loads of patients with psychosocial problems who desire treatment. For example, it was estimated that 300 patients were seen for psychiatric care in the EW in 1952. In 1956 Dr. Jack H. Mendelson estimated that over 750 psychiatric patients were seen in the Psychiatry Service of the EW, while Dr. Howard T. Blane reported 875 individuals seen in 1958. Our present carefully tabulated data reveal that, if present trends continue, over 3,000 individuals will be seen by the Acute Psychiatric Services in the EW in 1963, for a total of 5,000 visits in one year. This increase in the number of persons seeking psychiatric aid is not a problem for the Massachusetts General Hospital alone. Bellak, in Elmhurst, N. Y., has instituted a "Trouble Shooting Clinic" in the EW, and the Albert Einstein Medical School has for two years operated an EW Psychiatry Clinic similar to ours.

At one time the EW was mainly a life-death unit, but gradually and increasingly it is fulfilling the role of a community general practitioner, with the estimate that only 5% of the EW population fits into the life-death model. However, the life-death model of rapid diagnosis, immediate and urgent intervention, and recognition of only the presenting problem persists and is often transmitted throughout all specialties in an Emergency Ward. Balanced against this model is the changing reality that an increasing number of people with minor medical problems, chronic debilitating illnesses, and psychosocial crises are coming to the EW. What we are therefore confronted with is a need to intensively evaluate the patient medically, psychiatrically, and socially, and to arrive at a treatment plan which may involve not only the patient but also his family, his environment, and the use of extrahospital community resources. Contrary to the operation of most psychiatric emergency services where immediate short-term treatment planning is the major goal, we shall emphasize long-term planning which incorporates short-term goals.

In order to trace the evolution of our current effort of research, service, and training in the Acute Psychiatric Services of the Emergency Ward to meet the growing demand, we must briefly review our work in alcoholism, which serves as the model for the present undertaking.

In 1952, when the Alcohol Clinic opened its doors as a State-supported operation, two objectives existed: (1) to see if psychodynamic psychotherapy could be effective in the treatment of alcoholism, and (2) to see if, from this psychiatric encounter, we could evolve other techniques of treating alcoholism. The necessity for both objectives derived from a commonly-held impression that psychiatric treatment was ineffective with alcoholics, and our belief that so little scientific effort had been attempted in understanding the principles underlying alcoholism that techniques were limited to symptomatic treatment alone.

In 1957 Mendelson and I reported that, out of more than 1200 alcoholics seen annually in the EW, less than 1% made their way to the Alcohol Clinic for continued treatment. At first our impression was similar to that of the general public and the medical profession: alcoholics are not interested in receiving treatment. However, we soon came to recognize that modifications in psychotherapeutic techniques were necessary if we wished to establish workable treatment relationships with most alcoholics. Support from the National Institute of Mental Health enabled us to test our ideas in two studies — the design, methodology, and results of which were reported elsewhere.(1) The aim of these studies was to see if we could motivate alcoholics to enter treatment. In brief, our approach involved these five points: (1) the use of a psychiatrist and social worker to modify the traditional mode of initial contact with the alcoholic in the Emergency Ward by offering the patient a nonfragmented, consistent relationship; (2) further utilization of psychodynamic understanding of alcoholism by constructively meeting the alcoholic's dependency needs; (3) the practical application of the theory that patients asking for help during an acute episode of a chronic problem are asking for aid for the underlying problem as well; (4) the incorporation of Dr. Erich Lindemann's crisis theory, whereby the patient in crisis is considered to be in a propitious state for therapeutic intervention; and (5) utilization and integration of a large number of community resources in our program. The first year's study showed that 62% of the experimental population started treatment; and, as a result of modifications in technique, 77% started treatment during the second year's study. Subsequently we received funds to support the undertaking as a demonstration-service oriented program in the EW which is currently in operation, and preliminary figures indicate that 95% of the referred population started treatment. Because we have also become especially aware that studies in alcoholism have focused mainly on those most severely ill and deprived and therefore most difficult to reach, we are in the process of undertaking studies in the early identification and treatment of alcoholism and alcohol-related problems. These studies include a survey of female alcoholism and the effect of alcoholism in parents upon the emotional development of their children.

In July 1962, Dr. Lindemann, Chief of our Department of Psychiatry, asked that we apply the model of our work with the alcoholic to the general psychiatric population in the Emergency Ward. This undertaking is designed to meet the increasing demand for psychosocial service, of which we spoke earlier, in consonance with the goals of the Administration of the M.G.H. in its expanding interest in the Hospital's role in the community.

In review, then, we are attempting a new and expanded approach to the problems to be met in the Acute Psychiatric Services in the EW. This endeavor is modeled after our work with alcoholics in the EW and is based upon 4 assumptions: (1) a patient asking for help with his immediate problem is at the same time asking for help with his underlying problem, and a crisis situation is a propitious moment in which to make an alliance; (2) strengthening the patient's motivation to enter therapy and maintain the relationship is mainly the responsibility of the caretaker and the agency; (3) if treatment facilities are not available in an institution, careful and efficient interagency referrals can be made, tailored to the needs of the patient and within the resources available; and (4) that the Acute Psychiatric Services in the EW are an excellent locale for the training of young psychiatrists for their general practice in psychiatry.

With the background in mind, what are the aims and operations of the Acute Psychiatric Services? Our aim is to deal with the broad range of psychiatric patients coming to the EW — many of them considered unreachable or untreatable — who, we believe, can be motivated to enter and maintain treatment by an approach tailored to evaluate and meet the individual's requirements, and integrated with the efforts of existing community resources. To achieve our aim we attempt the following: (1) a careful team evaluation of the patient and his primary social system; (2) comprehensive treatment-planning that involves the patient and his family with intrahospital as well as community resources; (3) careful utilization of initial contacts with patients and family members, to enhance motivation for continuing care; (4) follow-through on referral to other resources, to solidify working rapport with extrahospital facilities and to serve as a check-up on the correctness of treatment-planning for patients; (5) continuing cooperation, coordination, and consultation with a variety of community agencies in treatment-planning and implementation; (6) an in-service training program for residents in psychiatry, social work students in psychiatry, and psychology trainees, and the complementary program of training for community agents, both lay and professional; and (7) the building of a body of knowledge from the Acute Psychiatric Services patient population that may result in new avenues of research and treatment.

The services operate as follows: Dr. Freddy H. Frankel (c.r.p. *Psychiat.* 1953), who recently rejoined us from South Africa, acts as coordinator of the service. Dr. Frankel serves on a full-time basis in the EW, managing administrative problems, supervising residents in psychiatry, reviewing the daily patient population and records, coordinating the team efforts of our residents and social workers, and conducting conferences, consultations, and liaisons with community agencies. He is ably assisted in these multiple efforts by Dr. Gerhart A. Duda on a full-time basis and by Dr. Robert L. Bragg on half-time service. A first and a third year resident in psychiatry are on duty in the EW at all times. At present, the first year resident evaluates every patient referred to the service, taking into account the information gained by the social worker. Then, mutually arrived at short-term and long-term treatment plans are developed. Third year residents serve as front-line reviewers of the patients examined by the first year resident and often, in the event of simultaneous referrals, they evaluate and plan for patients who cannot be seen by the first year man. In the near future, the third year residents will be the front-line psychiatrists in the EW, since the problems to be met there require the more, rather than the less, experienced psychiatrist.

Psychiatric social service is heavily involved in the Acute Psychiatric Services of the Emergency Ward. Under the direct supervision of Miss Eleanor Clark and with the enthusiastic cooperation and support of Miss Josephine C. Barbour, Director of the Social Service Department at the Hospital, the social workers do an initial intake with all patients, gather information from relatives or others who accompany the patient, investigate the patient's social environment, make specific arrangements in the event of referral to community resources, provide short- and long-term case work, and, as noted above, cooperate with other staff members in treatment-planning. In order to employ the special capabilities of the workers most effectively, social work assistants assume some of these day-to-day activities. Finally, daily problem-solving rounds are held in the EW by senior staff psychiatrists and are attended by the psychiatrists and social workers who were on duty during the previous 24 hours.

When a patient is referred to the service, his name, unit number, and the time of referral are entered on a flow chart. The intake social worker sees the patient briefly, but immediately. The psychiatrist then sees the patient, while the social worker interviews the person who accompanies the patient and, when indicated, gathers information over the telephone from sources outside the Hospital. A long-term treatment plan is formulated calling upon consultation with other staff members if necessary. When one contact is insufficient for arriving at a long-term plan, an interim plan is made and the patient and/or his family are given a return appointment for long-term planning and follow-through. Patients whose situations are not deemed emergencies are evaluated and planned for at a slower pace, with 3 to 5 return appointments, as might be necessary. Coffee is provided for patients who must wait, and a social worker, social work assistant, or secretary sees that the patient is kept informed as to inadvertent delays if they occur, so that he will not feel neglected.

Since, as we have shown in our alcoholism work, the initial contact of a person in crisis with caretakers is of prime importance in enhancing or inhibiting motivation for treatment, we make a continuous effort, first of all, to try to gratify within the limits of reality the expressed needs of the patient in order to constructively utilize his dependence. Further, we offer a continuous interest in, and unfragmented relationship with, and acceptance of, the directly or indirectly expressed feelings of the patient. Also, as noted above, we attempt to enhance motivation by recognizing with the patient not only his immediate problem but those underlying problems as well. We try, further, to strengthen motivation by reducing reality frustrations to a minimum, i.e., avoidance of lengthy waits, fragmented contacts with a number of personnel, or behavior on the part of any member of the staff which can be interpreted by the patient as hostile or rejecting.

Since patients do not live in a vacuum, we have learned that maximum motivation, evaluation, and treatment must be developed within the setting of the individual, his family, and the community. This involvement of the family in early planning and treatment is immensely useful in enlisting the family's aid in programing and in enhancing motivation. Interpretation of aims, reassurance, and discussion of the problems that may arise for relatives as a consequence of the treatment plan tend to reduce the gross and subtle pressures relatives can exert to influence negatively the patient's decision regarding treatment plans. In this way, the family, not the patient alone, becomes the focus of treatment.

The use of extrahospital community resources bears a major significance in our work. Very early in our experiences with the alcoholic we recognized that the M.G.H. was in no position to provide many of the basic needs of the socially deprived patient, nor should it. Search for existing facilities revealed that although many were listed as available to alcoholics, their administrative practices excluded those patients they supposedly served (e.g., the alcoholic must have lived in one residence for 5 years or must have been sober for 3 months, or he must pay a high fee, etc.). We learned, however, that many of these community agencies would alter their existing practices when approached in relation to our work. In addition, when we evaluated the strengths and weaknesses of a particular institution or agency for ourselves and made referrals to their strengths and avoided referrals to their weaknesses, better interagency working relations resulted. Coupled with our follow-through practice, whereby the psychiatrist and social worker kept in frequent contact with the caretakers of the extrahospital resource, a working rapport developed. The other agency did not feel that the M.G.H. had "dumped" the patient on them, and they correctly felt that our continuing interest in the patient offered them the opportunity for consultation and support in their efforts. As a result, interagency and interprofessional tensions and conflicts from which the patient is the one who suffers were reduced.

One consequence of our integration of extrahospital resources in our psychiatric-alcoholic programs has been the survey of "repeaters" in the EW. Our initial survey revealed 30 patients who had multiple visits to the EW (some up to 50 visits) in a short span of time. Not only did these patients make frequent use of EW facilities of the M.G.H., but they drew heavily upon other agencies: general, mental, and tuberculosis hospitals; social welfare agencies; and courts and correctional institutions. Although these patients circulate from agency to agency and were often referred to as "well known", examination of their records revealed little in the way of essential history, comprehensive evaluation, and treatment-planning. Making the rounds from agency to agency, costing the community large sums of money, these patients never benefit from a carefully evaluated, well-coordinated community effort, whereby their needs are determined and treatment-planning implemented. The results of our survey of the "repeater" patient have been made available to the Commissioner of Public Health in order to help him get legislation for funds for half-way houses and therapeutic community-style hospitals. In this way we hope to realize the goal of our philosophy that successful efforts within the M.G.H. will create sufficient pressure outside the Hospital to generate the rightful assumption of responsibility on the part of the community.

We believe that in the acute psychiatric service in the emergency ward of a large general hospital, services must be offered to all who ask for help. We believe, therefore, that we must pursue systematically and continuously the search for methods of therapy for those patients who do not enter or who prematurely discontinue therapy. One reason why patients do not enter or prematurely discontinue therapy is the factor of low socio-economic class position. Explanations of the relation between low social position and unsuitability for psychiatric treatment have ranged from ineffective communication between middle-class therapists and lower-class patients to divergent value systems between physician and patient. Our research with alcoholics, a majority of whom were from lower social class positions, revealed that action-oriented encounters whereby concrete needs were met, rather than a verbal-thinking approach, were essential in the initial therapeutic encounters.

Along with the low social class patient who receives treatment with difficulty is the patient population which falls into the area of social deviation, character disorder, passive-resistance, and those patients whose medical problems are more socially acceptable than their underlying, pressing psychosocial difficulties. Many of the above noted problems contribute to the difficulties of the Acute Psychiatric Services in the EW.

Beyond the changing character of the Emergency Ward, the need for new psychiatric techniques for evaluation and treatment and the necessity for coordination of community resources, lies the untapped body of knowledge in the EW concerning acute psychiatric problems which lends itself to research and teaching purposes. Since the structure of medical practice is changing, as reflected in the changing pattern of emergency services, research into the new patient populations and their problems becomes essential, as well as the development of teaching practices. The EW is an excellent locale for the young psychiatrist to have a wide range of experiences. However, it is important to both patient care and the psychiatrist's learning experience that proper supervision of this learning experience be close at hand.

There are many phases of our activities which we cannot describe in this brief article: the necessary follow-through, cross-checking within and without the Hospital, and the circumventing of innumerable obstacles and frustrations which beset most patients; an elaboration of the intricacies of treatment-planning, use of community resources, and inservice training and education involving social workers, volunteer college students, and mental health workers in the community. What we hope is that when our program is fully developed, just as with the alcoholic, general psychiatric patients often considered unreachable and untreatable may indeed be reached and treated — this, regardless of the kind of problem or the social class position. We further hope to show that reaching and treating individuals in psychosocial stress does not require radical changes in commonly held viewpoints with regard to the treatment of psychiatric problems. Reaching and treating patients involves, rather, careful conducting of the initial contact and shifts of emphasis in dynamic theory: from the individual *in vacuo* to the individual as a member of a dynamic social system; from an agency as the sole treatment resource to a community of agencies; from an effort to fit all patients into a middle-class value system to an effort to understand and function within the value system of each patient's subcultural group. These we hope, ultimately, will be the contributions of the new endeavor in the Acute Psychiatric Services of the Massachusetts General Hospital.

Morris E. Chafetz, M.D.,
Director, Alcohol Clinic and
Acute Psychiatric Services

The Board of Trustees, at their meetings during March, voted:

That Dr. Erich Lindemann be granted leave of absence with pay for the period March 12 through June 10;

That Dr. Howard P. Baden, Clinical Associate in Dermatology, and Dr. Ruth K. Freinkel, Assistant Dermatologist, be allowed to see a limited number of private patients at the Hospital;

To accept the resignation of Dr. Joseph Dobkin as Assistant Biochemist at McLean Hospital, effective retroactively to January 26;

That the resignation of Dr. Winfield S. Morgan, Associate Pathologist, be accepted with regret, effective March 31;

That the resignation of Dr. Herman Turndorf, Assistant in Anesthesia, be accepted with regret, effective March 15.

To promote:

Dr. Bruce W. Fischberg from Clinical Fellow in Psychiatry at McLean Hospital to Clinical Assistant in Psychiatry at McLean, effective retroactively to January 1;

Dr. Eda M. Kahana from Clinical Fellow in Psychiatry at McLean Hospital to Clinical Assistant in Psychiatry at McLean, effective July 1.

To appoint:

Dr. Otto Appenzeller as Clinical and Research Fellow in Neurology for one year, beginning May 1;

Lenin A. Baler, Ph.D. as Assistant Psychologist, beginning April 1;

Dr. Sidney A. Blubaugh as Assistant Resident in Anesthesia, beginning September 1;

Dr. Randolph Catlin, Jr. as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Robert Cserr as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Ralph B. Dell as Exchange Assistant Resident on the Children's Service, for the period February 27 through April 9;

Dr. Marianne Dierks as Assistant Resident in Psychiatry for one year, beginning July 1;

Dr. Donald G. Dorencamp as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Robert A. First as Assistant Resident in Orthopedic Surgery for one year, beginning April 1;

Dr. Ramon S. García as Clinical and Research Fellow on the Children's Service for one year, beginning July 1;

Peggy J. Golde, Ph.D. as Assistant Sociologist, beginning April 1;

Dr. Frank Haendel as Clinical and Research Fellow in Psychiatry, beginning July 1;

Dr. Francoise Halkin as Clinical Fellow in Anesthesia (resident status) for one year, beginning April 1;

Dr. Howard T. Hermann as Assistant Psychiatrist at McLean Hospital, beginning September 1;

Dr. James C. Jordan as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;

Dr. Alfred J. R. Koumans as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Sidney Levin as Associate Attending Psychiatrist at McLean Hospital, beginning March 15;

Dr. John B. Livingstone as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Donald A. McGee as Clinical and Research Fellow in Neuropathology for one year, beginning July 1;

Dr. Raymond J. McGill, Jr. as Assistant Resident in Dermatology, beginning July 1;

Dr. Michael T. McGuire as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. James W. Meade as Clinical Assistant in Surgery, with the privilege of assisting Dr. Robert Linton, beginning July 1;

Dr. Donald J. Morrison as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Joseph Pines as Clinical and Research Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;

Dr. Judith G. Ronat as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Christopher Van A. Rowland, Jr. as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Krishna M. Saxena as Clinical and Research Fellow on the Children's Service for one year, beginning July 1;

Dr. Edwin L. Tolman as Assistant Resident in Dermatology, beginning July 1;

Dr. Michael J. Walker as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Dale E. Wenlund as Second Assistant Resident in Radiology, beginning July 1;

Dr. John B. West as Assistant Physician, beginning July 1 (title Clinical Fellow until license is received);

Dr. Edwin T. Wyman, Jr. as Assistant in Or-

thopedic Surgery;
Dr. Donald N. Wysham as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;
Dr. Shing Y. Yip as Assistant Resident in Dermatology, beginning July 1;
Dr. Thomas E. Zion as Clinical Fellow in Neurology, to act as Resident, beginning July 1.

The Trustees voted to appoint the following Interns on the Medical Service, to begin July 1:

Dr. Arthur J. Atkinson, Jr.
Dr. Winthrop H. Churchill
Dr. Robert B. Copeland
Dr. Bernard G. Forget
Dr. Thomas D. Gelehrter
Dr. Albert R. Martin
Dr. Frederick L. Moolten
Dr. Gordon T. Moore
Dr. John Noble, Jr.
Dr. Richard K. Root
Dr. Jay H. Sanders
Dr. Samuel R. Snodgrass, Jr.

The Trustees also voted to appoint the following Interns on the Children's Service, to begin July 1:

Dr. Lewis B. Holmes
Dr. Mark E. Molliver
Dr. Esther H. Robinson
Dr. Joel Rutman

At their meeting on March 29, the Trustees changed the titles of three members of the Administrative Staff, to indicate more clearly the responsibilities and functions of the individuals involved. Mr. Henry J. Murphy becomes Associate Director, Mr. Lawrence E. Martin becomes Associate Director and Comptroller, and Mr. David C. Crockett is Deputy to the General Director. In addition, Dr. Dale R. Lindsay, at present Chief of the Division of Research Grants at the N.I.H., will, as of August 1, become Deputy to the General Director for Research Administration.

At their meetings on March 6 and 27, and April 3, the General Executive Committee voted:

To accept the resignation of Dr. Sharad G. Joshi from the position of Research Fellow in Medicine, effective as of February 2;
To promote Dr. Donald L. Leake to the position of Resident in Dental Medicine for one year, beginning July 1;
To reappoint Dr. Isadore Starr as Clinical Fellow in Medicine for one year, beginning April 14.

To appoint:

Mary C. Glick, Ph.D. as Research Fellow in Biochemistry (Medicine) for one year, beginning as of February 18;
Dr. Perla B. Salama as Research Fellow in Neurology, assigned to Electroencephalography, for the term December 15, 1962 through March 15, 1963;
Dr. Prem S. Sarin as Research Fellow in Medicine for one year, beginning September 1.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all recent articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

Anesthesia

Laver, M. B., and Turndorf, H.
Atrial activity during halothane anesthesia in man.
Anesthesiology 24:133.

Slater, E. M., Surtees, A. D., Tassie, J. A., and Todd, D. P.
Anesthesia by remote control during radiation therapy.
Anesthesiology 24:112.

General Medicine

Smith, L. H., Jr., and Lotz, M.
Studies on congenital orotic aciduria: Comparison of orotic acid metabolism in microorganisms.
J. Lab. & Clin. Med. 61:211.

General Surgery

Grillo, H. C.
Origin of fibroblasts in wound healing: An autoradiographic study of inhibition of cellular proliferation by local X-irradiation.
Ann. Surg. 157:453.

Laboratory Science

Dvorak, H. F., Kosunen, T. U., and Waksman, B. H.
The "transfer reaction" in the rabbit. I. A histologic study.
Lab. Investig. 12:58.

Waksman, B. H.
The pattern of rejection in rat skin homografts, and its relation to the vascular network.
Lab. Investig. 12:46.

Orthopedic Surgery

Cave, E. F.
The healing of fractures and nonunion of bone.
Surg. Clin. N. America 43:317.

Cave, E. F.
The past and present of trauma.
Surg. Clin. N. America 43:337.

Pathology

Munger, B. L., and Roth, S. I.
The cytology of the normal parathyroid glands of man and Virginia deer. A light and electron microscopic study with morphologic evidence of secretory activity.
J. Cell. Biol. 16:379.

Roth, S. I., and Munger, B. L.
Recent advances in the histology and ultrastructure of the parathyroid glands.
In Evaluation of thyroid and parathyroid functions, F. W. Sunderman and F. W. Sunderman, Jr., Editors, Philadelphia, J. B. Lippincott, chap. 17.

Roth, S. I., and Munger, B. L.
Recent advances in the pathology of the parathyroid glands.
In Evaluation of thyroid and parathyroid functions, F. W. Sunderman and F. W. Sunderman, Jr., Editors, Philadelphia, J. B. Lippincott, chap. 18.

Psychiatry

Whiskin, F. E.
The use of the "soliloquy" in the therapy of the silent juvenile.
J. Offender Therapy 6:62.

Radiology

Potsaid, M. S.
New developments in fluoroscopy.
M. Science, March 10:349.

Wang, C. C.
Experimental studies of relative biological effectiveness of 910-Mev alpha particles in mammalian cells.
Radiology 80:304.

PARKINSON'S DISEASE PROJECT

We became specifically interested in Parkinson's disease in 1938, in the winter, about a year after the founding of the Electroencephalographic or Brain Wave Laboratory. During a study of the brain waves and tremor frequency in a group of Parkinson patients, we found we needed 15 more patients. Since I was then a consultant to the Long Island Hospital, where there was a large number of these patients permanently on the chronic wards, we decided to go there. Therefore, on a cold brisk morning, late in February, we took the entire EEG equipment and a portable alternating current generator, because the current on Long Island was direct current, down to the Municipal Wharf and loaded it onto the small Long Island steamer. We took everything we had in the laboratory at that time: technicians, storage batteries on wheels, tool kits, and a special direct current timer made at the Massachusetts Institute of Technology just for this trip. We think it was the first time that a brain wave laboratory took a short sea voyage. There were no casualties. We spent about 9 hours at the hospital and collected data on over 22 patients, giving us an adequate number for our study.

A paper which resulted from this study showed there was no relationship between the brain wave frequency and the tremor rate. In June of that year my paper, sponsored by Dr. Stanley Cobb, was presented at the meeting of the American Neurological Association and was subsequently published in the *Journal of Neurophysiology*. It was the first paper from the Electroencephalographic Laboratory and the first from this Parkinson's Disease Project.

In 1948, renewed interest in this disease was stimulated by a chance to test a synthetic drug, Panparnit, in a group of these patients. We had the good fortune to have at that time, in Dr. Stanley Cobb's department, Dr. Denis Leigh of London, who was assigned to this particular project. In order to get enough patients for trial of this new compound we established in the Neurological Out-Patient Department a Parkinson's Disease Clinic which met on Wednesday mornings under the supervision of Dr. Leigh and me. One purpose of such a special clinic is to provide an adequate number of patients for such testing and keep them together. It was soon evident that there was a need of some kind of objective measurement applied to the patient each time he came to the clinic. Therefore we began the development and trial of various types of objective tests of function, rigidity, and tremor in our patients. A favorable report of this first drug was presented before the American Neurological Association in June 1949.

From that time on, the clinic was maintained and a number of other compounds were under test. In the autumn of 1949, Dr. John Stobo Prichard, a neurologist from London, came to us for a year's work in our Parkinson's Disease Project. The clinic had now grown and there were a large number of patients who were in the Hospital for various periods, as well as private patients who were coming to see us in our office. We were applying these tests, as well as the usual neurological assessment, to all of the patients every time they were seen. It now became quite obvious that help was needed in the examination and follow-up of these patients. A nurse was employed who administered the tests, kept the books, and assisted the physician in the Parkinson's Disease Clinic. In 1951, Mrs. Garrison was in charge, and from 1952 through 1958, Mrs. Sylvia Walker was in charge of this program. From 1958 to the present, Mrs. Helen Tewksbury has been employed full time at this work.

During the course of these 15 years of clinic operation, over 25 different objective tests have been tried. Some of these have been reported in detail in the medical literature, a number have been abandoned as inaccurate or too complicated, but at the present time we use about 8 which we feel give us a reliable, standard estimation of the Parkinson's ability to use his muscles. The most useful of these is the bulb ergogram, which we have used since 1952. We have a number of speed and motor tests, such as drawing 10 circles as fast as possible, walking a 10-meter course as rapidly as possible, and a simple but rather boring test for most patients: taking off their shoes and socks and putting them on again as rapidly as possible—each part of the process being timed by the nurse in charge.

During these 15 years we have tried 35 different substances taken by mouth, and half a dozen substances that can be used only by intravenous or intramuscular routes. An example of an unexpected valuable side issue that we certainly missed out on in the testing of a drug follows: We were given some tablets in 1954 by one of the pharmaceutical houses to try against Parkinsonian tremor. Since this particular substance had been used successfully against the spasmodic jerking movements in dogs who had encephalitis from distemper, it was thought that it, therefore, might be useful in the tremor of Parkinson's disease. We were given 10,000 sugar-coated tablets containing this material, as well as a supply of intravenous ampoules of the same material. This particular trial was clearly negative. Twelve patients had been on the oral tablets for several months without any improvement in their tremor, even when large doses of the drug were taken. Side effects from this particular substance were minimal, and the dose could be increased until slight unsteadiness and dullness appeared which would promptly disappear when the dose was reduced. Intravenous injections of this same material produced no reduction in the tremor, which we were measuring by the electromyogram as well as clinical evaluation. Therefore, we concluded that the substance was not useful to our patients and so notified the drug company, asking what they wanted us to do with the remaining 2,000 tablets. These were sent to their director of medical research, whose curiosity was several degrees beyond that of the author of this article. Before throwing them into the waste barrel he wondered what they tasted like. He bit into one of the tablets and was astounded to find that his mouth became immediately anesthetized. He called me on long distance telephone to ask if I had ever tasted the medication, or if I had had any report from any of our patients about this phenomenon. We had had absolutely no comment. Apparently our patients had swallowed all of the sugar-coated tablets without biting into them, so we had nothing to contribute to this discovery. To make a long story short, the company immediately developed this material into a topical anesthetic, and used our carefully controlled data on 12 patients to convince the Federal Drug Administration that the material was safe for human beings. This material is now on the market as a topical anesthetic. It is in general use by dentists, and nose and throat and genito-urinary surgeons throughout the United States. Of course, since that time the undersigned has bitten into any product that has come to the project for testing, but opportunity knocks only once in a matter of this sort.

Collaboration with neurosurgeons

Since the beginning of this project, we have collaborated with neurosurgeons in trying to help patients with Parkinson's disease. In 1939, two of our patients had total thyroidectomy in an effort to reduce their tremor, but in both of these the procedure was a failure. In 1940, the late Dr. Roland Klemme persuaded Dr. James C. White to try some of his cortex ablation operations to reduce rigidity and tremor in Parkinson's disease. Dr. White operated on 12 patients during the period from 1940 through 1942. In only one was there a good result. In this young man (H. B.) the tremor and stiffness of the left side was completely taken away without any weakness or awkwardness. Localized brief epileptic seizures occurred at first, but have been controlled completely by drugs since 1945. This man, now 44 years old, is still free of all Parkinson's disease (his right side never was affected) and works as a railroad fireman. With only an 8 percent favorable result rate, the Klemme type of operation was abandoned.

After the second World War, when Dr. James C. White and I had returned from duty with the United States Navy, we again had the problem of what to do for the Parkinson patients who were not being helped adequately by drugs. In 1947, an Australian doctor, Dr. B. Wyke, visited us and suggested an operation on the outer brain itself that convinced us, from the account of his observations in Australia, that it would relieve the shaking and stiffness. Dr. White performed this procedure on two of our patients in the presence of Dr. Wyke. We were much disappointed with the results, and we found out that at several centers in the United States operations of this type had been done with Dr. Wyke in attendance and had not turned out well at all. A group of eight of us who had had this experience reported together on a total of nine operations, and Dr. Stanley Cobb edited the report. The article, which was published in the *Archives of Neurology and Psychiatry,* indicated that this type of approach was not successful in any of the cases. During this type of surgery it was quite obvious that our method of quantitating the motor performance and tests in our Parkinson patients was very useful in evaluating and proving that such kinds of surgery were not helpful.

During this period we also cooperated with Dr. White in three operations on the cerebral peduncle — two of which were fairly successful in relieving tremor and some rigidity, but they were rather dangerous procedures and the patients were quite ill for some time afterward. We were sufficiently discouraged from these results to abandon this approach. We also followed a good suggestion from some of the physiologists working at the Massachusetts Institute of Technology that the cutting on both sides of that part of the 8th nerve that is involved with the balancing mechanism might help these patients. This was done in two of our group of Parkinson patients, but again the results were disappointing and that procedure was discontinued.

We did have a remarkably good result in a patient who had the unusual complication of a burning pain over his entire right side. This patient was operated on by Dr. William Sweet. He removed a considerable amount of cortex from the opposite side, in the frontal area, with a good disappearance of this pain, although the Parkinson's disease itself, as one would suspect, was unaffected.

In 1953, Dr. Irving S. Cooper in New York reported on his tying of the choroidal artery which relieved tremor and stiffness on the opposite side in patients with Parkinson's disease. We began to consider this procedure with Dr. White and Dr. Sweet. When Dr. Cooper developed, a year later, a better procedure — namely, that of injecting alcohol through a cannula into the globus pallidus, we thought it sufficiently safe and logical to attempt this with some of our own group. Dr. Sweet and his associates began to see special patients who were young enough to withstand this procedure, and whose symptoms were more one-sided than the others', which would make it unnecessary to do the operation on both sides.

This really began a very active collaboration between Dr. William Sweet and his associates and the Parkinson Project, because we furnished the patients, did the preoperative and postoperative follow-ups, and collaborated intensively in this very difficult problem—namely, that of selecting the right patients for the procedure. At the same time that this collaboration with our own Department of Neurosurgery was going on, patients were being referred directly to Dr. Cooper at St. Barnabas Hospital in New York.

In 1955, I attended an International Neurological and Neurosurgical meeting in Montevideo, Uruguay, where this problem of brain surgery in Parkinson's disease was discussed in some detail, and we had an opportunity there, with both Dr. Sweet and Dr. Cooper, to describe our evaluation and report on the results.

In 1956, the Parkinson's Disease Foundation, Inc. was established to support and encourage basic research on this disease and I was appointed one of the members of the Medical Advisory Board. We received financial help from this foundation in support of our own endeavors at the Massachusetts General Hospital, and also actively collaborated in an International Symposium sponsored by the United States Public Health Service and this foundation at Arden House in 1959. In the previous year (1958), there was a symposium at Houston, Texas, on Parkinson's disease, and again we collaborated actively, reporting our methods of evaluation of patients, before and after surgery, and the criteria for selection of the right type of patient for the operation.

There has been a most pleasant and active cooperation and liaison with neurosurgeons over the past ten years, not only in our own institution but in New York and elsewhere, both in evaluating the results of their surgical interventions and in helping neurosurgeons select the right patients for the procedures. For example, in 1956 and 1957, Dr. Albert C. England, Jr. and I went down to Dr. Cooper's nearly every week to examine his patients who had come back for follow-up study after the various procedures had been done, and we also examined patients before operation. This resulted in our confirming the fact that this type of basal ganglia surgery which was now being done in many centers throughout the world did provide, in the majority of patients, permanent relief from their rigidity and tremor. These joint efforts are being continued here at the present time with Dr. William Sweet and his associate, Dr. Raymond N. Kjellberg, and with Dr. Cooper in New York. Dr. England and I act as the neurologists involved in this project.

In 1961, Dr. David C. Poskanzer returned to the Neurological Service after his training as a resident, and joined our Parkinson's Disease Project to study the relationship of age in our patient population and the possibility of our patients having an infective origin for the disease — possibly the virus associated with epidemic encephalitis during World War I, or even the Spanish influenza which was current at that time. We had found previously very suggestive evidence that our patients, as a group, were older people, suggesting a common cause for this disorder. We felt, from our own data, that it was not due to the increased life span of the general population in the United States. With Dr. Poskanzer on the team, and his special qualifications in Public Health and Epidemiology, we were much strengthened in continuing this investigation.

Dr. Poskanzer examined the records of all patients with Parkinson's disease who had been seen at the Massachusetts General Hospital since 1873. He found that between 1873 and 1917, approximately half the number of years to the present time, there were only 33 patients with Parkinson's disease at the Hospital, whereas since 1917 up to the present time the number has risen to over 1400. It is quite obvious that some of these identifications are due to our own interest in the disease and the establishment of our Parkinson's Disease Clinic and Project, but we felt that this was not the main cause of this increase. Other centers had also described an unusually large increase in patients with this disease. Dr. Poskanzer strongly supported our original feeling that this disease went back to the period of worldwide epidemics from 1917 through 1929, and, with his more accurate and up-to-date epidemiological survey, the material was put together in such a way that it seemed quite convincing. This was reported at a special meeting in Florida in October 1962, and will appear shortly in the *Journal of Chronic Diseases.* For example, he pointed out that 10 percent of our large number of patients gave a positive history of having had lethargic encephalitis and another 35 percent gave a positive history of having had Spanish influenza during that period of time. In a group of patients and persons who did not have Parkinson's disease, who were matched for age and sex so that they would be the same, we found that none of these controls, so-called, had any history of encephalitis and only 14 percent of them gave a history of having had Spanish influenza during this period of time.

These differences are highly significant and certainly suggest that this group is aging as a "cohort" and when they die off through various causes — old age, and so on, since Parkinson's disease itself is not a killer — this disease should then become as uncommon as it was before the first World War. Dr. Poskanzer estimates that this would probably be somewhere round 1985, and we would hope that the Massachusetts General Hospital News, in that year, will recall this article and make a note whether or not these predictions have come out as expected.

This forecast or tentative guess that the disease is going to diminish slowly with the passing years until somewhere round 1985 is only one side of the problem. Others in this country feel — and these would be best represented by Dr. Lewis J. Doshay of New York, and Dr. Leonard Kurland, Chief of the Epidemiology Branch of the United States Public Health Service in Bethesda, Maryland — that the increasing number of elderly patients with Parkinson's disease reflects the fact that there are more people living in this geriatric age group today than there were twenty-five or fifty years ago. They would agree that we do not see today the younger patients who have had encephalitis and that we see patients whose disease often begins in this geriatric period after the age of sixty, and so on, and is associated with hardening of the arteries and other signs of aging. They do not necessarily believe that the aging process causes the disease, but they certainly feel that it is in this age group that Parkinson's disease begins. Their feeling, therefore, is just the opposite to ours — namely, that as more and more people survive to the seventies and eighties, the more will Parkinson's disease develop, and, instead of diminishing to a level which one can estimate for the years before the first World War, the disease is steadily going to increase in numbers until over one million or one and one-half million people will have Parkinson's disease in the United States. One can be certain that this difference of opinion about the future of this disorder will resolve itself in the course of the next five to ten years by the simple results of whether or not there is an increase in the number of new patients and in the total number of patients in any community at any given time.

We have encountered from time to time patients whose father or brother had Parkinson's disease, and the question is raised as to whether this is a familial disorder or whether there is a strong familial predisposition to acquiring Parkinson's disease. About five years ago we made a preliminary check on some of our patients and found that approximately 4 percent reported the disease in direct members of their family, such as a parent, sibling, or child. This is considerably lower than in the Swedish reports, where familial incidents reached over 30 percent. In 1963 Dr. Poskanzer reviewed our total group of patients for familial incidence and found it somewhere round 6 percent. It is worth while at this point to mention that we have encountered a total of 12 pairs of twins in our series of patients, one-half of them identical, and in none of these was the other twin affected by the disease. This does not prove that the disease is not familial, but it is strong evidence against it because familial disease is usually present in both members of twins, especially in identical twins. It might be worth mentioning here that on the Island of Guam, a territory of the United States in the far west Pacific, there is an extraordinary group of patients who have a disease somewhat like Parkinson's, as we know it, but with a considerable number of differences. The inhabitants of this island — Chamorros — suffer from a familial condition of muscle wasting which produces death in three or four years, and is very similar to amyotrophic lateral sclerosis seen in the United States. The difference on Guam, however, is that in percentages, in some villages, there are nearly 100, and sometimes 200, times the number of patients with this disorder than in any other part of the world. There is also a condition that begins at about the age of fifty, in which the mind is affected in nearly every patient, that resembles in some ways Parkinson's disease, but there is a very high familial incidence and, peculiarly enough, some of the patients with this Parkinson's dementia complex, as it is called, also have the muscle wasting disease. The two clinical conditions overlap in over one-third of the cases. We were so interested in this that Dr. Kurland took me out there in April 1961 to set up the Electroencephalographic Laboratory in the Guam Memorial Hospital's Research Unit and to look over this extraordinary group of neurological patients. In October 1962 a second conference was held on Guam and on this occasion not only I attended, but Dr. Raymond D. Adams, Chief of our Neurology Service, was one of the consultants. We examined these patients carefully during this four-day period. The tremendous activity of the research unit on Guam has been seriously curtailed this year by extensive damages to both the hospital and the island in general by a terrible typhoon which swept the island in November 1962.

We have no clear idea at the moment as to what causes these peculiar neurological diseases among the Chamorros on Guam and we are hoping that, if the cause of such peculiar concentration of this disease on this small island is found out, some of this information may be of use in the management of patients in this country.

The Parkinson's Disease Clinic

It was mentioned before that every Wednesday a Parkinson Clinic is held in the Neurological Out-Patient Department at the Massachusetts General Hospital. This clinic has been in operation since 1948, which is now fifteen years. At the present time two doctors spend the morning in this clinic: Dr. Morris E. Chafetz, who is a psychiatry consultant to the Parkinson Project, and Dr. Albert C. England, Jr., who has been with this project for over ten years. He is an associate of the undersigned in this project and is a neurologist on the staff of the Hospital. Our nurse, Mrs. Helen Tewksbury, is in attendance during the entire morning, and at regular intervals Mrs. Sylvia Walker, who is retired from active work at the Hospital, comes in to help us out in the clinic on Wednesday mornings.

Approximately eighteen patients, sometimes as many as twenty, have appointments to attend the clinic on Wednesday. The results of an abbreviated form of routine tests, including the ergogram and some speed circles, and, of course, the patient's weight, are obtained from each patient. It is in this group of patients that we have a most extensive testing of new drugs and compounds. New patients who are suspected of having Parkinson's disease are referred to the clinic for consultations, but the majority are patients whom we have followed, in some instances, for as long as twenty years.

It would be appropriate at this time to say something about these Parkinson patients who comprise our out-patient and private list, because they are a remarkable group. Their loyalty to the Hospital and to the clinic is phenomenal. Their faithfulness in attending the clinic, even when the weather is wretched, is very noteworthy. It must be recalled that patients with Parkinson's disease have great difficulty in traveling on public transportation. Many of them are unable to drive their own cars and have to be driven in to the Hospital or take taxis, and yet it is very unusual for any patient to miss his appointment, regardless of the conditions of weather or traffic. It is always amazing, on a blustering day in midwinter, to see an elderly Parkinson patient brought in by his devoted family, sometimes from many miles away, and appear on time and eager to face whatever new drug or test is in store for him. These patients well know that many of the therapies we try are not only failures in their ability to help them, but many of them produce undesirable side effects, such as dizziness, nausea, excessive dryness of the mouth, and so on, which will add to their burden and to their misery. Yet they understand the importance of careful drug testing and evaluation of these compounds so that others besides themselves may benefit if they are of any value. Therefore, they carefully follow the instructions to the letter and report faithfully and as objectively as they can about the good or bad effects of such compounds. We regard some of these patients as sophisticated, experienced subjects for such drug testing. They are not fooled by the fact that they are getting a new compound or that any suggestion implied by such a new compound will make them feel better. They try desperately to be honest, and they know perfectly well that if they report failures over and over again, these reports are just as important to the physicians and that there is absolutely no advantage to them to turn in an optimistic or false report on any therapy.

The same devoted loyalty and faithfulness applies to the private Parkinson patients we see in our office. They put up with this large battery of testing, the trial of new drugs, and the necessity, very often, of being delayed in their return home, because they feel that they are part of a joint effort in this Parkinson Project and that the goal is to work out better and more effective therapy for this disease. We are proud to be able to report that annually these devoted and grateful patients contribute a total sum of $10,000 to the Parkinson Project, to continue its investigation and therapy. In 1962, for example, nearly three hundred of our total patient population contributed to this fund. Of course, many of the gifts are small because these people have extremely limited economic means and many of the drugs they have to take are very expensive.

In conclusion I am afraid we have to inject a somewhat pessimistic note. In spite of fifteen years of coordinated intense effort in working with patients who have Parkinson's disease, we have not come up with any type of therapy which restores our patients to a normal performance, such as insulin does in diabetes. In

Dr. Morris E. Chafetz, Associate Psychiatrist
Director of the Alcohol Clinic and Acute Psychiatric Services

about one-fifth of the patients who have been operated on, the results have been spectacularly good. In the remainder, the results have been good to satisfactory, which is about the same as reported from other centers.

In the ninety percent of patients who have not had any surgery and for whom we feel the operation would be of little or no value, we have been limited to the use of drugs, physiotherapy, and, in some patients, psychotherapy and general supportive measures. It is hard to assess or give any percentage of benefit to a group as large as this, but we do not think we have helped significantly more than one-third of our patients. We have helped slightly, perhaps, another third, and we have been unable to do anything at all for the remaining third of this group. This certainly does not add up to any triumph, and the successful therapy for the prevention of progress in this disease still remains one of the greatest challenges today.

Robert S. Schwab, M.D.,
Neurologist

Dr. Michael H. Bell, Assistant Resident in Orthopedic Surgery — born in Vancouver, British Columbia, September 30, 1934; M.D., University of British Columbia, Vancouver, 1959; Intern and Resident in General Surgery, Montreal General Hospital, Montreal, Canada, 1959-61; Resident in Accident Surgery, Radcliffe Infirmary, Oxford, England, 1961-62; Resident in Orthopedic Surgery, Princess Margaret Rose Hospital, Edinburgh, Scotland, 1962.

Dr. Robert J. Boyd, Assistant Resident in Orthopedic Surgery—born in Detroit, Michigan, July 1, 1930; A.B., Harvard College, 1952; M.D., McGill Medical School, Montreal, Canada, 1956; Intern (rotating), Stanford Service, San Francisco General Hospital, 1956-57; military service: MC, USA, Germany, 1957-59; Resident in Surgery and U.S.P.H. Research Fellow in Surgery, Stanford Medical Center, Palo Alto, California, 1959-61; Assistant Resident in Orthopedics, Children's Medical Center, Boston, Massachusetts, 1962; married.

New addresses:

Dr. A. Robert Arnstein (*M.* 1956), Henry Ford Hospital, Detroit 2, Mich.
Dr. Richard M. Barry (a.r.p. 1957), 464 Ocean Ave., New London, Conn.

Dr. James E. Breslin (*C.M.* 1938), Yacht *Noa Noa,* Dinner Key Marina, Miami 33, Fla.
Dr. Joan W. Flacke (a.r.p. *An.* 1963), 1 Emerson Place, Boston 14, Mass.
Dr. David C. Mitchell (a.r.s. *Or.* 1963), Henry Ford Hospital, Detroit 2, Mich.
Dr. Grace L. Murphy (r.p. *D.* 1930), 601 S. Bowman Ave., Merion Station, Pa.

Brief bits:

Dr. Bradford Cannon returned recently from a 4-weeks' tour of the Marshall Islands as a consultant for the Atomic Energy Commission. The purpose of this visit was to continue the studies on the Marshallese who were exposed to radioactive fall-out in 1954. During his visit several cleft lips unrelated to the fall-out and deformed hands from burns were treated.

During the past six months Dr. Benjamin Castleman conducted a Clinicopathological Conference at the Connecticut Clinical Congress in New Haven, was the guest speaker at the Annual Meeting of the Associacion Mexicana de Patologos in Mexico City, participated in a Symposium on Colonic Polyps at the New Jersey Gastroenterological Society in Newark, spent a few days as Consultant and Lecturer to the Department of Pathology at the Meharry Medical College in Nashville, gave the Phi Delta Epsilon Annual Lecture at Baylor University College of Medicine in Houston, and delivered the Alpha Omega Alpha Lecture at the Downstate Medical Center of the State University of New York.

Dr. Oliver Cope was in Phoenix, Arizona, from April 3 to 5, for the meeting of the American Surgical Association. Dr. Cope is the President of the Association. The subject of his Presidential Address was "On balance".

Dr. Arthur S. Spangler gave a talk on "Biochemical changes in papular dermatitis of pregnancy" at the University of Miami Medical School, Miami, Florida, on February 7.

Dr. C. C. Wang and Dr. Henry P. Pendergrass were awarded the degree of Fellowship in the American College of Radiology at its annual meeting held in Chicago on February 8.

Dr. Lawrence K. Lunt (*W.M.* 1916), our "singleton" in Santa Fe, New Mexico, has sent us this most alluring letter, although he thinks he hasn't anything of interest to tell us about:

As it is some 15 years since I retired from practice, there is nothing to say about my professional activities.

There is plenty of "local color", however, in this most colorful part of the United States —colorful in the indescribable beauty of much of its physical character, and colorful because of the three "cultures" that exist here: the original inhabitants (Pueblo, Navajo, Apache Indians); the first white interlopers (the Spanish, who have many direct descendants here); and, third, we "Anglos".

There are far too many citizens of the United States who haven't the slightest conception of what their country contains.

I'm sorry I have nothing of real interest for you.

THE NATURE OF A TEACHING HOSPITAL

Each of us has a personal philosophy which guides us in our personal conduct and everyday life. It is our mental compass—our distillate of wisdom—our feelings about human nature, about morality, about life, about reality. Some of these feelings were taught us in childhood, and some we developed ourselves. With some we are vague and inarticulate, but with others definite in the way we show them in discussions and in decisions.

So, too, the teaching hospital has a guiding philosophy which expresses its distinctive personality and nature. It is shown in the conduct and everyday life of the hospital, but it is seldom discussed because it is a deceptively simple philosophy based solely on the spirit and act of GIVING.

When this concept of total commitment to GIVING is recognized, it provides clearer meaning to the work, the conduct, and the individual natures of those involved in patient care, teaching, and research. Furthermore, it can be used intellectually in determining organizational decisions and plans, the selection of leaders, the pattern of organizational hierarchy, the intellectual climate, and the relative priority of goals.

But is this philosophical concept in keeping with our changing culture? Will it and its subsidiary principles push a teaching hospital forward to keep pace with the future needs of a changing community?

In discussing the philosophy and nature of the hospital and community, I will try to use only my observations of those everyday situations in the home or hospital which are familiar to you through your own participation in one way or another.

For future guidance, we must look first to the past for a reference point to establish our original motivation and direction. For this, I need only briefly remind you that the members of religious orders in our own and other civilizations conceived and developed the first hospitals. These hospitals were modified temples, churches, or hotels which served as refuges for sick and weary strangers and outcasts. What little there was to offer in the way of therapy was secondary to the giving of food and sanctuary to those who would otherwise die of starvation and exposure. With so little known about disease and infection, epidemics flared within hospital walls and decimated those who gave care as well as those who received it. But the giving never ceased. There were always more who continued their giving because they intuitively believed or were led to believe by religious or moral principle that "each man is his brother's keeper".

The visionary men of good will who conceived the idea of the Massachusetts General Hospital and its teaching function also planned the M.G.H. as a refuge for the sick or injured social outcast and stranger to the Port of Boston. Parenthetically, our present intensive effort to help alcoholic patients suggests that we have not forgotten this resolve of a century and a half ago to help the social outcast who is ill.

Looking back over the sixty years of this century should produce still better reference points from which to chart our course. This period has been one of continuous change in our national society. All of us have either seen the changes for ourselves or have heard the changes discussed by our parents. I would like to examine only three of the many changes which affect the hospital and its future course.

The first of these is the rapidity with which new knowledge has been discovered and spread. All of us are familiar with the claim that the knowledge accumulated by man before this century has been doubled already in this century and, furthermore, that it may well be redoubled in the next twenty years or so. The impact of this can be felt best by the simple expedient of talking to any reasonably intelligent ten-year-old child. The comparison of that child's conceptual and factual knowledge with your own at that age should provide both understanding and shock.

This increase in knowledge has also led to a better spread of knowledge. Teachers have obviously exploited the research work of the social scientists and have put it to good use. And although the invention and exploitation of television as a mass communication medium has not made our young people more articulate, it has certainly contributed to this astonishing spread of conceptual and factual knowledge.

Keeping this in mind, you can understand these inferential statements:

1. Those who are in teaching and executive work must continuously learn, accept, and use new social and scientific concepts and facts in order to avoid the intellectual scrap heap to which young people are so prone to assign their elders.

2. Each new generation of students and workers has a more sophisticated set of concepts than had the previous generation. Because a hospital should be thought of as a group of persons rather than a group of buildings, it is the responsibility of the existing group not only to orient the new member to the concepts of those already there but also to orient themselves to the concepts of those who join now and those who join in the future.

This implies a guiding principle: Any teaching hospital which hopes to remain a pioneering organization must anticipate the concepts and reality of the future community far enough in advance to provide the time necessary for the changes to take place and to be in readiness.

3. In the complicated organizational patterns of a hospital with its many hazards for the inexperienced, it is naturally difficult for the older established person to give the younger unestablished person an opportunity to experiment with unsolved problems—particularly those located at the interface of multiple disciplines. You often hear the sentiment: "The brash youngster succeeds only because he doesn't know that the problem can't be solved." Perhaps this is true to a point, but it is also possible that he knows more than does his elder of the contributions made by the social scientists in the areas of group dynamics and communications.

4. We should be wary of harsh criticism of the occasional student nurse or student physician who appears in some way to be unaware of the patients' needs or who appears to show irresponsible apathy by failure to match the dedication of the group primarily responsible for the patients' care. Perhaps we and the vast increase of knowledge are equally at fault. The amount of factual material a student must absorb in a limited time increases annually. And a student's security and rewards depend on his absorption powers—that is, his ability to take. Certainly, we shouldn't assume that a person's "giving" propensities must automatically match his "taking" propensities. At present we can only select students whose taking abilities are shown by their previous grades and hope that all the candidates for selection have the intuitive judgment to have selected themselves for these giving professions because of their own need to give.

There has been a second change in the last sixty years which affects the course of the teaching hospital, and that is the change in the understanding of social responsibility. At the turn of the century, it was a generally accepted view that everyone was his brother's keeper, but its meaning was something different from what it is today. It meant that if there was a sudden catastrophy, such as fire, neighbors would house, feed, and clothe the dispossessed on a temporary basis. Community giving was more intimate, local, and temporary.

Now you need only look to your taxes to understand the change in meaning. In the local community, you provide, through your government, a livelihood for the older person or invalid who cannot work, or for, perhaps, the deserted wife whose children you feed, clothe, and educate until maturity. You do this across the nation, and each year you increase the number of those whom you feel worthy of your support. And after the Second World War you set new standards of national giving by not looting your defeated enemies but by giving generously to them. To almost every nation in need you have been giving not only capital, food, and tools, but also knowledge through the Point 4 Program.

All of you may not agree with this, but your legislators here and in Washington represent fairly well the social understanding of the majority. They give as you wish them to give. And the trend toward assuming greater responsibility, as shown over the past half century, indicates no sign of slowing or changing direction.

This major change provides both reference points and guidelines for the teaching hospital. There are direct implications of the method and degree of giving to be assumed by the community in medical care, and there are indirect implications of the impact to be felt by the teaching services of the hospital.

Teaching services and charity care may no longer be synonymous, and the open ward with its social connotations may become an anachronism in tomorrow's society. But society will demand well-educated doctors and nurses from the teaching hospital; and this means that the teaching hospital must look carefully to its traditional concept that teaching is possible only in conjunction with the gift of "free" medical care.

And now I come to the last of three major changes which affect the course of the teaching hospital. To me it is the most important, because it implies so much in organizational patterns and in the personal conduct, attitudes, and relationships of all of us who contribute in one way or another to the total functioning of the hospital.

I refer now to the revolutionary change in the basic organizational structure upon which our entire society rests—the FAMILY. You cannot help but be familiar with the American family's many changing aspects if you read any of the popular magazines. Articles entitled "What has happened to the American wife?" or "What has happened to the American man?" or "Why our children go wrong" are on the continuous bill of fare and are primarily devoted to the problems created by this change in family relationships and conduct. None of the articles is calculated to make us more tranquil!

Sensational as these articles may be, they nevertheless do serve a useful purpose. We are all in the position of being unable to see the individual trees around us because we are so deep in the woods. And these articles often focus our attention on the singular aspects of this cultural revolution.

Some of these changing aspects also affect the organizational structure and conduct of the hospital. I would like to focus your attention on the how, the where, and the why of their effect. To do so will require that I use a common tool of an administrator—the organizational chart, for my purpose here an imaginary one. This tool will allow me to sketch the more simple of the relationships within the family and within the hospital and to compare them currently as well as at the turn of the century.

Before doing so, I would first like to point out that a hospital, like a nation, is an organization created of people, by people, and for people. This is its greatest protection, because the hospital is only an instrument of our society; and its growth, its usefulness, and its life must depend on how well it fits our society and its needs. Fortunately, society provides new patients and new participating members to test this. If they are uncomfortable, they express it in words or actions. If those who make up the organization are sensitive enough and flexible enough, the necessary changes in relationships and atmosphere occur.

The basic organizational unit of society —the family—is, of course, the training ground for the new participating members and patients of the hospital. It is here that they develop most of their abilities for relating with other humans and their individualized preferences and concepts. And it is to the changing nature of these relationships in the American family and the consequential changing relationships in the hospital that I would like to address myself.

The American family at the turn of the century had a structure easily understood by all. There was no question that the father was the head of the family. In a subsidiary position was his wife, who had promised in their marriage ceremony to love, honor, and obey him—and in that era very likely meant every word of it!

And then, in the most subsidiary position, came the children. The aphorism of that day, "Children are better seen than heard", provides the best clue to assessing their situation. Orders went down this structure to the children. Any discussion of these orders by the children was apt to be considered "back-talk", requiring a "summary court martial" on the spot! Articulate, imaginative children in those days were considered undisciplined brats and probably brought more shame than praise to their parents. And, furthermore, the children of the average American family completed their schooling in the fourth grade. From that point on, whether in the city or rural area, the children worked in some way and contributed to the welfare of the family. How this contribution was to be utilized by the family was largely determined by the father.

With this as the structure of the basic organizational unit in society, it shouldn't come as a surprise to find the structure of other organizations in the same society bearing a marked resemblance.

In the hospital of that era, as in the hospital of today, the nursing service provided the most readily identifiable hierarchy of the hospital. Its easily observable authority structure also provided strength, cohesiveness, and a communications system from top to bottom. For these reasons, I would like to use it to represent the more complex and less easily understood total hospital structure.

Like all women executives of her day, the director of nursing service and school naively assumed that success and strength in her position lay in her absolute imitation of male executives. She played the role of "Captain of the Ship" both in and out of the hospital. Any friendliness or intimacy with her subordinates was forbidden in this role because it might lead to disrespect and contempt. She designed her speech and action so as to create awe; and she intentionally won the desirable title of "The Old Battle-axe".

She also distrusted information coming from her subordinates and, therefore, devoted much of her time to detailed inspection of her ship. Everything had to be in exact order! And this included the posture and appearance of patients as well as nurses and students. There was no excuse for individual variations, partly because individuality was frowned upon and partly because an excuse had to be verbalized and this was tantamount to "back-talk". Her communication system, in short, went only from top to bottom and then only in writing so that subordinates who did their own thinking and speaking could be spotted and terminated.

Her resemblance to the classical "father" of the era is easily seen. And her immediate subordinates, teachers and supervisors, gave her honor and obedience, if not love. In turn, they were vigorous and demanding in their approach to their subordinates.

The head nurses—more likely third year students—thought and acted like all students of the era. They learned and repeated again and again in word action exactly what they had learned from the teacher or supervisor. Individual or imaginative thinking was the exclusive prerogative of age and position. Any student who might be inclined toward a research-pattern of thinking was rigorously reoriented, so the student went to work quickly and contributed maximally to the welfare of the organization.

The patients were the subordinates of all subordinates. No matter how dignified by age, they were usually called by their first names. So little was required in conversation from the patient that a complete foreign language barrier presented few problems. Textbooks of nursing care were devoted primarily to the patient's physical care, which could be well regularized. Little effort was wasted by the authors on the care of the patient's emotional problems other than by their solution through the use of physical restraints. The apocryphal story of the little old non-English-speaking man who accompanied a friend to an outpatient department and was finally returned to his grieving family three weeks later, after surgery, speaks volumes—whether or not it actually happened.

I now want to call your attention to the family structure which I think is evolving today in our society and which I think is affecting the hospital in many ways. If you are either mothers or fathers with growing children, you will immediately recognize a symbolic representation showing the children in the top echelon, with the father and mother below.

With all the "scare" articles in the popular magazines, you are well prepared for this. The articles devoted to the father state that he has abrogated his traditional authority by his venturing into diaper-changing and dishwashing; that his role in the eyes of his sons is so neutral as to produce young men with no interest in young women; or that he is a corporate executive, living on an expense account and giving so little emotional support to his children that they become the delinquents of the suburbs and exurbs! Obviously, this corporate executive of today has replaced the minister or psychiatrist of yesteryear in his ability to produce delinquent sons.

The articles about today's mothers are still more deprecating. She is out of her home and working, and that's bad. Or she is at home wasting her intelligence and education, and that's bad. Or when she isn't buying ready-to-bake cakes or using an automatic dishwasher, she is busily inventing new ways to destroy her husband's ego—all of which is worse.

The children are treated more sympathetically in these articles. Although most of them would appear to be delinquents, their faults are happily blamed entirely on their badly motivated parents, their modern teachers, or those violent Western morality plays on television. With modern teaching, which requires articulate and responsive students, and television, which does not encourage conversational development, it is only natural that many of these articles resolve the conflict by recommending the junkheap for one or both. Fortunately, fathers and mothers are still considered useful.

But amid all this terrifying cacophony there is one melodic phrase which appears again and again: The primary responsibility of parents is to give their children understanding and love. No longer is there much discussion of providing for the physical needs of the children. This is a rich country. And other than giving vitamins for unobservable and indeed non-existent vitamin deficiencies, the parents must worry only about their lack of restraint in giving too many calories and too many convertibles to their teen-age children. And in a society which prefers thinking about Freud and psychiatry to thinking about Einstein and the atom bomb, parents are becoming relatively sophisticated about the giving of love and understanding to their children. They can easily differentiate firmness and consistency of policy and emotion from the physical disciplining of bygone generations.

And, furthermore, they usually do understand the ideal of equal and mutual support by both mates.

In a schematic way, I have tried to represent in this last imaginary chart the organizational structure being built by the current American family. Because "understanding" means "standing under", the position of the parents under the children has meaning in the reality of family life. The idealistic situation is where there is *equal* mutual support between mates. However, if you will analyze your friends' marriages or your own—if you are inclined toward dangerous undertakings, you may discover in each case that one mate gives most of the emotional support in the family—to the other mate as well as to the children. The chart of the family may, therefore, be modified to show the children in the top bracket with Mate I below and Mate II below Mate I.

Incidentally, the giving mate (Mate II) may be either the husband or wife and, strangely enough, may not be the "boss" who makes most of the family's decisions. This person is the one, however, who "carries the family"; and it is to this person that troubled members of the family first turn for emotional support and decisions. The growing climate for the children probably also depends on the emotional reservoir and understanding of this person.

If the family is involved in so radical a reorientation, what is happening in our society's less important organizations, such as the hospitals? Certainly the doctors, nurses, employees, executives, students, and patients are affected by their family lives, consciously or unconsciously. Their thinking, their behavior, their expectations must have some perceptible effects on the direction taken by the hospital, whether it be personnel policy, organization, medical care, teaching, research, or whatever.

Having come this far with organizational charting, it seems anticlimactic to chart the nursing service as it may well be developing—an upside-down organization in which the patients are at the top and the nursing director is at the bottom, with assistant directors, supervisors, head nurses, graduate nurses, practical nurses, floor secretaries, aides, ward-helpers, and the student nurses arranged properly inside a massive organization.

In her position at the bottom of this inverted pyramid representing the total nursing service, it is obvious that the present director of the service must be a much stronger woman and executive than was her counterpart at the turn of the century. Nothing so foolish as imitating male executives ever enters her head, for she knows full well that the equality of men and women resembles the equality of apples and pears—both equally valuable but totally different.

In her supportive role she works mostly with four or five immediate lieutenants, each of whom, in turn, does the same. This seems to follow throughout the organization, with the bedside nurse on the day shift ideally caring for four or five patients. This pattern of support resembles that of the family chart in which one person supports a mate and the current average of three or four children, bringing the total to four or five.

In addition, this director at the bottom of the heap must be a reasonably good "applied social scientist". She must know how to build and maintain a fast and accurate two-way communications system within her organization. The information coming now through her lieutenants must provide her with the necessary clues to the most minor fluctuations in individual or group attitudes and efforts. She must also be sophisticated enough to analyze the information properly and redirect or strengthen these attitudes and efforts without jarring her organization. Her strength as a woman and an executive is constantly tested.

Let's skip now to the top of our imaginary chart and look at the patients. The quite important and mature corporate executive who comes in for surgery may reveal something. Why is it that before the operation he will look to a young graduate or student nurse for reassurance when he is so accustomed to calling only for the professional services of other equally important persons, such as the surgeon who is to operate on him shortly? Why is he so upset when he hears the nurses or doctors joking among themselves as they go about their work? Why is it that, although he is going nowhere for the next ten days he must ask the nurse what time it is and then get upset if she isn't definite about the time? And why does he call for the nurse in the middle of the night although he has no evident need?

You, of course, know the answers to these questions. He is doing what all "good" patients do. He becomes as dependent as a child and manifests the same characteristics. He unconsciously places doctors and nurses of all ages in the role of parents. Naturally, like any child, he is upset that such important people may be joking among themselves and laughing at each other. And, moreover, he expects such individuals to be definite about everything, including the time. He calls for the nurse in the middle of the night, of course, for the same reason that a child calls his mother for a glass of water—simply to be sure that she is there.

But after the operation all this will gradually change as he pursues an upward road from dependency to maturity. His demanding ways will diminish. He will start to see the doctors and nurses as men and women rather than fathers and mothers. And, consequently, he will start joking with the nurses. Unfortunately, we still tend to evaluate physical condition rather than emotional condition and we will, therefore, probably discharge him before he has regained his former maturity and ability to give his family and subordinate executives their customary support. We must upset and disorganize a lot of families and commercial corporations in this way.

This man represented well the "good" patient who immediately falls into a "taking" posture when admitted. We also know of the patient who refuses to take and who, through true courage or foolhardiness, is determined to brazen out the entire preoperative and postoperative periods. For some reason he tends to a rocky postoperative period with more chance of physical and emotional complications and a longer stay in the hospital.

The best "givers", be they doctor, nurse, or hospital executive, all seem to fall into the category of bad patients. Perhaps they are so used to their own "giving" roles in this same environment that they have difficulty assuming the necessarily dependent and "taking" role of the good patient.

We will now move down our imaginary chart to those who give the care to the patients by first scrutinizing the statement heard so often from patients: "I had such an understanding nurse". Certainly none of us would assume that these patients considered their nurses to be psychoanalysts, well trained to understand the emotional conflicts and problems of the patients. They simply meant that their nurses stood under them and supported them emotionally during their crises. The equal distribution of praise for the understanding of both nurses and doctors bodes well for both professions and their future social images.

What I have done so far is point out that the nursing service organization can be a magnificent method for providing emotional support and care from one end of it to the other. It is not perfect, however, because the head nurse position is almost untenable in this new turnabout. She alone of all the executives in the hospital is expected to support an unlimited number of others. She should be working with a few doctors and teamleaders. But, in actuality, dozens of doctors, nurses, patients, relatives, and individuals from other departments approach her directly at the tested rate of more than thirty an hour. If she is also in an emotionally-trying situation in her private life, it is inevitable that her emotional reservoir will be drained. As she becomes less able to give, her ability to make decisions diminishes and her absenteeism increases.

When this happens, everyone around starts to shield her by giving to her. During this period of breakdown, which may be lengthy, the organization devoted to giving is short-circuited at her level. At this point, both patients and doctors note the change of atmosphere and lack of care at the bedside.

Fortunately, there is often a supervisor, floor secretary, or physician who heads off this eventuality by a quiet, unostentatious daily ministration of support to the head nurse. The physician's help is worth noting because it represents the most natural and most easily given support—that of support between the two sexes. This natural support, so taken for granted, may be basic to some of our successes and failures, and may possibly explain the occasional impasse in relationship which occurs between physician and nurse.

Have you ever wondered why we are so successful in gaining the appreciation of male patients of all ages? Or why it is that we fail so often in giving sufficient personal care to please the elderly woman? I once pondered the possibilities that either younger women were intolerant of older women or that younger women were unsuccessful in maintaining a mother role with older women. But my detailed questioning of both patients and nurses revealed that the women patients received as much or more care than did the men patients. Could it simply be that a few minutes of support of one sex by the other sex is equivalent to an hour's support of one sex by the same sex? This is probably so; and particularly so in the case of the elderly woman who has so many unfulfilled emotional needs. And with so many more women than men supplying care, she has much less chance of being satisfied.

The occasional impasse between doctor and nurse may often be based on a similar situation in reverse. The situation may be familiar to you. It appears to start when a physician in or near a nursing station complains that the nursing profession has reached a sorry state of affairs, that nurses have become cold and interested only in paper work, and that the schools of nursing are turning out chemists rather than nurses. The response is inevitable. A verbal defense may not be forthcoming, but the action is surely forthcoming. He is given the "deep-freeze" treatment! Frigid cooperation—just one step above no cooperation at all—serves only to aggravate him more and apparently prove his point. Rapid communication insures the same treatment for him on other floors until he is pushed to the point of retreating to his own office or going to the office of either the hospital administrator or nursing director to denounce the nursing profession.

Questioning of the original nurses involved brings forth the following defense: The doctor was a boor who insulted the nursing profession without provocation, and was guilty himself of over-ordering tests, medications, and repetitive checking of his patients—all of which is responsible for excessive paper work.

Investigation of this familiar situation makes me believe that the complaints of both physician and nurses leading to this impasse were incorrect. I would like to suggest, instead, that something far simpler occurred in the following manner.

First, let me say that almost all doctors and nurses are "giving" people who frequently go beyond their endurance not only in the hospitals but in their homes as well. The demands of their mates and children compete with the demands of their patients. It's natural that they occasionally forget that they must each give support to the other when it's needed—just as must the two parents in the "typical family".

In this instance, it's quite possible that the physician, after having been up late caring for a patient, was vigorously reminded by his wife that she and the children needed more of his time and attention. It's understandable that he arrived at the hospital with a headache and feelings of oppression and depression. It's possible that he entered a nursing station and wandered about disconsolately before he was interrupted with the question: "Would you like to give some orders, Doctor?" This may have been a perfectly businesslike, courteous question which befitted the environment, but it was not fitted to his mood. He was in no mood to give anything, including orders. His answer and perhaps his facial expression should have provided a clue to the nurse that he was in as much need of solicitude as any patient under care. Apparently, however, she failed to respond. And perhaps because she and his wife, as women, failed in giving, and because the members of the nursing profession are mostly women, he arrived on the next floor with his commentary on the nursing profession!

Had the first nurse offered only a few minutes to his care, perhaps the whole impasse would have been averted. Had she asked him whether he had a headache and then offered sympathy or two aspirin tablets, she might have given the necessary support. Apparently this mechanism functions properly in most instances if I am to believe the television commercial which claims that 99% of all doctors use aspirin regularly.

This discussion, so far, has been devoted to the changing forces affecting the teaching hospital in the past and the present. It has also included some examples of the ways in which GIVING plays a role and gives meaning to the work, the conduct, and the individual natures of those involved in patient care.

But what about those in teaching and research? Does GIVING also play a role there? It will not be necessary to go into the detail given to patient care because I think that almost everyone feels that the good teacher's relationship to the student is the same relationship borne by the parent to the child and the physician or nurse to the patient. As was mentioned before, this relationship has changed in our culture gradually from an authoritarian and demanding one to an understanding and encouraging one. Perhaps the metamorphosis of the schoolmaster in the famous novel *Good-bye, Mr. Chips* best exemplifies this change in role.

In the role of the student at the turn of the century, the youngster of unusual sensitivity and imaginative thinking ability rapidly developed the habit of repressing his aberrant thinking to avoid personal destruction—a sorry pattern for the development of sensitive and imaginative physicians and nurses. Those students made of sterner material often suffered the consequences of rebellion and were forced to finish their education under their own tutelage. Fortunately, most students survived this jungle, and had enough originality and sensitivity left to become the great researchers, teachers, doctors, and nurses of the past half century. How many students were "stifled" or totally lost can only be surmised.

In the medical world where completion of a formal education has been a basic requirement and rebels have been irretrievably lost, the medical world has been particularly fortunate in having a select group of individuals who were naturally equipped to provide the understanding or supportive teaching that has only recently been given in the non-medical disciplines. The Flexner report earlier in the century also did much by eliminating those medical schools which gave too little to their students. And our present accreditation standards for hospital residencies and schools of nursing lead to excellency in teaching by setting a constantly rising minimum standard for this giving.

If I am not overly optimistic about the improved teaching in the teaching hospital, there should be an ever-increasing number of young individuals whose trained minds retain conceptual originality and thereby qualify them for careers in research. The increasing flow of such young candidates indicates some grounds for my optimism. And their dedication to providing a gift of knowledge to us all puts them in a special category of giving.

We have been talking primarily about those who are directly involved in the patient care, teaching, and research of the teaching hospital. We must also touch briefly on those whose responsibility and privilege it is to provide the proper "growing climate" and environment for those who are so directly involved. This responsibility belongs to the individual in any position of leadership, whether it be that of a trustee, a department or service chief, a hospital administrator, or someone serving on a committee.

This leadership must provide an environment which fosters the creativity and change so necessary to the pioneering function of the teaching hospital as well as its three primary functions. Such an environment is one in which a new idea is capable of exciting individuals and groups throughout the organization. It is one in which the leadership, in a risk-taking spirit, stretches the organization to the limit of its capacities to effect the implementation of an idea.

This environment is one in which the individual's right to think and act in an unorthodox fashion is defended and encouraged whenever possible; in which rules are flexible, not restrictive; in which errors of commission are not considered in the same light as errors of omission.

This environment is one in which the relationships among all professions, skills, and ranks are fluid, respectful, and easily maintained; and ideas are quickly communicated back and forth formally and informally so as to make cross-pollination of thinking a matter of casual routine.

This environment is one in which the tradition most respected is the tradition of constant change and improvement. It is the type that cannot be ordered into being, but must be nurtured by an understanding and spirited leadership.

Leadership of this type can be successful over a long period of time only if it is aware of the teaching hospital's total commitment to GIVING. If it accepts the primacy of GIVING in the work, the conduct, and the individual natures of those involved in patient care, teaching, and research, this leadership may well use certain principles subsidiary to the central GIVING concept in guiding the hospital forward in keeping with the future needs of the community. Of the many possible subsidiary ideas, I would like to suggest only four:

1. The striving for excellence in every area, no matter how minor, is essential to the idea of giving to the utmost.

2. Patient care should have or should appear to have priority over teaching and research in order to maintain the sanctity of the individual patient to whom so much must be given now and for whose future care so much education and research must be provided. Assigning priority to teaching activities or research activities suggests that the patient of the future is more important than the patient of today—a suggestion that the patient of today naturally finds unreasonable, even though he may be the patient of the future. As long as he and his care are more important than the learning going on about him, he is comfortable in his proper role. With any reversal of that role, he may appear to be the giver and those around him the takers—a possible distortion of care and of teaching discernible to both the patient and the student.

3. The self-sacrificial nature of greatness in man or institution poses a constant threat of over-extension and self-destruction for the man or institution aspiring to maximal contribution. However, the mediocrity that comes from moderate effort is a quality which the teaching hospital can ill afford to show in policy, in action, or in goals.

4. As greater insight into man and his illnesses is gained, this insight must be put to use for the benefit of not only the patients but those who care for the patients as well. This means, when put into practice, that an understanding leadership by its very nature comes to constantly greater understanding and gives more and more to those who give.

These four principles, with the others mentioned earlier, may also serve the teaching hospital as guidelines in meeting the changing needs of our society—a society whose direction of evolutionary change in some ways may be predicted from analysis of its recent past. The nature of the teaching hospital in its present development provides reason for believing that these needs will be well met.

Ellsworth T. Neumann, M.D.,
Administrator

Dr. Henry K. Beecher has received the German Medical Prize from Bonn, Germany. This includes not only a citation but a $2000 award, and is in general recognition of his work in anesthesia and especially for his pioneer work on quantitative studies of the effect of drugs on the mind. Other recipients have been George Beadle, Georg von Hevesy, and Arne Tiselius.

* * *

Dr. Arthur L. Watkins has received the Meritorious Service Award for "furthering rehabilitation of the physically handicapped" from the National Rehabilitation Association—Massachusetts Chapter.

The Board of Trustees, at their meetings on March 29, and April 12 and 26, voted:

To accept the resignation of Dr. Roman W. DeSanctis, Clinical Assistant in Medicine at McLean Hospital, effective April 1;

To accept the resignation of Dr. George F. Kwass from the position of Assistant in Pathology and to appoint him as Clinical Assistant in Pathology, beginning April 1;

To reinstate Dr. Herman Turndorf as Assistant Anesthetist, for the period March 19 through May 31.

To promote:

Dr. Arthur J. Cain from Assistant Psychiatrist to Associate Attending Psychiatrist at McLean Hospital, effective April 26;

Dr. James A. Haycox from Assistant Psychiatrist to Associate Psychiatrist at McLean Hospital, effective April 26.

To reappoint:

Dr. Jane M. Berman as Clinical Fellow in Psychiatry at McLean Hospital for one year, beginning July 1.

To appoint:

Dr. Michael A. Ashworth as Assistant Resident in Orthopedic Surgery for one year, beginning July 1;

Dr. Nelson E. Bailey as Intern in Dental Medicine for one year, beginning July 1;

Dr. Bob Bullwinkel as Assistant in Anesthesia, beginning July 1;

Dr. Laurent Descarries as Clinical and Research Fellow in Neurology, beginning July 1;

Dr. Maria L. Dufau as Clinical Fellow in Medicine, beginning September 1;

Dr. John T. Dunn as Clinical and Research Fellow in Medicine, beginning July 1;

Dr. Harold F. Dvorak as Clinical and Research Fellow and Acting Intern in Pathology, beginning July 1;

Dr. Robert E. Evans as Intern in Dental Medicine for one year, beginning July 1;

Dr. James M. Gibson as Clinical Fellow in Pathology, beginning July 1;

Dr. Graeme L. Hammond as Third Assistant Resident in Surgery for one year, beginning July 1;

Dr. Joshua Hollander as Clinical Fellow in Neuropathology, beginning July 1;

Dr. Henry I. Kohn as Consultant in Radiobiology in the Department of Radiology;

Dr. Paul L. Kornblith as Third Assistant Resident in Surgery, for the period July 1

through December 31, and as Assistant Resident in Neurosurgery for one year, beginning January 1, 1964;
Dr. Alfred Leitner as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Geraldo A. Medeiros-Neto as Clinical and Research Fellow in Medicine for one year, beginning September 1;
Dr. Guillermo H. Merino as Clinical Fellow in Radiology, beginning July 1;
Dr. Roger H. Morris as Assistant in Anesthesia, beginning July 7;
Dr. Walter J. O'Donohue, Jr. as Clinical and Research Fellow in Medicine, beginning July 1;
Dr. Shyam S. Pant as Clinical Fellow in Neuropathology, beginning July 1;
Dr. David W. Parsons as Clinical Fellow in Medicine for one year, beginning May 1;
Dr. Joseph G. Pittman as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Ruick S. Rolland as a member of the Courtesy Staff of McLean Hospital, beginning April 26;
Dr. Takahiro Sakai as Research Fellow in Medicine for one year, beginning September 1;
Ralph G. Semon, Ph.D. as Associate Psychologist at McLean Hospital, beginning March 18;
Dr. Patricia R. Sexton as Assistant Resident pro tempore on the Children's Service;
Dr. Edward P. Sirois as Exchange Assistant Resident on the Children's Service, for the term April 10 through May 22;
Dr. Robert E. Sweat as Second Assistant Resident in Surgery for one year, beginning July 1;
Dr. Arthur Taub as Clinical Fellow in Neurology, to act as Assistant Resident, beginning July 1;
Dr. John McL. Tew as Assistant Resident in Neurosurgery for one year, beginning July 1, 1965;
Dr. Howard A. Trachtenberg as Assistant in Anesthesia, beginning June 30;
Dr. John T. Truman as Clinical and Research Fellow in Medicine, beginning July 1;
Dr. Guillermo Urrutia as Clinical and Research Fellow in Medicine, beginning July 1;
Dr. Paul G. Walfish as Clinical Fellow in Medicine for one year, beginning July 1;
Dr. Robert R. Young as Assistant Resident in Pathology, assigned to Neuropathology, for one year, beginning July 1.

The Trustees voted to appoint the following Interns on the Surgical Service, to begin July 1;

Dr. Douglas M. Behrendt
Dr. Richard F. Brubaker
Dr. Joseph M. Civetta
Dr. Preston H. Gada
Dr. Gerald N. Gold
Dr. Donald P. Griffith
Dr. Miles J. Novy
Dr. Joseph B. Philipson, Jr.
Dr. Robert E. Steele, Jr.
Dr. Clinton D. Vermillion
Dr. Andrew L. Warshaw
Dr. Dennis R. Whitlow

The Trustees also voted to reappoint the following Residents in Psychiatry at McLean Hospital for one year, beginning July 1;

Dr. John H. Backman
Dr. Robert M. Chalfin
Dr. Robert W. Farkas
Dr. Miroslav M. Kovacevich
Dr. Richard Sens
Dr. Emmett Wilson, Jr.

At their meetings on March 20, during April, and on May 1 and 8, the General Executive Committee voted:

To change the appointment of Dr. John B. Blennerhassett from First Assistant Resident to that of Resident in Pathology for one year, beginning July 1;
To change the appointment of Dr. Jónas Hallgrímsson from Clinical Fellow to that of Resident in Pathology for one year, beginning July 1;
To accept the resignation of Dr. Charles M. Lapiere from the position of Research Fellow in Medicine.

To promote:

Dr. Sheldon S. Baddock to the position of Third Assistant Resident in Pathology for one year, beginning July 1;
Dr. Francisco Civantos to the position of Second Assistant Resident in Pathology for one year, beginning July 1;
Dr. Norman G. P. Helgeson to the position of Second Assistant Resident in Pathology for one year, beginning July 1.

To reappoint:

Dr. John A. Bolzan as Clinical Fellow in Medicine for one year, beginning July 1;
Dr. Jack Braunwald as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Stanley E. H. Brooks as Clinical Fellow in Pathology, for the period February 1 through June 30;
Dr. Stanley Cohen as Clinical and Research Fellow in Pathology for one year, beginning July 1;
Dr. John R. Collins as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Arthur W. Duff as Clinical Fellow in Pathology for one year, beginning July 1;
Dr. Norton J. Greenberger as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. John W. Harthorne as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;
Dr. Lore G. Hopff as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;
Elton P. Katz, Ph.D. as Research Fellow in Orthopedic Surgery for one year, beginning April 28;
Dr. Norman S. Lichtenstein as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Austra Likais as Clinical Fellow in Medicine for one year, beginning June 1;
Dr. Kilmer S. McCully as Research Fellow in Medicine for one year, beginning July 1;
Dr. Gordon K. MacLeod as Clinical Fellow in Medicine for one year, beginning July 1;
Dr. Hans B. Nevinny-Stickel as Clinical Fellow in Medicine for one year, beginning July 1;
Dr. Richard W. Sagebiel as Clinical and Research Fellow in Pathology for one year, beginning July 1;
Dr. Lewis Sasse as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Robert L. Scheig as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Jeremiah E. Silbert as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Hubert J. Wolfe as Clinical and Research Fellow in Pathology for one year, beginning July 1.

To appoint:

Douglas N. Butler, Ph.D. as Research Fellow in Neurosurgery for one year, beginning October 1;
Mr. Csaba J. Horvath as Research Fellow in Chemistry, assigned to Medicine, for one year, beginning July 1;
Dr. Jan-Gerrit Rausch-Stroomann as Research Fellow in Medicine, for a period of six months, beginning September 1;
Dr. Clement B. Sledge as Research Fellow in Orthopedic Surgery, on leave of absence, retroactive to January 1;
Ivan Spuzic, Ph.D. as Research Fellow in Medicine for one year, beginning September 1;
Mr. Peter R. Taylor as Research Fellow in Medicine for one year, beginning July 1;
Mr. Douglas H. Thomson as Research Fellow in Medicine for one year, beginning July 1;
Ralph W. Turner, B.Sc. as Research Fellow in Neurosurgery for one year, beginning October 1.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear in each issue of this paper. The purpose of this listing is to report, as soon as possible, titles of all recent articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the name of the hospital department with which you are affiliated.

The following new titles have been received:

Biochemistry

Schmid, K., and Kamiyama, S.
Studies on the structure of α_1-acid glycoprotein. IV. Optical properties.
Biochem. 2:271.

Schmid, K., and Mazzone, H. M.
Determination of the particle weight of spherical viruses.
Nature, London 197:671.

Biology

Drabikowski, W., and Gergely, J.
The role of sulfhydryl groups in the polymerization and adenosine triphosphate binding of G-actin.
J. Biol. Chem. 238:640.

Cardiology

Currens, J. H.
Clinical trial with two potent thiazide diuretics: Polythiazide and cyclothiazide.
Current Therapeut. Res. 5:202.

Segall, H. N.
Cardiovascular sound and the stethoscope, 1816 to 2016. The twenty-fifth Louis Gross Memorial Lecture.
Canad. M. A. J. 88:308.

General Medicine

Schapiro, R. H., and Isselbacher, K. J.
Benign recurrent intrahepatic cholestasis.
New England J. Med. 268:708.

Otolaryngology

Kelemen, G.
Hemorrhage: A specific poison to tissue of ampullar cupulae.
Arch. Otolaryng. 77:365.

Psychiatry

Benda, C. E.
Aspects of endocrine disorders in mental retardation.
In Proceedings of the Second International Congress on Mental Retardation, Vienna, August 1961. New York/Basel, S. Karger, pt. I:278, 1963.

Radiology

Bohrer, S. P.
Recurrent right lower lobe disease.
J.A.M.A. 184:229.
Carter, G. B., and Tanner, J. W.
Anterior mediastinal mass.
J.A.M.A. 183:1031.
Pendergrass, H. P.
Retroperitoneal radiography: Roentgen techniques to demonstrate pheochromocytomas and other retroperitoneal masses.
Radiol. Clin. North America, April 1963:195.
Webster, E. W.
Discussion. U.S. Public Health Service Symposium, Session on fluoroscopy and cinefluorography, March 6, 1962, Murray L. Janower, Editor, 1963.
In Technological needs for reduction of patient dosage from diagnostic radiology. Springfield, Ill., Charles C. Thomas, p. 329.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

Abercrombie, M., and Brachet, J. (Editors)
Advances in morphogenesis, vol. 2.
New York, Academic Press, Inc., 1962.
(2Am)
Allen, R. M.
Psychological evaluation of the cerebral palsied person.
Springfield, Ill., Charles C. Thomas, 1962.

REPORTS FROM RECIPIENTS OF GRANTS

THE BLOOD BANK

The generous gift which the Massachusetts General Hospital has received from the Hood Dairy Foundation for a new Blood Bank will enable us to carry out the program for improvement of our quarters and thereby our service to the Hospital and its patients.

The new Blood Bank will be located in the new North Building, which is at present in the planning process. This gift from the Hood Foundation will be used for equipment, such as refrigerators, freezers, laboratory instruments, etc., as well as for the decorative improvements of donor rooms, offices, and such.

With the still-increasing work load on our present facilities, it is indeed a consolation to know that we now have the necessary funds available for a new Blood Bank which will be able to fulfill the future needs of the Massachusetts General Hospital.

Morten Grove-Rasmussen, M.D.,
Director, Blood Bank and Transfusion Service

You recently requested me to supply you with some information regarding the research work for which we recently received a grant from the Medical Foundation, Incorporated. I am enclosing herewith a brief summary of the article which was prepared by this Foundation. This is to be printed in their annual report, but may serve as some background information.

For many years my laboratory has been interested in various phases of pancreatic research. Last summer I had the idea of attempting to establish an isolated dog pancreas, maintaining the organ artificially by means of a heart lung machine. This was an exciting prospect, not only because it had never been accomplished but because such a preparation would offer almost unlimited possibilities for investigations into both the endocrine and exocrine aspects of pancreatic pathophysiology. I suggested such a preparation to Dr. Jacobus Greep, a United States Public Health Research Fellow from The Netherlands and Mr. Charles McCrae, a first year Harvard Medical student, both of whom are working in my laboratory. They spent last summer devising the anatomical and mechanical techniques necessary for such a perfusion, and in the fall of 1962 we had our first successful perfusion of a totally isolated dog pancreas.

At this stage we applied for and received support from the Medical Foundation to pursue this work on a more intensive basis. We are currently doing a weekly perfusion in the Vascular Laboratory. With the invaluable help of Dr. Gerald Austen we have been able to apply numerous sophisticated analytical techniques to our research. Drs. Donald Fawcett and Atsushi Ichikawa at the Harvard Medical School have been doing electron microscopy studies in the course of the perfusion. Their anatomical findings, when correlated with the enzymatic studies of Mr. Donald Chambers in our laboratory, will provide a most valuable correlation of pancreatic structure and function. I believe that as time goes on we will be able to make many interesting and original observations on the physiology, pathology, and cellular structure of the pancreas with the cooperation of numerous investigators of both the Hospital and Medical School.

George L. Nardi, M.D.,
Associate Visiting Surgeon

The summary of the article prepared by the Medical Foundation, mentioned above, follows.

STUDIES OF THE VIABILITY OF THE PERFUSED ISOLATED DOG PANCREAS

After five hours of complicated surgery, Doctor Nardi is ready to remove the pancreas from a dog. He has only an additional five minutes to connect the organ to mechanical devices that will keep the pancreas alive outside the body. His successful conclusion marks the first time that anybody has accomplished such a feat. Now the fundamental biochemical and physiological processes of the living pancreas can be studied independent of the body.

While the pancreas works within the body, it interacts with other organs, making it difficult to distinguish its own unique functions. Dr. Nardi's surgical accomplishment allows an investigation of the basic action of the gland as it produces digestive juices, as it manufactures insulin, and as it secretes other proteins. With the pancreas isolated from the body, the effects of drugs and the course of diseases such as pancreatitis can be correlated to the tissue changes noted and perhaps to human illness.

Stimulated by an idea from Dr. Nardi, a medical student cooperated with a research fellow from The Netherlands to devise the surgical procedure. The first time they tried the operation, it was a total failure; the third time, the pancreas was kept alive for 90 minutes; now they have managed to maintain the gland for as long as 5 hours.

PSYCHOLOGICAL RESEARCH IN THE STANLEY COBB LABORATORIES

Just over three years ago, shortly after the experimental research laboratories of the Department of Psychiatry had moved over to the Warren Building to become the Stanley Cobb Laboratories, I tried to define for THE NEWS my thoughts about psychological research in a general hospital(1). Our program in the intervening years has proceeded along the course outlined on that occasion, expanding in scope but also focusing more closely on certain problems. As so much current research in a medical setting, most of our work has been conducted with the support of the Public Health Service for specific projects. Some of our research, however, has been sponsored by other organizations, such as the Medical Foundation of Boston, which has recently helped us to set up a pilot study on the effects of electroconvulsive shock therapy on cognitive function.

This pilot project fairly illustrates the manner in which we attempt to discharge our duty and to take advantage of the opportunities that arise in the general hospital setting. About a year ago, arrangements were made to include electroconvulsive shock therapy in the treatment program of the Psychiatry Service. This treatment is given primarily to patients with severe depression, a group with which we have not been directly concerned in the research activities of our laboratory. We have, however, become involved in a number of problems of remembering and forgetting. Our study of amnesic patients has, in time, led to various experiments in the short term memory of healthy persons. One of these has confirmed the finding made by others that most of us are quite likely to forget a message of no more than three unrelated letters in as short a time as 6 to 12 seconds, if we are not allowed to repeat and rehearse the message during that time.

Normally, of course, if I want to remember a telephone number while waiting for the line to be free, I repeat it silently over and over again. If I have in front of me a list of six items that I want to discuss over the telephone and I turn my attention to these as soon as I have looked up the telephone number in the directory, my chances of remembering the number when I reach the end of the list are distinctly poor. It may be better to repeat the number a few times before looking at the list, and better still to repeat it after every item, if I do not want to look for it in the book again. What does this predicament at the telephone show? Information, in order to be retained and recalled, takes some time to sink in. Remembering after 12 seconds seems, of course, a very different activity from remembering something after twelve years or even twelve hours, and probably different processes are involved in the two feats. Remembering a sequence of consonants or a telephone number also appears to be something quite different from remembering the morning news or whatever you may have read in a textbook in your student days, though not so very different from remembering your son's birthday. It is obvious, though, that whatever one forgets in 6 or 12 seconds he is unlikely to remember a day or ten years later. The laws that govern or describe long term remembering may be entirely different from those that apply to immediate memory, but if some circumstance interferes with immediate remembering there will not be much to show in long term memory.

Now, interference with the process of consolidation is just one of those circumstances that may account for very rapid forgetting. If newly received information must undergo a process of consolidation in order to be remembered, then undoubtedly there are conditions that can interfere with this process. The trouble is that consolidation is the kind of explanatory concept that many of us believe in so as to make sense of certain observations. Not every psychologist believes that consolidation is a necessary process for remembering. The only way we can demonstrate that consolidation takes place is to think of a condition that would interfere with it if it did take place, set it up experimentally and test our prediction. If we succeed, of course there might be other explanations that account for our finding. If we fail, we try to set up a better experiment.

It is difficult to believe that we are apt to forget quite simple messages in a space of 3 to 15 seconds, but this is what the Petersons(2) have demonstrated in their experiment, and others have confirmed it, using the same or a similar method. Sequences of three consonants, preferably those that do not remind you of a natural word or of the initials of a public person or institution, are read out and followed immediately by a number of three digits. The subject's instruction is to try to memorize the letter sequence, but as soon as he hears the number he is to start subtracting by threes at a steady rate, until he receives a signal to stop and repeat the three letters. Trials are repeated with intervals of varying length, though always of less than 20 seconds.

In the Petersons' experiment most trials were successful after an interval of 3 seconds occupied by subtraction, but only a third of the answers were correct after 9 and rather less than a tenth after 15 seconds. In our own experiment the slope of forgetting was not quite so steep; nevertheless, fewer than half the responses were correct after 9 seconds. When strings of four or five letters were to be memorized the proportion of correct answers dropped further still—down below one-fifth. We also allowed for a condition in which the subjects repeated the number, though not the letters, before subtraction, and that considerably improved their performance. In an ongoing study they repeat both letters and number, and that makes for still more correct responses. This finding is, at any rate, consistent with a consolidation process.

All this brings me back to our pilot study with electroshock therapy patients. In addition to its more lasting effects in relieving depression, this therapy also causes some retroactive amnesia, i.e., patients are liable to forget whatever they had been told, whatever they had experienced shortly before treatment. Since, apart from the effects of depression, at that time before treatment they would be functioning quite normally, and since they will never recover those lost memories, it is reasonable to blame the electric shock for interfering with the process that turns those experiences, converts that information into memories. This, of course, is the process of consolidation, and if it can be disrupted 10 or 15 minutes after it had begun its course, it must be a process extended in time far beyond the duration of the original impressions. One of our interests in electroshock patients is to explore the range of the consolidation process.

Most of our current work with these patients is done at the Boston State Hospital, where we greatly benefit from the cooperation of the Superintendent, Dr. Barton, and his staff, as we did earlier in our study of Korsakoff's psychosis. Another extramural project of our laboratory is at the Lemuel Shattuck Hospital where, in collaboration with Dr. Timberlake, Chief of the Neurology Service, we are studying certain effects on cognitive and motor function of drugs given Parkinsonian patients to alleviate their movement disorder. Still another joint venture of our laboratory is concerned with the effects of aging on the selection and immediate retention of visual and auditory information. This project originated as one of several branches in a research program on the normal aging process, directed by Dr. James Cummins at the Boston V.A. Clinic. We started with a group of veterans of the Spanish-American War, and have now worked our way through to the younger age groups. Other collaborative enterprises have been with investigators in our own Hospital. These include psychopharmacological experiments conducted jointly with Dr. Gardner Quarton, Director of the Stanley Cobb Laboratories; investigations of the effects of large and smaller doses of alcohol on manual skills and attention in conjunction with Drs. Jack Mendelson and James Muller of our Psychiatry Service, and carried out at the Bridgewater Correctional Institution; studies of certain brain surgical patients in association with Drs. Mark and Kjellberg of the Neurosurgery Service and Dr. Ervin of our own Department. The very foundation of our research program was a collaborative research project; our work with Korsakoff patients was initiated by Drs. Adams and Victor in the Neurology Service.

This survey of our current activities is likely to convey an image of multiplicity in research objectives, in which the common strands that run through the several projects are lost from sight. In all our research we study the processes by which man makes sense of his environment, orders the information he receives, makes it available for future reference, and recovers it. In other words, all our research ventures are directed toward certain problems in perception, attention, and memory. We study the effects of drugs, of certain diseases and treatments, of brain damage or of the normal aging process, for the lessons they can teach us about these processes. Cognitive function is systematically changed by several of the conditions we study, but also a clearer understanding of the cognitive processes helps to explain how a patient deals with a disease, how man reacts to drugs or to the gradual changes characteristic of aging. In our pursuit of a better understanding of the cognitive processes, we also accumulate a good deal of ordered information on the diseases, treatments, and conditions that are represented in our experimental samples. Since for most of our studies we also must establish control norms, our research produces maps of the areas in which, and measures of the extent to which the disease, treatment, or condition investigated can be expected to alter the mental function or behavior of the human organism.

It is very puzzling that some patients, who seem to behave with such perfect composure and in full command of the more elementary social graces, should be unable to remember the interviewer's name or the date of the day for three minutes. The knowledge that, under certain conditions, any one of us is liable to forget information quite as rapidly may have taken us a step or two closer toward the solution of this puzzle.

George A. Talland, Ph.D.,
Psychologist

VOLUNTEER GROUPS

Distaff Club

Now that the end of the year is drawing near, we feel it would be appropriate to summarize our activities to date and tell about our plans for the next few weeks.

Last summer we gave our usual July tea for new members of the house staff and their families. To further help them to feel at home, we held area parties and published our annual directory, as well as the first of our four Newsletters.

In the fall, we were fortunate in having Judge Jennie Loitman Barron speak to us and, on another occasion, we honored our visitors from other lands with a program of wood-wind music.

On Halloween we gave a party for the children in Burnham, which we probably enjoyed quite as much as they!

The winter months found us busy with wrapping gifts for the Hospital Christmas party and decorating the penthouse for our own holiday cocktail party. A bake sale then fattened our treasury enough to enable us to entertain the patients in Burnham on Valentine's Day. A hayride on a beautiful winter evening proved exciting, too.

Early spring brought with it two stimulating programs: one, a meeting at which Dr. Knowles spoke; another, an evening with Dr. Evelyn Goodenough Pitcher, Director of the Eliot-Pearson School, as our guest. In the meantime, we were busy meeting in area groups to make mobiles for the children in the Hospital.

We are presently looking forward to the Spring Dance, a joint meeting with the Service League, the annual Memorial Day picnic, and a final general meeting.

MGH Service League

In addition to the Annual Meeting, the Service League held a joint meeting with the Distaff Club on May 8, from 3 to 5 P.M. The final social activity for this group was the annual picnic, held in Lincoln on May 30, at the home of Dr. and Mrs. Bradford Cannon.

The Annual Meeting of the Massachusetts General Hospital Service League was held on May 14 at Walcott House. Following morning coffee, reports of the various committees were presented by means of illustrated posters.

The meeting opened with the election of officers for the coming year. Following this, Mr. David C. Crockett, Deputy to the General Director, spoke on "Accomplishments of the 150th Anniversary Program".

Reporting for the Reception Center, where visitors register upon arrival at the Hospital, were the co-chairmen—Mrs. Avery D. Weisman and Mrs. H. Peter Mueller.

Mrs. Grant V. Rodkey reported that every international professional visitor to the M.G.H. this year has been entertained in the home of a staff member. International visitors number approximately 200, from 44 countries.

Mrs. C. Miller Fisher reported that 223 tickets to the Boston Symphony Orchestra concerts and other cultural affairs were donated to the Reception Center and given to professional visitors at the Hospital.

Mrs. John F. Burke and Mrs. Nathaniel Adamson reported that, through the furniture exchange, 330 pieces of furniture were distributed to 31 families from 16 different countries. Mrs. Alfred Kranes and Mrs. Philip R. Dodge reported that 147 families and individuals have been helped with housing. Mrs. Perry J. Culver, in charge of the International Visitor List, reported that there were 96 new arrivals at the Hospital this year.

Mrs. Nathan B. Talbot reported on the concerts which were held in the Hospital Chapel. From October 15 through May 15, 11 concerts were presented by outstanding artists of this area.

Other chairmen carrying on special projects during the year were: Mrs. John W. Cass, Jr., who reported for the Information Desk in the Brick Corridor of the Hospital, and Mrs. Francis M. Ingersoll for the Clinics Information Desk. Mrs. John M. Head and Mrs. Robert F. Tilley edited the Service League Newsletter; Mrs. Joseph S. Barr was in charge of Membership; Mrs. George L. Nardi, Teas; Mrs. Kurt J. Isselbacher, Legal Consultant; Mrs. Robert Wolff, Resource File; Mrs. Alexander Leaf, Schedules; and Mrs. Lawrence Ring, Supplies.

1811

THE McLEAN HOSPITAL RESEARCH LABORATORY ✓

The McLean Hospital Research Laboratory occupies a building immediately north of the Administration Building. The Laboratory Building, a 175 x 47 feet two-story structure, was built in two stages: the western half in 1945 and the eastern half in 1959-60. It provides over 16,000 square feet of floor space which is occupied by laboratories and by general research facilities, including a research library. These facilities are divided into four roughly equal divisions, devoted to the chemistry of tissue structural components, to metabolic studies, to quantitative histochemistry, and to biophysics. The first two divisions are under the supervision of Dr. Jordi Folch-Pi, the third under Dr. Alfred Pope, and the fourth under Dr. J. David Robertson. The work of the Laboratory is reviewed yearly by an Advisory Committee which consists of Dr. Raymond D. Adams, Chairman, and Drs. Walter Bauer, Fritz A. Lipmann, R. Lorente de No, Alfred H. Stanton, and Donald D. Van Slyke.

The construction of the Laboratory in 1945 was indicative of the continuation of a long tradition of research at McLean Hospital. This tradition goes back to 1888-1892, when research in the cause and treatment of mental illness was initiated by the establishment of three laboratories—physiological, biochemical, and psychological—under the direction of Dr. Hoch, who had been trained in Germany in experimental psychology. The biochemical laboratory, from which the present laboratory is the lineal descendant, gathered momentum in 1900 when it came under the direction of Dr. Otto Folin, who, during the seven years of his tenure (until 1907, when he moved to Harvard), started at McLean many facets of his monumental work on practically all aspects of biochemistry. Among Folin's successors, two are worthy of special mention—namely, Dr. J. Whitehorn who, from biochemistry, moved gradually into a career in psychiatry that was to take him to the highest leadership in the field, and Dr. E. Stotz who, in 1942, moved from McLean Hospital to occupy the Chair of Biochemistry at the Rochester University School of Medicine.

Thus the decision in 1945 to establish the new Research Laboratory was only a reaffirmation by the Trustees of a resolve of long standing to maintain at McLean Hospital an active center of research pertinent to the understanding of the nature of nervous and mental disorders. Toward this goal, the assigned task of the new Laboratory was the study of the nervous system in health and in disease by the tools of the basic medical sciences. From a two-year-long survey of the field encompassed by this assignment, it was decided that the most promising approach to follow was the study of the "chemical anatomy" of the nervous system—that is to say, the establishment of the distribution of tissue components in relation to histological structure. A corollary of the program was to apply any results that might be obtained to other experimental and clinical problems as early as it appeared possible to do so. In outline, the contemplated study required from the very beginning two different lines of work—namely, (1) the isolation and identification of the structural tissue components, i.e., of the compounds that constitute the structure revealed by microscopic and ultramicroscopic examination, and (2) the actual work of correlation of the distribution of components with histological structure. To implement such a dual attack, the first appointment to the staff was that of Dr. Alfred Pope, a young physician with training in neuropathology and extensive experience in biochemistry. The continuation of this dual approach attracted biochemists, neuropathologists, and clinical neurologists to the staff. As a natural evolution, the program was expanded in 1956 to comprise (3) metabolic studies, specially directed to the elucidation of the biosynthetic mechanisms involved in the synthesis of tissue structural components. Finally, in 1960, (4) biophysical studies were added to the program under the direction of Dr. Robertson, as a necessary adjunct to the other three lines of work. From this gradual evolution there are now at McLean four different groups of specialists working independently but complementarily toward the common goal of establishing the components and the forces that nervous tissue uses to develop and maintain its purposeful tri-dimensional patterns. The staff has grown from your reporter, in 1946, to 16 professional people and 23 in other capacities in 1962.

The work carried out during these 16 years has followed the general outline formulated in 1946. The study of the chemistry of the structural components of the nervous tissue, which has been the special concern of your reporter, in collaboration at various times with L. L. Uzman, J. A. Meath, M. Lees, F. N. LeBaron, G. H. Sloane-Stanley, G. Webster, and others, consisted originally of the development of procedures of isolation of tissue components, with an emphasis on the use of mild manipulations of tissue and of tissue fractions, so as to allow the separation from the tissue of "native" components—that is to say, of components in a condition as close to their state in the living tissue as possible. A number of procedures were thus developed, and they permitted the isolation of various components which clearly would have been destroyed by earlier, more drastic procedures. The components thus recognized, and partly purified and identified, were generally large molecular weight substances and belonged mainly to the group of lipoproteins. These are compounds consisting of the combination of a protein part with a lipid part. The nature of the link that holds together the constituent parts or "moieties" is poorly understood, partly because the fragility of lipoproteins limits severely the conditions under which they can be studied. The results of our work justified the assumption that the bulk of proteins and of lipids in nervous tissue are combined with each other in various forms of lipoproteins. Two such lipoproteins appeared to be of particular interest—namely, the *proteolipids,* which are lipoproteins soluble in organic solvents and insoluble in water (other lipoproteins are either soluble in water and insoluble in organic solvents, or wholly insoluble) and the *phosphatido-peptides.* The proteolipids are clearly related to myelin and hence lend themselves to correlative biochemical and morphological studies. The phosphatidopeptides are, strictly speaking, not lipoproteins, but the lipid moiety of an insoluble lipoprotein fraction which is related to classical neurokeratin. Not the least important of their features is that they contain, as an integral part, one or more phosphoinositides, i.e., lipid moieties having inositol as a constituent. Besides lipoproteins, an apparently macromolecular form of gangliosides has also been isolated: *strandin.* This lipid-carbohydrate complex substance appears to be only part of a greater aggregate that has not yet been identified and which appears to be destroyed even by the mild procedures now used. All these macromolecular species underlie the structural detail discernible by electron microscopy, by X-ray diffraction, and by other methods of ultrastructural observation. These studies constitute a most active continuing line of work. They have been strengthened further by the recent addition of an Organic Chemistry Laboratory under Dr. Pierre J. Stoffyn.

In parallel with these studies, the group under Dr. Pope had been analyzing nervous tissue directly by the ultramicro methods developed by the Danish School of Linderstrøm-Lang and Holter. In these methods, serial histological sections are used alternatively for chemical analysis and for histological examination. Thus it is possible to correlate with great certainty the chemical structure with the histological picture. Dr. Pope, who was joined by Dr. Helen H. Hess in 1951, carried out a series of investigations on the intralaminar distributions of enzymes in the somatosensory isocortex of the albino rat. Partially overlapping these studies were a parallel series upon the enzymatic architecture of the human frontal isocortex obtained as biopsy specimens during the era of psychosurgery. In recent years this work has been continued on autopsy specimens. The program had broadened gradually to include the distribution of tissue components other than enzymes, specially the macromolecular species that had been recognized and partially identified by the parallel work of the group under your reporter. This gradual growth has evolved into a broad program which includes five major divisions: I) development of ultramicroanalytical methods for analysis of tissue samples of 10-100 μg fresh weight; II) surveys of regional neurochemistry in rats and man; III) studies in ultramicrochemical neuropathology, both experimental (as exemplified by Dr. Pierre M. Dreyfus's work on deficiency diseases in rats, etc.) and naturally occurring in man (diseases of the cerebral cortex, brain tumors, etc.); IV) special emphasis given to studies on the nature and enzymatic properties of brain ATPases and related enzymes; and V), as a central problem, the elucidation of the ultramicrochemical architecture of mammalian isocortex, particularly that of man. The eventual construction of an elementary, but orderly, chemoarchitecture that is the reasonable eventual result of such an enterprise will permit correlations with cortical anatomy and physiology and will provide a framework for comparative studies upon cortical diseases. It will also permit the establishment of the microchemical counterpart, if any, of the psychopathological reactions in the patients from whom specimens have been obtained.

The metabolic studies which were made possible, starting in 1956, by a grant from the Ford Foundation, have gained strength by the contributions of Drs. Mudlagiri K. Gaitonde, George P. Hauser, Lewis C. Mokrasch, and Joseph Dobkin. The rationale of their inclusion in the program has been abundantly justified by the progress made toward the elucidation of biosynthetic mechanisms of the various macromolecular species the Laboratory is specially interested in. Thus, it has been found that phosphorus in the phosphoinositides constituent of phosphatido-peptides exhibits a remarkably active rate of turnover, that proteolipids differ markedly from other proteins in their metabolic activity, that the site of their synthesis appears to be in mitochondria, rather than in microsomes. These are only a few highlights of a very active program, justice to which could be made only by devoting to it the whole of this review.

The biophysical studies inaugurated three years ago were also justified as a necessary part of an evolving program. The rationale in this case is that with the increased resolution of methods for study of ultrastructure and the increasing ability to handle macromolecular tissue components, a common ground has been reached in the sense that the latter are potentially recognizable as discrete features in the ultrastructural picture. As in the other aspects of the over-all program, the biophysical studies proceed on their own momentum and with their own emphasis, and collaboration with other disciplines is only a development to be hoped for, not to be enforced or in any way engineered. In fact, such collaboration is already taking place in the form of a combined ultrastructural and ultramicrochemical study of the outer ends of retinal rods, now being jointly pursued by Dr. Robertson and Dr. Hess.

In implementation of the basic corollary of applying our findings to other clinical and experimental problems, a substantial part of the laboratory work has dealt at all times with pathological and clinical problems. This work is in no way applied work, but partakes of the same conceptual and technical rigor that is inherent in the other studies mentioned above. The scope of this review does not allow its detailed discussion. Let it only be stated that besides the studies on the chemoarchitectonics of cortices of patients with various forms of mental illness carried out by Dr. Pope's group, and already referred to, studies have been carried out on the state of copper in Wilson's disease (a line of work being most successfully pursued by Dr. Huntington Porter in his present position at the New England Center Hospital), on the chemical nature of the antigen in experimental allergic encephalomyelitis, on the chemical composition of pathological brains, and on many other experimental and pathological problems.

This brief description of the activities of the Laboratory would not be complete without mentioning its very important function as a training center for neurochemical studies. From its inception, almost as many trainees as regular staff members have contributed to the work of the Laboratory. Such trainees have consisted of graduate students from the Division of Medical Sciences of Harvard University, of medical students on short-term projects, and, mainly, of postgraduates—either biochemists or neurologists. Those in the last two groups have been numerous, and it has been a source of gratification to see that almost without exception the clinical neurologists, trained here in neurochemistry, have continued to be active in neurochemical research upon their return to clinical neurology, and have made contributions of significance. The names of L. L. Uzman, N. Allen, H. Porter, P. Dreyfus, H. Moser, and E. Lewin, among others, attest to the fact.

Throughout this short review, the attempt has been made to show the unity of thought that underlies the over-all program of the Research Laboratory, and to emphasize that the various and, at times, widely differing projects the Laboratory has embarked on, represent, indeed, parts of a broad effort aimed at a better understanding of the function of the nervous system in health and in disease.

As a final comment, it should be stated that the whole staff of the Research Laboratory is looking forward to the healthy growth of the present program of research in psychiatry and the social sciences, with the conviction that such growth will be a source of strength to the Hospital and that both research programs will benefit from constant interchange of ideas and information.

Jordi Folch-Pi, M.D.,
Director of Scientific Research,
McLean Hospital

[The above describes only one of the many facets of research going on at McLean Hospital. The News plans to publish articles in the future on such subjects as research in clinical physiology, in the behavioral sciences and psychiatry, and other related activities. —— *Editor*]

Brief bit:

Dr. Oliver Cope participated in Surgical Grand Rounds at the Malden Hospital on May 1, and gave a talk on "The place of surgery and the various types of thyroid disease".

THE PLASTIC CLINIC

This year marks the 84th birthday of our distinguished colleague, Dr. V. H. Kazanjian. The Plastic Clinic at the Massachusetts General Hospital was founded in the twenties by Dr. Kazanjian and has continued to draw patients

DR. ELLSWORTH T. NEUMANN, ADMINISTRATOR

in increasing numbers during the years since then. At one time this was a joint MGH and Massachusetts Eye and Ear Infirmary clinic—an arrangement that was discontinued after World War II when the Eye and Ear group withdrew to their own quarters at the time when Dr. Kazanjian retired as chief of both clinics. Certain obvious advantages were lost with the change, the most important of which was the opportunity for each group representing different points of view to profit by association with the other. A reunion of these groups, in adequate quarters, might again prove profitable.

About two years ago the picture in the Plastic Clinic changed with the assignment of members of the house staff from both the East and West Services to Plastic Surgery and the announced intention of Dr. John D. Constable to concentrate in the field of Reconstructive Surgery. A continuity of care was thus possible, not only at the visit level as originally insisted on by Dr. Kazanjian, but also at the house staff level. A very obvious change in the variety of problems and the number of patients has occurred with the broader clinic coverage. The referrals from the house and other clinics, in turn, have increased significantly. In fact, the number of patients seen at each biweekly clinic has increased to such an extent that a weekly session would be desirable if space were only available.

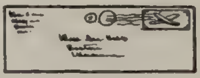
What is the scope of Plastic Surgery? Many physicians and laymen consider that the plastic surgeon is concerned solely with cosmetic or aesthetic surgery. This is not the case at the Plastic Clinic. In fact, the members of the Clinic have discouraged patients with purely cosmetic defects from seeking help through this channel. On the other hand, cosmetic defects resulting from trauma or valid congenital anomalies are accepted without question. The majority of patients who present themselves have varying degrees of functional disability, often from trauma such as an injury from automobile accidents or burns; but a significant group seeks repair following surgical eradication of malignant disease.

Members of the Clinic are always on call for consultation on the house services in other surgical areas. Since Plastic Surgery is a specialty of methods, there are frequent requests for advice in methods of closing wounds, appropriate means of preparing a wound for grafting, etc. The acutely injured extremity is often the object of these consultations. An adequately protected fracture with good skin covering providing an abundant blood supply will usually heal without complication of infection, non-union, etc. Without adequate care and blood supply the convalescence may be prolonged for months or years. The chapter on "Soft tissue repairs" in the Fracture Book entitled *Fractures and other traumatic conditions,* edited by Dr. Edwin F. Cave in 1958, had its origin in cooperative experiences of the Plastic and the Fracture Clinics in dealing with the complex problem of the healing of open or compound fractures of the extremity. In the same volume, the chapter on "Facial injuries" was compiled from the combined experiences of the Plastic Clinic at the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary.

The prospect of establishing a center for the care of the burned or injured child as a part of the MGH imposes a heavy obligation on the members of the Plastic Clinic. Few of the senior staff will forget the disruption of the normal functioning of the Hospital at the time of the Cocoanut Grove fire in 1942, and few of the junior staff will forget the arduous tasks involved by the arival of one or more burned patients in the Emergency Ward or any other area of the Hospital. There is the constant check of the adequacy of the fluid therapy. There is the puzzling decision about the depth of the burn. There is the arduous care of the wound itself—a task which increases in its demands until healing is complete. And there must be a calm, unruffled, gentle tolerance of the emotional outbursts that accompany the burned state in most seriously burned patients. The opportunity for study of the problem of the burned child is a challenge. The staff of the Massachusetts General Hospital is well equipped to accept this challenge and to continue to make important contributions to it.

The members of the Plastic Clinic look forward to inviting qualified surgeons to join the group for specialized training here and at allied hospitals in the Boston area. Opportunities for a varied experience are available when suitable integration of several programs is established.

Bradford Cannon, M.D.,
Visiting Surgeon



Dr. Witold Drabikowski (res. fel. *M.* 1962), now at the Nencki Institute of Experimental Biology, 3 Pasteur St., Warsaw 22, Poland, sends us this message:

> I am now back in my fatherland, but the nice time which I spent at the M.G.H. is still vivid in my memory and will never be forgotten.
>
> I hope I shall be able to visit the Massachusetts General Hospital again some day.

A New Kind of Community Center for Rehabilitation

McLean Rehabilitation Center to be Dedicated

Clinical Symposium and Dinner on October 18

Another significant project supported by the 150th Anniversary Program of the Massachusetts General Hospital comes to fruition on Friday, October 18. On that day the new McLean Hospital Rehabilitation Center will be dedicated at an all-day Clinical Symposium, followed by an evening dinner. The modern concepts of psychiatry underlying the Center are implicit in the theme of the Symposium: "The Individual and the Community—Current Perspectives in Rehabilitation."

It is expected that over 500 physicians, nurses, social workers, auxilians, volunteers, and friends of the Hospital will attend. The Symposium will include one morning session and two afternoon sessions. The Center will be open for inspection and guided tours during luncheon and prior to the dinner.

Mr. Ralph Lowell, member of the Board of Trustees and Chairman of the McLean Hospital Committee, will preside at the dinner. The Right Reverend Robert P. Barry, also of the Board of Trustees and a member of the same committee, will give the invocation. The principal speaker will be Dr. Dana L. Farnsworth, Director of the University Health Services and the Henry K. Oliver Professor of Hygiene, Harvard University. The toastmaster will be Dr. Erich Lindemann, Chief of the Psychiatric Service, MGH, and Professor of Psychiatry, Harvard University.

The Rehabilitation Center is the first new building in many years to be built for the use of patients at the McLean Hospital. It was designed by the architectural firm of Shepley, Bulfinch, Richardson, and Abbott. Its cost is somewhat over one million dollars, of which about $384,000 was obtained from the federal government under the Hill-Burton Construction Act. The remainder came from contributions made to the 150th Anniversary Program of MGH. The Ground Breaking Ceremony was held on May 4, 1962, and the cornerstone was laid on October 15, 1962. The building was ready for occupancy the following June.

Architecturally the new Center retains an identity of its own. Its proximity to other units of the Hospital makes it readily accessible to inpatients and facilitates efficient servicing. The main floor consists of modular structural units 33 feet square, arranged in series and occupying about 22,000 square feet. The architectural keynote is flexibility; the building can accommodate about 200 patients daily, and can be expanded by the addition of more modular units.

The Village Green

The Rehabilitation Center provides facilities for the Day Care Center, psychiatric outpatient clinic, occupational therapy, library, music rooms, offices, and the Civic Center. The latter, which is housed in the central unit under a large skylight, consists of a coffee shop, store, beauty salon, barber shop, laundromat, and two meeting rooms, all arranged around the "Village Green." Community living is thus the leitmotiv of the Civic Center. The Village Green symbolizes the new concepts of psychiatry.

Dr. de Marneffe explains this dramatic departure from conventional institutionalism:

"The patient convalescing from a serious mental illness often has to relearn some elementary activities, for example, how to make an appointment with the hairdresser, how to make a phone call, how to buy things. The patient's sense of strangeness often creates a serious problem when he returns to the community. Providing opportunities within the hospital, in a setting unlike the traditional institution but quite like a small community center, we believe, will make it possible for him to retain the ability to do those things for himself. The Village Green may help patients learn new social and vocational skills which will benefit them after discharge."

Dr. de Marneffe adds: "The Rehabilitation Center will not only expand the present treatment program at McLean, but to some extent will change its character. In the clinical, research, and training areas it will make possible an integrated approach to the patient's treatment. For inpatients it will provide, to a greater extent than we have been able to offer before, an environment like that commonly found in the community. For pa-

Dr. Soutter Becomes Chairman of MGH Committee on Teaching

Dr. Lamar Soutter, upon rejoining the MGH family after a decade at the Massachusetts Memorial Hospitals and the Boston University School of Medicine, was immediately appointed Chairman of the Committee on Medical Teaching and Education. This is a subcommittee of the General Executive Committee and was created in 1962 to coordinate and improve the varied medical teaching activities at MGH, including those relating to Harvard.

Dr. William V. McDermott served as its first Chairman until his recent departure to become Director of the Sears Laboratory for Surgical Research at the Boston City Hospital and Professor of Surgery at the Harvard Medical School.

In announcing the new appointment Dr. John H. Knowles, General Director, stated: "Dr. Soutter's activities on this committee will be concerned broadly with our relationships with the community hospitals, particularly as regards the sharing of education and teaching opportunities. In this context, we will be actively exploring the possibilities of television as a medium for interhospital communication and teaching, as well as joint conferences, speakers' bureaus, interhospital seminars, joint house training programs, etc."

In 1942 Dr. Soutter, then an Assistant in Surgery, established the MGH Blood Bank in the basement of the Moseley Building, and it was largely the availability of plasma that enabled this hospital to convert the Cocoanut Grove fire disaster into an episode of extraordinary MGH achievement.

During the following decade (with time out for military duty) Dr. Soutter served MGH in a dual role as member of

Editorial

On the Support of House Officers

THE forerunner of the present-day house officer was the doctor's apprentice in colonial times. In return for a year or two of training at the hands of the practicing physician, he helped with the care of patients, collected herbs and composed medicinal concoctions of dubious therapeutic value, took care of his preceptor's horse, and even cooked meals and waited on table.

Patients were cared for at home, or sometimes were taken into the doctor's house so that they could be provided with close attention. Hospitals, including the ones that existed in Boston in the eighteenth century, were pest houses, or asylums, where the old, the maimed, the insane, the contagious, and the incurable could be filed away at public expense, out of the sight of the community.

The creators of the Pennsylvania Hospital (1752) introduced the novel concept of using such an institution for curing the sick. They also conceived of a more formal apprenticeship for the student in which he spent a year in the hospital working under several doctors, instead of just one. These apprentices were called pupils, and were expected to serve under a practicing physician after completion of their training. It is not unlikely that these students paid for the privilege of serving a year in the hospital. They certainly paid each lecturer (in the College of Philadelphia, later known as the University of Pennsylvania) for the privilege of listening to his discourse, and they paid another fee to each professor whose examination they passed successfully.

During the two hundred years that hospital training has been in vogue it has altered considerably, becoming more complicated, more formal, and more prolonged, particularly since the advanced period of residency training was brought to this country from Vienna by the Johns Hopkins Hospital. Not only is hospital training longer, but the time spent at medical school, which was originally but one year, reached four years at the turn of the century, and thanks to the Flexner Report, four years of college became more or less mandatory between secondary school and medical school—an idea which was undreamed of a century ago.

*

In this country and in England the main source of medical school applicants was for generations the professional and other well-to-do families, who could well afford the expense of the long program of education and training which preceded the time of earning a livelihood. According to the Bane report (1959), this trend is probably still persisting to some extent, as 40 per cent of medical school students come from the top 8 per cent of the population financially, and only 20 per cent come from the lower half.

How much this trend is influenced by the economics of medical education is hard to say. The average doctor is from 28 to 32 years of age before he begins to earn his living. Very few parents can afford to support their children so long, let alone pay the high tuition rates of the private colleges and medical schools. Students with medical ambitions but little or no income have recourse to three methods of gaining support: to earn money in their spare time, to obtain a scholarship (funds for which are very meager at most medical schools), or to borrow money. The problem of the married student is even more grave, unless his wife has a lucrative job or can otherwise support him in style. Over one half of senior medical students are married, as are most house officers. This is biologically far sounder than the enforced celibacy of the past generations of house officers, but it costs money.

According to the Bane report, 11 per cent of single senior medical students and 21 per cent of married ones already had debts in excess of $5,000. It should not be necessary for a student to have to go through a period of privation and debt in order to obtain medical education or good hospital training. In a democracy these opportunities should be available to talented and willing students regardless of their economic background. Such opportunities are available in Russia, and they are, through grants, in England. The pool from which able doctors may be drawn is much larger, comparatively, in those countries than here because of the financial barriers placed in the way of American medical aspirants.

Mrs. Mary N. Kenneally, Assistant to the Editor.

Dr. Lindsay Appointed Administrator of MGH Research Program

Dale R. Lindsay, former Chief of the Division of Research Grants at the National Institutes of Health, joined the MGH Staff on August 1 as Deputy to the General Director for Research Administration. This is a new, full-time position which combines a number of functions that previously had been distributed as part-time activities among several administrative officers and scientific members of the Staff.

One of Dr. Lindsay's duties, for example, will be to serve as Executive Secretary to the Committee on Research, a post recently relinquished by Dr. Adelbert Ames, III, Associate Biochemist in Neurosurgery.

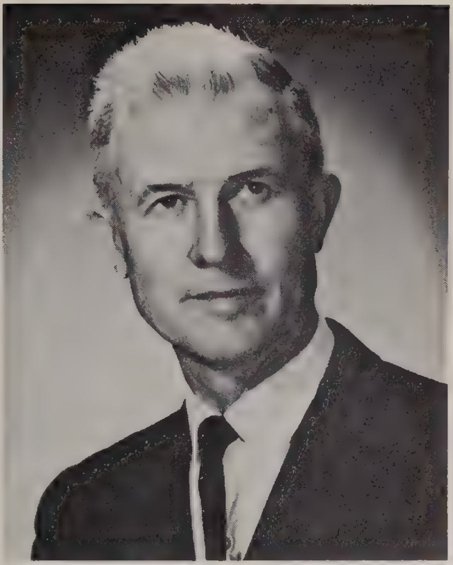
The research program that Dr. Lindsay will administer has expanded rapidly since 1935, when the yearly cost was only about $50,000. The separately budgeted research program at MGH now amounts to more than $7,000,000 annually, about one half of which comes from the National Institutes of Health. The research budget at MGH is nearly one-fourth of the total budget.

Statement of Policy

The following policy with respect to the research program is now guiding the Administration:

"The General Director and the Board of Trustees have recognized an obligation to provide an administrative setting which will help ensure proper relationships within the hospital complex of responsibility for patient care, for optimum advancement of medical science, for scientific freedom for the investigators, and for probity and prudence in the expenditures of funds provided from both private and public sources. The primary objective is not necessarily to enter into more research endeavors, but to assure the maximum productivity of investigators within the limited space and facilities which the Hospital can utilize for this purpose.

"The new position of Deputy to the General Director for Research Administration will provide additional management resources to the MGH research staff. The incumbent will be responsible directly to the General Director for certifying that good research grant and contract management procedures are utilized throughout the Hospital; that all requirements of sponsoring organizations and agencies are met; that the scientific freedom of investigators is maintained within the overriding responsibilities of the medical care program; and that constant surveillance of research objectives is maintained in order to permit the General Director, with the advice of the Committee on Research, to periodically refocus the entire institutional research program."



Dr. Dale R. Lindsay

Dr. Lindsay enjoys describing how he entered the hospital field through the pursuit of entomology. At the University of Kansas he had actually completed a major in economics in preparation for a legal career, before heeding the call of biology. He then changed his major to entomology and went on to earn the A.B. and M.A. degrees. He worked at Iowa State University for the Ph.D. degree. He became a teacher and a research worker in crop entomology, operating under a grant from the Department of Agriculture.

During World War II he entered the Public Health Service Commissioned Corps and developed interests in medical entomology and epidemiology. From 1945 through 1953 he was engaged in studies of arthropod vectoring of certain pathogens, particularly of the role of flies in the dissemination of diarrheal diseases. He was working at field stations in the lower Rio Grande Valley of Texas, among Indian pueblos in New Mexico, and in several communities in southwest Georgia.

Joins NIH

In 1953 he joined the staff of the Division of Research Grants at the National Institutes of Health. He served successively as Scientific Director, Assistant Chief, and Chief of the Division. Finally, after more than 20 years as a Regular Corps Officer, USPHS, he retired from the Service on July 31, 1963. He now resides with his family in Sherborn, Mass.

Dr. John H. Knowles, General Director, states: "Dr. Lindsay's unique combination of experience in both biological science and research administration should certainly prove useful as he takes up the role of MGH research administrator."

MGH and Harvard to Cooperate in New Clinical Curriculum

For some time a study of a new curriculum has been under way at the Harvard Medical School. Last spring the general outline of the curriculum was agreed upon and the affiliated teaching hospitals were asked to make plans to implement it.

The new curriculum is set up to cure a number of the ills of the former one. It begins with a three month period in the third year called Introduction to the Clinic, which will serve to strengthen the student's understanding of history taking and physical examinations, prior to actual work on the wards. During this period the students will also be exposed to a multidisciplined study of the clinical aspects of the pathophysiology of disease.

Then follows a twelve month period known as the Principal Clinical Year. During this time the student body will be divided into four sections. Each will spend twelve weeks in Medicine, twelve weeks in Surgery, and twelve weeks split among Obstetrics, Gynecology, and Pediatrics. In the final twelve week period, six weeks will be devoted to Psychiatry, two to Neurology, and one each to Dermatology, Ophthalmology, Otolaryngology, and Orthopedics. Certain courses such as Preventive and Legal Medicine will be covered by afternoon lectures.

The final period of five or six months in the curriculum will be devoted to tutorial and elective courses, selected by the student under the guidance of a tutor.

This program provides a stimulating change. The transition from preclinical to clinical subjects will be much better. The year of clinical work will be less fragmented than the present third and fourth years. There will be less travel involved and a better allotment of time to the basic disciplines rather than the specialties. The tutorial and elective period is a highly desirable feature, which the students should find attractive and challenging. The general trend is towards more of a graduate program of study providing closer student-faculty relationships.

The actual implementation will depend largely upon the staffs of the individual hospitals. They will have the opportunity for more interdisciplinary exercises, for more stimulating methods of introducing various subjects, and, hopefully, for the designing of programs which will inspire the students to pursue their studies with more enthusiasm.

As in all new curriculums, there will be some degree of trial and error before a final, workable form can be achieved. Nevertheless, the chances are very good that much can be accomplished at MGH to implement the new plan, which will be stimulating to the Faculty as well as to the students.

Hartford Foundation Aids Two Units:

Cardiorenal

The John A. Hartford Foundation, of New York City, has awarded a grant of $241,442 to the Cardiorenal Unit for a three year study of the mechanisms of fluid and electrolyte transport by living cells and tissues. This project will be under the direction of Dr. Alexander Leaf, Chief of the Unit. The Foundation has given previous support to this project.

The announcement of the award was made recently by Mr. Ralph W. Burger, President of the Hartford Foundation. With regard to the significance of this project, Dr. John H. Knowles, General Director, commented in a release to the press:

"Each of the several billions of cells in the human body is enclosed within its individual cell membrane. This membrane is approximately 4 billionths of an inch thick, and yet it serves to retain within the cells those substances which are necessary for normal cellular function and to exclude those substances which would be potentially harmful to the cell. Furthermore, the composition of the cell is very different from that of the surrounding fluid in which it lives. This means that the cell membranes are continually controlling the traffic of molecules which enter and leave the cell so as to preserve the normal composition of the cell. We know that certain hormones regulate the rate at which specific substances can cross cell membranes.

"In health all these complicated processes proceed with miraculous precision. In certain disease states, however, disturbances in transfer of substances across cell membranes may occur which may seriously jeopardize the life of the cell and of the whole patient.

"Dr. Leaf and his associates have been studying the mechanisms by which substances cross cell membranes and how hormones affect this transport. Their findings have special pertinence to certain diseases of the kidneys and of the heart. From a better understanding of these basic cellular processes, we can expect a more rational and effective treatment for these conditions."

* * *

Dr. Kurt J. Isselbacher, Chief of the Gastrointestinal Unit, has been selected the Roger Morris Lecturer and appointed to serve as Visiting Professor of Medicine at the University of Cincinnati School of Medicine in November 1963.

Can you identify a STAT call over the MGH loudspeaker system? Do you know how to respond to it? If you don't, then call Miss Evelyn Dunn, Communications Coordinator, or check with your supervisor or the Chief Resident of a service.

Gastrointestinal

The Gastrointestinal Unit, under the direction of Dr. Kurt J. Isselbacher, Chief, is the recipient of a grant of $123,297 from the John A. Hartford Foundation of New York City. This grant will support a comprehensive investigation of the biochemical, metabolic, and immunologic derangements which occur in the liver and in the body as a whole following injury to the liver, such as that produced by the hepatitis virus, by drugs, and by other toxic substances.

In general, the research to be undertaken under the support of the Hartford Grant may be considered under five broad categories.

- (1) The role of immunologic (antigen antibody) reactions in the causation of chronic liver disease will be studied. Experiments of an immunologic nature are planned to determine what role allergic processes have in converting an acute hepatitis episode into one of a subacute chronic nature.

- (2) The effects of hormones in the causation and evolution of liver disease will be studied. A considerable body of information has been obtained in laboratory animals that sex hormones influence the severity of processes such as the development of fatty liver and of hepatitis. Clinically, it is evident that women, especially young women, frequently have more severe forms of chronic liver disease.

- (3) The investigation begun by the Gastrointestinal Unit of the effects of alcohol on the liver will be continued. It would appear that in the chronic alcoholic subject seen in this hospital the cirrhosis is due, in all likelihood, to a combination of poor nutrition plus the direct toxic effects of alcohol on the liver.

- (4) Hormonal and other factors which may influence the process and rate of liver regeneration in the experimental animal will be investigated. With the increasing efforts, especially by the Surgical Service of this hospital, to resect portions of the liver for cancer, it is important to obtain more information about liver regeneration.

- (5) The final group of studies will be directed toward finding further clues to the causation of hepatic coma, one of the clinical end stages of liver disease. Although Dr. William V. McDermott and his associates have emphasized the importance of ammonia in the causation of hepatic coma, it is becoming evident that more than ammonia is involved.

It is hoped that the studies carried out by the Gastrointestinal Unit under the support of the Hartford Foundation will lead to a more rational approach to the treatment of liver disease in general.

Dr. Ropes Is First Woman Elected to Presidency of ARA

Dr. Marian W. Ropes of the MGH Arthritis Unit has become the first woman president of the American Rheumatism Association. At the annual meeting of the Association last June at Atlantic City, she accepted the gavel from the outgoing president, Dr. Ephraim P. Engleman, of San Francisco.

Three other staff members from MGH attended the meeting: Dr. Charles L. Short, Dr. John A. Mills, and Dr. George Fostiropoulos.

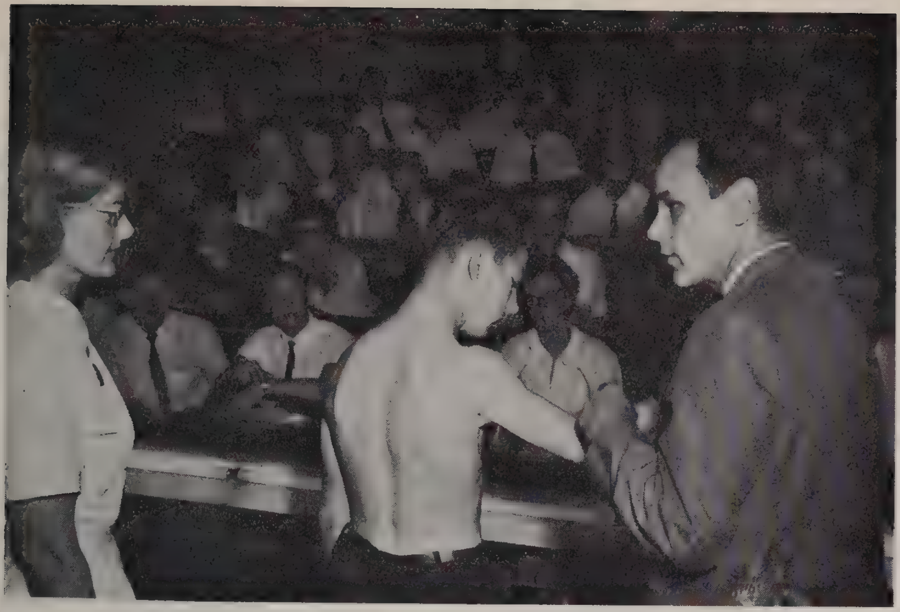
Dr. Ropes is a Physician on the Visiting Staff and Associate Clinical Professor of Medicine at the Harvard Medical School. Her earlier studies led to the concept that certain changes in joint fluid could be utilized to differentiate major groups of joint disease from joint trauma. Currently Dr. Ropes is reviewing the past 30 year experience at MGH with disseminated lupus, dermatomyositis, and other types of connective tissue disease. She is studying the therapeutic and toxic levels of aspirin and the form in which aspirin is carried in the blood. She is also investigating the effect of ascorbic acid on the level of Congo red retention in the blood of patients with rheumatoid arthritis.

In 1959 Dr. Ropes received an Elizabeth Blackwell Citation from the New York Infirmary for "outstanding contributions as clinician and investigator in internal medicine."

* * *

The book of MGH-Lowell Institute Lectures conceived and edited by Dr. Henry K. Beecher, and published in 1960 by the Harvard University Press under the title of *Disease and the Advancement of Basic Science,* has been selected for inclusion in The American University Presses' Project. This is a collection of scholarly books to be sent by the Agency for International Development, Department of State, to about 100 AID offices and national libraries in Asia, Africa, and Latin America. The thesis of this lecture series was that some types of conceptual science, i.e., science concerned with the discovery of new and basic concepts. can be initiated only at the bedside of the patient.

At the 88th Commencement Exercises of the MGH School of Nursing on September 13 at John Hancock Hall, 105 nurses joined the ranks of more than 5,000 alumnae. A reception was held afterwards on the Bulfinch lawn.



Swedish Medical Students Meet Everett Knowles

A group of medical students from the University of Gothenburg, Sweden, visited MGH on July 19 during their two week tour of American medical centers. In honor of our guests, the flag of Sweden was flying above the main entrance to the George R. White Memorial Building. The feature of the day was a clinical session in the Bigelow Amphitheater, during which Surgeon John M. Head presented patient Everett Knowles, Jr., whose severed right arm was successfully reattached at MGH on May 23, 1962. The nerves were rejoined on September 11, 1962.

Repeat Performance of History-Making Feat

Lightning sometimes does strike twice in the same place; and on September 6, 1963, Fate decreed that the MGH should perform the second reattachment in history of a traumatically severed human limb—after having performed the first such operation less than 16 months ago.

The victim was Mr. Lennart Turnquist, a 44 year old machinist of Reading, who is the father of seven children. His unconscious body was found beside a B&M railroad track in Wakefield, with the severed right arm lying nearby. At the Melrose-Wakefield Hospital, Dr. Harry Schwartz applied a pressure bandage to the stump, packed the limb in ice, and dispatched both to the MGH.

At the end of an 11 hour operation by a team of nine surgeons and five nurses, circulation had been restored in the reattached arm. Realignment of the bone was effected by the insertion of an intramedullary nail. During this procedure three main nerve trunks were rejoined. There was considerable loss of skin owing to the trauma of the accident. This was compensated for by the use of skin grafts and a flap of skin from the abdominal wall. Mr. Turnquist is making a very good recovery. The circulation in the arm is excellent; his hand is warm and of good color. He should continue to progress well.

Dr. Austen: Markle Scholar

Dr. W. Gerald Austen, Chief of the Surgical Cardiovascular Research Unit, MGH, and an Associate in Surgery, Harvard Medical School, is the recipient of a five year, $30,000 scholarship grant from the John and Mary R. Markle Foundation, of New York City. This foundation conducts a "Scholar in Academic Medicine Program" designed to support the development of young medical faculty members who plan careers in research and teaching. The grant is made formally to the medical school, and may be used in any way the school and its Markle Scholar select.

Dr. Austen plans to use part of his grant in studying cardiovascular techniques at medical centers in England, Switzerland, Italy, and Scandinavia. He has already contributed significantly to better understanding of the physiology of various cardiac lesions.

The Markle Scholars are selected annually through a complicated procedure. This year 59 medical schools in America and Canada nominated one candidate apiece, and then the candidates traveled to New York and underwent four days of intensive interviewing. As a rule, about one third of them pass this test successfully. Dr. Austen is the first surgeon ever to have been nominated by Harvard for this honor.

Dr. Kalckar Awarded Saunders Fellowship

Dr. Herman M. Kalckar, the Henry S. Wellcome Research Biochemist at MGH and Professor of Biological Chemistry at the Harvard Medical School, has been awarded a $15,000 writing fellowship by the W. B. Saunders Company of Philadelphia. A formal presentation of the award will be made at the November meeting of the American Philosophical Society. A Saunders writing fellowship has also been granted to Dr. Paul B. Beeson, Ensign Professor of Medicine at Yale.

Dr. Kalckar plans to write a series of articles (which may appear later in book form) on what he likes to call "ektobiology." This deals with the metabolic and molecular basis for the biosynthesis of complex polymers on the surface of the cell, within the cell membrane or wall.

These units manifest themselves as antigenically active substances (surface antigens), as blood groups, or as receptor sites for viruses. Manifestations of sex in microorganisms (including bacteria) or of histocompatibility in higher organisms are probably related to ektobiological units. Sequences of various sugars tied to protein or to lipids are the major constituents of "ektopolymers." The sequences of sugars form the molecular basis for the "language" of these specific ektopolymers; perhaps lipids and peptides will also prove to be endowed with ektobiological specificity.

One of the most important sugars of these ektopolymers is galactose, which is made from glucose by a specific enzyme, related to a racemase. Mutants lacking this metabolic enzyme may lose one or more of the ektobiological units, such as surface antigens or virus receptor sites. Dr. Kalckar has found that several types of tumors show a defect in the glucose galactose conversion. This defect is not directly hereditary but is an imposed feedback-inhibition attributed to the high aerobic glycolysis of these cells. He would like to encourage more study of the biosynthetic pathways in the belief that these substances are crucial in the normal and pathological development of organisms (differentiation, controlled and uncontrolled growth, and especially the selective advantages of malignant tumor cells).

Mr. John L. Dusseau, Vice President and Editor of the W. B. Saunders Company, publishers, comments as follows on Dr. Kalckar's earlier publications: "I have found them altogether fascinating and they suggest to me that the book you write will need by no means be a detailed research report, but rather may be a medium for the broad interpretation and analysis of many of the advances of modern medicine which rest on a new understanding of molecular activity. In fine, I look upon your projected book as illumination rather than recapitulation."

Miss Holbrook Retires After Two Decades As Editor-Archivist

For nearly two decades *The News* prospered under the firm guidance of a lady possessed of fine editorial skill and endowed with poetic sensitivity. The personality of this lady and the personality of her publication appeared to blend as one. To her intimate friends—poets, artists, teachers—she is known as "Cody"; the future historians of the Massachusetts General Hospital will speak in terms of greatest respect toward Miss Cora F. Holbrook, Editor-Archivist from June 1944 until her retirement in June 1963.

The News was started in 1942 by Miss Helen Boyer, the first Editor-Archivist, primarily as a medium of communication between the Hospital and the staff members and personnel who were serving overseas in the Armed Forces. So successfully was this function carried out, first by Miss Boyer and then by Miss Holbrook, that at the end of World War II, when the question of continuing *The News* was raised, this announcement appeared in the issue of December 1945:

"Yes, *The News* is going to continue. As one who is very well known by every MGH-er put it the other day, 'Why, I believe our Staff and alumni would rise in protest—almost to a man—if we should suggest such an idea as stopping *The News*.' "

In the 100th issue of *The News* (April 1951) Dr. James Howard Means (now Honorary Physician, MGH) stated: "On this occasion . . . all members of the hospital family can take great satisfaction that our hospital possesses such a worthy and excellent organ."

On September 26, 1963, one day before the current issue of *The News* went to press, two distinguished gentlemen paid separate visits to the News and Archives Unit. The first was Dr. Nathaniel W. Faxon, Director Emeritus, who praised Miss Holbrook's editorship in warm terms. The second was Dr. Means, whose remarks were equally flattering toward Miss Holbrook. Dr. Means said that when she began her duties as Editor-Archivist she was "like a breath of refreshing air" to MGH writers who needed her help.

Dr. Means also pointed out that although Miss Holbrook had never been a professional journalist, *The News* possessed under her editorship an air of quiet dignity.

Her successor is likewise not a professional newspaper worker. However, he is fortunate in having the support of something that Miss Holbrook never had—an Editorial Board. The members of this newly appointed Board hope the "new look" of *The News* will achieve no less dignity than it did under Miss Holbrook's devoted care. *G. H. J.*

The stone on the desk is dressed Chelmsford granite removed from a wall of the historic Bulfinch Building, the oldest structure at MGH. In a recent ceremony Surgeon M. A. Razek (center) of the new Maadi Military Hospital in Cairo, Egypt was presented the stone by Dr. John H. Knowles, General Director (right), and Dr. Paul S. Russell, Chief of the General Surgical Services. Dr. Razek has completed an MGH training course in cardiac surgery and will bring the stone to his hospital in Cairo.

Apologia

The News greatly regrets the omission of much material prepared for this issue, which was originally planned to be a 10 or 12 page issue. Budgetary limitations (and also the arrival of the deadline) made it mandatory to stop at Page 8. The cost of publishing *The News* far exceeds its income from subscription fees and contributions. However, staff authors of recent articles and books are urged to continue reporting them to the editorial office; these references are a measure of MGH achievement, and will be published in *The News.*

* * *

Dr. Werner Mueller, retired Director of the Mosher ENT Pathology Laboratory in the Massachusetts Eye and Ear Infirmary, made a recent pilgrimage with his wife Emma to his native land, Germany—after an absence of 50 years. He will soon present at the Infirmary a showing of the Agfachrome slides he took on his tour. Your Editor has viewed them all, and commends them highly.

The News requests staff members and personnel to submit photographs of their own taking which they think show merit and which relate in some way to MGH. It is planned to reproduce one such photograph in each issue. Mr. Stanley Bennett, head of the Photo Lab, will serve as consultant in the judging of these pictures.

Dr. Soutter . . .

(*Continued from Page* 2)

the Surgical Staff and Director of the Blood Bank. Subsequently he became Visiting Surgeon at the Massachusetts Memorial Hospitals, Professor of Surgery and Dean of the Boston University School of Medicine, and Area Chief of Surgery for the Veterans Administration Area Medical Office. He retained his ties with MGH in the status of Clinical Associate in Surgery.

A grant from the Rockefeller Foundation in 1955 enabled Dr. Soutter, as member of an interdisciplinary committee at Boston University, to study and inaugurate a new six year program of undergraduate medicine and liberal arts, designed to broaden the student's education.

A delegation of MGH surgeons attended the 20th Congress of the International Society of Surgery held recently in Rome. Dr. Claude E. Welch is treasurer of the North American Section.

House Officers . . .

(*Continued form Page* 2)

The house officer, if he does not receive enough support from his salary to permit an adequate existence for himself or his family, has three recourses. First, he can incur or enlarge a debt by borrowing, which is something that he may be very loath to do. Second, he can find jobs in his off-time hours, which is referred to as "moonlighting." This can be illegal if he is practicing medicine without a regular license. It is physically exhausting if he already has a full schedule, and it can make him too tired to do his regular work well or to study. Third, he can, and often does, apply for training at a hospital which does not have a strong program but pays well; or else he limits his period of training to a bare minimum, which severely curtails his choice of a medical career. All of these alternatives are bad for him, bad for his family relationships, and particularly bad for medicine. Prolonged training with little or no pay is one of the deterrents to young men and women who consider a career in medicine.

*

If we agree that house officers should receive adequate support, how do we define what is adequate? This is quite difficult and has been interpreted in a variety of ways. One practical approach to the problem has been that of the State of New York in considering house officers' salaries in Brooklyn. There the cost of an average apartment for three in East Flatbush for one year was ascertained. This figure was multiplied by four, in planning an intern's salary, on the grounds that only one fourth of a person's income should be spent on rent. The resulting figure was a little over $4,000. Increases in pay for each year of training are included. Certainly the planning of house officers' salaries should provide for all basic needs, insurance, coverage for illness, vacations, and other accepted necessities of life.

The sources of funds to provide adequate salaries are varied. The most common, of course, is that of hospital funds. As most hospitals have little or no endowment, this means that the cost is borne by the patient. The problem which concerns trustees is: just how much do patients benefit from the attentions of house officers, and how much therefore of their bill should cover the item of residents' salaries. This riddle has no easy answer.

At some hospitals, residents are paid for teaching, either of medical students or of nurses and technicians. This is a helpful contribution toward their support, and encourages them to devote attention to teaching. Federal grants are available in certain "scarce" specialties to encourage house officers to enter those fields. Psychiatric and radiologic residents may obtain them. This program is not apt to be extended beyond the scarce categories because most legislators fail to recognize the financial hardships of medical students and house officers, and think of doctors only as being affluent.

At some hospitals the staff has established a fund under its control into which various contributions are made and out of which money is paid to the house staff on the basis of seniority—and regardless of their service or help in earning the money. This is a difficult matter to work out, as some doctors object to it for financial or other reasons. It does, however, indicate recognition by the hospital staff to the fact that the residents are helping the doctors care for their patients, a service which they would have to pay for if there were no residents. It also can make available third party payments of fees by insurance companies and welfare agencies, which at present are not collected for ward cases. The mechanism of collection is a somewhat difficult problem, as a doctor in training may not receive such a fee and only a practicing physician who actually performs a service to a patient may collect it. As most of the fees are for surgical procedures, such a procedure might cut down to some extent the amount of operating done by the house staff.

All of these sources of additional revenue need to be studied in an effort to provide adequate financial support for house officers.

There are many other problems concerning residency training with which the medical profession should be concerned, such as the time involved, the opportunities for study, the amount of exposure to a variety of teachers, the quality of the training, and the need for formal teaching exercises. Stipends are but part of an over-all but continuing problem which warrants our serious attention.

Dr. Thip Pholpoke of the Phramongkutklao Hospital in Bangkok, Thailand, paid us a social call recently. He was a graduate student assistant in surgery here in 1952.

The Harvard Medical Chorus welcomes to membership all MGH doctors and personnel. Weekly rehearsals are held on Tuesdays at 6 p.m. in the auditorium of the Boston Lying-in Hospital.

Dr. Paul C. Zamecnik, Director of the J. Collins Warren Laboratories of the Huntington Memorial Hospital, was recently awarded the Lucy Wortham James Award of the James Ewing Society in New York for his contributions to basic research in the field of cancer.

The next issue of *The News* will contain obituaries of two members of the Honorary Staff, Dr. Donald S. King and Dr. George G. Smith.

McLean Center . . .

(*Continued from Page* 1)

tients living in the community it will provide psychiatric and other facilities which only a mental hospital can provide —and to the extent required by the patient's clinical condition. We believe that the Rehabilitation Center will bring the hospital closer to patients living in the community and the community closer to patients living in the hospital."

The Program

The program for the Clinical Symposium and Banquet is as follows:

Chairman: Francis de Marneffe, M.D., Director, McLean Hospital.

10:a.m. - 12:00. Participants:

Alfred H. Stanton, M.D., Psychiatrist in Chief, McLean Hospital: "The McLean Hospital Rehabilitation Center: Development of a New Clinical Program."

Samuel Silverman, M.D., Director of Clinical Psychiatry, McLean Hospital: "The Restitutional Process in Psychosis."

Rose Farkas, M.S.S., Director of Activity Therapies, McLean Hospital: "The Other Hours."

12:00 - 2:00 p.m. Luncheon. Tours of the Rehabilitation Center.

2:00 - 4:00 p.m. Participants:

Donald W. Winnicott, M.D., F.R.C.P., Physician, Paddington Green Children's Hospital, London, England: "Hospital Care Supplementing Intensive Psychotherapy in Adolescence."

Daniel A. Blain, M.D., Director of Commission for Psychiatric Services, Institute of the Pennsylvania Hospital, Philadelphia, Penn.: "Rehabilitation in the Context of Emerging Trends in Psychiatric Services."

4:15 - 5:45 p.m.

A discussion group meeting for patients and their families, on "The Significance of the Rehabilitation Center for the Hospital's Treatment Programs." Participants:

Samuel Silverman, M.D., Director of Clinical Psychiatry, McLean Hospital.

Stephen L. Washburn, M.D., Assistant Psychiatrist, and Psychiatrist in charge of the Day Care Center, McLean Hospital.

Rose Farkas, M.S.S., Director of Activity Therapies, McLean Hospital.

4:00 - 6:00 p.m. Rehabilitation Center open for inspection.

7:00 p.m. Dinner.

* * *

Another step in staff reorganization at the McLean Hospital was the recent appointment of Dr. Samuel Silverman as Director of Clinical Psychiatry. This position is a new one designed to enable the Psychiatrist in Chief, Dr. Alfred H. Stanton, to allot more of his time to the development of the research program at McLean. Dr. Silverman has also assumed responsibility for the residency training program in psychiatry.

Ether Day — 1846

Who were present at the first public demonstration of ether anesthesia on October 16, 1846, in the surgical amphitheater of this hospital? There will probably never be complete agreement among medical historians on the answer to this question.

One answer has been provided in a pamphlet entitled *Hinckley's Who Was Who on Ether Day.* It was written in 1962 by Dr. Henry R. Viets, Honorary Physician, MGH, and Curator of the Boston Medical Library. The above halftone illustration reproduces a color plate in this pamphlet, showing the famous oil painting of the event together with a line drawing of numbered heads that serves as a key to the identities of the men depicted.

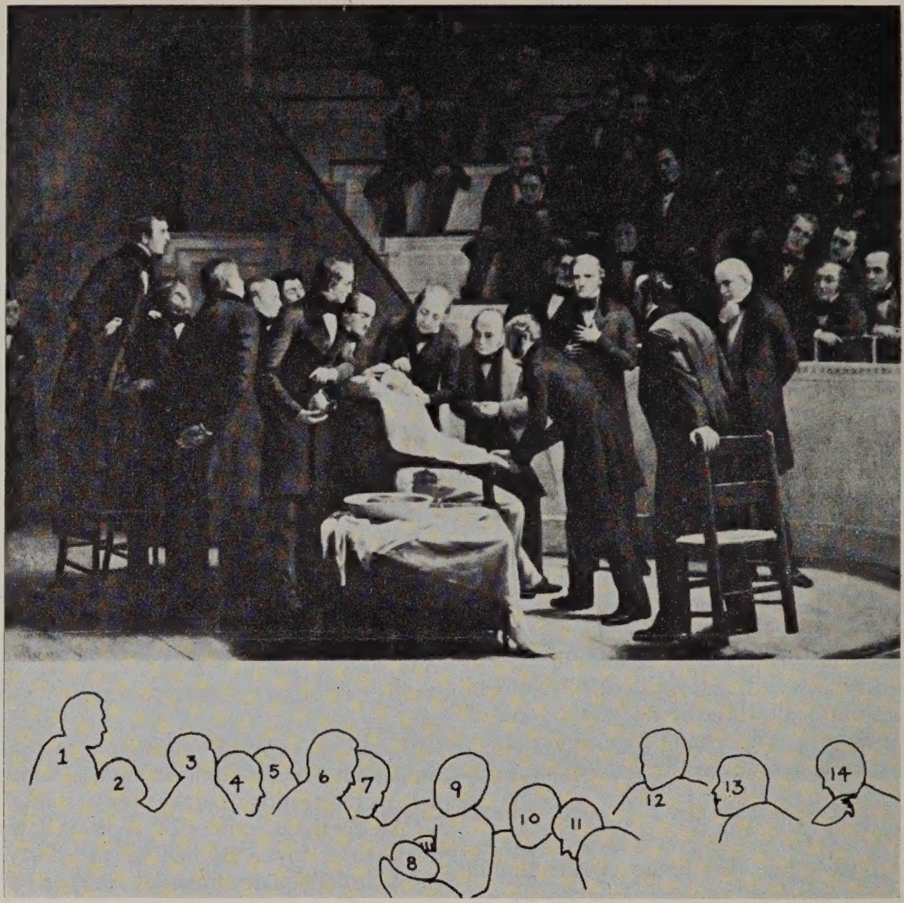
Robert Hinckley (1853-1941), originally a Bostonian, executed this painting in the 11 year period 1882-1893. It is now the property of the Boston Medical Library. It was loaned to MGH last August and will hang above the stage in Moseley Auditorium until the new Countway Library of Medicine (a joint venture of the Boston Medical Library and the Harvard Medical Library) is ready to receive it.

Like the ether episode itself, the Hinckley painting has been a subject of controversy. Some people are said to have been displeased at the attitude in which Dr. Bigelow was portrayed. Many people were shocked to find in the painting two surgeons (Mason Warren and Lawrence Peirson) who were positively known *not* to have been present at the historic operation. Dr. Viets took special note of this in his booklet.

Many people will naturally wonder why this painting was not purchased by MGH when Hinckley offered it for sale. One reason is that in the 19th century a charitable institution was supposed to refrain from buying "luxuries." The painting stood unwanted in Hinckley's studio for many years. In fact, Hinckley was about to cut it up to reuse the canvas when his friend, Dr. James Read Chadwick, then librarian of the Boston Medical Library, persuaded him to donate it to the Library (1903).

It is hoped that the healing powers of Time will eventually dispel the acrid vapors of controversy that still float over both the ether episode and the Hinckley painting. Artists and those who appreciate art recognize the principle of artistic license: the painter need not adhere to literal truth so long as he seeks to interpret the essential truth inherent in his subject. Mason Warren and Lawrence Peirson played essential roles in the early development of ether anesthesia. As Dr. Viets wrote: "We can forgive Hinckley's artistic license in view of his realistic and warm painting, so vividly portraying the memorable occasion."

G. H. J.



Key Prepared by Dr. Henry R. Viets

1. Newspaper "reporter."
2. John Call Dalton, medical student.
3. William W. Wellington, M.D.
4. A. Lawrence Peirson, M.D., Consulting Surgeon, MGH.
5. Charles H. Hildreth, student.
6. William T. G. Morton, anesthetist.
7. J. Mason Warren, M.D., Visiting Surgeon, MGH.
8. Gilbert Abbott, patient.
9. John C. Warren, M.D., Chief Surgeon, MGH, operating.
10. Eben H. Frost, merchant, who had tooth extraction under ether on Sep. 30, 1846.
11. Charles F. Heywood, M.D., House Surgeon, MGH, taking pulse.
12. Henry J. Bigelow, M.D., Visiting Surgeon, MGH.
13. Augustus Addison Gould, M.D.
14. Solomon Davis Townsend, M.D., Visiting Surgeon, MGH.

Ether Day — 1963

This year the traditional observance of Ether Day at MGH will be held in the Moseley Auditorium on Wednesday, October 16, at 3 p.m. Mr. Elliot L. Richardson will bring the greetings of the Board of Trustees. Dr. John H. Knowles, General Director, will deliver an address entitled "MGH—Present and Future."

At the customary Service Pin Ceremony Mr. Henry J. Murphy, Associate Director, will present the Candidates to Dr. Knowles, who will award the pins. The first Service Pin Ceremony took place in 1945, and since then well over 2,000 pins have been awarded.

Dr. Madhukar A. Pathak, Assistant Biochemist in Dermatology, participated in the Second International Congress of Pharmacology held recently in Prague, Czechoslovakia. In the Symposium on Drugs and Enzymes, Dr. Pathak spoke on "Photosensitivity to Drugs."

The Vincent Memorial Hospital is now enjoying its coffee party season. In September the Board of Managers entertained the fifty doctors attending the Harvard postgraduate course in gynecology at MGH. On Thursday, November 12, the Board will hold its 16th annual birthday party in honor of the opening of the Vincent Building in 1947.
